# Windows Phone 7 Application

Project name: My Assistant.

Student: Motasim Albdarneh.

Major: CS

This application is programmed on Visual Studio Express for Windows Phone using C# and XAML languages for developing. This application is tested on Visual Studio Express for Windows Phone Emulator.

On the other hand it provides the type of services; (Bing Maps), (search) service for windows phone, (store market search), plus traditional search on Google and Bing.

The user can choose the search category he wants, but in case the order is not provided, the user can search for any topic he requests.

This application includes a set of three types of reminders:

- Call reminder.
- Message reminder.
- Regular reminder.

Also it categorizes the reminders under the title (Today) if the reminder date matches the system date and all saved reminders under the title (All reminders).

When it comes to create a new reminder under the title of (Call) or (Message), the user will choose a name from his own contacts, time and date.

But when it comes to create a regular reminder, only date is required.

This application allows the user to call and message the person viewed in the reminder, plus it has an option for using (Bing Maps), (Set a place to meet) and traditional searching options available with full services and capabilities.

The application has a (Settings) page where the user can choose his settings for this application.
