Research Synopsis: The systems described by linear elliptic partial differential equations of the second order are chosen as an object of investigation. The subject of investigation is the observation problems under incomplete data when the observed functions are connected with solutions of the considered boundary value problems by means of linear integral operators with additive random errors of measurements. Problems of estimation are reduced to certain problems of optimal control of adjoint equations with the quadratic performance criteria under the restrictions on control and without them.

General methods of investigation are essentially based on modern achievements in such fields as optimization and identification for partial differential equations.
