Abstract

Design is the key to sustainable living. It leads to designing innovative products that consider the environment and the role of the designer in the community. It's about exploring environmental, economic and social issues and their relationship to design. Therefore, design reflects human needs today and in the future. 3-D design provides visualization of the products and their environment in a way that simulates reality. This helps ensure customer satisfaction with the finished product since the customer can actually see it before it is made.
