ABSTRACT: Modern wireless communication technologies require improved reliability, efficient spectrum

utilization, and huge data rates that achieve better channel capacity. Multi Input Multi Output (MIMO) systems with multiple antenna elements at both link ends are an efficient solution to enhance the system performance under the constraints of limited bandwidth and transmit power by using Orthogonal Space-Time Block Code (OSTBC). In this work, a performance investigation of uncoded and Trellis-coded QAM, sequential with OSTBC 2×2 , 2×3 , and 4×4 MIMO systems over AWGN and fading channels, in terms of Bit Error Rate. The simulation outcomes indicate that the more signal to noise ratio (E_b/N_0) is required for uncoded QAM to achieve the same BER performance of Trellis coded QAM. The overall system performance has been improved by about 3.5 dB in terms of E_b/N_0 saving in the case of applying Trellis Coded Modulation (TCM) technique. Additionally, the simulation outcomes exhibited that the system in both cases uncoded-QAM and Trellis coded-QAM has performed better in the case of AWGN channel compared to Rician and Rayleigh channels. © 2022 IEEE.

ABSTRACT: This study aimed to show the impact of data mining techniques on achieving the quality of the information in insurance companies listed on the Amman Stock Exchange to achieve these goals the study authors used the descriptive and analytical approach based on the questionnaire distributed to the members of the study community by (130) employees in the areas of information technology, accounting and insurance risk management processes and distributed to (25) insurance companies representing the entire study community. The study found that the ranking of the areas seen when investigating the effect of data mining methods on achieving the quality of the data in insurance companies, was according to their importance and level of importance in them among the members of the study community, as follows: chances to strengthen knowledge systems with the growth of the environment of study systems and data retrieval This variable obtained the highest average and the arithmetic average of this variable was equal to (4.17), followed by the variable of discovery, distribution and participation of knowledge systems' and the arithmetic average of this variable was equal to (4.01). In addition, there is a statistically significant effect of data mining methods (enhancing knowledge systems with the growth of the environment of study and data retrieval systems, discovery, distribution and sharing of knowledge systems) on achieving the quality of the data in insurance companies listed on the Amman Stock Exchange. One of the main recommendations of the study is the need for continuous development and improvement of the use of data mining techniques, necessary to improve knowledge systems with the development of the environment of research and data retrieval systems, to achieve the quality of information, and in a way that helps achieve the goals sought by these techniques to increase the efficiency and effectiveness of the production of appropriate information, in addition to the need to employ data mining techniques to facilitate the innovation of new ideas in an organized and appropriate framework to produce information to increase the predictive capabilities of policymakers at all levels. © 2022 IEEE.

ABSTRACT: The fourth industrial revolution brought digital solutions to modernize how firms manufacture and distribute their products. A fusion of artificial intelligence advances is utilized to blur boundaries between the biological, physical, and digital worlds. Firms are redesigning their supply chains to attain high levels of operational effectiveness. Supply chain activities are crucial for the success of manufacturing firms. Blockchain is a promising technology for managing the supply chain efficiently. Blockchain is an immutable, distributed ledger to record transactions digitally. A smart contract is a coded agreement between two parties that executes an exchange automatically in the absence of trusted authorities. This study aimed to explore the prospects of utilizing blockchain and smart contracts as empowering technologies for food supply chain management. The study used a case study approach. Blockchain has the potential to play a vital role in almost every aspect of the future. Implementing blockchain in the supply chain will enhance the transparency, traceability, and flow of goods and services across the supply chain. Additionally, a blockchain-based smart contract will facilitate, validate and impose negotiation and execution agreements among multiple parties in

real-time, enhancing the collaboration and quality of management. Carrefour UAE successfully joined IBM Food Trust. Carrefour's initiative came after growing customers' concerns about product provenance and ethical sourcing. The Carrefour initiative helped to resolve the problem of trust in the food supply. Improvements in the supply chain are expected to happen, including enhanced efficiency, traceability, reduced execution risk, low cost, etc. © 2022 IEEE.

ABSTRACT: The channel state information (CSI) of the sub-carriers employed in orthogonal frequency division multiplexing (OFDM) systems has been employed traditionally for channel equalisation. However, the CSI intrinsically is a signature of the operational RF environment and can serve as a proxy for certain activities in the operational environment. For instance, the CSI gets influenced by scatterers and therefore can be an indicator of how many scatterers or if there are mobile scatterers etc. The mapping between the activities whose signature CSI encodes and the raw data is not deterministic. Nevertheless, machine learning (ML) based approaches can provide a reliable classification for patterns of life. Most of these approaches have only been implemented in lab environments. This is mainly because the hardware requirements for capturing CSI, processing it and performing signal-processing algorithms are too complex to be implemented in commercial devices. The increased proliferation of IoT sensors and the development of edge-based ML capabilities using the TinyML framework opens up possibilities for the implementation of these techniques at scale on commercial devices. Using RF signature instead of more invasive methods e.g. cameras or wearable devices provide ease of deployment, intrinsic privacy and better usability. The design space of device-free wireless sensing (DFWS) is complex and involves device, firmware and ML considerations. In this article, we present a comprehensive overview and key considerations for the implementation of such solutions. We also demonstrate the viability of these approaches using a simple case study. © 2022 IEEE.

ABSTRACT: In this paper, we introduce a method to enhance drone location estimation using angle-of-arrivals (AOA)s measurements. It is assumed that sensors are distributed in a field and each two close sensors form doublets. AOA estimation for the drone is performed by each doublet. The locus of each AOA estimation for each doublet will form a cone with its axis coincides with the doublet axis. A previous published method in the literature proposed using the loci interceptions of six AOA estimations to estimate the drone location. Practically, when considering the noise in the AOA measurements, the cones will not intercept in a point and a residual error will appear. So, a cost function is formed from the sum of squared of these residual errors. Then by minimizing this cost function to achieve an optimum solution, this will lead to an enhanced drone location estimation. In this paper, we utilize the gradient descent algorithm to minimize the proposed cost function. Significant enhancement in locating the drone is achieved as will be shown in the simulation results provided in the paper. © 2022 IEEE.

ABSTRACT: Biofilms have a negative impact on the health of the patients, it is one of the global health concerns that need to be nullified to enhance and improve the health outcome. The knowledge and awareness of biofilms among pharmacy students is very essential. Hence this study aimed to assess the overall knowledge and awareness regarding biofilms among pharmacy/Phar.D. students in multiple universities in Jordan. A descriptive cross-sectional study was conducted in the period between February 1st, 2022, and April 1st, 2022, to assess and evaluate knowledge about biofilms among undergraduate pharmacy/Phar.D. students in Jordanian universities, this was performed by sampling respondents from pharmacy schools in both public and private universities. An online questionnaire-based survey was used to collect the data which were then statistically analyzed using SPSS software. A total of 1,058 undergraduate pharmacy/Phar.D. students are enrolled in this study. Nearly all the students were in their 3rd and 4th year of study. A high number of participating students (80.7%) have previously been enrolled in or are currently receiving an academic course in pharmaceutical microbiology and around half (48.0%) have been enrolled in or are currently receiving a related course. The study found a significant lack of information in the enrolled students regarding the specifics of biofilms, creating a better understanding of the information needed to be supplemented to raise students' knowledge and avoid common misconceptions. © 2022 Journal of Advanced Pharmacy Education & Research | Published by SPER Publication

ABSTRACT: Background: We hypothesized that superlative dual cytotoxicity-antiinflammation bioefficacies of 9 selected lipophilic statins correlate to their chelation effect of 3,5-dihydroxyheptanoic acid. Methodology: Lipophilic-acid chelating statins have been screened for in vitro duality of proliferation inhibition and NO-radical scavenging capacities. Results: Their spectrum of selectivity indices for safety in PDL fibroblasts -based 72h incubations was reported. Surprisingly despite its lack on macrophages LPS-triggered inflammation over 5-200 µM and unlike the 8 statins; cerivastatin had growth inhibition IC50 values of 40nM (SW620), 110nM (HT29), 2.9 µM (HCT116), 6µM (SW480), and most notably 38µM (<50 µM, in Caco2). Exclusively cerivastatin exerted antitumorigenesis IC50 values <50 µM in all T47D, MCF7 and PANC1 72h cultures. In statins with greater antiinflammation affinity than indomethacin's; lovastatin had cytotoxicity IC50 values <20 µM in SW620<HT29<ACT116<SW480 and >100 µM in Caco2. Atorvastatin was found of viability reduction IC50 value <20 µM in HCT116<SW620. Simvastatin exerted growth inhibition IC50 values <20 µM in HT29<SW620<SW480 and MCF7. Rosuvastatin, pitavastatin and fluvastatin proved equipotency to indomethacin but cytotoxicity IC50 values >50µM in T47D, MCF7 and PANC1. Rosuvastatin had antineoplastic IC50 values (<50 µM) in SW620<SW480<MCF7. Pitavastatin was ascribed cytotoxicity IC50 values (<50µM) in HT29<SW620<HCT116<SW480. Fluvastatin had antiproliferation IC50 values (<50µM) in SW620<HT29<SW480<HCT116, and the rest were >50 µM in remaining colorectal, breast and pancreatic cancer cell lines. In statins with appreciable antiinflammation but reasonably lower affinity than indomethacin's and cytotoxicity IC50 values >50µM in T47D, MCF7 and PANC1; pravastatin had viability reduction IC50 values <50µM in HT29<HCT116. Mevastatin was reported for growth inhibition IC50 values <50µM in HT29<SW620<HCT112<SW480. Antitumorigenesis IC50 values>50 µM were for statins in remaining colorectal cancer cell lines, breast cancer and pancreatic cancer cell lines. Conclusion: Among the rest, cerivastatin warrants further novel scaffold development to maximize efficacy and optimal molecular action mechanisms of chemotherapy/prevention. © This work is licensed under a Creative Commons Attribution-Non Commercial 4.0 International License.

ABSTRACT: Background: Quality of life (QoL) of diabetic patients is a primary outcome in the management of diabetes. However, to improve patients' QoL, validated instruments are necessary to

measure QoL, moreover, identifying variables that may influence patients QoL is the first step in improving patients' QoL. The study aim was to develop and validate a brief tool to assess diabetic patients' QoL and identify the factors associated with poor QoL among adult Jordanian patients with type 2 diabetes. Method: Based on literature review, a brief questionnaire (Brief Arabic Diabetes QoL (BADQoL)) was developed to evaluate patients' QoL in the present cross-sectional study. Patients' socio-demographics and disease status information were gathered, in addition to the participants' beliefs about medicines and their medication adherence. Factor analysis was conducted to validate the use of BADQoL. Stepwise binary regression analysis was performed to identify the independent predictors of poor QoL. Results: A total of 287 diabetic patients were enrolled in the study. The factor analysis indicated that one factor with 14 items was the best model for BADQoL. Moderate QoL was observed among the participants as the QoL score mean was 47.17(± 11.33) out of 70. Necessity score significantly increased the odds of having higher QoL (OR=9.11, p-value < 0.01), while low adherence and moderate adherence (OR=0.09 and 0.13 respectively, p-value < 0.01), uncontrolled diabetes (OR=0.19, p-value < 0.01) and longer duration of diabetes significantly decreased the odds of having higher QoL (OR=0.85, p-value < 0.01). Conclusion: Several factors were associated with diabetic patients' QoL. Implementing disease management programs while taking into consideration these factors could improve diabetic patients' QoL. © 2021 The Author(s)

ABSTRACT: Hormone-sensitive lipase (HSL) is a pivotal enzyme that mediates triglyceride hydrolysis to provide free fatty acids and glycerol in adipocytes in a hormonally controlled lipolysis process. Elevated plasma-free fatty acids were accompanied by insulin resistance, type-2 diabetes, and obesity. Inhibition of lipolysis through HSL inhibition may provide a mechanism to prevent the accumulation of free fatty acids and to improve the affectability of insulin and blood glucose handling in type II diabetes. The published studies that examine the structure, regulation, and function of HSL and major inhibitors were reviewed in this paper. © 2022 Arwa R. K. Althaher.

AFFILIATIONS: Department of Accounting, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study seeks to analyse the direct association between earnings management (EM), earnings quality (EQ) and the cost of equity capital (CoEC). It also studies the mediating role of EQ and the moderating role of board gender diversity (BGD) in the context of the EM-CoEC nexus. Contradictions in the results of earlier investigations inspired the current study, with the findings filling a gap in the existing literature. This study presented a novel empirical model based on a mediation-moderation model, which sheds light on the mechanism of effect of numerous factors on the CoEC. The findings of this study reveal that the influence of EM practices on EQ is negative. Furthermore, the impact of EM practices on CoEC was positively significant, implying that the more EM practices there were, the higher the CoEC. At the same time, the findings show that EQ has a negative significant influence on CoEC. Additional findings confirm that EQ fully mediates the EM practices-CoEC nexus. Following that, in terms of BGD's moderating role, the findings indicate that BGD has a significant negative impact on CoEC, and the interaction impact (EM \times BGD) is positive and significant. © 2022 International Management Institute, New Delhi.

ABSTRACT: Digital transformation and the digitalization of economic activity are ongoing trends profoundly shaping the global economy. Digitalization reflects digital inputs in the production process and new household and government consumption modes, investment possibilities, and financial instruments, increasingly envisaged by digital technologies and tools. This is also impacting the

labour markets, on the one hand substituting machines to labour for routinized tasks and thus decreasing the demand for soft skills labour, but on the other hand, increasing the need for new professions revolving around new production and consumption modalities and digital skills. Considering these contrasting effects, it is essential to estimate the overall impact of digitalization on employment. Therefore, this study captures the impact of economic growth and digitalization on unemployment change, evaluating a modified version of Okun's Law on a balanced panel data set for 58 countries between 2013 and 2019. The results from the estimation of a fixed-effect model show the empirical validity of Okun's law for the sampled countries and a significant contribution of digitalization on unemployment reduction. © 2022, Bononia University Press. ABSTRACT: This paper intends to propose a general approach established to control the states of some classes of fractional-order discrete neural networks. For this reason, a novel influential result is set up and theoretically derived in light of the Lyapunov direct method in order to assure the accomplishment of the desired stabilization for those classes under consideration. The influence of such stabilization approach is validated through some performed numerical simulations. © CSP - Cambridge, UK; I&S - Florida, USA, 2022

ABSTRACT: In this work, we intend to study certain mappings in bitopological spaces such as pairwise perfect and pairwise countably perfect mappings that possess the property (E). Some properties of such mappings are provided which have helped us to obtain some finite product theorems concerning with pairwise expandable and almost pairwise expandable spaces. Two illustrative examples are given to demonstrate the effectiveness of some proposed results. © 2022 the author(s).

ABSTRACT: Aims: This study aimed to investigate the effects of consuming Phoenix dactylifera and fasting on the mRNA expression of major hepatic drug-metabolizing enzymes in mice. Methods: Phoenix dactylifera ethanolic extract was analyzed using LC-MS/MS. We used forty-two male Balb/c mice, which were treated with low (300 mg/kg) and high (2583 mg/kg) doses of Phoenix dactylifera and fasted for 24 hours, two weeks, and one month. Then, we analyzed the expression of cyp3a11, cyp2c29, cyp2d9, and ugt2b1 using real-time polymerase chain reaction assay. In addition, we assessed the relative liver weights of the mice and the hepatic pathohistological alterations. Results: We found that Phoenix dactylifera ethanolic extract contained 38 phytochemical compounds, mainly kaempferol, campesterol, lutein, apigenin, genistein, and isoquercetin. Fasting significantly upregulated the mRNA expression

of several drug-metabolizing enzymes in a time-dependent manner and we showed that consuming the low dose of Phoenix dactylifera significantly upregulated the expression of drug-metabolizing enzymes more than the high dose. The results of the histological examinations and relative liver weight showed that fasting and consuming of Phoenix dactylifera did not cause any toxicological alterations in the liver of the mice. Conclusion: It is concluded from this study that fasting and consuming of Phoenix dactylifera upregulated the mRNA expression of major drug-metabolizing enzymes in mouse livers. These findings may explain, at least partly, the variation of drug response during fasting in the month of Ramadan and would direct future clinical studies in optimizing the dosing of pharmacotherapeutic regimen. © 2022 Bentham Science Publishers.

ABSTRACT: Background. Glycation is implicated in the pathophysiology of many diseases, including diabetes, cancer, neurodegenerative diseases, and aging. Several natural and synthetic compounds were investigated for their antiglycation activity. We evaluated the antiglycation effect of vanillic acid (VA) using in vitro and in vivo experimental models. Methods. In vitro, bovine serum albumin (BSA) (50 mg/ml) was incubated with glucose (50 mM) with or without VA at 1.0-100 mM for 1 week at 37°C, and then, excitation/emission fluorescence was measured at 370/440 nm to determine glycation inhibition. The cytoprotective effect of VA was evaluated using RAW 264.7 cells incubated with or without VA at 7.8-500 µM along with 100-400 µM of methylglyoxal for 48 hours, and cell viability was determined using the MTT assay. Aminoguanidine (AMG) was used as a positive control in both in vitro and cell culture experiments. In vivo, 52 streptozotocin-induced diabetic rats were randomly assigned to 4 groups and treated with 0, 1.5, 4.5, or 15 mg/kg VA for four weeks. Serum fructosamine and blood glycosylated hemoglobin (HbA1c) were then measured, and advanced glycation end-products (AGEs) were detected in the kidneys and the skin of deboned tails using an immunohistochemistry assay. Results. VA caused a concentration-dependent effect against BSA glycation (IC50 of 45.53 mM vs. 5.09 mM for AMG). VA enhanced cell viability at all concentrations of VA and methylglyoxal. VA did not affect serum fructosamine or blood HbA1c levels, although it markedly decreased AGEs in the kidney in a dose-dependent manner and decreased AGEs in the skin of deboned tail tissues. Conclusion. VA had significant antiglycation activity at cellular and long-term glycation. © 2022 Amani Alhadid et al.

ABSTRACT: A bifacial photovoltaic (bPV) is a double-sided solar panel that converts sunlight into electrical energy using both sides. They are different from conventional PVs which only use one side of the solar panel. In this work, a comparison study of bPVs performance is conducted. More precisely, the study considers different reflecting grounds to the rear side of the bifacial panels, such as asphalt and reflective white painted ground. Different design parameters of the bifacial solar technology are investigated, such as installation height and albedo factor. The results show considerable improvement in bPV performance using the reflective white painted ground over other material, recording better albedo metric and increasing the power gain by around 20%. Moreover, improved efficiency can be obtained when the optimal parameters are determined in the design of bPVs. © 2022 IEEE.

ABSTRACT: The recent pandemic COVID-19 has forced almost all governments in the globe to take stringent actions to counteract the spread of this new deadly virus. In Jordan, the government introduced the Marshal Law and enforced lockdown of all activities in both of private and public sectors in the country including schools, universities and social gatherings. As a result, demand on the Internet increased sharply: working from home, on-line teaching and learning and on-line orders for different supplies. Such sudden and unexpected dramatic changes increased the load on the fragile existing network and available E-learning systems. In this study, online teaching process, in-house solutions for virtual coaching, in the faculties of engineering, was evaluated and analyzed, with focus on students' points of view. To achieve such goal, a structured questionnaire was distributed to engineering students from different levels and streams. Statistical analysis was conducted to determine the level of satisfaction of students and testify how far the E-learning process was successful as compared with conventional classroom learning. It was concluded that students were not comfortable with this first experience related to online teaching, especially when it comes to specialized technical and practical courses as well as labs. Moreover, they faced serious problems in following up online lectures. This could be attributed to the fact that this is the 1st experience on distance learning and weakness in existing facilities and lack of awareness among students as well as staff members. © 2022, Rajarambapu Institute Of Technology. 85142293459&doi=10.15849%2fIJASCA.221128.11&partnerID=40&md5=f97ff61b130bd984d68b0926d9599b67

AFFILIATIONS: Faculty of Science and Information Technology, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Recommendation systems are an important feature in the proposed virtual life, where users are often stuck with choices most of the time and need help to be able to find what they are looking for. In this work, content-based techniques have been employed in the proposed recommender system in two ways, a deep review for content and features contents such as (cast, crew, keywords, and genres) has been conducted. A preprocessing stage using TF-IDF and CountVectorizer methods have been employed efficiently to prepare the dataset for any similarity measurements. Cosine similarity algorithm has been employed as well with and without sigmoid and linear kernels. The achieved result proves that similarities between movies using TF-IDF with-Cosine similarity (sigmoid kernel) overcomes the TF-IDF with-Cosine similarity (linear_kernel) and Cosine similarity with CountVectorizer in collaborative filtering. The accuracy values of different machine learning models are validated with K-fold Cross Validator techniques. The performance evaluation has been measured using ROOT Mean Square Error and Mean Absolute Error. Five Machine learning algorithms (NormalPredictor, SVD, KNNBasic (with k=20 and K=10), KNNBasic (with sim_options), and NMF (in several rating scales)). Accuracies are finally been validated with 3 folds from each validator. The best achieved RMSE and MAE scores are using SVD (RMSE = 90%) and (MAE = 69%), followed by KNNBasic (with sim_options, K= 20), NMF, KNNBasic (K=20), KNNBasic (K=10), ending with KNNBasic(sim_options, K= 10). © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: This study aimed to assess Readiness of Jordanian Universities for E-learning. For the purpose of the study a questionnaire consisting of (42) items was developed and divided into five domains, namely: organizational readiness, ICT tools, technical resources, faculty members, and students. The statistical analyses have been done using descriptive and inferential analytical approaches by the Statistical Package for Social Sciences. The results indicated that Readiness of Jordanian Universities for e-learning was medium. On one hand, the findings indicate that there were statistically significant differences at the significance level ($\alpha \leq 0.05$) in individual responses to the study sample attributed to the type of faculty variable in favor of sciences faculties. On other

hand there were no statistically significant differences at the significance level ($\alpha \leq 0.05$) in individual responses to the study sample attributed to variable of faculty members by the academic rank. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Solar water disinfection (SODIS) is a simple and low-cost method of increasing water quality. However, it takes about 6 hours of exposure to solar radiation. The elimination of harmful pathogenic germs from drinking water can be accelerated using a combination of sun disinfection and nanotechnology. In this study, a hybrid water purification technique using solar water disinfection, Titanium Oxide (TiO₂), and natural mineral clays was investigated. TiO₂, natural kaolin clay nanoparticles, and a mixture of TiO₂ and natural clay were added to contaminated wastewater containers at different concentrations. After that, the containers were exposed to sunlight for different time intervals. Samples were then collected from all tests to measure the total counts of Total Coliform and Escherichia coli (E. coli) using the IDEXX system. The results showed that the addition of TiO₂ and natural kaolin clay to wastewater with solar water disinfection reduced the total count of the pathogenic microorganisms and decreased the time needed time for the disinfection process compared to using solar energy alone. The results also showed that the optimum concentration of the TiO₂, which yielded the shortest purification time and lowest levels of pathogenic microorganisms, was 0.006 g/ml. In contrast, the most effective concentration of natural clay was 0.0015 g/ml. Moreover, the results showed that the optimum concentration of the mixture of TiO₂ and natural clay, which speeds up the purification time and lowest the level of pathogenic microorganisms was 0.006 g/ml for TiO₂ and 1.2 g/ml for the natural clay. © 2022, Journal of Ecological Engineering. ABSTRACT: Introduction: The COVID-19 situation is placing nurses under great stress which may negatively influence their health. Objective: The purpose of this study was to examine the association between occupational stress and general health of critical care nurses during COVID-19 pandemic. Methods: A descriptive, cross-sectional design was used. A convenience sample of 150 Jordanian critical care nurses completed the study. Results: Occupational stress was a significant predictor of nurses' general health. Female gender, young, living with elderly or persons having chronic diseases, and little nursing experience were associated with worse general health, while living with elderly or persons having chronic diseases were associated with more occupational stress.

Conclusion: Providing psychological support services for critical care nurses is required to reduce the impact of occupational stress on nurses' poor general health. © The Author(s) 2022.

ABSTRACT: Introduction: Student in a maternity nursing program must be engaged in practical training and they must be well prepared and directed along the way to becoming qualified professionals.

Objective: The study aimed to investigate the effect of progressive muscle relaxation exercise on anxiety among male nursing students undergoing maternity clinical training. Methods: A quasi-experimental, pre-post study was conducted on nursing at Arab American University Palestine. The sample of the study consisted of 48 male nursing students enrolled in the maternity nursing course. They were selected through convenience sampling. This study was conducted on one group of male nursing students that received Jacobson's progressive muscle relaxation exercise for five consecutive days per week. The S-anxiety scale (STAI Form Y-1) was applied to collect data before and after the intervention. Results: The magnitude of anxiety reduction after the progressive muscle relaxation exercise was greater than before ($t(47) = 21.2, p < .05$). Conclusion: The current study's findings indicated the influence of progressive muscle relaxation on maternity clinical setting anxiety reduction among male nursing students. © The Author(s) 2022.

ABSTRACT: This paper analyzes the importance of size and capital for risk-taking incentives of Jordanian banks using panel data of 13 commercial banks for the period 2007–2017. The results reveal that size and capital add to stability, consistent with the economies of scale and scope hypothesis. In developing countries, banks are more conservative and less involved in market-based activities; however, they are interconnected just as in developed countries. The results of the first model and second model reveal that as size increases by 1 percent, risk decreases by 0.11 percent and 0.03 percent, respectively, implying that too-big-to-fail is not present and that moral hazard is not a serious issue. In both models, large size is driven by diversification not by risk-taking incentives. In terms of capital, the results of the first model and second model reveal that as capital increases by 1 percent, risk decreases by 0.48 and 0.12 percent, respectively. The fact that Jordanian banks are overcapitalized indicates that the central bank regulation is not binding. Banks increase their capital adequacy ratios to reduce risk. It is clear that there is economic benefit from increased size. However, the failures of large banks are systemic due to their interconnectedness. Therefore, regulators need to pay special attention to them in accordance with Basel III Accord. © Marwan Alzoubi, Alaa Alkhatib, Ayman Abdalmajeed Alsmadi, Hamad Kasasbeh, 2022.

AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Dyslipidemia is an abnormal lipid profile associated with many common diseases, including coronary heart disease and atherosclerosis. Cholesteryl ester transfer protein (CETP) is a hydrophobic plasma glycoprotein that is responsible for the transfer of cholesteryl ester from high-density lipoprotein athero-protective particles to pro-atherogenic very low-density lipoprotein and low-density lipoprotein particles. The requirement for new CETP inhibitors, which block this process

has driven our current work. Here, the synthesis as well as the ligand-based and structure-based design of seven oxoacetamido-benzamides 9a-g with CETP inhibitory activity is described. An in vitro study demonstrated that most of these compounds have appreciable CETP inhibitory activity. Compound 9g showed the highest inhibitory activity against CETP with an IC₅₀ of 0.96 μM. Glide docking data for compounds 9a-g and torcetrapib provide evidence that they are accommodated in the CETP active site where hydrophobic interactions drive ligand/CETP complex formation. Furthermore, compounds 9a-g match the features of known CETP active inhibitors, providing a rationale for their high docking scores against the CETP binding domain. Therefore, these oxoacetamido-benzamides show potential for use as novel CETP inhibitors. © 2022, Faculdade de Ciencias Farmaceuticas (Biblioteca). All rights reserved.

ABSTRACT: Background: Prophylactic laxatives were associated with decreasing the incidence of Opioid-induced constipation among patients with cancer. This study aims to evaluate the effectiveness of early prophylactic laxatives therapy on the severity of constipation and quality of life among patients with cancer receiving opioids. Methods: Using a quasiexperimental design with 64 patients assigned to control group and 66 patients assigned to intervention group. The final sample was composed from 112 patients (57 in control group and 55 in intervention group), who were selected from an oncology clinic. Patients in the intervention group have received prophylactical laxatives The intervention included an oral colonic stimulant laxative (i.e., Bisacodyl, Dose= 3 tab/ day and/or Senna 6.8 mg twice daily) and an oral colonic osmotic laxative (i.e., Lactulose, Dose = 15 ml three times per day). Patients in the control group continue to receive their routine care without laxatives. Results: Patients in the intervention group have reported a significant reduction in the severity of constipation symptoms at eight weeks post the intervention ($p < 0.001$). Furthermore, the patients in the intervention group have revealed a significant improvement in their quality of life (QoL) ($p < 0.001$). Conclusions: Patients with cancer need to use the first line of laxatives as prophylactic alongside with opioids to minimize the severity of Opioid-induced constipation symptoms and to enhance the QoL. © This work is licensed under a Creative Commons Attribution-Non Commercial 4.0 International License.

ABSTRACT: Companies try to create robust supply chains that allow them to bring their products to market faster, more efficiently, and more affordable than their competitors. However, due to the crisis repercussions, many companies faced many challenges to maintain their revenues and enhance their competitive positions, by gaining a competitive advantage and sustaining them for the longest possible period. However, this paper aims to investigate the moderating role of talent management processes between supply chain and competitive advantage in light of COVID-19. a survey questionnaire was used, which was constructed according to sources related to supply chains in the context of Jordanian industrial companies. Moreover, this paper is characterized by recognizing the role that supply chain management plays in achieving competitive advantage, and the modified role of talent management. Contributions were made to decision makers about taking advantage of the benefits of supply chain management in achieving competitive advantage and the need to more focus on talent management. © 2022 IEEE.

ABSTRACT: The fields of Natural Language Processing (NLP), Computer vision and speech processing witnessed great breakthroughs caused by the continuous advances in Deep Learning (DL). The implementation of DL techniques in Online Social Networking and Sentiment Analysis have proved to provide a state-of-the-art result in these areas. In this research, we survey the papers that claims to use the DL methods in NLP. We focus on the research that is related to the Arabic language due to the scarce resources in Arabic NLP. We concluded that most of the early research in Arabic NLP focusses of OCR-Digitization and most recently is focusing on applying DL methods in Sentiment Analysis, diacritization and machine translation. We present this survey to provide the growing community of researchers in ANLP in the hope of bridging the gap between the ANLP and the English NLP. © 2022 IEEE.

ABSTRACT: Interest is increasing towards revealing genes network underlying cereals developmental stages. Pattern of HvOPR1 gene expression during spike developmental stages has remained unknown. In this study, the relationship between HvOPR1 and spike development in barley was identified. Transcriptomic levels of HvOPR1 gene were quantified using qRT-PCR. Expression analysis revealed that HvOPR1 was differentially regulated during spike development. The lowest expression levels were scored for Milk Development and Dough Development stages. One the other hand, the highest expression of HvOPR1 was noticed during Heading. Our data showed an evidence of a possible regulatory role of HvOPR1 during booting, heading and pollination stages. © 2022, Plant OMICS. All Rights Reserved.

Effect of Educational Program on Knowledge, Skills, and Personal Preparedness for Disasters Among Emergency Nurses: A Quasi-Experimental Study
(2022) Inquiry (United States), .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140507871&doi=10.1177%2f00469580221130881&partnerID=40&md5=f34c3da1295631091f4317e51758af11>
AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan
ABSTRACT: Continuous nursing education has a significant correlation with increasing knowledge, improving skills, and personal preparedness for disasters among nurses which leads to a decrease in mortality rate and enhances the quality of care. However, there is limited literature evaluating the effect of educational programs on the knowledge, skills, and personal preparedness for disaster preparedness among emergency nurses at Arab countries including, Jordan. This study evaluated the effect of an educational program on knowledge, skills, and personal preparedness for disasters among emergency nurses. A quasi-experimental study and one-group pretest-posttest design was used. A convenience sample was adopted to recruit registered nurses who are working in emergency rooms in the private and government health sectors in Jordan (N = 50). This study was conducted between May and June 2021. The intervention included an educational program consisting of 5 topics about disasters. The participants attended this program for 8 h over 1 week via Zoom application. There were significant differences between the pre-post educational intervention for knowledge ($t = 4.79$, $P \leq .001$), skills ($t = 6.66$, $P \leq .001$), and personal preparedness ($t = 9.56$, $P \leq .001$) for disasters. These findings suggested the importance of implementing continuous education and training programs for emergency nurses about disasters due to increasing frequency of disasters worldwide. © The Author(s) 2022.

ABSTRACT: As the concept of individual's private electronic life has broadened, it became a real challenge for humanity which is subject to infringement, violations, and penetration on one hand and difficult to technologically and legally control, being a human right, on the other. Thus, methods for controlling and protecting it have become more difficult. Consequently, the difficulty to control methods of committing the crime of penetrating private electronic life and to include that in strict legal provisions assist to achieve a successful protection for it. Undoubtedly, the absence of legislative provisions for some forms of crimes endangers the future of individual's private electronic life, hence fails in to punish penetrators and parasites, due to the legislative provision which stipulates that no crime and no punishment can be inflicted without a provision. The current study sheds light on private electronic life of individuals through presenting problems and challenges that it encounters, besides the preventive remedial possible solutions for this phenomenon which disturbs whoever deals with information technology. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: Background: Nursing is a noble profession that aims to care for individuals, families, and communities to achieve optimum health and quality of life. Nurses are the largest constituent of the healthcare team and nursing students' motivation towards their field of inquiry affects their satisfaction and academic performance. Aim: To examine the academic motivation among nursing students in public universities in Jordan in the context of COVID-19. Materials and Methods: A descriptive cross-sectional study conducted in three public universities in Jordan. A total of 437 nursing students in their second, third, or fourth year of study answered a self-administered online questionnaire. Descriptive and multivariant analysis was conducted using SPSS 24. Results: Academic motivation among students from three public universities was below the averages reported in the international literature. Students' mean scores on the academic motivation scale knowledge was 90.25 out of 196, and the average mean scores for all subscales were just above the midpoint, except for the extrinsic regulation scale, which was 14.57 out of 30. Students reported higher levels of extrinsic motivation. Conclusions: Educators must focus on nursing students' need for support and consider the development of a curriculum that strengthens student learning and nurtures their internal and external motivation needs. © 2022 DSR Publishers / The University of Jordan. ABSTRACT: In this paper, we have introduced some of the most interesting user interface software for developing applications with Arduino modules. A brief comparison of the most used Graphical interfaces is done based on student's feedback and experiment. The first scenario was a questionnaire presented to License L3 students and Master students in their final project work. The second scenario is taken from research's documentation from the web. We concluded that students like to have GUI in their applications however they prefer simplicity, clearness in the GUI and real-time interaction. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: This paper aims to understand better how Big Data and Big Data Analytics (BDA) affect professional judgement, audit performance and perceived audit quality in Canadian audit firms. Our findings are based on semi-structured interviews conducted with audit professionals firms. This research evidence suggests that auditors' skills and competence to perform engagement activities are assertively affected by BDA in audit methodology. Auditors benefit from being able to visualise audit evidence so they can use it to guide their professional judgement and decision making. We found evidence that the early stages of adopting data analytics and implementing are inefficient, but they save auditors' time as the tools get more familiarised. Finally, we documented that auditing professionals can use analytics to gain more insight into clients' business and offer them insights, which leads to confidence in clients. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: This exploratory research aims to ascertain participants' perspectives on the use of Big Data and Big Data Analytics methods during audit brainstorming sessions at Canadian audit firms, and whether such methods aid in the risk assessment process to fraud detection. A Canadian qualitative research method is applied in this study to provide an overview of the results from audit industry interviews. The complete sample included twenty-two external auditor participants who attended an office interview in Canada during the third and fourth quarters of 2019; twelve auditors from the Big-4 and ten from mid-size audit firms. The research discovered that, on average, brainstorming sessions interpret the impact of Big Data and Big Data Analytics favourably. Additionally, our study findings show that utilising Big Data Analytics during brainstorming sessions improves the efficiency and effectiveness of fraud risk evaluations substantially. Finally, the paper discussed how Big Data had altered auditors' positions and professional decisions. Our analysis and results have a broader effect on the purpose of fraud detection brainstorming sessions and the quantification of fraud risk in an audit context. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Cultural Value Orientations Among Managers of Travel Agencies

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140482957&doi=10.1007%2f978-3-031-05258-3_29&partnerID=40&md5=1e872ac40de966b51d207b5f48ab8c2a

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study aims to examine cultural value orientations on the work orientation of marketing managers of Jordanian travel agencies. Cultural Orientations are investigated depending on the theoretical framework proposed by Kluckhohn and Stodtbeck's (1961) model. Descriptive analysis and structural equation modeling approach are used to test the effect of cultural value orientations on work orientation. The study reveals that travel agency managers are characterized by some traditional values such as subjugation, individualism, future time orientation, being work orientation, and changeable human nature. Furthermore, managers are future-oriented, subjugated, and individualistic. They have a high tendency towards "being orientation" and changeable human nature. The study is one of the first to examine the influence of culture in the field of the hospitality industry in developing countries. It necessitates more studies to compare cultural values between Arab and western managers. However, the cross-sectional nature of the data is incapable of confirming the causal inference empirically. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

AFFILIATIONS: Department of Banking and Financial Sciences, Alzaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The aim of this paper is to investigate the impact of Covid-19 on Amman Stock Exchange performance (ASE) in Jordan using the Auto Regressive Distributed Lag Model (ARDL) and daily observations over the period of January 3, 2021 to April 25, 2021. The variables included in this study are the ASE index, the Covid-19 positive cases, the Covid-19 death cases, the Covid-19 recovered cases, the world Oil prices and the Euro/JD exchange rate. The long-run results reveal that positive cases have negative effect on ASE performance, recovered cases and exchange rate have positive effects. The positive reaction of the performance of ASE to movements in exchange rate may be attributed to the fact that imports largely exceeds exports. Therefore, an appreciation of the JD makes imports less costly which goes in line with economic theory as gross consumption in Jordan is mainly attributed to foreign products. Furthermore, positive cases are also highly significant while death cases are not which could be attributed to the fact that positive cases may have spill-over effect while death cases may not. Also, the magnitude of positive cases is much larger than that of death cases. In the short-run, all variables except recovered cases cause the performance of ASE. The system adjusts in the current day to any short-run departure in the previous day from long-run equilibrium in the previous day, which confirms the evidence of the long-run cointegration relationship. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Role of Accounting Information Systems (AIS) Applications on Increasing SMES Corporate Social Responsibility (CSR) During COVID 19

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140476354&doi=10.1007%2f978-3-031-05258-3_43&partnerID=40&md5=5645c8980193b440686b7948243fb7e8

AFFILIATIONS: Accounting, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan; Department of Banking and Financial Scenics, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Main aim was to highlight role of AIS applications in increasing CSR during COVID 19. (132) individuals responded to an online questionnaire. Results indicated that AIS supported CSR among SMEs in Jordan attributed to credibility and reliability of AIS outcomes. In other words, main hypothesis was accepted and there was a positive impact of AIS applications on CSR in the fields of legal, economic, ethical and philanthropy and indicated that organizations were to support the community during the pandemic through organizing their own finances, avoid corruption and support the society through funding, donations and charity works as they were aware of their profits and abilities. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Opportunities and Challenges of Applying Electronic Human Resources Management in Business Organizations an Applied Study in the Telecommunications Sector, Jordan

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140475699&doi=10.1007%2f978-3-031-05258-3_19&partnerID=40&md5=ae39005fcec38e86ca335f1f4412690

AFFILIATIONS: Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Electronic human resources management constitutes an important element in achieving success for business organizations today. The use of electronic human resources management techniques directly contributes to creating effective human resources, which is the decisive factor in achieving organizational goals. Business organizations are currently facing great challenges in various fields of their work, especially in the field of electronic human resources management and its role in providing appropriate and qualified talents to accomplish work and achieve success by taking advantage of the available opportunities and addressing the threats. The aim of this study is to identify the reality of electronic human resources management in business organizations and its role in contributing in the development of work and assisting organizations in taking advantage of the available opportunities and more effectively facing the challenges. The sample of the study amounted to (332) respondents who were selected from among the employees of the three Jordanian telecommunications companies. One of the most prominent findings of the study is the presence of a clear and statistically significant impact of electronic human resources management on the work of Jordanian telecommunications companies, taking advantage of the available opportunities and contributing to effectively facing the challenges. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Does Perceived Organizational Support Have a Mediating Role in Directing the Relationship Between E-Banking and Corporate Digital Responsibility?

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140474485&doi=10.1007%2f978-3-031-05258-3_49&partnerID=40&md5=1c2b367311cea25d4840c372200cc431

AFFILIATIONS: Accounting Department, Business Faculty, Al-Zaytoonah University, Airport Road, Amman, Jordan;

Accounting Department, King Talal School of Business Technology, Princess Sumaya University for Technology, Amman, Jordan

ABSTRACT: The aim of this research paper is to investigate E-Banking impact on Corporate Digital Responsibility in the Jordanian banking service sector. Meanwhile, then this work also focuses to propose a mediating role of Perceived Organizational Perspective (POS) to measure the association influences between exogenous and endogenous variables. Modeling tests based on hypotheses was performed through e-surveys, totaling 88 respondents from the financial department gathered from 16 Jordanian banks. Results based on the respondents' opinions reveal determination that E-Banking is a direct element in the dimensional model that assists in indicating a positive relationship Social Corporate Digital Responsibility (SCDR), Economic Corporate Digital Responsibility (ECDR), and Technological Corporate Digital Responsibility (TechCDR). POS has a partial positive mediating effect in the relationship between E-Banking and ECDR, and between E-Banking and TechCDR, with no mediating effect in the relationship between E-Banking and SCDR. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Cloud ERP Systems and Firm Performance

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140468760&doi=10.1007%2f978-3-031-05258-3_15&partnerID=40&md5=d46c6ca85af657591b62fa8ff057b081

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Cloud ERP systems provide solutions to all difficulties and challenges which traditional ERP systems may encounter, in addition to providing more benefits. This study aimed at providing an evidence on whether cloud ERP adoptions improved the financial performance of companies. A range of financial indicators were used to test the effect of implementing cloud ERP over a window of three years (One year before and two years after). The results showed that the return ratios had increased and the cost ratios had decreased after the cloud ERP implementation. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The current research attempts to examine how gratifications predict the continuance intention to use YouTube among university students. Partial least squares structural equation modeling (PLS-SEM) was used to examine causal relations proposed in the research model. The sample comprised 446 students from selected universities in the United Arab Emirates. The research findings revealed that hedonic, escapism and social interaction gratifications have a significant impact on the continuance intention. However, it is unexpected to find that information seeking, mobility and information overload gratifications have an insignificant effect on the continuance intention. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The pandemic took a heavy and instant toll on jobs all over the globe and represented the most severe crisis for employment since the 1930s Great Depression. How do ethnocentric tendencies towards local products and empathetic feelings towards local workers impact consumers' willingness to purchase local products during the pandemic is the main question that this paper grapples with at its most general level. Data were collected from 217 Jordanian subjects during the summer of 2020. Our findings show that COVID-19 pandemic outbreak contributed to build a new "buy local" line that might shift spending towards locally made products. Also, the results concluded that when Jordanian consumers express empathetic feelings towards local workers due the COVID-19, they are more willing to purchase local products. Finally, our study provides some interesting insights for managers on how to market their products during a severe crisis such as the pandemic. © 2022, The Author(s), under

ABSTRACT: Knowledge management is well researched topic in the empirical as well as theoretical literature. The purpose of this study was to understand the literature that has already been published in the field of knowledge management especially related to firms. The literature mainly focused on knowledge management and organizational performance. While reviewing the literature it has been observed that leadership play a significant role in developing the culture for learning and knowledge management. The systematic review identified several research streams and has identified several inconsistencies which raise certain ambiguities and open the doors for research. The purpose of this study is to understand the new directions that can be set through the review of existing literature in the field of knowledge management. For the said purpose a systematic review was conducted. The articles were initially collected based on key words knowledge management and firm performance. While filtering the articles all the articles related to other fields were removed and finally 75 chosen articles were kept on the basis of which the analysis has been made. The study opened the horizons for future research and concluded that knowledge management in becoming more and more important for the sustainability, survival, and performance of businesses. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Bank Interest Rate Spread: Operating Expenses and Noninterest Income Beyond Risk

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140449453&doi=10.1007%2f978-3-031-05258-3_40&partnerID=40&md5=d9f152fc4fb290845a7c22c149495fe9

AFFILIATIONS: Department of Banking and Financial Sciences, Alzaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study investigates the impact of Operating Efficiency, Noninterest Income and risk on net interest margin (NIM) of Jordanian banks during the period 2007-2017 by applying the random effect model in a panel setting. Our results confirm that bankers are risk-averse; they require risk premiums by widening the spread whenever their risks are higher. Operating efficiency (Operating expenses to total assets) is highly significant with the expected positive sign. This may be due to lack of competition and requires additional measures by regulators such as licensing new banks. To examine this further, we find that concentration is significant and positively associated with bank spread. Likewise, since noninterest income helps reduce the margin, banks could improve their performance with better diversification. Such as providing consultancy services, cash management, leasing, venture capital financing, insurance (through subsidiaries), investment banking (underwriting) and trust services in addition to the off-balance sheet activities. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

COVID-19 and the Economic Activity of Jordanian Companies: The Mediating Role of the Community Response

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140448574&doi=10.1007%2f978-3-031-05258-3_50&partnerID=40&md5=8e7d56348cd621e885752bc10db384d5

AFFILIATIONS: Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study aimed at determining the impact of Covid-19 on the economic activity of Jordanian companies through three dimensions of the pandemic (damage and risks, working under the pandemic, and the need for treatment) as factors affecting economic activity during two stages: the recession and recovery. The study also sought to identify the impact of the societal response as a mediating variable on the causal relationship between the dimensions of COVID-19 and the economic activity of Jordanian companies. The results of this study have contributed considerably to understanding the impact of the pandemic on Jordanian companies. On the other hand, the outcomes of the study have confirmed that Nigeria damages and risks had the greatest effect in creating the economic recession. The results of the study also, have confirmed that the need for medical treatment had stronger impact on economic stagnation than its impact on recovery. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Impact of the COVID 19 Shock on Intention to Adopt Social Commerce

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140445635&doi=10.1007%2f978-3-031-05258-3_9&partnerID=40&md5=8ed067012560ea482f7adc6f92e169a2

AFFILIATIONS: Al-Zaytoonah Univeristy of Jordan, Amman, Jordan

ABSTRACT: This study aims to explore the impact of the COVID 19 shock on the intention to adopt social commerce. It also examines the impact of the pandemic shock on Electronic Word of Mouth (EWOM) and the perceived usefulness of social commerce. Data were collected from Facebook users in Jordan and analyzed using smart PLS software. The results show a significant impact of the COVID 19 shock on EWOM, perceived usefulness, and intention to adopt social commerce. The findings also show a significant mediating impact of EWOM and perceived usefulness on the relationship between the COVID 19 shock and intention to adopt social commerce. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Deep Neural Network to Forecast Stock Market Price

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140444554&doi=10.1007%2f978-3-031-05258-3_12&partnerID=40&md5=2b091ce0adf3b075a0cd358c4834ea20

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The forecasting of the stock exchange asking price has been affected by a number of monetary and nonmonetary indexes that might be used as a warning rule for investors. Expecting the future trend of the stock market is a critical issue in investment sector. In this work, the forecasting of futurity open and close asking price of Dow Jones Industrial Average (DJIV) has been performed utilization deep neural network. The Long short term memory (LSTM) network was used to predict values of futurity time steps of a sequence of opening and closing into Dow Jones Industrial Average stock market. The LSTM network learns to forecast the value of the next step. By train the LSTM network, we have expect the value of future time steps of open and close of the stock market. The performance of the proposed technique is promising for DJIV stock market expectation. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Impact of Pro-cyclicality Fluctuations, Financial Assets' Fair Value, Equity Ratio on Banks' Financial Position Statement

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140442873&doi=10.1007%2f978-3-031-05258-3_54&partnerID=40&md5=23c1f570e21c0b544bac9239f0dc02e5

AFFILIATIONS: Department of Accounting, Al_Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This research aims to study two different financial performance situations for the impact of Pro-cyclicality on financial assets fair value and on equity ratios. The study also compared this relationship across two different years, one is an ordinary year 2019, and the second year is the Covid-19 year 2020. The study population is formed out from the Jordanian Commercial Banks. Moreover, one sample T-test was performed to assess the difference between Pro-cyclicality disclosure, Financial Assets' Fair Value disclosure, and equity ratio performance of the year 2019 and the year 2020. The study concluded that, Jordanian banks were having an inverse relationship between pro-cyclical fluctuations and the fair value of financial assets, also most of these banks were having positive relationship between pro-cyclical fluctuations and equity ratio. Also, Banks equity ratios, Pro-cyclicality disclosure, and Financial Assets' Fair Value disclosure in the ordinary year 2019 is significantly different in the pandemic year 2020. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Factors Affecting the Intention to Use Cloud Accounting in SMEs: Evidence from Vietnam

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140441743&doi=10.1007%2f978-3-031-05258-3_47&partnerID=40&md5=fabff9956b4df292c1dc16d3a6776e5c

AFFILIATIONS: Faculty of Business, Accounting Department, Al-Zaytoonah University of Jordan, Amman,

Jordan;

Tien Giang University, Tien Giang Province, My Tho, Viet Nam

ABSTRACT: Cloud accounting and its application in business activities are relatively new research topics in Vietnam. This study investigates the factors affecting the intention to use cloud accounting according to managerial and accountant perspective in small and medium-sized enterprises (SMEs). It provides empirical evidence from Vietnam. Data is collected quantitatively utilizing an online-survey questionnaire. It was sent by email to managers and accountants in 300 SMEs. The results show that perceived usefulness and availability to embrace technology have a positive impact on the intention to use cloud accounting. A rather interesting result is that perceived ease of use technology has also a positive effect on the intention to use cloud accounting. These results provide reliable evidence for managers and accountants to strategically accelerate the cloud accounting application process and improve financial and business efficiency. These results are also a reference for software manufacturers providing products with more suitable features. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Bank Capital and Reputational Risk

(2022) Studies in Computational Intelligence, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140439042&doi=10.1007%2f978-3-031-05258-3_39&partnerID=40&md5=6e61054b8579e75d62c9717209730eff

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan;

Essex Business School, University of Essex, Colchester, United Kingdom

ABSTRACT: Environmental, social, and governance risks are becoming increasingly relevant for bank regulators and stakeholders due to market developments, regulation, and social attitudes. This paper investigates the relationship between equity capital and reputational risk related to Environmental Social Governance (ESG) issues for the European Economic Area's listed banks. We find that banks with higher reputational risk face higher costs of financial distress and therefore tend to have more capital. Additionally, in line with the corporate finance literature, we find that equity capital is negatively associated with size and positively with profits and market return volatility risk. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

College of Business, Al Ain University, Al Ain, 64141, United Arab Emirates;

Department of Marketing, Setif University, Setif, Algeria

ABSTRACT: This study explored the innovative practices related to marketing mix elements and investigates their impact on firms' performance. Validated questionnaires (n = 60) were distributed to four of the biggest malls in Amman. The main finding of this study is that the growing complexity of customers' needs and the changeable businesses environments promoted investors to use innovative marketing tools, which improves the organization's performance in terms of efficiency and effectiveness. Also, the innovative marketing tools is not limited to a single element of the marketing mix but include all the marketing strategies related to the product, pricing, distribution, and promotion. Implementing more innovative marketing mix elements in the organization will add value and be beneficial to the customers. It is recommended to give more attention to identifying innovative marketing tools that were ignored by other competitors, then build integrated marketing mix strategies, considering these overlooked aspects, which is expected to enable them to maximize their performance internally and externally. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

College of Graduate Studies, Universiti Tenaga Nasional, Selangor, Kajang, 43000, Malaysia;

Business Administration, Sur University College, 411 Sur Sultanate, Sur, Oman

ABSTRACT: This study aimed to illustrate the effects of the financial technology tools as a base for reinforcing financial inclusion indicators on profitability in the Jordanian commercial bank listed in the Amman stock exchange. A panel of data from 16 banks listed in the Amman stock exchange was

used between 2010 and 2019. The financial technology changed the structure of the overall financial services, therefore, increase the availability for a wider social group. Further, the financial technology tools significantly reinforce the financial inclusion indicators over the studied profitability indicators, including return on assets and equity. It is recommended to adopt effective and modern financial, technological strategies that provide the marginalized social groups access to the financial services and products that meet their needs. Thus, getting the added value, which would increase the financial inclusion indicators. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Department of Clinical Pharmacy, Jordan University of Science and Technology, Irbid, Jordan

ABSTRACT: Recently, there has been an increasing interest in innovative business development.

Nevertheless, in the pharmacy practice field, there seems to be a gap in perceptions, attitudes, and knowledge about innovation between practicing pharmacists and academia. This study explores this gap and aspects of pharmaceutical innovation in Jordan comparing pharmacists and last-year pharmacy students. A validated ($r_2 = 0.74$) and reliable (Pearson's $r = 0.88$) online questionnaire was designed to assess and compare knowledge, attitude, and perceptions about pharmaceutical innovation. A total of 397 participants (215 pharmacy students and 182 pharmaceutical professionals) responded. Compared with 50% of the pharmacists, only 32.1% of the students claimed that they knew the differences between pharmaceutical innovation, discovery, invention, and entrepreneurship [$\chi^2(2) = 14.238$, $p = 0.001$; Cramer's $V = 0.189$]. Pharmacists demonstrated a higher level of trust in the innovative website design for their institution compared with students (25.3% vs. 16.3%, $p < 0.001$, Cramer's $V = 0.327$). However, 60% of the students did not know the innovative design standards for websites, while the corresponding percentage was 37% for the pharmacists ($p < 0.001$; Cramer's $V = 0.327$). The majority of the students were interested in pharmaceutical innovation (81.9%). Unfortunately, 76.3% never studied about innovation in their pharmacy curricula. Similarly, most pharmacists (76.4%) considered adopting innovation, but only 30% had a concrete plan. For the field where pharmacists aim to innovate in the next 5 years, new pharmaceutical services were the dominant field (34.6%). Despite a positive attitude and perception, pharmacists and pharmacy students expressed poor knowledge about innovation. Policies to enhance awareness about innovation and professional educational tools should be implemented. © 2022 Mohanad Odeh et al. ABSTRACT: Azo dyes account for 70% of dye chemistry, and their importance may grow in the future.

Empagliflozin is a sodiumglucose co-transporter-2 (SGLT2) inhibitor. SGLT2 transporters are primarily responsible for glucose reabsorption in the kidney. In 2014, empagliflozin was approved for medical use in the United States and the European Union. With over 4 million prescriptions in 2019, it was the 146th most commonly prescribed medication in the United States in 2019. The spectrophotometric determination of empagliflozin is described using coupling agents such as 3-chloro-4-nitroaniline or sulfanilamide. These methods are straightforward and are based on the reaction of empagliflozin with diazotized products of 3-chloro-4-nitroaniline or sulfanilamide to produce colored azo dyes with

absorption maxima at 470 and 480 nm. Empagliflozin was linear from 1.2 to 26.6 μgml^{-1} or 0.8 to 20.4 μgml^{-1} when combined with diazotized 3-chloro-4-nitroaniline or sulfanilamide, respectively. Empagliflozin's molar absorptivity and Sandell's sensitivity to 3-chloro-4-nitroaniline or sulfanilamide azo dyes were $3.179 \times 10^4 \text{ l mol}^{-1}\text{cm}^{-1}$ or $4.367 \times 10^4 \text{ l mol}^{-1}\text{cm}^{-1}$ and $1.149 \times 10^{-2} \mu\text{gcm}^{-2}$ or $8.368 \times 10^{-3} \mu\text{gcm}^{-2}$, respectively. The formed colored azo dyes are stable for more than 12 hours. The optimal reaction conditions and other analytical parameters are assessed. Foreign organic compound interference has been studied. The method has been successfully used to determine empagliflozin in pharmaceutical samples © 2022 Wael Abu Dayyih et al. This is an open access article distributed under the terms of the Creative Commons Attribution 4.0 International License (<https://creativecommons.org/licenses/by/4.0/>).

Nexus among big data analytics, environmental process integration and environmental performance: moderating role of digital learning orientation and environmental strategy

(2022) VINE Journal of Information and Knowledge Management and Systems, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139484777&doi=10.1108%2fvjikms-05-2022-0186&partnerID=40&md5=9cdc5a4ce245c60518e00a31927ef36e>

AFFILIATIONS: Department of Accounting, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan;

Department of Accounting, Faculty of Economic - Law, Tien Giang University, My Tho, Viet Nam

ABSTRACT: Purpose: This study aims to examine the influence of big data analytics (BDA) on environmental performance (ENP) in the post-COVID-19 context in Vietnam, as a developing country. In which, this study considers environmental process integration in accounting reports as a mediator variable. Furthermore, digital learning orientation (DLO) and environmental strategy (ES) are proposed as the moderator variables for relationships in the proposed model.

Design/methodology/approach: Data was collected by survey method via email with convenient sampling method. In total, 611 emails, including the survey, were sent to executive managers of Vietnamese manufacturing companies listed on stock exchanges. The final sample of 419 responses was used for analysis. Findings: By using the partial least squares structural equation modeling, this study's results elucidate that BDA positively affects ENP. Moreover, DLO positively moderates the nexus between BDA and environmental process integration in accounting reports, while ES plays a positive moderating role on the nexus between environmental process integration and ENP. Practical

implications: In terms of managerial implications, this paper mentions pretty attractive features of using modern technique and ENP. This research emphasizes the key role of the BDA for both reporting and accounting performance (e.g. environmental process integration and ENP) of the company. Thus, managers should examine implementing BDA when necessary to make accounting reports more transparent and modern, thereby enhancing the organization's ENP. Particularly, managers should focus on improving the organization's ENP indicators. Originality/value: This study complements the ENP literature by showing a positive effect of BDA and environmental process integration on ENP. Additionally, this study's results determine the efficacy of DLO and ES as well as their regulatory roles. Finally, this study was conducted to supplement empirical evidence on ENP in the post-COVID-19 context in developing countries, specifically Vietnam. © 2022, Emerald Publishing Limited.

ABSTRACT: The aim of this study is to investigate the relationship between oil prices and oil production capacity and financial market performance in the Kingdom of Saudi Arabia and how oil prices and oil production capacity influence the decision making and uncertainty factors in Saudi Arabia's financial markets. The key variables considered are oil prices and oil production capacity in the Kingdom of Saudi Arabia. Other variables such as foreign direct investment decisions and domestic investment decisions are adopted to explore their impact and reaction to the various risks identified. Therefore, data was collected from online sources to analyze qualitative and quantitative information to understand risks, uncertainties and decision-making considerations. The findings of this paper indicate that rising oil prices increase the value of the Saudi Arabian financial market. The study showed that the diversification of the investor portfolio increases the stability of Saudi

Arabia's financial market. Also, the KSA's financial market volatility primarily reflects oil price fluctuations, and the Saudi Arabian oil production capacity directly affects its financial market performance. Saudi Arabia's oil production was also found to pose insignificant risk to long-term economic growth and stability, thereby putting investors' long-term investments at risk. The study also showed that investors in Saudi Arabia's financial market fail to objectively analyze risks by focusing on short-term high-profit margins from oil prices. © Ayman Abdalmajeed Alsmadi, Najed Alrawashdeh, Anwar Al-Gasaymeh, Loai Naser Alhwamdeh, Amer Moh'd Al_hazimeh, 2022.

ABSTRACT: Objective: The study aims to evaluate the impact of distance education on Pharmacy, Pharm.D and postgraduate students' satisfaction and its associated factors during COVID-19 pandemic. Methods: A cross-sectional web-based survey was distributed online for Pharmacy, Pharm.D and postgraduate Diploma and Master Students across Jordanian universities. Expiratory factor analysis (EFA) and Cronbach's alpha were conducted to examine the validity and the internal consistency of the survey, respectively. Analysis of Covariance (ANCOVA), Chi square test and t-test were conducted to evaluate the variables associated with students' satisfaction with distance learning. Results: A total of 860 students completed the survey. The EFA generated a three-factor model including positive impact, negative impact and general impact. The mean scores of the factors were 2.84 (SD=1.03), 2.78 (SD=0.92) and 2.34 (SD=1.22) respectively. Several factors were associated with students' level of satisfaction with distant learning including gender, nationality, university type and field of study. Conclusion: Distance education had negative impact on Pharmacy and Pharm.D. students' satisfaction, which opens the doors for the necessity to improve the distance education for university students. Variables including gender, nationality, university type and field of study were associated with students' level of satisfaction. © 2022 DSR Publishers/The University of Jordan. All Rights Reserved.

ABSTRACT: Chemoprevention with alternative approaches is emerging as a significant component of therapeutic regimen for the management of various diseases in human population including cancer. The concept of personalized nutrition is attracting considerable interest as an effective and affordable strategy in the prevention of chronic diseases. It is acknowledged that diet-derived agents or non-dietary natural products are not only the source of traditional medicines but also the lead compounds for currently used pharmaceuticals with excellent efficacy against a number of human diseases. *Achillea* species (Asteraceae) are considered as functional foods, which are important constituents of traditional medicine and commonly consumed as herbal tea or food additives worldwide. The studies presented herein demonstrate the effects of the hydro-methanolic extract of *A. fragrantissima* against a panel of cancer cells that include breast cancer (MDA-MB-231, MCF-7, SKBR3), pancreatic cancer (BxPC-3, MiaPaCa-2), prostate cancer (LNCaP, C4-2B, PC-3), and lung cancer (A549). The experimental results presented in the study show that the extract, which is rich in structurally diverse phytochemicals, effectively inhibits the cell growth and induces apoptotic cell death in human cancer

cells. The treatment of the cancer cells with the extract resulted in a progressive decrease in cell migration and invasiveness, demonstrating an effective anti-metastatic activity. The mechanism by which the extract exerts its effects against cancer cells potentially engages NF- κ B signaling and downregulation of its target cytokines such as VEGF. The study provides evidence that partially support the importance of functional foods and highlights their significance in disease prevention. © 2022 Chiriotti Editori. All rights reserved.

ABSTRACT: Objectives: The present study was carried out to identify and report the pattern of antibiotics prescribing to determine the adherence to the international empirical and therapeutic guidelines of antibiotic use. Methods: A point prevalence survey took place at a selected date of January 26, 2020, in which data collection was performed to all the patients present in the hospital who used at least one systemic antibiotic agent as an inpatient from 00:00 am until midnight of that day. This was performed using European Surveillance of Antimicrobial Consumption (ESAC - audit tool). The participated hospital in this point prevalence study represents a major government hospital in the UAE. Descriptive statistics were used and results were expressed using standard statistical methods. Results: Out of the 125 hospitalized patients, a total of 41 (32.8%) patients were included in the survey and treated with different trends of antibiotics on the date point prevalence survey. The total number prescribed antibiotics was 54 with a higher percentage of treatment indication (70.4%), compared to prophylaxis indication (29.6%). The combinations of penicillin's win in being the most commonly used agents by a percent of 31.5%, including the use of Amoxicillin-clavulanic acid by 22.2% and Piperacillin-tazobactam with 9.3%. The compliance with local/international guidelines accounts for 78.0% of the treated & prophylaxis patients. Conclusions: Considerable results have been obtained which can assure the quality improvement of the antibiotic use in the studied hospital. © the Authors.

ABSTRACT: Honey is now being renowned as an alternative treatment due to its broad-spectrum antibacterial activity. The purpose of this study was to compare the antibacterial activity of Citrus honey (CH) and Jabali Honey (JH) with that of Manuka honey (MH) against *Pseudomonas aeruginosa*. The antibacterial, antibiofilm and antivirulence activities of CH, JH and MH against *P. aeruginosa* were investigated by agar well diffusion, Minimum Inhibitory Concentration (MIC), Minimum Bactericidal Concentration (MBC), time-kill curve, microtiter plate and reverse transcription-quantitative polymerase chain reaction (RT-qPCR). Agar inhibition assay showed that the CH, JH and MH at 20% have antibacterial activity with an inhibition zone of 14.1 ± 0.1 mm, 12.2 ± 0.2 mm and 10.9 ± 0.1 mm respectively against *P. aeruginosa*. The results showed that the MIC values for CH and JH were 25% compared to MH (12.5%) and the MBC values for CH and JH were 50% compared with MH (25%) against *P. aeruginosa*. In addition, the MIC₅₀ and MIC₉₀ values for CH and JH were 25% and 50% respectively compared with MH (MIC₅₀: 12.5% and MIC₉₀: 25%) against *P. aeruginosa*. In time-kill curve, treatment *P. aeruginosa* with 2×MIC of MH, CH and JH for 9-hours resulted in reduction in colony-forming unit. The lowest concentration 20% of MH, CH and JH was found to inhibit and eradicate *P. aeruginosa* biofilm. RT-qPCR analysis revealed that the expression of all genes (*oprB*, *oprC*, *fleN*, *fleQ*, *fleR*, *lasR* and *lasI*) in *P. aeruginosa* were downregulated after exposure to all the tested honeys. Among the all-tested honeys, MH showed the highest total antibacterial, antibiofilm and antivirulence

activities against *P. aeruginosa*. This study indicates that CH and JH has antibacterial and antibiofilm activities compared with that of MH due to a decrease in expression of essential genes associated with *P. aeruginosa*. © 2022 Mohammad A. Al-kafaween et al.

ABSTRACT: This research aims to explore the impact of profitability indicators (including return on equity, gross profit margin, operating profit margin, and return on investments) on EVA of equity-owned Jordanian insurance companies. Economic value added (EVA) is an innovative approach to measuring company performance and gives a more realistic view of the company's current finances compared to traditional performance indicators (Subedi & Farazmand, 2020). Many traditional indicators of performance that have been used by the companies could not provide an objective assessment that differentiates between return and capital (Siniak & Lozanoska, 2019). EVA is used to calculate the true economic profit of a company (Pernamasari, 2020). All companies that have complete annual reports from 2006 to 2019 were included in this study (n = 13). The multiple and simple regression analysis to answer the questions of the problem and test the hypotheses of the study was applied. This study found an impact of profitability indicators on the EVA. Therefore, it is necessary to draw the attention of investors and the Amman Stock Exchange to the EVA, as it is a more effective and comprehensive indicator than the traditional ones when it comes to evaluating the company's financial performance, as it reflects useful and adequate information. © 2022 The Authors.

ABSTRACT: This research provides evidence on whether enterprise resource planning (ERP) implementation affects accrual-based earnings management (AEM) in the service and manufacturing firms listed on the Amman Stock Exchange (ASE). The Huber-White's sandwich estimator for pooled ordinary least squares (OLS) regression was utilized for this investigation as the primary statistical technique. Using three different AEM models and a sample of 390 firm-year observations for the period spanning from 2015 to 2019, this study reveals a significant and negative nexus between ERP implementation and AEM. The findings show that ERP adopting firms are less likely to engage in AEM practices than ERP non-adopting firms. In terms of contribution, the present research is considered among the first to investigate the impact of ERP system adoption on earnings management (EM) in Jordan. © 2022 International Management Institute, New Delhi.

ABSTRACT: A series of N-(benzoylphenyl)-carboxamide derivatives (2a, 2b, 3a, 3b, 4a, 4b, 5a, 5b, 6a and 6b) was prepared with good yields by reacting the corresponding carbonyl chlorides with aminobenzophenones at room temperature. This was followed by evaluating the hypotriglyceridemic and hypocholesterolemic effects of 3b, 5a and 5b. Triton WR-1339 (300 mg/kg) was intraperitoneally administered to overnight-fasted rats to induce hyperlipidemia. Rats were divided into six groups: control, hyperlipidemic, hyperlipidemic plus compounds 3b, 5a and 5b and hyperlipidemic plus bezafibrate. Results showed that after 18 h of treatment at a dose of 15 mg/kg body weight of each of the test compounds, the elevated plasma levels of triglycerides (TG) and total cholesterol (TC) were significantly lowered by compounds 5b and 3b ($p < 0.001$) and by 5a ($p < 0.0001$), compared to the hyperlipidemic control group. Compounds 3b and 5a significantly increased levels of high-density lipoprotein cholesterol (HDL-C) by 58 and 71%, respectively. In addition, compounds 3b and 5a caused significant reduction ($p < 0.0001$) of low-density lipoprotein cholesterol (LDL-C) levels compared to the control group. These results suggest a promising potential for compounds 3b, 5a and 5b as lipidlowering agents, which may contribute to reducing the risk of atherosclerosis and cardiovascular disease. © 2022, Faculdade de Ciencias Farmaceuticas (Biblioteca). ABSTRACT: *Staphylococcus aureus* is one of the most common pathogens in biofilm-associated chronic infections. Bacteria within biofilm are typically more resistant to antibiotics than are planktonic cells. The objective of the study was to evaluate the effect of Ciprofloxacin (CP), Gentamicin (GEN), Tetracycline (TET), Amikacin (AMK), Clindamycin (CLI), Erythromycin (Ery) and Vancomycin (VAN) against *S. aureus*. The effects of CP, GEN, TET, AMK, CLI, Ery and VAN on *S. aureus* planktonic and biofilm were determined by antibiotic susceptibility test, Minimum Inhibitory Concentration (MIC), Minimum Bactericidal Concentration (MBC), microtiter plate and RT-qPCR. Antibiotic susceptibility test showed that CP, GEN, TET, AMK, CLI, Ery and VAN have antibacterial activity against *S. aureus* with an inhibition zone of 28 mm, 21 mm, 27 mm, 20 mm, 25 mm, 27 mm and 19 mm respectively. The results showed that the CP and AMK possessed the lowest MIC and MBC values with 0.125 µg/mL and 0.25 µg/mL respectively against *S. aureus*. All the tested antibiotics at MIC concentration were found to disrupt microcolony formation in *S. aureus*. In addition, at 0.25 µg/mL concentration to 8 µg/mL concentration of each antibiotic were significantly found to degrade and inhibit biofilm formation in *S. aureus*. The RT-qPCR analysis showed that four genes *argF*, *purC*, *adh*, and *fabG* in *S. aureus* were downregulated, whilst, three genes *scdA*, *pykA* and *menB* were upregulated after exposure to CP, GEN, TET, AMK, CLI, Ery and VAN. This study showed the activity of all antibiotics against planktonic, biofilm and gene expression profile in *S. aureus* and that different concentrations of antibiotics have different degrees of potential effect on planktonic, biofilm and gene expression. These results provide the theoretical parameters for the selection of effective antimicrobial in clinical therapy and demonstrate how to correctly use antibiotics at MIC and sub-MIC as preventive drugs. © 2022 Mohammad A. ABSTRACT: The present study was conducted to analyze the hydrodynamic characteristic of a conical-cylindrical spouted bed reactor for the application of ceramic-coated bearings. In this experimental work, dioxide titanium films were prepared as a coating layer on ceramic substrates to enhance their mechanical properties. Four different ceramic substrate materials made of silicon carbide, steatite, corundum, and sintered clay in various shapes (rings, cylinders, and spheres) were considered as porous ceramic media, having a porosity in the range of 0.35-0.59. A liquid metal solution of dioxide titanium in ethanol was pushed through a porous ceramic by an external pressure using a piston pump inside the conical-cylindrical spouted bed. Furthermore, ventilated hot air around 70°C was used to evaporate the ethanol and coat a thin film of metal titanium onto the ceramic material. It was demonstrated that the relation between the pressure differences of inlet and outlet ventilation air during an increasing or decreasing flow is a hysteretic process. This nonlinear phenomenon is due to the different input flow rates and initial conditions. Besides that, the characteristics of pressure drops were investigated at different bed depths and porosities. We included a comprehensive literature review of the topic and an accurate new correlation equation developed from the experimental results as a function of ceramic structure geometry and the properties of ceramic and fluid flow. The correlation equation is valid in the Reynolds number range $745 < (Re)_m < 2200$, the bed height with respect to the inlet flow diameter range $0.6 < H_0/d_0 < 1.35$, and the angle of conical base range $30^\circ \leq \gamma \leq 40^\circ$. © 2022 by Begell House, Inc.

ABSTRACT: Background: People perform sports for better health and wellbeing. However, the use of doping agents is emerging among young adults. This study investigated aspects related to doping agents. Methods: A reliable self-administered questionnaire (Cronbach's alpha =0.72, Pearson's r = 0.89) was used to assess knowledge, attitudes, and practicalities related to the use of doping agents. Results for pharmacists as health care providers (HCP, n=550) were compared with non-healthcare providers (Non-HCP, n=319). Results: Among pharmacists, 82.9% knew the definition of doping agents vs. 72.4% of non-HCP ($P < 0.001$). However, 36.7% of pharmacists vs. 39.6% of non-HCP incorrectly classified doping agents ($P = 0.02$). The majority of responders (89.8%) supported having an anti-doping authority, yet, only 15% were aware of the anti-doping organizations. The majority of responders (83%) did not receive an official education related to doping agents. Enhancing physical performance was perceived as a leading driver (82.1%) to use doping agents. More than 90% of responders supported awareness in the community. The perceived best tool for awareness was social media and TV sites, as suggested by pharmacists (95.0%) and non-HCP (92.1%, $P = 0.312$). A total of 6.1% had ever used doping agents (3.6% pharmacist vs. 9.8% non-HCP, $P < 0.001$). Almost half of the users utilized a diet or medication to counteract the side effects of doping agents. Within pharmacists, males received more requests to provide doping agents (41.9%) compared with females (23.8%, $P < 0.001$). Conclusion: It is crucial to enhance professional and legal knowledge and public awareness about doping agents, not only for non-HCP but also for HCPs. Applying more restrictions on doping agents is strongly recommended. © 2022 Odeh et al.

Private Tutoring during COVID in Jordan. Improving Academic Performance, or Chasing after an Illusion (2022) 2022 IEEE 2nd International Maghreb Meeting of the Conference on Sciences and Techniques of Automatic Control and Computer Engineering, MI-STA 2022 - Proceeding, .

ABSTRACT: Online learning has been the center of the education systems around the world for approximately two years now. Since the COVID pandemic appeared, many nations have resorted to online

learning formats in their schools and higher education institutes. Consequently, private tutoring in all education levels started to rise as students were trying to cope with the sudden changes in their courses. However, the effect of private tutoring is somewhat ambiguous due to the lack of feedback from students. This study presents an online survey on students' experiences with private tutoring in the higher education institutions in Jordan. A total of 107 students participated in this study from different academic levels. The results of the survey showed that 63% of participants believed that the online learning format in their courses was one of the reasons they went to private tutoring. However, nearly half of the sample did not believe that instructors played a role in them resorting to private tutoring. The results also showed that senior level students believed that private tutoring improved their academic standings. In fact, their answers were statistically significantly different than students from the other academic levels. The results also showed that students in the lower academic levels (freshmen, and sophomores) expressed their disappointment in the outcomes of private tutoring. © 2022 IEEE.

ABSTRACT: This paper investigates the wealth effects of the consumer price index, interest rate, domestic credit and real economic activity on the Amman Stock Exchange performance. Over the period 1991-2020 using the autoregressive distributed lag (ARDL) bounds test. While the interest rate is a powerful monetary tool to fight inflation and recession, it can be detrimental to investors. The target variables, consumer price index (CPI) and interest rate (IDR), are both highly significant with the correct signs. An increase of 1 percent in CPI and IDR leads to a fall in stock prices by 1.6 percent and 5 percent, respectively. While the central bank is targeting inflation by raising interest rates, its actions reflect negatively on the stock market. The short-run model confirms the causality from the independent variables to the dependent variable. Moreover, the error correction term (ECT) is very high and significant at the 1 percent level amounting to 83.3 percent, which confirms the evidence of the long-run relationship. Monetary objectives are really important, but financial stability is also important. © Marwan Alzoubi, 2022.

ABSTRACT: This paper's purpose is to introduce and present a simulation-based study of the effect of using different crossover operators in a genetic algorithm to extend the life span of a wireless sensor network (WSN) and reduce its overall energy expenditure. One of the genetic algorithm's pillars is the crossover operator. Crossover operators are classified into four types: one-point crossover, uniform crossover, k-point crossover and hybrid crossover. It is shown that using different types of crossover operators has only a minor impact on WSN lifetime and stability period. When compared to other operators, one-point crossover improves network stability period and throughput slightly. © 2022 IEEE.

ABSTRACT: In recent decades, concrete prepared with bentonite clay has evolved as an accepted substitute of natural aggregate concrete due to the increasing focus on the development of sustainability and the environmental issues. In this research, the evaluation of possible and suitable use of Jordanian bentonite as a partial replacement of Ordinary Portland Cement (OPC) or fine aggregate in the production of concrete mixtures has been investigated. Bentonite has been used

as 0, 5%, 10% and 15% by weight replacement of OPC or fine aggregate passing sieve No. 50 to conduct and compare the fresh properties, the mechanical strength and the permeability of concrete mixtures. Elemental compositions and crystalline phases of bentonite clay have been tested by using X-Ray Fluorescence (XRF) and X-Ray Diffraction (XRD), respectively. The test results have revealed that the compressive and flexural strengths have decreased as bentonite level has increased beyond 5% with substitutions of fine aggregate, whereas the compressive strength has decreased at every increased dosage of bentonite replacing partially the OPC. The strength activity indices have been higher than the ASTM C618 specified limit of 75%, except for the concrete mixture containing 15% bentonite replacing OPC. The incorporation of bentonite improves the permeation resistance of concrete and the enhancement is more pronounced at higher bentonite increments, especially when replacing the fine aggregate partially with bentonite. © 2022 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: Background: From a chemistry point of view, we hypothesized that superlative dual cytotoxicity-radical scavenging bioefficacies of series 4 FQs correlate to their acidic groups and C8-C7 ethylene diamine Chelation Bridge. Methodology: Newly synthesized 16 lipophilic-acid chelating FQs have been screened for in vitro duality of proliferation inhibition and radical scavenging capacities. Results: Substantially in LPS prompted RAW264.7 macrophages inflammation, IC50 values (μM) in the ascending order of new FQs' NO scavenging/antiinflammation capacity were $4e<4b<3d<4f<5c<indomethacin$ ($17.6<25.5<27.7<38.5<46.1<indomethacin$'s 55.1, respectively). Exceptionally reduced FQ 4b exhibited comparable DPPH radical scavenging capacity to ascorbic acid (IC50 values (μM) 4.3 vs. 3.4, $p>0.05$). In comparison to classical and robust antineoplastic agent cisplatin and unlike triazoloFQs; nitroFQs (3a, 3b and 3f) and the reduced FQs (4a, 4c, 4d and 4e) exerted antiproliferation IC50 values $<50\ \mu\text{M}$ in leukaemia K562. Besides nitroFQ 3, the reduced FQs (4c and 4f) exhibited antineoplastic IC50 values $<50\ \mu\text{M}$ in lung A549 carcinoma. NitroFQ 3c and reduced FQs 4b, 4c, and 4f in breast MCF7 and reduced 4c in pancreatic PANC1 had reduction of viability IC50 values $<50\ \mu\text{M}$. NitroFQ 3e, reduced FQs 4b and, 4c and triazoloFQ 5a exerted antiproliferation IC50 values $<50\ \mu\text{M}$ in breast T47D cells. Also nitroFQ 3e, reduced FQ 4c and triazoloFQ 5f exhibited antineoplastic IC50 values $<50\ \mu\text{M}$ in PC3 prostate cancer cells. Exceptionally triazoloFQ 5a, but neither nitron or reduced FQs, had cytotoxicity IC50 value $<50\ \mu\text{M}$ in resistant melanoma A375 cells. Unequivocally 4b antineoplastic effectiveness linked with its radical scavenging and antiinflammation effects while 3d and 5c lacked matching antiproliferation potentialities to their exquisite antiinflammation capacities. Explicitly reduced 4e and 4f exerted antiinflammationselective cytotoxicity duality in vitro. Conclusion: Collectively, this work reveals lipophilic-acidic chelator FQs as authentic agents for the repurposing approach in anticancer chemotherapy/prevention. © This work is licensed under a Creative Commons Attribution-Non Commercial 4.0 International License.

ABSTRACT: In this study, the influence of thermal radiation and dispersion on a porous medium which was filled in a vertical cylinder was numerically solved. A finite-difference method was used to solve the non-dimensional equations by applying a Crank-Nicolson implicit numerical technique. Moreover, an experimental set-up has been initially built to investigate the effect of three different grain sizes of the porous materials on the heat transfer process. The numerical results indicated that the thermal radiation increased the momentum and the thickness of the thermal boundary-layer during the natural-convection heat transfer process. Whereas, the thermal dispersion factor decreased the momentum and the thickness of the boundary-layer during the natural-convection heat transfer process, which enabled a steady and transient heat transfer. The experimental results indicated that the pore size of the medium significantly affected the rate of the heat transfer process. A smaller pore size showed a greater effect and could be used in different applications that involve a higher heat transfer rate, while a larger pore size can potentially be used as an

insulating material. © 2022. Society of Thermal Engineers of Serbia Published by the Vinča Institute of Nuclear Sciences, Belgrade, Serbia. This is an open access article distributed under the CC BY-NC-ND 4.0 terms and conditions

ABSTRACT: In light of the trend of countries to give vaccines to their people, it was concluded that the best solution to confront the COVID-19 pandemic is to give the vaccine, as it prevents its transmission from person to person, and if the infection is infected, the symptoms are much less than the degree of danger of the person who did not meet the vaccine. In this paper, we presented tables on the types of vaccines, a brief explanation of the Coronavirus, and the idea of our software project. Vaccine handling skills, where gives users the opinions of the people who received the vaccine and the doctors also according to the age group and the disease. © 2022 IEEE.

ABSTRACT: Hand veins can be used effectively in biometric recognition since they are internal organs that, in contrast to fingerprints, are robust under external environment effects such as dirt and paper cuts. Moreover, they form a complex rich shape that is unique, even in identical twins, and allows a high degree of freedom. However, most currently employed hand-based biometric systems rely on hand-touch devices to capture images with the desired quality. Since the start of the COVID-19 pandemic, most hand-based biometric systems have become undesirable due to their possible impact on the spread of the pandemic. Consequently, new contactless hand-based biometric recognition systems and databases are desired to keep up with the rising hygiene awareness. One contribution of this research is the creation of a database for hand dorsal veins images obtained contact-free with a variation in capturing distance and rotation angle. This database consists of 1548 images collected from 86 participants whose ages ranged from 19 to 84 years. For the other research contribution, a novel geometrical feature extraction method has been developed based on the Curvelet Transform. This method is useful for extracting robust rotation invariance features from vein images. The database attributes and the veins recognition results are analyzed to demonstrate their efficacy. © 2022 Tech Science Press. All rights reserved.

ABSTRACT: Human face is considered as one of the most useful traits in biometrics, and it has been widely used in education, security, military and many other applications. However, in most of currently deployed face recognition systems ideal imaging conditions are assumed; to capture a fully featured images with enough quality to perform the recognition process. As the unmasked face will have a considerable impact on the numbers of new infections in the era of COVID-19 pandemic, a new unconstrained partial facial recognition method must be developed. In this research we proposed a mask detection method based on HOG (Histogram of Gradient) features descriptor and SVM (Support Vector Machine) to determine whether the face is masked or not, the proposed method was tested over 10000 randomly selected images from Masked Face-Net database and was able to correctly classify 98.73% of the tested images. Moreover, and to extract enough features from partially occluded face images, a new geometrical features extraction algorithm based on Contourlet transform was proposed. The method achieved 97.86% recognition accuracy when tested over 4784 correctly masked face images from Masked Face-Net database. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: The purpose of this study was to show how financial technology tools can be used to reinforce financial inclusion indicators on the profitability indicators of a Jordanian commercial bank listed on the Amman stock exchange. Between 2010 and 2020, a quantitative and qualitative panel data set was used. The study population is represented by all the banks listed on the Amman stock exchange (n = 16). The study found that financial technology through its multitools changed the structure of the overall financial services, besides the diversity and style of financial services for the commercial banks' clients, thus reinforcing and increasing the availability for a wider social group that did not have access to that service. Further, it was found that there is a significant effect of the financial technology tools to reinforce the financial inclusion indicators over the studies' profitability indicators that include return on assets, return on equity, and earnings per share (JD). It is recommended to adopt effective and modern financial and technological strategies that provide marginalized social groups and small and medium enterprises reasonable access to the financial services and products that meet their needs, including transactions, payments, savings, credit, and insurance. Thus, getting the added value of the data and investing it to increase the financial inclusion indicators improves the profitability indicators and income for commercial banks. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Cloud computing faces numerous challenges in many areas including security and privacy issues. In this work, a developed approach is suggested to tackle three security and privacy issues: network intrusion detection (NID), privacy, and internal attacks. A decision tree (J48) has been used to generate a set of rules based on the CICIDS2017 dataset to solve the NID problem. The accuracy of the generated rules approaches 99.8%. A set of policies are attached to the data file on the bases of a sticky policy to preserve privacy. A new approach is suggested based on blockchain to detect internal attacks in real-time, in which a set of trustees-chain are identified by the data owner. Any data modification conducted by a trusted member will be reported to all members of the trust group including the owner. The developed approach suggests adding a Privacy and Detecting Intrusions Service (PDIS) layer as part of the cloud computing main service model. PDIS includes the three suggested approaches above (NID, sticky policy, and trustees-chain). Finally, a web-based application is implemented to act as casework to validate PDIS and evaluate its reliability. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: The major goal of the this work is to present an optimal design of the Fractional-order Proportional-Derivative-Integral (FoPID) controller for the single-joint arm dynamics. For meeting this aim, the Particle Swarm Optimization (PSO) algorithm will be implement to tune the parameters of such con-troller. Six FoPID-controllers will be generated in accordance with two kinds of approaches (Continued Fraction Expansion (CFE) and Outstaloup's approaches) for Laplacian operators, coupled with three fitness functions (IAE, ITAE, ITSE). These controllers will be competed to each other to determine which one can provide to the closed-loop system of the single-joint robot arm model a good rise time, short settling time, and an excellent overshoot. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Phishing detection is one of the most important services for cyber security. Phishing is an easy to implement attack that depends on social engineering. It is implemented leveraging web, Short Message Service (SMS) and social media. This attack is the backbone of other attacks. In this work, a new web phishing detection algorithm is proposed based on machine learning algorithms. The proposed algorithm is a hybrid machine learning algorithm that consists of two main layers. The first layer is the feature extraction and reduction layer that consists of multiple machine learning algorithms that work in parallel. The second layer consists of one feed-forward neural network layer. Different numbers and types of algorithms can be leveraged in the first layer of the proposed algorithm. The proposed model has been tested with four algorithms in the first layer, namely, K-means, support vector machine, logistic regression and random forest. Four features have been extracted from this layer and fed into the second layer "the neural network layer". The output of the second layer shows an accuracy that exceeded 99%. © 2022 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: The temperature of a photovoltaic (PV) panel has a detrimental impact on the electricity output. The operating temperature of the PV increases as the amount of solar irradiation falling on the solar panel increases. As a result, energy efficiency suffers. In order to keep PV temperatures as low as possible, a cooling system is required. This research has adopted a passive cooling strategy using Titanium oxide-coated L-shaped aluminum fins attached to the backside of the PV at different spacings. Five identical PV modules have been installed side by side. One has been used as a base module for comparison purposes. The backside of each of the other four fins has been attached at a fixed spacing and coated with a specific concentration of water-based TiO₂ nanofluid. The hourly average temperature of each module has been measured using three K-type thermocouples attached to its backside. The current and the produced power from each PV have been estimated using load resistors. Finally, the ambient temperature and the solar radiation values have been measured using the GRWS100 weather station located on the site. The passive cooling strategy using natural convection has significantly reduced the temperature at the backside of the PV modules, according to the findings. The highest significant power improvement has been roughly 9 W when using a 2 cm spacing between the fins and a 0.04% TiO₂ concentration. PV panels with 2 cm spacing and 0.04% TiO₂ fin cooling boosted their efficiency by roughly 1.72%. © 2022 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: Background: The number of lipid disorders cases has risen dramatically around the world as a result of poor dietary habits, hereditary risk factors, or other diseases or medicines. Cholesteryl ester transfer protein (CETP) is a 476 amino acid lipophilic glycoprotein that helps transport cholesteryl esters and phospholipids from proatherogenic LDL and VLDL to atheroprotective HDL. CETP inhibition increases HDL cholesterol, lowers LDL cholesterol and triglycerides, rendering it a promising therapy option for hyperlipidemia and its comor-bidities. Methods: In this research, fourteen benzenesulfonamides 7a-7g and 8a-8g were synthesized and identified using¹H-NMR,¹³C-NMR, IR and MS. The in vitro biological evaluation of 7a-7g and 8a-8g revealed CETP inhibitory activities ranging from 15.6 to 100% at 10 μM concentration. Results: Four aromatic rings compounds bearing either m-CH₃ (8c) or p-Cl (8g) were the most potent compounds with 100% CETP inhibition, while the most active compound was 7c bearing three aromatic rings and m-CH₃ with an IC₅₀ of 0.12 μM. LibDock displayed that benzenesulfonamides can form hydrophobic interactions with the side chains of Leu129, Cys13, Ala202, Val198, Leu217 and Ile215 and participate in n-n stacking with Phe441, Phe197 and Arg201 in the binding pocket of CETP. Conclusion: Pharmacophore mapping showed significant matching with the pharmacophoric features of Hypo4/8 and shape-complemented Hypo4/8 of CETP inhibitors for potent compounds. © 2022 Bentham Science Publishers.

ABSTRACT: What distinguishes the traditional education system is that it depends entirely on the transfer of information in one direction. As we note that in the past decades, the theoretical aspects of education were the core of the education process for students only, and this is certainly not enough to raise the level of students in higher education stages. Furthermore, understanding the handling and investing of securities is a challenging subject that requires students to understand and apply financial models and theories. Therefore, this study sought to seek the impact of the simulation room of the Amman Stock Exchange on the level of students of the College of Business at Al-Zaytoonah University of Jordan through the predictive approach. A total of 150 students were randomly used as a predictive experimental group. The results show that the simulation education system has many advantages, including; The use of technology in education can be encouraging for students and increase their intellectual abilities in the classroom. Secondly, an interactive session that attracts the attention of the students due to the strong relationship with the teacher. Finally, it gives a great opportunity for students to acquire the skills of dealing with the financial market in a practical and applied manner. © 2022, North American Business Press. ABSTRACT: Breast cancer is among the most common cancer types worldwide. The first and second line treatment protocols for various stages of breast cancer in females rely on tamoxifen. Until now, the development of tamoxifen resistance is not entirely understood. In this study, an automated sequential injection capillary electrophoresis with capacitively coupled contactless conductivity detector was developed for online levels monitoring of both lactate and pyruvate from the supernatant media of MCF-7 cells developing tamoxifen resistance. Changes in concentration of the two metabolites were simultaneously monitored from three model cell cultures and two control untreated cells. The electrophoretic separation was performed under reversed electroosmotic flow conditions. The system delivers high sample throughput at low sample consumption of 20 μL per analysis. The method is robust and achieved high sensitivity and resolution. Limits of detection were 8.0 and 17.0 nM and linear ranges were 0.15–5 and 0.01–1 mM with a correlation coefficient of 0.9951 and 0.9963 for lactate and pyruvate, respectively. Inter-run and intra-run accuracy were in the range of 95.37–107.02% with precision (RSD, %) of ≤9.84%. The method was completely validated and the data obtained were in agreement with results achieved using the lactate and pyruvate assay kits. The highly informative generated data revealed a significant increase in lactate and pyruvate production in the three tamoxifen resistant MCF-7 cells models compared to the two control cells starting from 5.8 hours and

6.8 hours culturing times, respectively. The increase in concentrations of both lactate and pyruvate were correlated with an increase in MCT1 and MCT4 genes expression. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: Supply Chain Finance (SCF) is playing an increasingly important role in operational and financial practices and attracted growing attention from academia and industry alike. However, researchers have not yet been totally able to reach a consensus on the definition of this phenomenon. The study presented in the paper provides an overview of the advancements present in research on Financial Supply Chain Management. Using a bibliometric analysis approach, the paper summarizes the trends of development and the status quo of the Financial Supply Chain Management. The aim is to provide the reader with guidance and a solid conceptual framework for future research. © 2022 Growing Science Ltd. All rights reserve.

ABSTRACT: In this study, seven Algerian honey samples were assessed for their antibacterial activity on the growth, viability, and biofilm formation of clinical strains of *Pseudomonas aeruginosa* isolated from infected wounds. The evaluation of the antibacterial activity of honey samples was determined by both well assay and micro-broth dilution assay. The effect of honey samples on the viability of *P. aeruginosa* was evaluated by a time-kill assay. The anti-biofilm effect was performed by using 96-well plates. The results revealed that Algerian honey exhibit an antibacterial effect against *P. aeruginosa*. The inhibitory diameters ranged from 14.97 ± 3.88 mm to 27.98 ± 3.19 mm. Minimum inhibitory concentration (MIC) values were in the range of 10 to 40% (w/v). The MIC₅₀ varied from 7.88 % (w/v) for honey sample 5 to 18.5% (w/v) for honey sample 7 and the MIC₉₀ was in the range of 18.78 to 38.35% (w/v). The minimum bactericidal concentration (MBC) values ranged from 22.43 ± 6.62 % (w/v) to 39.51 ± 8.35 % (w/v) and the MBC/MIC ratios were less than 2, indicating that Algerian honey displayed bactericidal activity on *P. aeruginosa* strains. In the time-kill curve, honey samples (1, 2, 3, 4, and 7) destroyed *P. aeruginosa* after 24 hours of incubation, with honey samples 5 and 6 destroying the bacterium after 21 hours of incubation. The anti-biofilm effect revealed that all tested honey samples effectively inhibited biofilm formation with percentages varying from 54.32% to 97.48%. In conclusion, Algerian honey can be effective as an alternative antibacterial agent for the treatment of infected wounds, especially those caused by *P. aeruginosa*. © 2022 Greek Society of Microbiology Ascent Ltd. ABSTRACT: This study provides a broad review of the evolution of the Six Sigma dimensions as a strategic vision and an effective methodology for improving quality and reducing defect in the growing interest of its application to the industrial and service fields. This study seeks to determine the effect of the Six Sigma elements (strategic vision, DMAIC cycle, patient (customer) orientation and hospital commitment to employees) on two criterions for market performance (competitiveness and hospital reputation) in Jordanian hospitals. The effect of the mediator variable

(acceptance of failure) in hospitals on the relationship between the Six Sigma and competitiveness is also investigated. The results confirm there is a positive impact of the three dimensions of the Six Sigma on the competitiveness and reputation of the company. The DMAIC cycle however, does not seem to have a significant effect. As well, acceptance of failure as a mediator variable does not show any significant impact on the relationship between Six Sigma and competitiveness. Copyright © 2022 Inderscience Enterprises Ltd.

ABSTRACT: Electrochemical etching (ECE) served to fabricate porous silicon (PS), and the impact of different volume ratios of HF:ethanol on the morphological properties of PS has been examined. ZnS/PS composites were obtained by depositing ZnS film on PS substrate with the adoption of the spray method at a substrate temperature of 300°C and a spray rate of 3 ml/min. The thin film was characterized systematically by using several characterization techniques such as field emission scanning electron microscopy (FESEM), X-ray diffraction (XRD), and UV-Vis-NIR spectrometry. The deposited film highlights a cubic structure with energy band gap of 3.66 eV. UV photodetectors (PDs) based on ZnS have been fabricated on PS substrates, and the PDs had shown a high photosensitivity (14×10^3) for 400 nm UV light with the current decay and rise times of 0.6 and 0.9 s, respectively, and bias voltage of 2 V. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: Purpose: COVID-19 vaccines are critical for containing the pandemic and preventing serious SARS-CoV-2 infections. In addition to the two main doses, a booster dose has been utilized to improve immunity. The aim of current study is to evaluate Iraqi adult population knowledge, attitudes, and practices towards COVID-19 booster dose. Subjects and Methods: This online cross-sectional survey of adult Iraqis (n = 754) assessed the attitudes of people who have had both immunizations regarding a potential COVID-19 vaccine booster dosage and to identify potential factors that might impact these attitudes. Factors evaluated in the current study included previously received vaccine type in the first two doses, socioeconomic characteristics, health status, knowledge about COVID-19 and its vaccines and adherence to protective practices. Results: Overall, 61.1% of participants expressed willingness to receive a COVID-19 booster dose, with a high median score of knowledge and practice toward COVID-19. Participants who did not perceive COVID-19 to be serious, p-value <0.001), participants who believed they would not be infected with COVID-19 in the next 6 months (p-value <0.001), low knowledge score group (p-value <0.001), lower education (p-value <0.001), participants who received the COVID-19 vaccine because of imposed laws (p-value <0.001), participants who received AstraZeneca vaccine (p-value <0.001), younger participants (p-value=0.003), low level of practice (p-value <0.001), participants who did not know someone who had died due to COVID-19 (p-value=0.01), low risk of developing serious side effects if infected with COVID-19 and participants in the low side effects score were significantly less frequently willing to receive a booster COVID-19 dose (p-value <0.001). The main reasons for booster dose hesitancy/refusal were the perceived lack of need for a booster shot, the uselessness of a booster shot and the conspiracy theory of boosting corporate profits through booster shots. Conclusion: There is high hesitancy towards COVID-19 booster dose

acceptance among the Iraqi population. The study identified several factors associated with vaccine hesitancy including low socioeconomic status and low knowledge about COVID-19 and its vaccines. © 2022 Al-Qeremet al.

ABSTRACT: Airway management is one of the main situations that required nursing skills. Actual airway management experience on live patients is limited due to few opportunities to perform endotracheal intubation for students and issues related to students' liability. Therefore, this study evaluated the effect of High Fidelity Simulation airway management training program on nursing students' performance, satisfaction, and self-confidence in Palestine. A pre-post-test control group was applied through the recruitment of a 154 nursing students from Arab American University Palestine. The sample distributed randomly to experimental and control groups. Data were collected using the American Heart Association airway management performance checklist and the learner satisfaction and self-confidence for Learning (LSSCL) Questionnaires. Findings showed that there were no significant differences of airway management performance, satisfaction, and self-confidence scores between both groups at pre-test. On the contrary, there were significant differences between both groups of airway management performance, satisfaction, and self-confidence at post-test. Thus, High-fidelity simulation (HFS) was found to be an effective tool to provide a safe and effective learning environment for nursing students, consequently improving their airway management performance and increasing their satisfaction and self-confidence. This study supports the need to integrate HFS into the nursing curriculum. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Objective: This study reports new solubility and physicochemical data for ribociclib (RCB) in water and ten organic solvents including "methanol (MeOH), ethanol (EtOH), isopropyl alcohol (IPA), n-butanol (n-BuOH), propylene glycol (PG), polyethylene glycol-400 (PEG-400), acetone, ethyl acetate (EA), Transcutol-HP (THP), and dimethyl sulfoxide (DMSO)" at 293.2–313.2 K and 101.1 kPa. Significance: The obtained data are useful for the industrial applications of RCB. Methods: The solubility of RCB was measured and regressed using "van't Hoff, Buchowski-Ksiazczak λ , the modified Apelblat, and Jouyban models." Results: The overall deviations of $\pm 4.0\%$ were recorded for all four models. The maximum mole fraction solubility of RCB was 2.66×10^{-2} in PEG-400 at 313.2 K, however, the lowest one was in the water. The RCB solubility increased with temperature and the order followed in the water and ten different organic solvents was PEG-400 (2.66×10^{-2}) > THP (1.00×10^{-2}) > PG (5.39×10^{-3}) > DMSO (5.00×10^{-3}) > n-BuOH (3.23×10^{-3}) > acetone (3.11×10^{-3}) > IPA (1.58×10^{-3}) > EA (1.41×10^{-3}) > EtOH (1.37×10^{-3}) > MeOH (8.10×10^{-4}) > water (2.38×10^{-5}) at 313.2 K. The maximum solute-solvent interactions were found in RCB-PEG-400 in comparison with other combination of RCB and solvents. "Apparent thermodynamic analysis" indicated an "endothermic and entropy-driven dissolution" of RCB in water and ten organic solvents. Conclusions: Based on all these data and observations, PEG-400 can be used as the best co-solvent for RCB solubilization. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Multivariate polynomials of finite degree can be expanded into Bernstein form over a given simplex domain. The minimum and maximum Bernstein control points optimize the polynomial curve over the same domain. In this paper, we address methods for computing these control points in the simplicial case of maximum degree L . To this end, we provide arithmetic operations and properties for obtaining a fast computational method of Bernstein coefficients. Furthermore, we give an algorithm for direct determination of the minimum and maximum Bernstein coefficients (enclosure boundary) in the simplicial multivariate case. Subsequently, the implicit form, monotonicity, and dominance cases are investigated. © 2022 Tareq Hamadneh et al.

ABSTRACT: The aim of this paper is to examine the ability of fair value accounting data to predict future operating cashflows up to three years ahead in Jordanian commercial banks, as well as to test whether there are significant differences among banks according to their size with regard to the ability of fair value accounting to predict cashflows. Multiple linear regression method is used to analyze the financial data of the study population, which consist of (13) Jordanian commercial Banks for the period (2005-2014). The study sample is the same as the study population. The fair value financial assets and liabilities are used in (3) models. The first model contains net financial assets; the second model includes total financial assets and total financial liabilities; and the third model contains the detailed components of financial assets and liabilities. The study concludes that fair value accounting data (through net financial assets, through total financial assets and total financial liabilities, and through items of financial assets and financial liabilities) have a statistically significant predictive ability in predicting future operating cashflows of Jordanian commercial banks for three subsequent years. The results also show that there are no statistically significant differences among Jordanian commercial banks according to their size with regard to the ability of fair value accounting to predict future operating cashflows up to three years ahead. Nevertheless, the predictive ability is greater for largesized banks. This study recommends maintaining the continuity of applying fair value accounting by Jordanian commercial banks, and following any updates related to fair value accounting in the IFRS. © 2022, Hrvatsko Drustvo Ekonomista. Department of Pharmacology and Toxicology, College of Pharmacy, King Saud University, Riyadh, Saudi Arabia

ABSTRACT: OBJECTIVE: Antibiotic resistance is a major health threat and efforts should be intensified to reduce its burden. Healthcare providers, especially pharmacists, can be actively involved in the reduction of antibiotic resistance. However, negative practices among pharmacists have been observed. This study evaluated knowledge, attitudes, and practices (KAP) among Jordanian pharmacy students. PATIENTS AND METHODS: A cross-sectional study used an online questionnaire that was developed and distributed to Jordanian pharmacy students from five different universities. KAP scores were calculated, with students categorized into low and high levels based on each score mean. RESULTS: A total of 890 pharmacy students completed the questionnaire. High positive response rate (PR%) for the

majority of the knowledge items was observed, exceeding 60% in all knowledge items, and similar PR% was observed in attitude items. The variables significantly associated with attitude were age [OR=0.92 (95% CI 0.87: 0.98), $p=0.01$] and knowledge [OR=1.35 (95% CI 1.01:1.82), $p=0.04$], while knowledge was significantly associated with practice [OR=0.23 (95% CI 0.16:0.31), $p<0.001$]. CONCLUSIONS: Jordanian pharmacy students showed adequate KAP toward the use of antibiotics although several aspects of malpractice were identified. Hence, adequate knowledge about antibiotics among pharmacy students should be ensured as knowledge is associated with attitudes and practices. © 2022 Verduci Editore s.r.l. All rights reserved.

ABSTRACT: A new composite film from chitosan (CS) and biotin (BIO) was developed to enhance burn wound healing. The film was prepared by electrostatic interaction between CS and BIO. Four different ratios of CS to BIO v/v (4:1, 3:2, 2:3, and 1:4) were prepared. The films were comprehensively characterized using FTIR, DSC, and AFM. The in-vitro release studies showed that the most promising formula with the highest release behavior was CS to BIO 1: 4. The ex vivo adhesion times were reported as 0.50 ± 0.30 min for CS film compared to 6.2 ± 0.30 , 8.4 ± 0.40 , 11.2 ± 0.50 , and 13.83 ± 1.04 min for CS to BIO films v/v (1:4, 2:3, 3:2 and 4:1), respectively. Most importantly, the skin healing activities of CS/BIO film in the excision wound model in mice and skin burn model in rats showed faster rates of healing compared to CS and placebo. Furthermore, skin stretching and burn wound contraction behavior treated with CS/BIO were higher than that of CS treated skin. In conclusion, the results obtained revealed that CS/BIO films possessed superior burn wound healing activity compared to CS. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: This study purposed to assess the mediating role of social support between stress, depressive symptoms, and self-esteem among Jordanian pregnant women. Across-sectional study recruited a total of 538 pregnant Jordanian women using a cluster stratified random sampling technique, during the period from September 2019 to February 2020. The study used the following measures: The Perceived Stress Scale (PSS), Beck's Depression Inventory (BDI), Rosenberg Self-Esteem Scale, and Multidimensional Social Support Scale (MSPSS). Descriptive statistics and inferential statistics were used to test the mediating effect of social support in terms of the association between depression and self-esteem. The results were considered significant if $p \leq .05$. The findings showed that 75.6% of participants had moderate-to-high stress levels. High levels of stress, depressive symptoms, and low self-esteem were highly correlated with low social support ($p < .05$). Depressive symptoms predict the self-esteem ($F(2, 537) = 158.631$ $p < .05$). Social support significantly mediates the relationship between the depressive symptoms and self-esteem with $p = .01$. Thus, during the antenatal care, administration of screening tools to identify pregnant women with low social support levels and at risk of developing psychological difficulties would allow primary healthcare to promote for positive health outcomes for the mothers and the babies. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: This paper explored the factors influencing the acceptance of e-accounting among SMEs

employees. The authors adopted the unified theory of acceptance and use of technology (UTAUT) as the underpinning theory, and distributed questionnaire copies to SMEs employees, from which 227 were deemed valid. The variables in UTAUT namely, performance expectancy, effort expectancy, social influence and facilitating conditions were examined. The results showed that performance expectancy, effort expectancy, and social influence all positively and significantly affected behavioural intention to use e-accounting. Moreover, facilitating conditions and behavioural intention to use e-accounting had positive and significant effects on e-accounting use behaviour. The role of UTAUT model is to explore and provide attention to the adaptation of new technology in SMEs. It is expected that the study framework could guide SMEs in their promotion and achievement of employees' e-accounting adoption. Copyright © 2022 Inderscience Enterprises Ltd.

ABSTRACT: Cloud ERP (C-ERP) systems help firms to reach greater levels of sustainable performance (Gupta, Qian, Bhushan, & Luo, 2019). Ali (2016) demonstrate that the enterprise resource planning (ERP) system implementation influences financial performance indicators. Huang, Rahim, Foster, and Anwar (2021) had investigated and identified the critical success factors (CSFs) which may affect the successful implementation of C-ERP systems. However, no empirical evidence was found on the relationship between C-ERP critical success factors and financial performance. This study examined the effect of key CSFs of the C-ERP systems on financial performance in the post-implementation stage. An online questionnaire was developed to collect data about CSFs in C-ERP firms. The financial ratios were collected from the Amman Stock Exchange (ASE) filings. OLS analysis suggests that financial performance is affected by technological competence, management support, organizational culture, and system characteristics. The study provides empirical evidence on the cause-effect relationship which emphasizes the difference made in long-term financial success by the various managerial techniques. The results provide practical implications to management and service providers that help in installing and maintaining C-ERP systems. © 2022 The Authors.

Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study enhances the existing literature on female online buying decisions by evaluating the factors shaping women's clothing purchase decision-making. Hence, it investigates the influence of social media interactive marketing activities, i.e., electronic advertising (e-Ads), electronic word of mouth (e-WOM), interaction (Int.), and content credibility (CC), on female purchase decisions. The study adopted the logic of quantitative approach using an e-questionnaire as a main data collection tool targeting online female consumers. Data were collected from 388 female social media users, and regression analysis was applied. The results of the study confirmed the association between a firm's use of and female activities and applications interactive marketing purchase decisions. In addition, the results pointed out the electronic interactive activities of social media platforms such as e-Ads, CC, and e-WOM as powerful tools that support firm's marketing strategies via their positive influence on female purchase decisions. The result is consistent with previous research (Park, Hyun, & Thavisay, 2021; Tran, 2017). The study provides several implications and recommendations for practice: focusing on content credibility, enriching the interactive content of brand name page, providing more details about offerings, and the continuous development of advertising, contents, and techniques. And for future research, as this study derived its findings from an evaluation carried out in the Jordanian clothing market, it is recommended to extend this evaluation to be conducted in other contexts and to consider other demographical and economic variables. © 2022 The Authors.

ABSTRACT: Flap peening (FP) is a cold working technique used to apply a compressive force using small shots, this will lead to enhance the surface properties that it can sustain for long life during working conditions. In this study, several aircraft aluminum alloys materials namely; 2219 T6, 2024 T6, 7075T6, and 6061 T6 were flap peened under different rotational speeds. The effect of rotational speed on the average surface roughness (Ra) and average surface micro hardness have been investigated. As seen by the Scanning Electron Microscope SEM photos that the hardness of peened layer is increased. It was found that as the flap peening speeds increase the percent change in surface roughness (Ra) increases, and the percent change in surface micro hardness decreases. The maximum increase in Ra occurs in 2219 T80 and the minimum in 6061 T6 alloys, and for hardness, it is reported that the maximum occurs in 6061 T6 and the minimum in 2019 T80 alloy. © 2022. ABSTRACT: The aim of this study is to investigate the effects of the four national culture (NC) dimensions of uncertainty avoidance, collectivism, power distance and masculinity on knowledge sharing. In addition, this study aims to examine the mediating effects of trust and social networking on the relationships between the four NC dimensions and knowledge sharing (KS). A theoretical model was developed, and a questionnaire-based survey was designed and targeted a 'knowledge intensive' sector, namely the healthcare sector in Jordan. Findings show that collectivism and uncertainty avoidance were the only two dimensions found to have a positive and significant effect on knowledge sharing, trust as well as social networking. Both trust and social networking were found to have positive and significant effects on knowledge sharing. Trust fully mediated the effect of collectivism on knowledge sharing and partially mediated the effect of uncertainty avoidance, whereas social networking was found to have a partial mediating effect. In conclusion, the study has contributed to the extant NC and KS literature by complementing studying a nation's distinctive cultural traits' on an organisational-level routine. © 2022 Inderscience Enterprises Ltd.

ABSTRACT: Using a new simple and well-behaved definition of the fractional derivative which is different from the Caputo and Riemann-Liouville fractional derivative and recently introduced by Khalil and others, we reformulate the second order Bessel differential equation in this new setting. In this article by the use of power series, one of the solution of the fractional differential equation is obtained. Moreover, we find the generating function and use it to prove some nice standard results and recurrence relations. Finally, we present some application and integral representations of Bessel functions of fractional type including sines and cosines. © 2022 Forum-Editrice Universitaria Udinese SRL. ABSTRACT: The various model that has been used to predict, datamining, and information retrieval are useful to use through the traditional database, due to big data the prediction should derive in a different role that conduct the hidden structure data based on a stability scale to allow discovering accrue unsupervised drug data. Especially, the drug data must be understandable to analysts. Following this approach, conduct the stability drug data through computation methods are quality measurements, preprocess data, k-mean cluster, and decision tree. This approach seeks to identify the data by two dimensions (vertically and horizontally), which extrapolations, compilation, and interpretation values of the dataset while considering individual attributes. A comparison with clusters defines the set for features using balance value by K-mean algorithm to determine the k clusters that consider the set of features based on two values 0 and 1, which given the discernible between dependent and independent class target, and pinpoint the relationship among them. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Background: Understanding the university students' perception of Water Pipe smoking addictions and factors behind the rise in the prevalence of Water Pipe smoking will contribute effectively in the prevention strategies and policies development. Aims: Thus, this study aims to assess the prevalence of Water Pipe smoking among university students and their perceptions on its addiction in Palestine, Jordan, and Turkey, as an initial step to reduce the spread of Water Pipe smoking. Methods: An online self-structured questionnaire was administered to 2030 selected university students from Palestine, Jordan, and Turkey. Prevalence, knowledge and other related factors concerning Water Pipe smoking and its addiction were compared between university students from three Middle East countries (Palestine, Jordan, and Turkey) using SPSS software for statistical analysis. Results: The overall prevalence of Water Pipe smoking was 31.8%, less than a quarter of university students (21.7%) had ever smoked Water Pipe. The highest percentage of current Water Pipe smokers were Palestinians (36.11%), and the lowest percentage was from Turkey (20.23%). Approximately 43% of Water Pipe smokers believe that they will be addicted to Water Pipe smoking and almost half of them smoke Water Pipe daily. The highest percentage of smokers were university students 25 years old and above. However, the highest percentage of smokers was low monthly income students. The university students living with their families were smoking Water Pipe less frequently than students living in private residencies. Conclusions: The prevalence of Water Pipe smoking among university students in Palestine and Jordan was high compared to Turkey. It was believed that the Turkish rules and regulations of Water Pipe smoking limit the Water Pipe smoking in Turkey © This work is licensed under a Creative Commons Attribution-Non Commercial 4.0 International License

ABSTRACT: International Financial Reporting Standards 15 – Revenue from Contracts with Customers (IFRS 15) was issued to inhibit the use of revenues for earnings management purposes. During COVID-19, the standard was used to manage earnings (Lopatta, Alexander, Gastone, & Tammen, 2020). This study aims to explain earnings management practices by using a revenue standard. An online questionnaire was distributed by Momentive Inc. (formerly SurveyMonkey Inc.) to accountants working in two different contexts: Jordan as an IFRS country and the USA as a Generally Accepted Accounting Principles (GAAP) country. A convenience sample of 304 questionnaires from both countries was valid for analysis. The findings of ordinary least square (OLS) regression suggest that, during COVID-19, both users used the revenue standard as a tool to manage earnings. In addition, IFRS users were more conservative than GAAP users in terms of existing contracts, while both of them were the same in terms of future contracts. The results should help policymakers and regulators to rethink the

flexibility given to managers in dealing with revenue contracts. In addition, they should help managers efficiently manage the revenue contracts. © 2022 The Authors.

ABSTRACT: In this paper, we tackle decision fusion for distributed detection in a randomly-deployed clustered Wireless Sensor Networks (WSNs) operating over a non-ideal multiple access channels (MACs), i.e. considering Rayleigh fading, path loss and additive noise. To mitigate fading, we propose the distributed equal gain transmit combining (dEGTC) and distributed maximum ratio transit combining (dMRTC). The first and second order statistics of the received signals were analytically computed via stochastic geometry tools. Then the distribution of the received signal over the MAC are approximated by Gaussian and log-normal distributions via moment matching. This enabled the derivation of moment matching optimal fusion rules (MOR) for both distributions. Moreover, suboptimal simpler fusion rules were also proposed, in which all the CHs data are equally weighed, which is termed moment matching equal gain fusion rule (MER). It is shown by simulations that increasing the number of clusters improve the performance. Moreover, MOR-Gaussian based algorithms are better under free-space propagation whereas their lognormal counterparts are more suited in the ground-reflection case. Also, the latter algorithms show better results in low SNR and SN numbers conditions. We have proved that the received power at the CH in MAC is proportional $O(\lambda^2 R^2)$ and to $O(\lambda^2 \ln^2 R)$ in the free-space propagation and the ground-reflection cases respectively, where λ is SN deployment intensity and R is the cluster radius. This implies that having more clusters decreases the required transmission power for a given SNR at the receiver. © 2015 IEEE.

ABSTRACT: Background and Objectives: Honey has excellent antibacterial properties against various microorganisms of several different species. To date, there is no comparative evaluation of the antibacterial activity of Jarrah honey (JH), Kelulut Madu honey (KMH), Gelam honey (GH), and Acacia honey (AH) with that of Manuka honey (MH). The purpose of this study was to conduct such study and to compare the antibacterial activity of JH, KMH, GH, and AH with that of MH against *Pseudomonas aeruginosa* and *Streptococcus pyogenes*. Materials and Methods: Activity was assessed using broth microdilution, time kill viability, microtiter plate, scanning electron microscope (SEM) and Quantitative Real-Time Polymerase Chain Reaction (RT-qPCR). Results: The susceptibility tests revealed promising antibacterial activities of all honeys against both bacteria. The MICs of JH, KMH, GH, and AH ranged from 20% to 25% compared to MH (12.5%) against both bacteria. The MBCs of JH, KMH, GH, and AH ranged from 20% to 50% compared to MH (20%) against both bacteria. Treatment of both bacteria with 2x MIC (Minimum inhibitory concentration) of MH, JH, KMH, GH, and AH for 9 hours resulted in reduction in colony-forming unit (CFU/ml). SEM images showed that the morphological changes, cell destruction, cell lysis and biofilm disruption in both bacteria after exposure to all honeys. RT-qPCR analysis revealed that the expression of all genes in both bacteria were downregulated following treatment with all honeys. Among the all-tested honeys, MH showed the highest total antibacterial and antivirulence activities. Conclusion: Our results indicate that all honeys activity included inhibition of both bacteria due to a decrease in expression of essential genes associated with both bacteria, suggesting that all honeys could potentially be used as an alternative therapeutic agent against certain microorganisms particularly against *P. aeruginosa* and *S. pyogenes*. © 2022 The Authors. ABSTRACT: OBJECTIVE: Achieving glycemic control significantly improves the progression of the disease among diabetes mellitus patients although this is not achieved by many diabetics. The aim of the study is to explore the factors associated with glycemic control among patients with type 2 diabetes.

PATIENTS AND METHODS: In addition to socio-demographic variables, beliefs about medications and medication adherence were evaluated using the validated Beliefs about Medications Questionnaire and the 4-item medication adherence scale. A cut-off point of HbA1c% <7 was used as an indicator of glycemic control. Stepwise binary logistic regression was conducted to explore the variables associated with poor glycemic control. RESULTS: A total of 287 patients participated in the study. More than half (58%) were found to have poor glycemic control. Females had significantly higher odds of having controlled diabetes (OR=2.28, p-value <0.01). Increasing necessity for diabetes medications was significantly associated with improved glycemic control (OR=2.75, p-value <0.01). Participants in low or moderate adherence groups had significantly higher odds of having uncontrolled diabetes.

CONCLUSIONS: Future diabetes management programs should focus on emphasizing medication necessity and improving medication adherence, particularly for male patients, with the aim of improving glycemic control and health outcomes among patients with type 2 diabetes. © 2022 Verduci Editore s.r.l. ABSTRACT: The fuzzy min-max (FMM) network is one of the most powerful neural networks. It combines a neural network and fuzzy sets into a unified framework to address pattern classification problems. The FMM consists of three main learning processes, namely, hyperbox contraction, hyperbox expansion and hyperbox overlap tests. Despite its various learning processes, the contraction process is considered as one of the major challenges in the FMM that affects the classification process. Thus, this study aims to investigate the FMM contraction process precisely to highlight its usage consequences during the learning process. Such investigation can assist practitioners and researchers in obtaining a better understanding about the consequences of using the contraction process on the network performance. Findings of this study indicate that the contraction process used in FMM can affect network performance in terms of misclassification and incapability in handling the membership ambiguity of the overlapping regions. ABSTRACT: OBJECTIVE The aim of this study was to determine pharmacists' perceived knowledge and expertise required to deliver pharmaceutical care services to pediatric patients. METHODS Once ethical approval was obtained, a questionnaire was posted on local pharmacy groups. The questionnaire is composed of 4 domains: 1) Demographics, 2) Perceived knowledge of pediatric treatment and dosing, 3) Real-life pediatric cases, and 4) Future aspirations to enhance pediatric pharmacy. RESULTS A total of 200 questionnaires were completed and submitted online. Most participants (62.5%) practiced in a community setting. Most respondents (40%) reported that 41% to 60% of their patients were pediatrics. In general, respondents had a good perception of their knowledge and expertise to deliver pharmaceutical care services to pediatric patients. However, most respondents had a low knowledge score when faced with real-life pediatric cases. On a scale of 7 most respondents obtained the score of 2 (32%). CONCLUSIONS The present study sheds light on an alarming lack of knowledge in pediatric pharmaceuticals among pharmacies in Jordan. Further training and educational programs should be put in place to address this gap in knowledge. © Pediatric Pharmacy Association.

ABSTRACT: Traditional knowledge of medicinal plant use in Jordan is poorly described. During the last years, many phytochemists and botanists from Jordan have conducted qualitative and quantitative several studies, to gather information from the local people in the different rural regions where herbal medicine flourishes. To assess the effectiveness of the specific plants used in the treatment

of certain diseases, several ethnopharmacological studies were carried out in different regions of Jordan. The reported use value (UV) and informant's consensus factor (Fic) of these studies were analysed and summarised. Artemisia and Achillea species scored the highest UV (above 0.8). Ajloun area, rich in medicinal plants, showed the highest average UV, followed by the rural area of Badia. Among all reported illnesses dental pain has achieved the highest homogeneity of the information (Fic 0.97). This ethnopharmacological review revealed that despite the availability of modern medicine in Jordan, traditional medicine is also widely practiced, especially in the rural areas of the country. © 2022 DSR Publishers/The University of Jordan. ABSTRACT: Aims: The current study investigates the student nurses' attitudes and opinions towards their health promotion role during the COVID-19 pandemic using social media. Background: Social media and networking have become the most secure modes of communication among health care providers and their clients during the COVID-19 pandemic all over the world. However, it is the primary means of disseminating health information about disease prevention and control. Methods: A cross-sectional study was conducted on 296 student nurses aged 19-49 enrolled at twelve Jordanian universities (6 public and six private) in Jordan. The research team developed the self-administered questionnaire to explore the student nurses' attitudes towards their health promotion role during the COVID-19 pandemic using social media and the Internet. Results: Findings revealed that the student nurses had positive attitudes towards their health promotion role during the COVID-19 pandemic. The majority of student nurses are using social media to raise the awareness of their community about COVID-19 prevention. Conclusion: The current research findings provide baseline data on the student nurses' attitudes about the proper utilization of social media to enhance their community health about COVID-19. Given the student nurses' positive attitudes about their role in COVID-19 health promotion, we strongly recommend that they be provided with the necessary knowledge and skills to demonstrate effective health education. © 2022.

ABSTRACT: Since the early days of 2020, COVID-19 has tragic effects on the lives of human beings all over the world. To combat this disease, it is important to survey the infected patients in an inexpensive and fast way. One of the most common ways of achieving this is by performing radiological testing using chest X-Rays and patient coughing sounds. In this work, we propose a Convolutional Neural Network-based solution which is able to identify the positive COVID-19 patients using chest X-Ray images. Multiple CNN models have been adopted in our work. Each of these models provides a decision whether the patient is affected with COVID-19 or not. Then, a weighted average selection technique is used to provide the final decision. To test the efficiency of our model we have used publicly available chest X-ray images of COVID positive and negative cases. Our approach provided a classification performance of 88.5%. © Al-Zaytoonah University of Jordan (ZUJ).

Effects of vitamin C and D on the mRNA expression of angiotensin converting enzyme 2 receptor, cathepsin L, and transmembrane serine protease in the mouse lungs

(2022) Libyan Journal of Medicine, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126672403&doi=10.1080%2f19932820.2022.2054111&partnerID=40&md5=7360d84be3e6890e7d89b2636ce68fa9>
AFFILIATIONS: Department of Clinical Laboratory Sciences, College of Applied Medical Sciences, Jouf University, Skaka, Saudi Arabia;
Department of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan
ABSTRACT: Vitamins (Vit) C and D are widely used as immunogenic supplements among severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infected patients. The SAR-CoV-2 virus enters into the pulmonary endothelial cells through attachment to angiotensin converting enzyme 2 receptor (Ace2) and the proteolytic activity of Cathepsin L (Ctsl) and transmembrane serine protease 2 (Tmprss2) enzymes. This study aimed to determine the influence of Vit C and D on the mRNA expression of Ace2, Tmprss2, and Ctsl genes in the mouse lungs. Vitamins C and D were administrated to different groups of mice through intra-peritoneal route in doses equivalent to human for 30 days. Then, the mRNA expression of SARS-CoV-2 entry gene was analyzed using qRT-PCR. It is found that Vit D, but not C, upregulated significantly ($P < 0.05$) the mRNA expression of Ace2 by more than six folds, while downregulated the expression of Ctsl and Tmprss2 genes by 2.8 and 2.2 folds, respectively. It can be concluded from this study that Vit D alters the mRNA expression of Ace2, Tmprss, and Ctsl genes in the mouse lungs. This finding can help us in understanding, at least in part, the molecular influence of Vit D on genes involved in the entry of SARS-CoV-2 into the cells. © 2022 The Author(s). THE INFLUENCE OF DATA MINING ON ACCOUNTING INFORMATION SYSTEM PERFORMANCE: A MEDIATING ROLE OF INFORMATION TECHNOLOGY INFRASTRUCTURE

(2022) Journal of Governance and Regulation, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126662119&doi=10.22495%2fjgrv11i1art13&partnerID=40&md5=73e87d25a12b88e46de731654082d4e6>
AFFILIATIONS: Al-Zaytoonah University of Jordan, P. O. Box 130, Amman, 11733, Jordan
ABSTRACT: The current study aimed at examining the influence of data mining (information and communication technologies (ICTs), knowledge management (KM), data warehousing (DW), and data mining (DM) on performance and outcomes of accounting information system (AIS) application through a mediating role of information technology (IT) infrastructure. Through adopting a quantitative approach, a questionnaire was distributed on 143 individuals working within food manufacturing organizations in Jordan; primary data were screened and analyzed depending on SPSS version 27. Results of the study matched what came along with Zhang (2021) and indicated that there is a positive relationship between data mining and AIS performance in terms of the fact that data mining along with its strategies (prediction, classification, collecting, and distributing) had the ability to ease the process of managing huge amount of data and transfer it to AIS application for better processing in accounting means. However, this relationship, as according to Kim (2020), was attributed to a well-built IT infrastructure that appeared to be the main and most important aspect that played a role in determining the level of performance of both data mining and AIS applications. In conclusion, the current study summed up that adopting technology means generating more data, the more data an organization gets the more it needs to improve its data organization, storage, classification, and analysis. This can only come from organizational vigilance and total awareness of technology and how it can improve organizational ability to generate well-built information that helps in decision-making. © 2022 The Author.

ABSTRACT: The coronavirus disease (COVID-19) prevented millions of students around the world from receiving their lessons, because of the closure of thousands of schools. The new COVID-19 global epidemic invaded the barriers of time and space. Using mobile phones in education is a new form of the distance learning system. M-learning is characterized by many characteristics, the most important of which are providing an interactive educational environment, flexibility in space and time, better adaptation to individual needs, acquisition of knowledge, interactive effectiveness, and developing self-learning skills for students. The main aim of this paper is to suggest a quality model for M-learning applications for children which contains the most common characteristics of M-learning, which must be taken into account when designing M-learning applications. Through previous studies

related to the quality model for M-learning applications, we proposed two quality characteristics, technical and pedagogical. We proposed 8 subcharacteristics with their features following the structure of the IOS/IEC 912 and DeLone and McLean IS model to find the effect of technical and pedagogical factors on user satisfaction with M-learning applications for children. Results show that the proposed model can be useful and effective to ensure the development of high-quality M-learning applications. © 2022 Ahmad Althunibat et al.

ABSTRACT: Introduction. This study is aimed at investigating the immunological response after treating THP-1 cells with gold nanorods conjugated with a phosphatidylinositol 3-kinase (PI3K α) inhibitor. Methodology. Gold nanorods were synthesized and functionalized with cholesterol-PEG-SH moiety, and the treatment groups were as follows: nanocomplex (a drug-conjugated gold nanorods), free drug (phosphatidylinositol 3-kinase (PI3K α) inhibitor), and GNR (the nanocarrier; cholesterol-coated gold nanorods). THP-1 cells were differentiated into macrophages and characterized by measuring the expression of macrophage surface markers by flow cytometry. Then, differentiated cells were activated by lipopolysaccharide (LPS). Afterwards, activated macrophages were treated with the different treatments: nanocomplex, free drug, and GNR, for 24 hrs. After treatment, the production of the inflammatory cytokines measured at gene and protein levels by using qPCR and CBA array beads by flow cytometry. Results. Our results show that THP-1 cells were successfully differentiated into macrophages. For inflammatory cytokine expression response, nanocomplex and free drug showed the same expression level of cytokines at gene level, as the expression of IL-1 β , IL-6, and TNF- α was significantly downregulated ($p < 0.0005$, $p < 0.0005$, $p < 0.0005$), respectively, while IL-8, IL-10, and TGF- β were all upregulated in a significant manner for nanocomplex ($p < 0.00005$, $p < 0.00005$, $p < 0.00005$) and free drug treatment group ($p < 0.00005$, $p < 0.05$, $p < 0.05$) compared to the control untreated group. While in the GNR group, IL-6 and TNF- α were downregulated ($p < 0.005$, $p < 0.00005$), and IL-12p40 ($p < 0.00005$) was upregulated all in a statistically significant manner. While at protein level, cells were treated with our nanocomplex: IL-1 β , IL-6, TNF- α , and IL-12p70 and were significantly decreased ($p < 0.00005$, $p < 0.005$, $p < 0.05$, $p < 0.00005$), and IL-10 was found to be significantly increased in culture compared to the untreated control group ($p < 0.005$). For free drug; IL-1 β and IL-12p70 were significantly decreased ($p < 0.00005$, $p < 0.00005$), while a significant increase in the secretion levels of IL-10 only was noticed compared to the untreated group ($p < 0.005$). For GNR treatment groups, IL-1 β , TNF- α , and IL-12p70 were significantly decreased ($p < 0.00005$, $p < 0.05$, $p < 0.00005$). Conclusion. We can conclude that our nanocomplex is a potent effector that prevents tumoral progression by activating three main immunological strategies: switching the surface expression profile of the activated macrophages into a proinflammatory M1-like phenotype, downregulating the expression of proinflammatory cytokines, and upregulating the expression level of anti-inflammatory cytokines. © 2022 Duaa Abuarqoub et al.

ABSTRACT: Purpose: To identify the gaps in the Jordanian population's knowledge about oral cancer, screening and attitudes toward screening, in addition to determining the barriers to oral cancer screening. Materials and Methods: A cross-sectional web-based study was conducted. The first section of the questionnaire employed collected the participants' sociodemographic data. A question about whether patients had heard about oral cancer was then included, and those who answered 'no' were instructed to submit the questionnaire. The subsequent parts evaluated the participants' knowledge of oral cancer and screening, attitudes toward screening, and barriers against screening. ANOVA and chi-squared tests were conducted to investigate the sample characteristics associated with the participants' unfamiliarity with oral cancer. Binary regression was conducted to predict the variables associated with the participants' knowledge and attitudes. Results The questionnaire was filled

by 1307 participants (1011 females). Most of the participants (70.01%) stated that they had heard of oral cancer, and the variables associated with awareness of oral were sex, monthly income, health insurance coverage, working status, and educational level. Sources of information and age were significantly associated with knowledge and attitude levels. The most 'agree/strongly agree' responses about barriers were lack of knowledge and lack of awareness. Conclusion The study participants had moderate knowledge about oral cancer and satisfactory attitudes toward screening. Nearly all barriers to screening can be overcome by the joint efforts of healthcare providers and health authorities. © This work is licensed under the Creative Commons Attribution 4.0 International License

ABSTRACT: The question of whether children should be vaccinated against COVID-19 is currently being argued. The risk-benefit analysis of the vaccine in children has been more challenging because of the low prevalence of acute COVID-19 in children and the lack of confidence in the relative effects of the vaccine and the disease. One of the most convincing arguments for vaccinating healthy children is to protect them from long-term consequences. The aim of this study was to assess Jordanian parents' intention to vaccinate their children. This is an Internet-based cross-sectional survey. The researchers prepared a Google Forms survey and shared the link with a number of Jordanian Facebook generic groups. Data were gathered between September and November 2021. In this study, convenience sampling was used. Knowledge about COVID-19 and preventive practices against COVID-19 were calculated for each participant. A total of 819 participants completed the survey (female = 70.9%). Of these, 274 (30.2%) participants intended to vaccinate their children, whereas the rest were either unsure 176 (21.5%) or intended not to vaccinate their children 396 (48.4%). The variables that increased the odds of answering "No" vs "Yes" to "will you vaccinate your children against COVID-19" included not willing to take the vaccines themselves (OR 3.75; CI, 1.46-9.62) and low protective practice group (OR 1.73; CI, 1.12-2.68). Participants had significant levels of refusal/hesitancy. Several barriers to vaccination were identified; attempts to overcome these should be stepped up. © 2022 The Author(s). ABSTRACT: In recent years, the telecommunications sector is no longer limited to traditional communications, but has become the backbone for the use of data, content and digital applications by individuals, governments and companies to ensure the continuation of economic and social activity in light of social distancing and total closure in most countries in the world. Therefore, electronic government (e-Government) and mobile government (m-Government) are the results of technological evolution and innovation. Hence, it is important to investigate the factors that influence the intention to use m-Government services among Jordan's society. This paper proposed a new m-Government acceptance model in Jordan (AMGS); this model combines the Information System (IS) Success Factor Model and Hofstede Cultural Dimensions Theory. The study was conducted by surveying different groups of the Jordanian community. A structured questionnaire was used to collect data from 203 respondents. Multiple regression analysis has been conducted to analyze the data. The results indicate that the significant predictors of citizen intention to use m-Government services in Jordan are Information Quality, Service Quality, Uncertainty Avoidance, and Indulgence vs. restraint. While, the results also suggest that Power Distance is not a significant predictor of citizen intention to use m-Government services. © 2022 Tech Science Press. All rights reserved.

ABSTRACT: The enlarged veins in the pampiniform venous plexus, known as varicocele disease, are typically identified using ultrasound scans. The medical diagnosis of varicocele is based on examinations made in three positions taken to the right and left testicles of the male patient. The proposed system is designed to determine whether a patient is affected. Varicocele is more frequent on the left side of the scrotum than on the right and physicians commonly depend on the supine position more than other positions. Therefore, the experimental results of this study focused on images taken in the supine position of the left testicles of patients. There are two possible vein structures in each image: A cross-section (circular) and a tube (non-circular) structure. This proposed system identifies dilated (varicocele) veins of these structures in ultrasound images in three stages: Preprocessing, processing, and detection and measurement. These three stages are applied in three different color modes: Grayscale, Red-Green-Blue (RGB), and Hue, Saturation, and Value (HSV). In the preprocessing stage, the region of interest enclosing the pampiniform plexus area is extracted using a median filter and threshold segmentation. Then, the processing stage employs different filters to perform image denoising. Finally, edge detection is applied in multiple steps and the detected veins are measured to determine if dilated veins exist. Overall implementation results showed the proposed system is faster and more effective than the previous work. © 2022 Tech Science Press. All rights reserved.

ABSTRACT: This study aims to perceive the effect of financial entrepreneurship performance (FEP) over sustainable innovation (SI) disclosure in an emerging market. Jordanian banks are tested based on a multiple regression analysis for the periods 2008 and 2018 and a time series forecasting webinar analysis for the period from 2019 to 2029 based on data ranging from 2008 to 2018. Innovation is indicated through disclosed intangible assets (IA), and items related to research and development (R&D) costs. As organizations anticipate stability by concentrating on technological awareness to influence higher innovative performance (Guo, Guo, Zhou, & Wu, 2020), this study came to converse the relationships between previous literature variables; Hussain (2015) as well as Lassala, Apetrei, and Sapena (2017) revealed through the regression models that there is a relationship between FEP and SI. Meanwhile, bank FEP is directed by return on assets (ROA) and return on equity (ROE). Results reveal that bank FEP affects SI disclosure in a positive manner for the period 2008 and at a higher significant level than 2018. In the meantime, the growth prediction analyses divulge that both ROA and ROE are expected to decrease rapidly within a coming couple of years and then increase promptly. © 2022 The Authors.

ABSTRACT: Background Patient satisfaction was defined as expectation and perception of the patients about real nursing care they receive. Objective The aim of this study was to evaluate the quality of oncology nursing care as perceived by patients with cancer in 3 Arabic countries (Jordan, Oman, and Egypt). Methods A cross-sectional design with convenience sampling approach was used. A total of 517 patients with cancer (Jordan, 200, 38.7%; Sultanate of Oman, 137, 26.5%; and Egypt, 180, 34.8%) participated and completed the study's questionnaires including sociodemographic data and the Quality

of Oncology Nursing Care Scale (QONCS). Results Moderate quality of oncology nursing care was reported by the participants. The overall mean for the quality of oncology care as measured by the QONCS-Ar (QONCS Arabic version) was highest in Oman (153.40; SD, 4.10), followed by Jordan (150.93; SD, 2.10) and then Egypt (148.0; SD, 3.80). The results were significantly different in the total score of the QONCS-Ar ($F = 45.20$, $P < .001$) among the 3 countries. The results also differed in all domains of oncology nursing care according to days of treatment and marital status. Conclusion Findings are considered a baseline for future research and highlight the importance of evaluating quality of oncology nursing care as perceived by the patients with cancer. Implications for Practice The results from the current study can be used to develop an interventional program focusing on the needs of patients and their perceptions of care. © Wolters Kluwer Health, Inc. ABSTRACT: Optimal node clustering in wireless sensor networks (WSNs) is a major issue in reducing energy consumption and extending network node life time and reliability measures. Many techniques for optimizing the node clustering process in WSN have been proposed in the literature. The metaheuristic algorithms are a subset of these techniques. Genetic algorithm (GA) is an evolutionary metaheuristic technique utilized to improve the network reliability and extending the network life time by optimizing the clustering process in the network. The GA dynamic clustering (GA-DC) algorithm is proposed in this paper to extend the network reliability and node life time of three dimensional (3D) WSN. The GA-DC algorithm made use of an improved fitness function that takes into account a variety of metrics such as energy expenditure per protocol round, clustering distance, and the number of long-distance wireless connections. There have been two types of simulation scenarios run. First, simulation results show that the GA-DC algorithm increases network life time by 80% and network throughput by 55% when compared to the well-known LEACH protocol. Second, simulation results show that the uniform node distribution outperforms the normal and exponential distributions in terms of network life time by 5.7% and 7%, network reliability by 4.2% and 76%, and data throughput by 10.85% and 19.54%, respectively. © 2022, Tech Science Press. ABSTRACT: Introduction: Annually, over two million newborns die worldwide immediately after birth, mostly because of failure to initiate and sustain breathing. A significant decline in newborn deaths can be achieved by using proper essential newborn care (ENC) techniques. Competency-based education (CBE) could successfully build ENC skills. The purpose of the present study was to investigate the effect of applying CBE on Midwifery students' knowledge and skills acquisition and retention of ENC. Methods: This quasi-experimental study recruited third-year under-graduate midwifery students (n=54). They were equally assigned to the interventional and control group. The interventional group was taught ENC by using CBE, whereas the control group was taught by using traditional methods. Students'

ENC knowledge was assessed three times using a multiple-choice question exam. The ENC skills were measured twice by using the Essential Neonatal Care Performance Checklist. Results: The intervention group exhibited significant ENC knowledge and skills, performance acquisition, and retention ($p < 0.001$). Conclusion: CBE is a useful educational model for the acquisition and retention of ENC. © 2022 UPM Press. All rights reserved.

ABSTRACT: Background: Relapse prevention is an essential component in sustaining positive treatment outcomes. Objective: The purpose of this study was to test the efficacy of a relapse prevention intervention on the ability of patients and their primary caregivers to self-detect and manage early warning signs of relapse, and its impact on relapse rate among patients diagnosed with schizophrenia. Method: Quasi-experimental design; one group posttest only, repeated measure time-series design was employed. A total of 40 patients and their primary caregivers represented the sample in this study. Results: The statistical analysis revealed that the effect of relapse prevention intervention on patients and their primary caregivers' ability to self-detect severity and manage early warning signs of relapse has sustainable and positive effect on patients and their primary caregivers from T1 to T3 (patients, $M = 9.0-9.3$; caregivers, $M = 9.7-9.9$). Also, positive effect of intervention detected on abilities of patients and primary caregivers to manage EWS from T1 to T3 (patients, $M = 35-36.0$; caregivers, $M = 39.7-38.1$). The analysis also showed a low relapse rate (14.9%). Conclusion: The study showed that relapse prevention interventions is effective and applicable approach that psychiatric nurses can use to ensure sustainable positive outcomes of psychiatric healthcare among patients with schizophrenia. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: The quality of honey may be affected during storage. The purpose of this study was to assess the impact of storage of nine Algerian honey samples on its antibacterial activity and antioxidant effect. The antibacterial activity of honey samples was evaluated by both the agar well diffusion and micro-broth dilution assays. The antioxidant activity was performed by using in vitro scavenging assays of 2,2-diphenyl-1-picrylhydrazyl (DPPH) and ferric-reducing antioxidant power (FRAP). All the analyses were performed before storage and after every six months of storage in the dark at room temperature ($24 \pm 4^\circ\text{C}$). All the honey samples showed a decrease in antibacterial activity after six months of storage except for the honey sample 2. Indeed, there were no significant variations in the total polyphenolic content and DPPH values before and after storage, except for honey sample 6. However, there was a significant decrease in the antioxidant capacity measured by FRAP assay ($P = 0.0002$). There was a strong correlation between the total polyphenolic content of honey and its antioxidant activity and a moderate correlation with the antibacterial activity. The storage of honey in the dark at room temperature for 18 months influences the quality of honey. However, further investigations are required to strengthen this argument. © 2022 Bouacha et al.

ABSTRACT: Purpose: The Coronavirus Disease 2019 (COVID-19) pandemic poses a serious threat to countless lives. Development of an efficient vaccination can help end the pandemic. Vaccine hesitancy/refusal is a huge issue that could stymie attempts to combat the disease. The goal of this study is to examine COVID-19 vaccine hesitancy in Iraq where at the end of July 2021, only 7.4% of the population was vaccinated. Participants and Methods: This is a cross-sectional web-based study. A survey was used to assess knowledge, attitudes and practice (KAP) toward COVID-19. Willingness to be vaccinated against COVID-19 was assessed, with a logistic regression used to identify variables associated with vaccine acceptance. Motives for vaccination refusal/hesitation were reported. Results: A total of 1542 participants (females = 56.7%) completed the questionnaire. Participants displayed high knowledge and good protective practices toward COVID-19 (median score = 15 out of 19 and 20 out of 25 respectively). 88.6% were willing to be vaccinated. Variables associated with vaccine acceptance included have not been infected with COVID-19 (OR=0.53, p=0.01), low-and moderate-income (ORs=0.42 and 0.63, p<0.01 respectively), low education level (OR=0.33, p-value<0.01) and perceived degree of vaccination importance (OR=1.30, P-value<0.01). The most mentioned reasons for vaccine refusal were concerns about vaccine safety and side effects (90.35%) and the need for more information about the vaccine (81.2%). Conclusion: Participants showed high acceptance toward COVID-19 vaccination, nevertheless more efforts should be applied to overcome barriers mentioned by the participants. © 2022 Al-Qerem et al.

ABSTRACT: Objective: Cost-effectiveness analyses that consider all currently used antiemetics in the case of emetogenic chemotherapy-induced nausea and vomiting (CINV) have not been performed yet. We aim to compare the cost-effectiveness of olanzapine (OLA), or/and neurokinin-1 receptor antagonists (NK-1-RAs), in combination with palonosetron (PAL) and dexamethasone (DEX) in preventing highly emetogenic CINV. Methods: Two decision analytic models were constructed. The first model was based on overall complete response (CR); the second model was based on rate of absence of nausea. Four antiemetic regimens PAL + DEX, NK-1-RAs + PAL + DEX, OLA + PAL + DEX, and PAL + NK-1-RA + DEX + OLA were compared in terms of cost, overall CR and rate of absence of nausea. Base case incremental cost-effectiveness ratio (ICER) estimates were calculated. The study was from the US payer perspective. Results: In terms of CR, the PAL + NK-1-RA + DEX + OLA was associated with the highest gains in the percentage of CR among all treatment regimens at base case ICERs of \$4220 versus PAL + DEX, \$4656 versus NK-1-RA + PAL + DEX, \$16,471 versus OLA + PAL + DEX. In term of rate of absence of nausea, the PAL + NK-1-RA + DEX + OLA was associated with the highest rate of absence of nausea among all the treatment regimens at base case ICERs of \$2291 versus PAL + DEX, \$1304 versus NK-1-RA + PAL + DEX, \$2657 versus OLA + PAL + DEX. Conclusion: from an economic perspective, our study revealed that whether to use overall CR or/and rate of absence of nausea as determinants in the antiemetic decision for the CINV patients, the CR-based-, and rate of absence of nausea-based cost-effectiveness analyses, showed negotiable ICER estimates for the treatment PAL + NK-1-RA + DEX + OLA over the combinations PAL + DEX, NK-1-RA + PAL + DEX, and OLA + PAL + DEX regimens. © 2022 Informa UK Limited,

ABSTRACT: Context: Recent scientific studies have reported that essential oils induce apoptosis in various cancer cell types by interfering with intracellular signaling pathways. Aims: To evaluate the cytotoxicity, the apoptotic activity of essential oil (EO) of *Ruta chalepensis* L. against MCF-7 cell line. Methods: Cytotoxicity was determined using methyl thiazol tetrazolium assay. The apoptotic activity of EO was analyzed using annexin V-fluorescein isothiocyanate/propidium iodide binding flow cytometry. The cell morphology was inspected under an inverted microscope. DAPI staining assay was used for the morphological observation. Activation of caspases-3/7, -8, and-9 was assessed using a caspase assay kit. Results: *Ruta chalepensis* essential oil significantly inhibited the proliferation of MCF-7 cells at 72 h. Moreover, the results showed that cell death is associated with the apoptotic process, and the number of apoptotic cells was significantly increased in the groups treated with EO than in control cells. The main morphological hallmarks of apoptosis in the nucleus were membrane blebbing, chromatin condensation, and nuclear fragmentation. Also, *R. chalepensis* EO-induced apoptosis in the MCF-7 cell line was via the extrinsic caspase-8 dependent pathway in a dose and time-dependent manner. Conclusions: *Ruta chalepensis* essential oil demonstrated significant apoptotic activity against experimental breast carcinoma. Therefore, it could be introduced as a suitable candidate for breast cancer therapy after further investigation. © 2022 *Journal of Pharmacy & Pharmacognosy Research*

ABSTRACT: Objectives: This study aimed to explore the experiences and views of domiciliary coronavirus disease (COVID-19) patients towards pharmaceutical care services provided during their infection. Methods: This was a single-centred observational study conducted among home-treated COVID-19 patients (n = 500), who were tested positive for COVID-19 in a medical centre in Lebanon. Key findings: Out of the 500 home-treated COVID-19 patients invited to participate in the study, 279 patients completed the questionnaire. Although the participants had a good view of pharmacists caring for COVID-19 patients (mean view score: 17.79/25), their treatment experiences were unsatisfactory (mean experience score: 1.51/4). Conclusions: COVID-19 patients reported minimal involvement of pharmacists in their treatment. Therefore, in response to the COVID-19 pandemic, healthcare authorities should intervene in restructuring, guiding and reviewing unrealized new pharmaceutical services to COVID-19 outpatients. © 2021 The Author(s) 2021. ABSTRACT: Providing vaccination in community pharmacies could increase the vaccination coverage rate as well as help reducing the workload of the healthcare system. The current study was conducted to evaluate community pharmacists' willingness and barriers to provide vaccination in community pharmacy setting. A validated questionnaire which included eight items to evaluate willingness and eleven items to evaluate the barriers to provide vaccines was distributed online. Binary logistic regression was conducted to explore the factors that are significantly associated with willingness and barriers to provide the vaccine. Among the 201 participating pharmacists, 174 (86.6%) had a high willingness level. Lack of authorization (91.6%), lack of collaboration with other healthcare professionals (85.6%), and lack of space for storage (74.1%) were the most recognized barriers to vaccinate. Pharmacists with BSc degree demonstrated less willingness (OR = 0.18 (0.07-0.46), and increased barriers (OR = 4.86 (1.56-15.17) to provide the vaccine when compared with Pharm D and postgraduate pharmacists $P < .01$. Factors including male gender (OR: 6.10), working in chain pharmacy (OR: 8.98) and rural areas (OR: 4.31), moderate income (OR: 19.34) and less years of experience (OR:0.85) were significantly associated with increased barriers to provide the vaccine ($P < .05$). Despite the high willingness of the community pharmacists to vaccinate, several barriers were present. Enhancing pharmacists' authorization and collaboration with other healthcare professionals and providing space for storage along with providing training courses and workshops should be considered to enhance pharmacist's engagement in vaccination service. © 2022 The Author(s). ABSTRACT: Few studies have comprehensively described Standard Business Reporting (SBR) as a policy-driven initiative based on inline eXtensible Business Reporting Language (iXBRL) aimed at reducing the administrative burden of statutory business reporting. The SBR term is still difficult to understand even by the countries where it has been implemented. The objective of this study is twofold. First, it describes in detail the evolution of the SBR initiatives in the UK. Second, it investigates the drivers and inhibitors of the take-up of the SBR initiative by small businesses based on the technology, organization, and environment (TOE) framework. It draws on contextual data and 23 interviews with participants involved in the development of these initiatives. The findings show that the following are perceived as drivers of the take-up of the SBR initiatives by small private companies: the relative advantages of using WebFiling, commercial filing software, and the digital services, the organizational accountant's readiness, and the influence of commercial filing software. However, we find no evidence that the relative advantage of using the joint-filing facility via iXBRL was perceived as a driver of the take-up of this innovation. The findings indicate that the absence of critical mass among government agencies inhibits its diffusion. This study provides specific implications to small businesses, the accountants working in small businesses and practice, government agencies in the UK, and other jurisdictions embarking on the SBR initiatives for further developments to reduce the reporting burden on smaller entities. © 2022, Universidad de Huelva. ABSTRACT: Objectives: The study aims were to evaluate the emotional well-being of nursing students in Jordan by measuring student levels of anxiety, depression, behavioural control, positive affect, and general distress, and to identify predictors of emotional well-being in nursing students. Background: Owing to a unique number of stressors, nursing students have been shown to experience high levels of stress. This stress may impact their learning, physical health, and mental health, as well as lead to burnout and potentially self-harmful behaviours. Identifying the predictors of psychological distress among nursing students is therefore critical. Method: A descriptive cross-sectional survey design was utilised. The Mental Health Inventory (MHI-38) was administered to a convenience sample of nursing students (n = 230) from a university in Jordan. Multiple regression analysis was performed to determine predictors of psychological distress and well-being. In presenting this research, the STROBE checklist was followed. Results: Nursing students had higher levels of psychological distress and moderate levels of emotional well-being. Nursing students scored high on general positive affect; however scores on domains related to the loss of behavioural/emotional control and anxiety were also high. Discussion: A significant proportion of nursing students within this study were experiencing psychological distress. Implications for practice: This study may be the first to evaluate the emotional well-being among nursing students in Jordan. Research evidence can inform decision makers in that they devise strategies and interventions that aim to build students' coping skills and promote emotional well-being. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: IEEE802.11, known as WiFi has proliferated in the last decade. It can be found in smartphones, laptops, smart TVs and surveillance cameras. This popularity has revealed many issues in health, data privacy and security. In this work, a WiFi measurement study has been conducted in Amman, the capital city of Jordan. An Android App has been written to harvest WiFi information of the transmitted frames of any surrounding Access points (APs). More than 240,000 APs information has been harvested in this work. The harvested data have been analyzed to find statistics of WiFi devices in this city. Moreover, three power distribution models have been derived from the data for three different areas, closed, open and hybrid areas. In addition, the collected data revealed that the SSID can be leveraged as a landmark for the access points (APs). To this end, SSIDtrack algorithm is proposed to track shoppers/walkers in closed areas, such as malls to find their walking route utilizing only the SSID information collected from the surrounding area. The algorithm has been tested in two different malls that consist of four different floors. The accuracy recorded for the algorithm acceded 95%. © 2022 Tech Science Press. All rights reserved.

ABSTRACT: Nanofibers have many promising biomedical applications. They can be used for designing transdermal and dermal drug delivery systems. This project aimed to prepare and characterize polyvinylpyrrolidone-based nanofibers as a dermal and transdermal drug delivery system using pioglitazone. Pioglitazone is an oral antidiabetic drug. In addition, it can act as an inflammatory process modulator, making it a good candidate for managing different skin inflammatory conditions such as atopic dermatitis, skin ulcers, and diabetic foot wound healing. Several nanofiber formulations were prepared using the electrospinning method at different drug loadings, polyvinylpyrrolidone concentrations, and flow rates. A cast film with the exact composition of selected nanofiber formulations was prepared as a control. Nanofibers were characterized using a

scanning electron microscope to calculate the diameter. Fourier-transform infrared spectroscopy, differential scanning calorimetry, thermogravimetric analysis, and powder X-ray diffraction were performed for physical and biochemical characterizations. In vitro release, drug loading efficiency, and swelling studies were performed. Ex vivo permeation studies were performed using Franz diffusion cells with or without applying a solid microneedle roller. Round uniform nanofibers with a smooth surface were obtained. The diameter of nanofibers was affected by the drug loading and polymer concentration. Fourier-transform infrared spectra showed a potential physical interaction between the drug and the polymer. According to X-ray diffraction, pioglitazone existed in an amorphous form in prepared nanofibers, with partial crystallinity in the casted film. Nanofibers showed a higher swelling rate compared to the casted film. The drug dissolution rate for nanofibers was 2.3-folds higher than the casted films. The polymer concentration affected the drug dissolution rate for nanofibers; however, drug loading and flow rate did not affect the drug dissolution rate for nanofibers. The application of solid microneedles slightly enhances the total amount of drug permeation. However, it did not affect the flux of the drug through the separated epidermis layer for pioglitazone. The drug permeation flux in nanofibers was approximately five times higher than the flux of the casted film. It was observed that pioglitazone is highly retained in skin layers. ABSTRACT: A genetic algorithm (GA) contains a number of genetic operators that can be tweaked to improve the performance of specific implementations. Parent selection, crossover, and mutation are examples of these operators. One of the most important operations in GA is selection. The performance of GA in addressing the single-objective wireless sensor network stability period extension problem using various parent selection methods is evaluated and compared. In this paper, six GA selection operators are used: roulette wheel, linear rank, exponential rank, stochastic universal sampling, tournament, and truncation. According to the simulation results, the truncation selection operator is the most efficient operator in terms of extending the network stability period and improving reliability. The truncation operator outperforms other selection operators, most notably the well-known roulette wheel operator, by increasing the stability period by 25.8% and data throughput by 26.86%. Furthermore, the truncation selection operator outperforms other selection operators in terms of the network residual energy after each protocol round. © 2021 by the authors. ABSTRACT: Vaccines are effective measures that can mitigate the high burden of diseases. However, vaccine refusal poses serious challenges for achieving coverage for population immunity. With the

availability of coronavirus disease-2019 (COVID-19) vaccines, limited information is available about the university students' acceptability and attitudes toward COVID-19 vaccines. This article reports study findings regarding factors that influence university students' decision of acceptability to the COVID-19 vaccine in Jordan. Results highlight the continued need for clear and consistent information about the vaccine by health care decision-makers and university administrations. Copyright © 2022 Wolters Kluwer Health, Inc. ABSTRACT: Monitoring the progress of telemedicine use in Sub-Saharan Africa (SSA) countries has received a considerable attention from many health organizations and governmental agencies. This study reviewed the current progress and challenges in relation to the development of telemedicine programs in SSA. The results from reviewing 66 empirical studies revealed an unbalanced progress across SSA countries. Further, technological, organisational, legal and regulatory, individual, financial, and cultural aspects were identified as the major barriers to the success of telemedicine development in SSA. This study reported the current trends in telemedicine application, as well as highlighting critical barriers for consideration by healthcare decision makers. The outcomes from this study offer a number of recommendations to support wider implementation and sustainable usage of telemedicine in SSA. © 2021, The Author(s).

ABSTRACT: Helicobacter pylori (H. pylori) infection is a global issue. Its eradication in affected individuals is important to prevent several further complications that may occur if left untreated.

Proton pump inhibitors (PPIs) serve an important role in the eradication regimens of H. pylori. PPIs are metabolized primarily through the CYP2C19 enzyme in the liver. Inter-individual variation in the response to eradication treatment may partly be due to variations in the metabolism of PPIs. The aim of this study was to determine whether there was any association between CYP2C19 genetic polymorphisms and the response to eradication therapy amongst Jordanians infected with H. pylori receiving lansoprazole-based regimens. The present study was approved by the Institutional Review Board of The University of Jordan Hospital. A total of 141 patients infected with H. pylori were

genotyped for the polymorphisms CYP2C19*2 and CYP2C19*17 using the PCR-restriction fragment length polymorphism assay method. Patients received lansoprazole-based triple or sequential therapy. The assessment of eradication was performed using either a H. pylori stool antigen test or from feedback from patients regarding their improvement. Eradication rates were 84.6% and 64.5% in the intermediate-metabolizer and extensive-metabolizer group, respectively. This difference was not statistically significant. Moreover, no significant association was found between the carriers of the CYP2C19*17 polymorphism and the response to eradication therapy. These findings suggest that there was no significant association between the CYP2C19 genotype and the response to eradication therapy amongst Jordanians infected with H. pylori. © 2022, Spandidos Publications. Multivariate outlier detection for forest fire data aggregation accuracy

(2022) Intelligent Automation and Soft Computing, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85116293886&doi=10.32604%2fiasc.2022.020461&partnerID=40&md5=bc9effc058a5c4286bd00c30770f1682

AFFILIATIONS: Alzaytoonah University of Jordan, Amman, 11733, Jordan

ABSTRACT: Wireless sensor networks have been a very important means in forest monitoring applications. A clustered sensor network comprises a set of cluster members and one cluster head. The cluster members are normally located close to each other, with overlaps among their sensing coverage within the cluster. The cluster members concurrently detect the same event to send to the Cluster Head node. This is where data aggregation is deployed to remove redundant data at the cost of data accuracy, where some data generated by the sensing process might be an outlier. Thus, it is important to conserve the aggregated data's accuracy by performing an outlier data detection process before data aggregation is implemented. This paper concerns evaluating multivariate outlier detection (MOD) analysis on aggregated accuracy of data generated by a forest fire environment using OMNeT++ and performing the analysis in MATLAB R2018b. The findings of the study showed that the MOD algorithm conserved approximately 59.5% of aggregated data accuracy, compared with an equivalent algorithm, such as the FTDA algorithm, which conserved 54.25% of aggregated data accuracy for the same event. © 2022, Tech Science Press. ABSTRACT: We aimed to explore reasons for delay in seeking healthcare among women with acute coronary syndrome (ACS) for the first time from urban and rural areas in Jordan. A qualitative descriptive design was used through face-to-face interviews with 33 women. Themes that explained why women delayed seeking healthcare when experiencing ACS were: Knowledge deficit about coronary artery disease; the effect of disparity in healthcare services on women decision; and life priorities of women during the ACS attack. Educational needs should be addressed based on variations in both areas. Supplemental data for this article is available online at

Optimizing traffic signals in smart cities based on genetic algorithm

(2022) Computer Systems Science and Engineering, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85114791763&doi=10.32604%2fcSSE.2022.016730&partnerID=40&md5=c097b0d1f17241650fbd96abb7fcc34

AFFILIATIONS: Al-Zaytoonah University of Jordan, Faculty of Science and Information Technology, Amman, 11733, Jordan

ABSTRACT: Current traffic signals in Jordan suffer from severe congestion due to many factors, such as the considerable increase in the number of vehicles and the use of fixed timers, which still control existing traffic signals. This condition affects travel demand on the streets of Jordan. This study aims to improve an intelligent road traffic management system (IRTMS) derived from the human community-based genetic algorithm (HCBGA) to mitigate traffic signal congestion in Amman, Jordan's capital city. The parameters considered for IRTMS are total time and waiting time, and fixed timers are still used for control. By contrast, the enhanced system, called enhanced-IRTMS (E-IRTMS), considers additional important parameters, namely, the speed performance index (SPI), speed reduction index (SRI), road congestion index (Ri), and congestion period, to enhance IRTMS decision. A

significant reduction in congestion period was measured using E-IRTMS, improving by 13% compared with that measured using IRTMS. Meanwhile, the IRTMS result surpasses that of the current traffic signal system by approximately 83%. This finding demonstrates that the E-IRTMS based on HCBGA and with unfixed timers achieves shorter congestion period in terms of SPI, SRI, and Ri compared with IRTMS. © 2022 CRL Publishing. ABSTRACT: The current study identifies the unique role of trait mindfulness in improving the psychological health of patients under hemodialysis. A correlational research design was employed with a sample of 221 patients under hemodialysis. Participants completed a survey about the basic demographics, psychological distress, and mindfulness. The mean age of the study participants was 51.87 years (SD = 14.00). Participants had a moderate level of psychological distress. Psychological distress was associated with various demographic and clinical variables. Mindfulness accounted for 2.6% additional variance above and beyond the 18% accounted by demographic and clinical variables. This study suggests that mindfulness may enhance the psychological health of patients under hemodialysis. Future research may want to develop an intervention that employs a mindfulness-based approach and assess its effectiveness in supporting patients under hemodialysis. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Background: COVID-19 is an infectious disease with a wide range of physical and psychological health threats among health care workers, in particular, nurses because they spend a long time caring for their patients. Aims: To investigate the prevalence and predictors of depression, anxiety, and stress among Jordanian nurses. Methods: This study was conducted among 405 nurses using an online survey from March 3, 2020 to March 24, 2020. The Arabic version of the Depression, Anxiety, and Stress Scale (DASS) was used. Results: the findings of this study showed that depression, anxiety, and stress were highly prevalent among nurses (57.8, 42.4, and 50.1%, respectively). Those who had close contact with a coronavirus disease 2019 (COVID-19) patient showed stronger psychological reactions than their counterparts. The full regression models in terms of depression, anxiety, and stress which contained gender, number of children, and dealing with a person with COVID-19 were statistically significant ($F(3, 216) = 11.801; p < 0.001$), ($F(3, 216) = 10.501; p < 0.001$), and ($F(3, 216) = 11.659; p < 0.001$), respectively. Conclusion: In the COVID-19 pandemic, the levels of depression, anxiety, and stress are high among Jordanian nursing working in clinical settings. Hence, the mental health status of nurses should be given a priority, with a specific emphasis on those who are in contact with infected patients with COVID-19, female nurses, and those who have children. © 2021 Taylor & Francis Group, LLC.

AFFILIATIONS: Department of Civil and Infrastructure Engineering, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Large amounts of waste white cement bypass dust (WCBPD) are generated in huge heaps near

white cement factories in Jordan, posing growing environmental concerns related to potential hazardous impact and additional disposal cost. This research evaluates possible and suitable recycling of WCBPD as a partial replacement of Portland cement in the production of the rapidly expanding roller compacted concrete (RCC). This experimental work aims to test the influence of using different proportions (10, 20, 30, and 40%) of WCBPD on the mechanical performance and durability of RCC subjected to sulphate attack. The investigation included compressive strength, a non-destructive test (ultrasonic pulse velocity), water absorption coefficient, and the sulphate linear expansion test. The experimental results were promising for recycling WCBPD as fractions of Portland cement in RCC mixtures at small amounts. Compared to reference cylinders, the reduction in compression strength was about 10, 28, 32 and 39% for 10, 20, 30 and 40% WCBPD replacement ratios, respectively. All RCC mixtures showed satisfactory sulphate resistance since no significant loss in compressive strength nor a significant increase in expansion ratio occurred due to sulphate exposure. The reductions in compressive strength at 180 days of sulphate exposure were 12.8, 15.6, 15.9, 16.1 and 16.6% for RCC cylinders prepared with WCBPD partial replacements of 0, 10, 20, 30 and 40%, respectively. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Purpose: This study aimed to determine the impact of Coronavirus disease, 2019 (COVID-19) confinement on older Jordanian adults' mental distress and to assess which study variables that predict Posttraumatic Stress disorder. Design and methods: This cross-sectional study was conducted on 315 older Jordanian adults using an online survey in Amman, Jordan between May 28 and June 12. Findings: The assessment revealed a moderate level of avoidance ($M = 1.97$, $SD = 0.7$), a higher effect of intrusion ($M = 2.08$, $SD = 0.9$), an above midpoint level of fear 18.50 ± 8.6 , and mild depression ($M = 6.96$, $SD = 7.3$). Hierarchical Multiple Regression model revealed that 77.8% of the Impact of Event Scale-Revised was explained by both Fear of COVID-19 Scale and Patient Health Questionnaire-9 (R change = 0.66, $SE = 8.4$, $p < 0.001$). Practice implication: This suggests that confinement affects different aspects of the psychological well-being of older Jordanian adults. An early assessment and intervention can make confinement as tolerable as possible. © 2021 Wiley Periodicals LLC

ABSTRACT: Social media addiction became a serious concern that has received more attention from the public health sector due to its addictive features and its correlated psychological consequences. Thus, this study aimed to analyze the direct effect of SMA on academic performance, and the indirect effects on psychological reactions among university students in Jordan. A random survey in two universities was conducted in a sample of 510 university students; 31.4% were males and 68.6% were females. Their average age was 21.38 years ($SD = 2.12$). To test and validate the research model, advanced data analysis (Structural Equation Modelling-Partial Least Squares [SEM-PLS]) was applied in this research. Findings revealed that social media addiction had an indirect effect on academic performance, however; it has a direct impact on students' stress and anxiety levels. The stress could influence anxiety levels, which could directly affect students' academic performance. Further, students' stress levels had a direct effect on anxiety, which could result in depression. Given the importance of social media addiction and its potentially substantive effects on students'

psychological reactions and impact of these reactions on academic performance, similar studies are recommended in other universities various fields to obtain a more conclusive result. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Photo-aging is caused mainly by sun radiations, which consist mainly of the ultraviolet radiation (UVA and UVB). Ascorbic acid (AA) has been widely used in the cosmetic field as an anti-wrinkle, anti-pigmentary, and antioxidant agents, however, its cosmetic application is limited due to its poor penetration across the skin, rapid oxidation, and instability of the formulation. The objective of the present study was to utilize a nanoemulsion as a nanocarrier strategy to deliver AA dermally and stabilize it. A concentration of 80 mg/mL AA was loaded into oil-in-water (O/W) nanoemulsion and characterized in terms of droplet size, zeta potential, thermodynamic stability, and morphology. Patches were then prepared using hydroxypropyl methylcellulose (HPMC) and sodium carboxymethyl cellulose (NaCMC), AA nanoemulsion, and plasticizers (PEG 400 in Formulation 1, F1, and isopropanol in Formulation 2, F2) and evaluated in terms of stability, in vitro release, and ex vivo permeation study. The mean droplet size of the AA nanoemulsion was 14.4 ± 1.9 nm, zeta potential was close to zero. The AA nanoemulsion was physically stable showing no phase separation or turbidity after centrifugation and heating/cooling tests. The cumulative amount per area of AA permeated across Strat-M® membrane was 602.2 ± 57.9 µg/cm². The ex vivo permeation profile showed a controlled-release profile of AA within 24 h, achieving a maximum amount of 414 µg permeated across the stratum corneum. The release fitted the Higuchi model with a correlation coefficient of 0.995. Nanoemulsion-based patches could serve a potential system for the dermal delivery of unstable hydrophilic compound. © 2021 Taylor & Francis Group, LLC.

ABSTRACT: Atorvastatin (ATR) is frequently prescribed to lower plasma cholesterol levels. However, features such as marginal aqueous solubility, high protein binding (>95%), and low bioavailability (12–14%) have opposed its oral use. Therefore, unidirectional controlled-release mucoadhesive patches of ATR, using Carbopol® (CP) as a mucoadhesive polymer, Soluplus® (SL) as a novel water-solubilizer carrier, and ethylene/vinyl acetate as a backing layer, were proposed as a potential strategy for buccal delivery. Various ratios of CP to SL were employed to prepare eight patches. Physicochemical properties, viscosity, mucoadhesion, and drug permeation were investigated. Patch A1 (3:1, CP:SL) emerged as the most promising system, with appropriate flexibility and uniform thickness, weight, and drug content. Additionally, the appropriate surface pH, positive mucoadhesion properties, and swelling level were observed. Flow curves of the polymer mixtures were fitted perfectly to the Carreau-Yasuda and Casson models. The amount of drug diffused, and flux were 51.57% and 0.82 mg/cm²/h, respectively, with a four-fold increase in permeability across the cellulose membrane ($P = 1.80$ cm/h) when compared with the reference patch composed of 0% SL. It can be postulated that micellar structures of SL were able to solubilize the poorly soluble ATR and control its release across the uncoiled buccoadhesive CP network. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: Shift-work can alter the nurses' lifestyle behaviors, which negatively influence health.

This study is purposed to assess the relationship between shift-work and selected lifestyle behaviors including, dietary habits, physical activity, and nicotine dependence among Jordanian nurses who work at the emergency department. A cross-sectional, descriptive correlational design was used. A total of 275 Jordanian nurses from the emergency department of Jordanian hospitals participated in the questionnaire. The results showed that 50.2% of the nurses suffered from poor dietary habits, 81.8% of them were physically inactive, and 65.1% had nicotine dependence. There was a positive correlation between shift-work, dietary habits, physical activity, and nicotine dependence. Therefore, the effects of shift-work should be considered when planning and developing interventional programs to enhance nurses' health and promote healthy behaviors among nurses workforce during shift-work. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: Several disorders have been linked to the onset and progression of oxidative stress. An oxidative imbalance in the cell sets in motion a chain of events that leads to cell death.

Antioxidant therapy has been identified as a potential palliative treatment, with benefits including slowed disease progression, reduced cell disintegration, and improved cellular activities. An organosulfur molecule called Alphasulfolipoic acid (ALA) is a well-known antioxidant that has been examined in a range of disease models. It's expected to be a potent micronutrient with a diverse set of pharmacological actions. It improves energy metabolism by optimizing the use of glucose and fatty acids. ALA also aids in the reduction of oxidative stress and the counteraction of inflammatory stimuli. A review of the literature was conducted using peer-reviewed journal articles to identify laboratory, animal, and clinical studies that have studied the most recent and advanced innovations regarding the possible pharmacological uses of ALA in the suppression of various pathological biomarkers. © 2021, SILAE (Italo-Latin American Society of Ethnomedicine). ABSTRACT: Background: In Iraq, the majority of atrial fibrillation (AF) patients are managed by primary care physicians (PCPs). Therefore, this is a cross-sectional study that aimed to evaluate the PCPs' knowledge, attitudes, and practices (KAP) toward the use of oral anticoagulants (OAC) in patients with AF and to identify the barriers to OAC prescription. Methods: A self-administered online questionnaire was completed by 150 PCPs. KAP scores were categorized as poor, fair, and good. Stepwise binary logistic regressions were conducted to predict the variables significantly associated with KAP. Results: 63.3% of the PCPs had poor knowledge and none had a good knowledge score. On the other hand, 78% of the PCPs had good attitude score. Having more than 5 years of experience increased the odds of having high KAP. Similarly, attending a training about OAC in AF patients increased the odds of having better knowledge and practice. Conclusions: Iraqi PCPs had poor knowledge, but satisfactory attitudes toward the use of OAC in AF patients. The majority were willing to attend training about AF disease and anticoagulation therapy. Such trainings will significantly increase the PCPs' knowledge about OAC which would improve AF patient management. © 2021, SILAE (Italo-Latin American Society of Ethnomedicine). ABSTRACT: Natural products are commonly used in cosmetics to maintain healthy skin and improve visible signs of aging due to great confidence that they are harmless. Nowadays, the therapeutic benefit of skin bioactive components has been well identified, and some of them have been established as drugs that target different kinds of skin diseases. A review of the literature was conducted using peer-reviewed journal articles to identify laboratory, animal, and clinical studies that have studied the most recent and advanced innovations in the bioactive properties and skin applications of the

different dermatological active natural ingredients that could be implemented in the development of various skin active products that could invade the photoaged skin. The provided data in this article aims to get the picture of the most recent investigations, and it might be helpful for dermatologists and other experts in cosmeceutical manufacturing companies. Despite the several advances in this field, additional development would enable scientists to develop new skin-active antiaging products. © 2021, SILAE (Italo-Latin American Society of Ethnomedicine). ABSTRACT: Curcumin (CUR) is a bioactive natural compound with potent antioxidant and anticancer properties. However, its poor water solubility has been a major limitation against its widespread clinical use. The aim of this study was to develop a nanoscale formulation for CUR to improve its solubility and potentially enhance its bioactivity, by leveraging the self-assembly behavior of tannic acid (TA) and amphiphilic poloxamers to form CUR-entrapped nanoassemblies. To optimize drug loading, formulation variables included the CUR: TA ratio and the type of amphiphilic polymer (Pluronic® F-127 or Pluronic® P-123). The optimal CUR nanoparticles (NPs) were around 200 nm in size with a high degree of monodispersity and 56% entrapment efficiency. Infrared spectroscopy confirmed the presence of intermolecular interactions between CUR and the NP formulation components. X-ray diffraction revealed that CUR was entrapped in the NPs in an amorphous state. The NPs maintained excellent colloidal stability under various conditions. In vitro release of CUR from the NPs showed a biphasic controlled release pattern up to 72 h. Antioxidant and antiproliferative assays against a panel of human cancer cell lines revealed significantly higher activity for CUR NPs compared to free CUR, particularly in MCF-7 and MDA-MB-231 breast cancer cells. This was attributed to greater cellular uptake of the NPs compared to the free drug as verified by confocal microscopy imaging and flow cytometry measurements. Our findings present a highly promising NP delivery platform for CUR prepared via a simple self-assembly process with the ability to potentiate its bioactivity in cancer and other diseases where oxidative stress is implicated. © 2021 Elsevier B.V.

ABSTRACT: Glucose oxidase (GOx) is an enzyme with important industrial and biochemical applications, particularly in glucose detection. Here we leveraged the oxidative self-polymerization phenomenon of simple polyphenols (pyrogallol or catechol) in the presence of polyethylenimine (PEI) to form adhesive coatings that enabled GOx immobilization on conventional multi-well plates. Immobilization was verified and optimized by directly measuring GOx activity inside the coated wells. Our results showed that incorporating PEI in polyphenol coatings enhanced their enzyme immobilization efficiency, with pyrogallol (PG)-based coatings displaying the greatest enzyme activity. The immobilized enzyme maintained similar affinity to glucose compared to the free enzyme. GOx-immobilized PG/PEI-coated wells exhibited intermediate recycling ability but excellent resistance to urea as a denaturing agent compared to the free enzyme. GOx-immobilized 96-well plates allowed the construction of a linear glucose calibration curve upon adding glucose standards, with a detection limit of 0.4-112.6 mg dL⁻¹, which was comparable to commercially available enzymatic glucose assay kits. The assay platform was also capable of effectively detecting glucose in rat plasma samples. Our findings present a simple enzyme immobilization technique that can be used to construct a glucose assay platform in a convenient multi-well format for high-throughput glucose quantification. © The Royal Society of Chemistry 2021.

ABSTRACT: Due to the COVID-19 pandemic, most universities around the world started to employ distance-learning tools. To cope with these emergency conditions, some universities in Jordan have developed "mobile learning platforms" as a new tool for distance teaching and learning for students. This experience in Jordan is still new and needs to be evaluated in order to identify its advantages and challenges. Therefore, this study aims to investigate students' perceptions about mobile learning platforms as well as to identify the crucial factors that influence students' use of mobile learning platforms. An online quantitative survey technique using Twitter was employed to collect the data. A two-staged ANN-SEM modelling technique was adopted to analyze the causal relationships among constructs in the research model. The results of the study indicate that content quality and service quality significantly influenced perceived usefulness of mobile learning platforms. In addition, perceived ease of use and perceived usefulness significantly influenced behavioral intention to use mobile learning platforms. The study findings provide useful suggestions for decision makers, service providers, developers, and designers in the ministry of education as to how to assess and enhance mobile learning platform quality and understanding of multidimensional factors for effectively using mobile learning platforms. © 2021 by the authors.

ABSTRACT: Developing resistance to the currently available antimicrobial agents, particularly anti-Bacterial, is a worrying issue that rises highly worldwide. Communities, health workers, and government officials around the world are joining in, calling for overuse and misuse of antibiotics to stop. The phrase "de-marketing" indicates a strategy that drives to organize the form and the level of the current and future demand; not only that, but rationalizes it by organizations (profit, non-profit organizations as well as governments) specified to discourage and minimize activities of organizations about selling, distribution, using, and advertising... etc. It is to conduct an investigation of the potential impact of demarketing in both controlling and minimizing the antibiotic misuse in Jordan. The essential purpose of the current analysis research is to manifest the contribution of the general demarketing strategy in influencing the attitude of consumers towards rationalization of taking antibiotics through regular medications, which is under the supervision and recommendations of professional doctors. In this article, we focused on those secondary resources derived from the published literature. Besides, we relied on the output of 450 consumers' interactions and responses to our 19 questions distributed as © The Author(s) 2021.

ABSTRACT: Jordan is considered an arid to semi-arid country. Water resources in Jordan comprise of conventional resources (ground water and surface water) and non-conventional resources mainly treated wastewater. In this study, artificial neural network (ANN) models were developed to provide predictions for the quality of treated effluent from Wadi Arab wastewater treatment plant (WWTP)-Phase1. This plant serves South-West of Irbid city. The treated effluent of Wadi Arab WWTP is used for irrigation. Four ANN models were developed to predict effluent quality of Wadi Arab WWTP-Phase1, namely BOD5, COD, SS, NH4-N. A systematic approach was employed to find the most appropriate architecture for each ANN model. The influent flow rate (Q), Temperature, pH, BOD5, COD, SS and NH4-N were the input quality parameters for each ANN model. Sensitivity analysis was conducted to uncover the prediction uncertainty of an ANN model to variations in each input parameter. The analyses showed that all four ANN models were highly sensitive to influent pH, while all were slightly sensitive to influent SS. This study found that ANN models were reasonably robust and they could be used to alert plant staff of future problems such as those indicated in the above scenarios. The results showed that ANN models are beneficial to manage the treatment process in Wadi Arab WWTP, to produce effluent quality within the Jordanian Standards for irrigation, and to protect the ecosystem in the Jordan Valley. © 2021 Elsevier Ltd

ABSTRACT: Background: Propositions simplification is a classic topic in discrete mathematics that is applied in different areas of science such as program development and digital circuits design. Investigating alternative methods would assist in presenting different approaches that can be used to obtain better results. This paper proposes a new method to simplify any logical proposition with two propositional variables without using logical equivalences. Methods: This method is based on constructing a truth table for the given proposition, and applying one of the following two concepts: the sum of Minterms or the product of Maxterms which has not been used previously in discrete mathematics, along with five new rules that are introduced for the first time in this work. Results: The proposed approach was applied to some examples, where its correctness was verified by applying the logical equivalences method. Applying the two methods showed that the logical equivalences method cannot give the simplest form easily; especially if the proposition cannot be simplified, and it cannot assist in determining whether the obtained solution represents the simplest form of this proposition or not. Conclusion: In comparison with the logical equivalences method, the results of all the tested propositions show that our method outperforms the currently used method as it provides the simplest form of logical propositions in fewer steps, and it overcomes the limitations of logical equivalences method. Originality/Value: This paper fulfills an identified need to provide a new method to simplify any logical proposition with two propositional variables. © 2021 Bentham Science Publishers.

ABSTRACT: Bitcoin is a decentralized system that tries to become a solution to the shortcomings of fiat and gold-based currencies. Considering its newness, the adoption level of bitcoin is yet understood. Hence, several variables are proposed in this work in examining user perceptions regarding performance expectancy, effort expectancy, trust, adoption risk, decentralization and social influence interplay, with the context of user's future expectation and behavioral intentions to use bitcoins. Data were gathered from 293 completed questionnaire and analysed using AMOS 18. The outcomes prove the sound predictability of the proposed model regarding user's future expectations and intentions toward bitcoins. All hypotheses were supported, they were significantly affecting the dependent variables. Social influence was found as the highest predictor of behavioral intention to negatively utilize bitcoins. The significant impact of social influence, adoption risk and effort expectancy which affect behavioral intention to use bitcoins the most, are demonstrated in this study. Bitcoins should thus, present an effective, feasible and personalized program which will assist efficient usage among users. Additionally, the impacts of social influence, adoption risk and perceived trust on behavioral intention to utilize new technology were compared, and their direct path was tested together, for the first time in this context. © 2021 Institute of Advanced Engineering and Science. ABSTRACT: Phosphoinositide 3-kinase α (PI3K α) is a propitious target for designing anticancer drugs. A series of new N'-(diphenylmethylene)benzenesulfonylhydrazide was synthesized and characterized using FT-IR, NMR (1H and 13C), HRMS, and elemental analysis. Target compounds exhibited an antiproliferative effect against the human colon carcinoma (HCT-116) cell line. Our cheminformatics analysis indicated that the para-tailored derivatives [p-NO₂ (3) and p-CF₃ (7)] have better ionization potentials based on calculated Moran autocorrelations and ionization potentials. Subsequent in vitro cell proliferation assays validated our cheminformatics results by providing experimental evidence that both derivatives 3 and 7 exhibited improved antiproliferative activities against HCT-116. Hence, our results emphasized the importance of electron-withdrawing groups and hydrogen bond-acceptors in the rational design of small-molecule chemical ligands targeting PI3K α . These results agreed with the induced-fit docking against PI3K α , highlighting the role of p-substituted aromatic rings in guiding the ligand-PI3K α complex formation, by targeting a hydrophobic pocket in the ligand-binding site and forming π -stacking interactions with a nearby tryptophan residue. © 2021 Dima A. Sabbah et al., published by Sciendo 2021.

ABSTRACT: Diabetes mellitus is a chronic illness that needs persistent medical attention and continuous patient self-management to avoid acute complications. Dipeptidyl peptidase-IV (DPP-IV) inhibitors minimize glucagon and blood glucose levels by increasing the incretin levels, glucagon-like peptide (GLP-1) and glucose-dependent insulinotropic poly-peptide (GIP), leading to insulin secretion from pancreatic beta cells. In the present study, nine 1,4-bis(phenylsulfonyl) piperazine derivatives 1a-i were synthesized and identified using 1H NMR, 13C NMR, MS and IR spectroscopies. These compounds were tested in vitro and showed inhibitory activity ranging from 11.2 to 22.6 % at 100 μ mol L⁻¹ concentration. Piperazine sulfonamide derivatives were found to be promising DPP-IV inhibitors, where the presence of electron-withdrawing groups such as Cl (1a-c) improved the activity

of the compounds more than electron-donating groups such as CH₃ (1d-f) at the same position. Additionally, meta-substitution is disfavored (1b, 1e, 1g). Induced-fit docking studies suggested that the targeted compounds 1a-i occupy the binding domain of DPP-IV and form H-bonding with the backbones of R125, E205, E206, F357, K554, W629, Y631, Y662 and R669. © 2021 Reema Abu Khalaf et al., published by Sciendo.

ABSTRACT: This study aims to investigate the direct and mediated associations among ownership structure (OS), cash holdings (CHs) and firm value (FV). It provides empirical evidence from insurance firms listed in Jordan over the period from 2009 to 2018 using panel data analysis method. The findings conclude that ownership concentration positively affects CHs, whilst the board of directors' ownership, organizational ownership and foreign ownership do not. Additionally, the CHs negatively affect FV. At the same time, the board of directors' ownership, organizational ownership and foreign ownership as proxies for OS directly affect FV, and these proxies also have an indirect effect on FV by the mediation of CHs. Finally, this study recommends future research to study more determinants of FV, especially in different countries, such as MENA countries. © 2021 Management Development Institute.

ABSTRACT: The use of oral contraceptive pills (OCPs) as a birth control method is very common worldwide. OCPs have many other labeled non-contraceptive indications, and as a result there is an associated risk of improper use, as with any other medications. This study was designed to assess the unforeseen improper uses of OCPs observed by community pharmacists in Jordan. Method A cross-sectional study design was conducted using a self-administered survey. A convenience sample (n = 380) of Jordanian community pharmacists, were recruited through social media resources. The survey included multiple-choice and open-ended questions. Descriptive statistics and correlation analyses were completed using SPSS. Results More than half of the recruited pharmacists (55.3%) were female, and the mean age of the participants was 32.58 ± 9.94. The majority of the pharmacists (85%) had good knowledge about the non-contraceptive indications of OCPs. About 53% of them confirmed their exposure to cases of the improper use of OCPs. About 67.5% of the pharmacists who confirmed exposure to such cases, reported the topical use of OCPs for the enhancement of hair growth. Around 15% of those pharmacists stated that OCPs were used to give negative results for addictive drug screening tests. In the event that the pharmacists suspected improper use, more than 90% suggested they would refrain from dispensing the pills. Conclusion This study has spotlighted many unforeseen uses of OCPs in Jordan and highlighted the need for restricted national regulations on the monitoring of OCP prescription/selling patterns in Jordan by policymakers. Moreover, there is a need for the establishment of national educational programs for the Jordanian community regarding the safe proper use of OCPs. © 2020 Barakat et al. ABSTRACT: Aim: A significant number of Syrian refugees are studying in Jordan's private universities. Syrian refugees are prone to many health problems, of which stress is one of the most common. Therefore, we aimed to compare the perceived stress between Syrian refugees and Jordanian university students. Subjects and methods: A cross-sectional comparative design was used. The study was conducted among four universities that were chosen by a stratified random sampling method according to each university's geographical area. A total of 1180 students participated in the study and completed questionnaires, including the Perceived Stress Scale 10-item questionnaire (PSS-10). Results: The PSS-10 revealed moderate levels of overall stress among university students. The mean level of the PSS-10 of Syrian refugees was significantly higher than for Jordanians. We also found significant differences between Syrian refugees and Jordanians in terms of their demographic characteristics, such as age. Conclusion: Syrian refugees who are studying in Jordan's universities should have access to healthcare facilities and should engage in more programmes to help them control and deal with their stress. © 2020, Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: In Tess of the d'Urbervilles Hardy's non-conformist views are evident through the dialectic of negation which opposes institutionalized codes, and rejects the stereotypical Victorian concepts of femininity. He hovers over Tess like a stricken father, and presents her as an innocent victim, yet he has not been able to save her from her pre-destined death. His endeavours to create a Utopian society and change the cultural logos in regards to sex and gender, have been hampered by various forms of repression from editors, reviews, publishers and supporters of "the purity movement". In his attempt to avoid the trauma of rejection, he made substantial expurgations and revisions of the original text, but the tragic death at the end of the book shows that the prevailing ideology, and excessive prudishness of supporters of the league of virtue have outweighed his perceptions and defeated his liberal concepts." His frustration, bitter experience, and the unpleasant attacks waged on him and his works, were apparently influential in making him cease writing novels. © 2021 ACADEMY PUBLICATION.

Bank Capital Adequacy: The Impact Of Fundamental And Regulatory Factors In A Developing Country

(2021) Journal of Applied Business Research, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135018132&partnerID=40&md5=8651800b6956867fe965a51f3337735d)

ABSTRACT: This paper provides evidence that the overcapitalized banks are much more sensitive to fundamental factors rather than to the regulatory requirements such the Basle's Accord requirements, which raises the question of whether Basel's limits are sufficient to minimize financial crises. Also, keeping buffers against falling below the minimum requirements appear to be of second order importance. Three fundamental factors affect capital adequacy in Jordan; risk, return and activity. Risk indicators drive the capital adequacy ratios downward. Return on average assets (ROAA) has the biggest impact among all factors, banks fuel their capital internally following the pecking order theory, and they also raise capital whenever their activities (loan to asset ratio) improve. Return on average equity (ROAE) is a cost factor; banks avoid issuing capital whenever cost of common equity is high. This paper also provides evidence that systematically important banks hold less capital, a sign of moral hazard. © by the authors.

ABSTRACT: Kelulut honey (KH) is produced by the stingless bees from *Trigona* species and has strong antibacterial activity and is useful medically and therapeutically. The purpose of this study was to investigate the antibacterial and antibiofilm activities of KH against *Pseudomonas aeruginosa* and *Streptococcus pyogenes*. Biofilms were cultivated in microtiter plates with and without a range of concentrations of KH, and effects on biofilm were monitored by optical density (at 570 nm), biomass (by staining with crystal violet), metabolic activity (using an esterase assay) and viability (by determining total cell counts). Structural effects on planktonic and established biofilms were examined by scanning electron microscopy (SEM). KH was found to disrupt microcolony formation in both bacteria at sublethal concentration of KH. The lowest concentration of KH found to prevent biofilm formation was 19% (w/v), whereas on average, 35.7% (w/v) of KH was required to inhibit established biofilms. Susceptibility was not differed with length of biofilm establishment between 24 and 72 hours. SEM analysis revealed marked changes in the bacterial cell morphology for both bacteria following treatment with KH. Extensive structural changes and loss of biofilm structure were seen in the sample after exposure to KH using scanning electron microscopy. Using a range of methods to evaluate planktonic and biofilm integrity, the results indicate that KH inhibits both bacteria planktonic and biofilm in vitro. © 2021 Al-kafaween et al.

ABSTRACT: The available surgical and chemotherapeutic treatments of breast cancer are costly and associated with undesired side effects. Therefore, new alternative treatments need to be investigated using medicinal plants that have been the source of active ingredients for many drugs. The aim of this study is to evaluate the in vitro cytotoxicity of ethanol extracts of *Acacia cyanophylla* leaves, *Eucalyptus camaldulensis* leaves and fruits, and *Pistacia atlantica* leaves and petioles against four breast cancer cell lines and one normal skin fibroblast cell line using MTT colorimetric assay. Phytochemical analysis of the plant extracts was conducted using High Pressure Liquid Chromatography (HPLC). *Acacia cyanophylla* leaves extract showed high cytotoxicity against MDA-MB-231 and very low cytotoxicity against the normal cell line. *Eucalyptus camaldulensis* fruits extract showed high cytotoxicity against SKBR3 and ZR-75-1 cell lines, with moderate cytotoxicity against the normal cell line. *Pistacia atlantica* petioles extracts showed moderate cytotoxicity against SKBR3 cell lines and low cytotoxicity against the normal cell line. All plant extracts showed low cytotoxicity against T47D cell line. Unique chemicals were detected in each extract that could explain the difference in cytotoxicity. Chemical composition analysis of the plant extracts revealed that isorhamnetin-3-O-robinobioside and spathulenol are candidate compounds for in vivo study in order to investigate their efficacy and safety as potential drugs to treat breast cancer. In conclusion, *A. cyanophylla*, *E. camaldulensis*, and *P. atlantica* extracts have potential cytotoxic effect against breast cancer cells and could be a potential source of compounds to develop a drug to treat breast cancer. © 2021 Al-Hadid et al.

ABSTRACT: Background: Atorvastatin (ATOR) is widely used for the treatment and prevention of hypercholesterolemia and various diseases, such as cardiovascular complications, with little data about the histopathological and ultrastructural renal alterations that might be induced by this drug.

Objectives: The present study was undertaken to investigate the potential toxicity of therapeutic doses of atorvastatin on the microanatomy and ultrastructure of renal tissues from Wistar albino rats. **Methods:** Adult male Wistar albino rats received an oral daily dose of 5 mg/kg bodyweight for 90 consecutive days. Biopsies from both kidneys of each study rat were taken for histopathological and ultrastructural examination. **Results:** ATOR-treated rats exhibited glomerular, tubular, and interstitial histological alterations, including degeneration, necrosis, hyaline droplets, edema, cortical hemorrhages, mesangial hypercellularity, and blood capillary dilation and congestion. In addition, ATOR exposure increased the activity of glucose-6-phosphate dehydrogenase and alkaline phosphatase with a concurrent reduction in proteins and neutral mucosubstances content of the glomeruli and renal cells. Moreover, ATOR-treated animals demonstrated glomerular ultrastructural alterations, consisting mainly of capillary tuft dilatation, glomerular basement membrane thickening, and mesangial cell proliferation. The renal cells of the proximal tubules demonstrated damaged mitochondria, degenerative cellular changes, endoplasmic reticulum dilatation, lysosomal and autophagosome activation, nuclear alteration, myelin figure formation, and microvilli disorganization. **Conclusion:** The findings of the present work may indicate that ATOR can induce renal histological, histochemical, and ultrastructural alterations that may affect kidney and other vital organ functions. © 2021 Bentham Science Publishers.

ABSTRACT: **AIM** The aims of the study were to identify professional values among third- and fourth-year baccalaureate nursing students at private and public universities in Jordan and to investigate the demographic variables correlating with professional values. **BACKGROUND** Educational curricula reinforce professional values among nursing students. **METHOD** A cross-sectional design was used; the questionnaire included a demographic variable survey and the Nurses Professional Values Scale-3. **RESULTS** The mean score for the overall value scale was moderate (3.5, SD = 0.4, range 1-5). The caring subscale was the highest (3.9); the professionalism and the activism subscales had the same mean (3.3). Male students, studying in private universities and employed in health care, scored higher ($p = .002, .001, \text{ and } .01$, respectively). Study track and age were insignificantly correlated. **CONCLUSION** The development of professional values is associated positively with practice and employment status; clinical experience improved students' sense of professionalism. © Lippincott Williams & Wilkins.

ABSTRACT: **Purpose:** To evaluate the anti-SARS CoV-2 effect of Coenzyme Q 10, Ubiquinol-10, and idebenone, which have beneficial therapeutic applications against diverse virus types, using molecular docking approach. **Methods:** The potential activity of Coenzyme Q10, Ubiquinol-10, and Idebenone against viral infections was explored through the collection of data from relevant literature, and by modelling these compounds virtually, using in silico investigation methods. **Results:** Coenzyme Q10 and ubiquinol-10 showed significant docking performance. They interacted with numerous amino acid residues of the main protease of SARS-CoV-2 ACE2 (7C8J), Alpha thrombin (1AE8), TYRO (4TS1) protein targets sides, SARS-coronavirus Orf7a accessory protein (1XAK), TNF (1RJ8), and Cytokine/receptor (1I1R). **Conclusion:** The findings of our study showed promising inhibitory activities of the selected compounds against the main proteases of SARS-CoV-2. Consequently, these compounds have theoretical effects on inhibiting the viral entry, reproduction, and ultimately the

prevention and/or treatment of the SARSCoV2 infection. © 2021 The authors.

Department of Mechanical Engineering, School of Engineering, The University of Jordan, Amman, 11942, Jordan

ABSTRACT: The COVID-19 pandemic has forced almost all universities in the world to switch from face-to-face to an online teaching format. In response to this sudden transition, the Mechanical Engineering department at the Al-Zaytoonah University in Jordan had to adapt to this change within two weeks in mid-March 2020. In addition, the department had to comply with the strict ABET accreditation regulations, among which is the indirect assessment of each course by the students each semester. They judge to what degree ABET-mandated student learning outcomes (SO) are actually met in any course designated to deliver the outcomes. Another ABET accreditation regulation is direct assessment, which is conducted by the instructor and relies on an instructor's own evaluation of tasks designated for certain student learning outcomes. The aim of this study is to determine if, during the COVID-19 pandemic, students' assessments changed significantly, in accordance with the ABET mandate, by using statistical analyses of students' responses on an online completed survey. An independent samples t-test was used to evaluate the statistical importance of the observed differences. The SO coverage rates were quite high during the pandemic, although, generally, somewhat lower than their pre-pandemic equivalents. In this study, the Air Conditioning and Heating (ACH) course was selected to compare direct and indirect student learning outcomes before and after the COVID-19 pandemic. Consequently, our findings revealed a positive effect on SO performance during the COVID-19 pandemic and due to e-learning teaching. © 2021 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Sustainable campuses have a substantial role to play in achieving the Sustainable Development Goals (SDGs). Worldwide, there are many rating schemes to assess universities' sustainability; UI GreenMetric is one of the most common global rating schemes aimed at encouraging green campuses and university sustainability worldwide. However, none of the existing rating schemes quantitatively measure the contributions of the implementation of its assessment indicators to achieve SDGs. There is a shortage of information on how sustainable campuses contribute to achieving SDGs. Thus, this research aimed to develop a novel index to assess and manage the contributions of sustainable campuses certified by UI GreenMetric to achieve SDGs. This article proposes novel indices, the GreenMetric Indicator Contribution Index (GMICI) and the GreenMetric Sustainable Campus

Index (GMSCI), to evaluate the contributions of implementing UI GreenMetric indicators for achieving the SDGs. By implementing questionnaire surveys, we collected the relevant data. Structured questionnaire surveys yielded 35 responses from experts. The contributions of UI GreenMetric indicators to achieving SDGs were evaluated using the Relative Importance Index (RII). The results indicated an important relationship between the GreenMetric indicator and SDGs 3, 4, 6, 7, 8, 9, 11, 12, 13 and 15. This research concludes that the proposed GMICI and GMSCI are a rigorous means for evaluating the contribution of UI GreenMetric indicators to UN-SDGs' achievement. © 2021 by the authors. College of Computer Sciences and Information Technology, King Faisal University, Al-Ahsa, 31982, Saudi Arabia

ABSTRACT: Recently, the emergence of the Covid-19 has caused a high acceleration towards the use of mobile learning applications in learning and education. Investigation of the adoption of mobile learning still needs more research. Therefore, this study seeks to understand the influencing factors of mobile learning adoption in higher education by employing the Information System Success Model (ISS). The proposed model is evaluated through an SEM approach. Subsequently, the findings show that the proposed research model of this study could explain 63.9% of the variance in the actual use of mobile learning systems, which offers important insight for understanding the impact of educational, environmental, and quality factors on mobile learning system actual use. The findings also indicate that institutional policy, change management, and top management support have positive effects on the actual use of mobile learning systems, mediated by quality factors. Furthermore, the results indicate that factors of functionality, design quality, and usability have positive effects on the actual use of mobile learning systems, mediated by student satisfaction. The findings of this study provide practical suggestions, for designers, developers, and decision makers in universities, on how to enhance the use of mobile learning applications and thus derive greater benefits from mobile learning systems. © 2021 by the authors. Department of Pharmacy, School of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan;

Department of Pharmaceutics and Pharmaceutical Technology, School of Pharmacy, The University of Jordan, Amman, Jordan

ABSTRACT: Background: The lack of definitive cure for COVID-19 and the late introduction of a vaccine were responsible to push the general public to look for a remedy to treat or prevent COVID-19. The objective of this study was to evaluate patterns and factors that affect self-medication practices in Jordan during the pandemic. Methods: This was a cross-sectional study using an online questionnaire that was developed, piloted and distributed to the general public via various social media platforms. The questionnaire assessed the type of drugs and treatments used to self-medicate, the reasons behind their self-medication, and the factors affecting their practices. Results: A total of 1179 participants (females 46.4%) with a mean age of 32 (SD = 12.5) completed the questionnaire. The overall prevalence of the use of at least one product to treat or prevent COVID-19 was 80.4%. The most commonly used products to self-medicate were vitamin C (57.6%), followed by paracetamol (51.9%), zinc (44.8%) and vitamin D (32.5%). Female gender (odds ratio [OR] = 1.603, working in the medical field (OR = 1.697), and history of COVID-19 infection (OR = 2.026) were variables associated with self-medication. The most common sources of participants' information about drugs to prevent or treat COVID-19 were newspapers (n = 519, 44.0%), followed by pharmacists (43.4%), friends (33.8%) and internet searching such as Google (30.7%). Conclusion: This study identified the main drugs and supplements used during COVID-19 and the motives behind their use. It also identified the most influential source of information on the public during the pandemic. Self-medication can lead to worsening of the patient's health and delay seeking medical advice from healthcare professionals. Efforts should be done to help mitigate risks of self-medications by active involvement of

pharmacists and other members of healthcare team to refute false claims about drug, especially in the media. © 2021 John Wiley & Sons Ltd

ABSTRACT: Background: Metastasis and drug resistance remain a persistent key clinical obstacle to the success of breast cancer treatments. Recent years have seen an increased focus on understanding the factors that influence metastasis and drug resistance. Methods: In this study, the changes in MMPs gene expression were investigated together with their regulatory pathways—PI3K, MAPK and NFκB pathways—during the process of developing tamoxifen resistance in MCF7 cell line. Gene correlation maps and Kaplan–Meier survival plots among all breast cancer patients and patients treated with tamoxifen were evaluated. Results: MMPs gene expression was found to be up regulated in MCF7 cell line treated with tamoxifen during the development of tamoxifen resistance using two approaches. Up-regulation of gene expression of AKT1 and MAPK1 started in cells treated with 10 μM tamoxifen that was followed with up-regulation of other genes in these pathways and MMPs in cells treated with 35 μM tamoxifen. MMPs and genes from PI3K, MAPK and NFκB pathways showed highly significant increase of expression at 50 μM or when cells were treated sequentially six times with 35 μM. Furthermore, increased genes expression was associated with aggressive pattern, clear morphological changes, higher growth rate, increased migration and adhesion potential and tamoxifen insensitivity. Breast cancer distant metastasis-free survival, and survival among tamoxifen treated patients had high expression levels of MAPK1, AKT1, TIMP2, MMP1, and MMP9 showed poor prognosis. Conclusion: Early changes of MAPK1, AKT1 gene expression upon tamoxifen treatment could possibly be used as an early marker of resistance and future poor prognosis. © 2021, The Japanese Breast Cancer Society.

ABSTRACT: The current paper empirically investigates the effect of environmental stress on economic growth in the Gulf Cooperation Council countries during 1995–2016. A panel cointegration analysis, specifically an autoregressive distributed lag model, is used to achieve the paper's goal. The present work is motivated by the high carbon dioxide emissions per capita and environmental stress in these countries relative to other countries, and it assumes that the income per capita is a function of the natural resource's rents and environmental stress. The findings show that environmental stress enhances economic growth, mainly in the long run. At the same time, the natural resources' rents improve it in the short run and impede it in the long run. These results are significant because they tell that the Gulf Cooperation Council countries' environmental stress did not reach critical levels that produce vast negative influences on the economy, and the resource curse hypothesis is valid in the long run. The current study's policy implication states that economic policymakers should monitor and evaluate future environmental stress outcomes in these countries. There is no guarantee that the positive influence prevails. Therefore, the Gulf Cooperation Council countries should adopt genuine procedures to diversify their economies. Besides, it should continue its initial steps to expand renewable energy resources, i.e., nuclear, wind, and solar. ABSTRACT: This study aims to explore the real-time impact of the COVID-19 pandemic on measured air pollution in the three largest cities of Jordan (Amman, Irbid and Zarqa). It is hypothesized that a sharp decrease in the emitted amounts of particulate matter (PM₁₀), CO, NO₂ and SO₂ during COVID-19 pandemic will be obtained, this corresponds with the reduced traffic due to mandated business closures. To achieve this exploration a paired sample t-test is used to compare the concentration of these four pollutants in the three cities over the period from 15 March to 30 June during the years from 2016 to 2020. It is found that there is a significant difference between the emitted concentrations mean values of CO, PM₁₀, SO₂ and NO₂ during the period of study. This was indicated by the values of p for each species, which was less than 5 % for all these pollutants. The maximum reduction in SO₂ and NO₂ concentration during the lockdown period was in Zarqa. Irbid city witnessed the highest percentage reduction in CO and PM₁₀. Furthermore, the correlation test, independent variable importance of multilayer perceptron and global sensitivity analysis using Sobol analysis showed that metrological data (Humidity, wind speed, average temperature and pressure) have a direct relationship with concentrations of CO, PM₁₀, SO₂ and NO₂ in Amman, Irbid and Zarqa before and after COVID-19 pandemic. © 2021

ABSTRACT: Background: Patient safety culture is an essential factor in the decreasing of medical errors and development of the institutions. This study was conducted to determine to what extent the selected variables, including age, weekly working hours, years of experience, burnout, turnover intention, workload, and job satisfaction, predict perceived patient safety culture among emergency nurses in Jordanian hospitals. Methods: A cross-sectional design with convenience sampling approach was used. A total of 157 emergency nurses from governmental and public hospitals were participated in the study and completed the study's survey: Hospital Survey on Patient Safety Culture (PSC), Copenhagen Burnout Inventory-Student Survey (CBI-SS), NASA Task Load Index (NASA-TLX), Nursing Workplace Satisfaction Questionnaire (NWSQ) and turnover intention scale (TIS). Results: The results showed that there was a negative relationship found between nurses' age and PSC perception ($r = -.166$, $P = .039$), personal burnout and PSC ($r = -.160$, $P = .048$), and there was also a negative relationship between turnover intentions and perceived PSC ($r = -.334$, $P = .000$). The results from the regression model indicated that turnover intentions, reporting patient safety events, and the number of events reported predicted PSC. The results showed that $R^2 = .29$, adjusted $R^2 = .287$, $F(6,141) = 9.45$, $P \leq 0.01$. Conclusion: Our results suggests that nurses' managers may pay attention to decreasing burnout and analyze turnover intention among nurses in order to improve the culture of patient safety. © 2021 FECA

ABSTRACT: We study the existence of Lie group structures on groups of the form $C^k(M, K)$ $C^k(M, K)$, where M is a non-compact smooth manifold with rough boundary and K is a, possibly infinite-dimensional, Lie group. Motivated by introducing this new class of infinite-dimensional Lie groups, we obtain a new version of the fundamental theorem for Lie algebra-valued functions. © 2021 Walter de Gruyter GmbH, Berlin/Boston.

ABSTRACT: Different strategies were followed to control the spread of the COVID-19 disease worldwide. Jordan declared a military-enforced curfew for three months, which successfully controlled the disease spreading. However, the curfew impacted several aspects of students' lives and personalities. This study discusses the impact of the COVID-19 curfew restrictions on university students' mental health, as this area was not fully discussed in previous studies. An online survey was distributed to cover the psychological symptoms and coping strategies of university students. Most of them experienced short temper, anxiety, and sleep problems. Female students expressed more psychological symptoms than males, they managed their stress by sleeping, studying, and worshipping. Whereas male students were working, exercising, and playing video games. A distinct interest was noticed among students of different ages. Young students (18-25 years) expressed unhappiness and distress-like symptoms; they advocated sleeping and playing video games. While elder students (>26 years) had anxiety, sleep problems, and short tempers, they managed their symptoms by studying, exercising, and worshipping. The curfew restrictions have negatively impacted the mental health of female and younger students more than other categories. These research outcomes will help decision-makers to implement healthy coping strategies to be followed during unusual conditions. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

Management accounting systems effectiveness, perceived environmental uncertainty and enterprise risk management: evidence from Jordan

(2021) Journal of Accounting and Organizational Change, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108181799&doi=10.1108%2fJAOC-10-2020-0165&partnerID=40&md5=fca390dacc9d2bd30ef2adafb5ee5e3b>

AFFILIATIONS: Department of Accounting, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Purpose: This study aims to investigate the direct relationship between management accounting systems effectiveness (MASE) and enterprise risk management (ERM). In addition, it aims to investigate the interaction (moderating) effect of each of the four informational characteristics of MASE and each of the three components of perceived environmental uncertainty (PEU) on ERM, using empirical evidence from the developing country's Jordanian market. Design/methodology/approach: The study population includes all Jordanian companies listed on the Amman Stock Exchange at the end of 2019, and the study sample consists of all these companies (complete surveying - census population). This study chooses a quantitative method through a survey design approach using questionnaire as the best method for data collection. Findings: The summation of the relationship and interaction effects (moderation) examined by this study are as follows: three of the four informational characteristics of MASE, namely, a broadness of scope, an aggregation and an integration, have a positive direct relationship with ERM. The characteristic 'timeliness' has non-significant negative relationship with ERM. Additionally, the interaction (moderating) effect of higher levels of two informational characteristics of MASE, namely, a timeliness and an aggregation and higher level of perceived competitor uncertainty, will result in a higher ERM implementation. Research limitations/implications: The results of this study have significant ramifications for numerous companies, administrators and interested parties, as they may allow them to build and sustain effective accounting processes for management. These results support adopting sophisticated management accounting systems (MASs) instead of traditional systems in the companies to help them in improving the information quality and control levels, as well as reducing the risks by implementation of ERM. In addition, to ensure that companies are confronted with the environmental factors they face. The results of the present study will enable administrators to develop a deeper understanding of such management accounting systems. Originality/value: To the best of the knowledge, this is the first study of Jordan to investigate the relationship between MASE and ERM, moderated by PEU. As such, the study raises significant findings, drawing attention to MASs and their role in Jordan. © 2021, Emerald Publishing Limited.

ABSTRACT: Background: Drugs incorporating heterocyclic chemical skeletons possess a plethora of therapeutic activities such as anticancer, antimicrobial, antihypertensive, and antipsychiatric effects. It is becoming routine, nowadays, to use cheminformatics and bioinformatics methods to elucidate the mechanism(s) of action of such drugs. Objective: This study aimed to probe the activity of a recently published series of N1-(anthraquinon-2-yl) amidrazone piperazine derivatives employing computational strategies[1], identify their structural basis of binding to BCR/ABL kinase domain, and explain their anticancer activities in human breast adenocarcinoma (MCF-7) and chronic myelogenous leukemia (K562) cell lines. Methods: We applied an in silico integrative informatics approach integrating molecular descriptors, docking studies, cheminformatics, and network analysis. Results: Our results highlighted the possible involvement of the BCR/ABL and DRD2 pathways in the anticancer activity of the studied compounds, and induced fit docking (IFD) indicated that the BCR/ABL kinase domain is a putative drug target. Additionally, high-scoring docking poses identified a unique network of hydrogen bonding with amino acids Y253, K271, E286, V299, L301, T315, M318, I360, R362, V379, and D3810. Conclusion: Using an integrative informatics approach to characterize our anticancer compounds, we were able to explain the biological differences between synthesized and biologically validated amidrazone piperazine anticancer agents. We were also able to postulate a mechanism of action of this novel group of anticancer agents. © 2021 Bentham Science Publishers.

ABSTRACT: Using e-learning system (moodle) in distance education in time of the Covid-19 has become a reality, and the study was concerned with revealing the degree of faculty members' benefit from the Moodle system, as well as the nature of the challenges they faced, in addition to their vision to develop the use of Moodle system in teaching. The study used the descriptive analysis method, and the results showed that faculty members have benefited from the Moodle system for a high degree, although they indicated that there are significant challenges. The faculty members suggested continuing training on using the Moodle system and updating the version of the system available at the university. Results also showed that there are statistically significant differences in the estimates of the study sample of the reality of employment in favor of female faculty members as well as faculty members with low teaching experience, in the youth group. Accordingly, the study recommends training the teaching staff to use educational platforms and face the challenges facing distance education through these platforms ©2021 Birlesik Dunya Yenilik Arastirma ve Yayincilik Merkezi. ABSTRACT: Myocarditis and pericarditis have been linked recently to COVID-19 vaccines without exploring the underlying mechanisms, or compared to cardiac adverse events post-non-COVID-19 vaccines. We introduce an informatics approach to study post-vaccine adverse events on the systems biology level to aid the prioritization of effective preventive measures and mechanism-based pharmacotherapy by integrating the analysis of adverse event reports from the Vaccine Adverse Event Reporting System (VAERS) with systems biology methods. Our results indicated that post-vaccine

myocarditis and pericarditis were associated most frequently with mRNA COVID-19 vaccines followed by live or live-attenuated non-COVID-19 vaccines such as smallpox and anthrax vaccines. The frequencies of cardiac adverse events were affected by vaccine, vaccine type, vaccine dose, sex, and age of the vaccinated individuals. Systems biology results suggested a central role of interferon-gamma (INF-gamma) in the biological processes leading to cardiac adverse events, by impacting MAPK and JAK-STAT signaling pathways. We suggest that increasing the time interval between vaccine doses minimizes the risks of developing inflammatory adverse reactions. We also propose glucocorticoids as preferred treatments based on system biology evidence. Our informatics workflow provides an invaluable tool to study post-vaccine adverse events on the systems biology level to suggest effective mechanism-based pharmacotherapy and/or suitable preventive measures. © 2021 by the authors. ABSTRACT: Gold nanorods have been implicated in several biomedical applications. Herein, the effect of two surface-modified gold nanorods on the early stages of embryogenesis and angiogenesis was investigated using avian embryos at three days and their chorioallantoic membrane (CAM) at five days of incubation. We found that gold nanorods (GNR) modified with PEGylated phospholipid moiety show a high mortality rate in embryos after four days of exposure compared to GNR modified with PEGylated cholesterol moiety. Meanwhile, our data revealed that surface modified-GNR significantly inhibit the formation of new blood vessels in the treated CAM model after 48 h of exposure. Moreover, we report that surface-modified GNR significantly deregulate the expression of several genes implicated in cell proliferation, invasion, apoptosis, cellular energy metabolism, and angiogenesis. On the other hand, our data point out that GNR treatments can modulate the expression patterns of JNK1/2/3, NF-KB/p38, and MAPK, which could be the main molecular pathways of the nanorods in our experimental models. © 2021 by the authors. ABSTRACT: Monoamine oxidases (MAOs) are oxidative enzymes that catalyze the conversion of bio-genic amines into their corresponding aldehydes and ketones through oxidative deamination. Owing to the crucial role of MAOs in maintaining functional levels of neurotransmitters, the implications of its distorted activity have been associated with numerous neurological diseases. Recently, an unanticipated role of MAOs in tumor progression and metastasis has been reported. The chemical inhibition of MAOs might be a valuable therapeutic approach for cancer treatment. In this review, we reported computational approaches exploited in the design and development of selective MAO inhibitors accompanied by their biological activities. Additionally, we generated a pharmacophore model for MAO-A active inhibitors to identify the structural motifs to invoke an activity. © 2021 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Aldehyde dehydrogenase 1A3 (ALDH1A3) has recently gained attention from researchers in the cancer field. Several studies have reported ALDH1A3 overexpression in different cancer types, which has been found to correlate with poor treatment recovery. Therefore, finding selective inhibitors against ALDH1A3 could result in new treatment options for cancer treatment. In this study, ALDH1A3-selective candidates were designed based on the physiological substrate resemblance, synthesized and investigated for ALDH1A1, ALDH1A3 and ALDH3A1 selectivity and cytotoxicity using ALDH-positive A549 and ALDH-negative H1299 cells. Two compounds (ABMM-15 and ABMM-16), with a benzyloxybenzaldehyde scaffold, were found to be the most potent and selective inhibitors for ALDH1A3, with IC50 values of 0.23 and 1.29 μM , respectively. The results also show no significant cytotoxicity for ABMM-15 and ABMM-16 on either cell line. However, a few other candidates (ABMM-6, ABMM-24, ABMM-32) showed considerable cytotoxicity on H1299 cells, when compared to A549 cells, with IC50 values of 14.0, 13.7 and 13.0 μM , respectively. The computational study supported the experimental results and suggested a good binding for ABMM-15 and ABMM-16 to the ALDH1A3 isoform. From the obtained results, it can be concluded that benzyloxybenzaldehyde might be considered a promising scaffold for further drug discovery aimed at exploiting ALDH1A3 for therapeutic intervention. © 2021 by the authors. ABSTRACT: The aim of this research is to empirically investigate the relationship between conflict management styles (CMSs), organizational agility, and innovation performance. Covariance-based structural equation modeling was used to test Rahim and Bonoma conflict management styles and their relations to organizational agility and innovation performance. A total of 460 questionnaires were collected from the Jordanian telecommunication companies. Findings revealed that integrating style has a significant impact on the organizational agility and innovation performance. Organizational agility mediates the relationship between compromising and integrating conflict styles and innovation performance. The obliging, dominating, and avoiding conflict management styles have an insignificant effect on innovation performance. This research has significantly contributed to the existing literature where prior studies were mainly conducted in the Western context. The conflict management field is still under research in the Middle Eastern business context. Copyright © 2021, IGI Global.

ABSTRACT: This work is a continuance to our previous findings on silica nanoparticles (NPs) modified with diamine polymer, carboxymethyl- β -cyclodextrin (CM- β -CD) and folic acid (FA), respectively. When four different polymer lengths (D230, D400, D2000 and D4000) were analyzed, the release rate of anticancer agents was inversely related to the polymer length while the cell toxicity was directly related to the length. We investigate here the effect of polymer length on the extent of cellular interaction with HeLa cells. The mean particle size, the polydispersity (PD) and the zeta potential of the NPs were measured using dynamic light scattering (DLS), the quantitative analysis of the extent of NPs' interaction was studied using fluorescence microscopy and transmission electron microscopy (TEM) was used to qualitatively visualize them. The particle size increased by increasing the polymer length, the PD values were within the acceptable ranges (0.3-0.5) and the zeta potential was in the range of (-16 to -20 mV). A direct relation was observed between the fluorescence

intensity and the length. All modified NPs were capable of entering the cells, however a greater number of NPs with long polymers was observed compared to short polymers. Thus, the direct relation of polymer length to the cell toxicity is due to the release rate behavior and the enhanced interaction of NPs which possess long polymers. © 2021 The Authors

ABSTRACT: In this research work we present the reaction of the precursor complexes $[\text{Fe}_2(\text{CO})_6\{\mu\text{-(SeCH}_2)_2\text{CMeR}\}]$ (R = H (1) or Me (2)) with monophosphine/phosphane ligands, PPh_3 and P(OMe)_3 , to afford the mono-substituted complexes $[\text{Fe}_2(\text{CO})_5\text{PPh}_3\{\mu\text{-(SeCH}_2)_2\text{CHMe}\}]$ (3), $[\text{Fe}_2(\text{CO})_5\text{PPh}_3\{\mu\text{-(SeCH}_2)_2\text{CMe}_2\}]$ (4), $[\text{Fe}_2(\text{CO})_5\text{P(OMe)}_3\{\mu\text{-(SeCH}_2)_2\text{CHMe}\}]$ (5) and $[\text{Fe}_2(\text{CO})_5\text{P(OMe)}_3\{\mu\text{-(SeCH}_2)_2\text{CMe}_2\}]$ (6). The structures of complexes 3–6 were confirmed by X-ray diffraction analysis. Moreover, we studied the influence of the steric interference of the $\mu\text{-Se-to-Se}$ linker with the nearby ligands (PPh_3 and P(OMe)_3) on the electronic properties, the solid-state structures and the mechanism of the cathodic process of complexes 3–6 compared to that of 1 and 2. In addition, a detailed electrochemical study of complexes 3–6 in the absence and presence of acetic acid AcOH , is also reported. © 2021 Elsevier Ltd

ABSTRACT: Background: Spirometry is a clinically useful test that can be used to assess lung function among children. Different equations had been formulated to determine the spirometric reference values depending on several individual characteristics. However, the widely used equations do not produce perfect suitability for Middle Eastern children. Objectives: This study aims to formulate Middle Eastern-specific equations that may be applicable for other populations in the region. Methods: The spirometric data were collected from Jordanian children between the ages of 6 and 17 years. The collected data were used to formulate customised reference equations for Middle Eastern children using generalised additive models for location, scale and shape. The newly formulated equation results were compared with Global Lung Initiative 2012 (GLI-2012) equations predicted values. Results: Spirometric values for 1576 healthy participants (870 males) were used to formulate the new equations. The assessment of z-scores produced by the present study equations and GLI-2012 indicated that the new equations were more suitable than GLI-2012 for Middle Eastern children. In-depth analysis of the results indicated that the suitability of GLI-2012 equations varied between different age points. Conclusion: This study formulated new spirometric reference equations for Middle Eastern children that can improve the diagnosis and management of different respiratory conditions. © 2021 John Wiley & Sons Ltd

ABSTRACT: By considering the Caputo fractional derivative and Riemann-Liouville integral, in the present work, we are concerned with a nonlinear sequential fractional differential system of Duffing oscillator type. The considered system has neither the commutativity nor the semi group properties, since the sum of the two orders of derivatives, of the left hand side of the problem, are outside the

interval $[0,1]$. With the absence of these two properties, we have to find other arguments to obtain the integral representation of the problem, to be able thereafter to present the other main results. Then, using the contraction mapping principle and Schaefer theorem, two main theorems on the uniqueness and existence of solutions are proved. Finally, some examples are given to illustrate the proposed main results. © 2021

ABSTRACT: Background: Chemotherapy-induced neutropenia is a serious global health concern. It is essential that student nurses who are the future of healthcare are equipped with the right knowledge to care for the unique needs of patients with neutropenia. Objective: The study assesses student nurses' knowledge of neutropenia management and examines the difference in their knowledge with regard to their demographics. Design: A descriptive cross-sectional survey design was used. Settings: Participants for this survey were recruited from four nursing schools from three countries: Jordan, Oman, and Saudi Arabia. Participants: The study sample comprised 230 student nurses representing all three countries. Methods: Online data collection was implemented. A message including the link to the study questionnaire was sent to students through their university portal. Demographic data and the neutropenia knowledge questionnaire were collected. Results: The student nurses showed poor knowledge of neutropenia and its management (mean = 10.1 out of 30). The bridging students ($M = 12.6$, $SD = 9.8$) had significantly higher mean total knowledge scores than the regular students ($M = 9.8$, $SD = 5.5$) ($t = 2.9$, $df = 38.9$, $p = 0.006$). However, students who had received previous education about neutropenia management ($M = 11.6$, $SD = 5.0$) had significantly higher mean knowledge scores than those who had not ($M = 9.5$, $SD = 5.6$) ($t = -2.73$, $df = 134.8$, $p = 0.007$). Conclusions: The study findings underscore the overarching necessity to improve students' knowledge of neutropenia and its management. However, addressing this concern is multifaceted and requires deliberate effort from various agencies. Developing innovative strategies to increase the coverage of oncology nursing in the curriculum, improving faculty expertise, enhancing staff nurses' knowledge and skills, provision of funding, and adoption of oncology-related competencies in the nursing program need to be explored as key solutions. © 2021 Elsevier Ltd

ABSTRACT: Breast cancer is one of the significant causes of death among women diagnosed with cancer worldwide. Even though several chemotherapy combinations are still the primary treatment of breast cancer, unsuccessful treatments, and poor prognostic outcomes are still being reported. DNA methylation and gene expression changes among two breast cancer cell lines representing luminal A (MCF-7) and triple-negative (MDA-MB-231) cancers were determined after sequential combination treatment of doxorubicin and paclitaxel and analyzed using Ingenuity Pathway Analysis. Promoter methylation changes were seen in different treated MCF-7 cells and accompanied by changes in the gene expression of CCNA1 and PTGS2. In MDA-MB-231 cells, the hypomethylation of ESR1 was not accompanied by an increase in its gene expression in any treated cells. The hypomethylation of GSTP1 and MGMT was accompanied by an increase in gene expression levels in the group treated with doxorubicin only. Also, significant downregulation of several genes like MUC1 and MKI67 in MCF-7 cells treated with

doxorubicin showed much lower gene expression (- 37.63, - 10.88 folds) when compared with cells treated with paclitaxel (- 2.47, - 2.05 folds) or the combination treatment (- 18.99, - 2.81 folds), respectively. On the other hand, a synergistic effect on MMP9 gene expression was significantly seen in MDA-MB-231 cells treated with the combination (- 9.99 folds) in comparison with the cells treated with doxorubicin (- 3.62 folds) or paclitaxel (1.75 folds) alone. Chemotherapy combinations do not always augment the molecular changes seen in each drug alone, and these changes could be utilized as treatment response markers. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: This paper presents two levels of enhancing the basic Moth flame optimization (MFO) algorithm. The first step is hybridizing MFO and the local-based algorithm, hill climbing (HC), called MFOHC. The proposed algorithm takes the advantages of HC to speed up the searching, as well as enhancing the learning technique for finding the generation of candidate solutions of basic MFO. The second step is the addition of six popular selection schemes to improve the quality of the selected solution by giving a chance to solve with high fitness value to be chosen and increase the diversity. In both steps of enhancing, thirty benchmark functions and five IEEE CEC 2011 real-world problems are used to evaluate the performance of the proposed versions. In addition, well-known and recent meta-heuristic algorithms are applied to compare with the proposed versions. The experiment results illustrate that the proportional selection scheme with MFOHC, namely (PMFOHC) is outperforming the other proposed versions and algorithms in the literature. © 2020, Springer-Verlag London Ltd., part of Springer Nature.

ABSTRACT: The regression testing is a software-based testing approach executed to verify that changes made to the software do not affect the existing functionality of the product. On account of the constraints of time and cost, it is impractical to re-execute all the test cases for software whenever a change occurs. In order to overcome such a problem in the selection of regression test cases, a prioritization technique should be employed. On the basis of some predefined criterion, the prioritization techniques create an execution schedule for the test cases, so the higher priority test cases can be performed earlier than the lower priority test cases in order to improve the efficiency of the software testing. Many prioritization criteria for regression test cases have been proposed in software testing literature; however, most of such techniques are code-based. Keeping in view this fact, this research work has proposed a prioritization approach for regression test cases generated from software specifications which are based on the criterion of the Average Percentage Transition Coverage (APTC) by using a revised genetic algorithm. This criterion evaluates the rate of transitions coverage by incorporating knowledge about the significance of transitions between activates in the form of weights. APTC has been used as a fitness evaluation function in a genetic algorithm to measure the effectiveness of a test cases sequence. Moreover, in order to improve the coverage percentage, the proposed approach has revised the genetic algorithm by solving the problem of the optimal local solution. The experimental results show that the proposed approach demonstrates a good coverage performance with less execution time as compared to the standard genetic algorithm and some other prioritization techniques. © 2021, Kauno Technologijos Universitetas. Metformin reduces oxandrolone- induced depression-like behavior in rats via modulating the expression of IL-1 β , IL-6, IL-10 and TNF- α

(2021) Behavioural Brain Research, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85111003042&doi=10.1016%2fj.bbr.2021.113475&partnerID=40&md5=8368bfc273b2ee21f50edab09986daae

ABSTRACT: Oxandrolone (OXA) is an androgen and anabolic steroid (AAS) that is used to reverse weight loss associated with some medical conditions. One of the side effects of OXA is its potential to induce depressive symptoms. Growing evidence suggested that neuroinflammation and cytokines play crucial roles in sickness behavioral and associated mood disturbances. Previous studies showed that metformin attenuated neuroinflammation. This study investigated the potential protective role of metformin against OXA-induced depression-like behavior and neuroinflammation. Twenty-four Wistar male rats were randomly grouped into four groups: the control group (Control) received only vehicle; the oxandrolone group (OXA) received oxandrolone (0.28 mg/kg, i.p); the metformin group (MET) received metformin (100 mg/kg, i.p); and the oxandrolone / metformin group (OXA + MET) received both oxandrolone (0.28 mg/kg, i.p) and metformin (100 mg/kg, i.p). These treatments were administered for fourteen consecutive days. Behavioral tests to measure depression-like behavior were conducted before and after treatments. qRT-PCR was used to measure the relative expression of proinflammatory and anti-inflammatory cytokines in the hippocampus and hypothalamus. The results showed that oxandrolone induced depression-like behavior and dysregulated pro-/anti-inflammatory cytokines, while metformin attenuated these effects. These findings suggest that metformin is a potential treatment to reverse the depressive effects induced by oxandrolone that involve neuroinflammatory effects. © 2021 Elsevier B.V.

ABSTRACT: The effect of different Ca-based additives in lignite on the sulfur removal during combustion has been examined using two Polish lignites. After demineralization, the lignite was loaded with Ca using different Ca-based compounds namely: calcium carbonate (CaCO₃), calcium hydroxide Ca(OH)₂ and calcium acetate Ca(CH₃COO)₂. Depending on the calcium compound used, the addition of Ca was by mechanical mixing or impregnation. The experiment was carried out in a laboratory scale drop-tube furnace reactor, under different O₂ concentration and temperature range of 800–1100 °C. The results showed that Ca added to the lignite strongly suppressed the emission of SO₂ under experimental conditions studied. The sulfur capture efficiency appeared to be independent of the calcium compound used and it increased along with the temperature rising up to 1100 °C. This may indicate that poorly dispersed Ca, prepared by mechanical mixing, offers as high efficiency in sulfur removal as Ca in ion-exchangeable form inserted by impregnation. The influence of mineral matter on the retention of SO₂ during combustion was also investigated. It was found that some inorganic species inherently present in lignite, particularly calcium in natural form, reduce SO₂ pollution. © 2021 Elsevier Ltd

ABSTRACT: Purpose: The present research builds upon the social identity theory and Balaji et al.'s (2016) research model to investigate student-university identification. The purpose of this paper is to examine the antecedents of university identification, namely, university brand knowledge, university brand personality and university identity. Furthermore, consequences of university identification, such as advocacy intentions, suggestion for improvements, university affiliation and strength of attachment, are examined. Design/methodology/approach: A quantitative research design was used, collecting data from students in private and government universities in Jordan. Structural equation modeling using SmartPLS 2.0 is employed to test the proposed research hypotheses. Findings: The results revealed that all the antecedents and consequences suggested in the research model have

positive significant relationships with university identification in the Jordanian higher education sector. Originality/value: University identification has been less precisely conceptualized and empirically tested in the higher education context in developing countries. The results improve our understanding of the antecedents and consequences of university identification for students in higher education. In addition, the constructs of university identification and strength of attachment are incorporated in the research conceptual model and have not been tested before. © 2021, Emerald Publishing Limited.

Translation, re-translation, and the reception of Arabic literature in English: The case of Ahlam Mostaghenami's novel Chaos of the senses

(2021) Journal of Educational and Social Research, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114899271&doi=10.36941%2fjesr-2021-0120&partnerID=40&md5=07fecc4cd00a9fdb7089c1248d5dc528>

AFFILIATIONS: Department of English Language and Literature, Al-Zaytoonah University of Jordan, Queen Alia Airport St 594, Amman, Jordan;
Jordan

ABSTRACT: The current study compares the two translations of Ahlam Mostaghenami's second novel Fawda Al-Hawas into English as Chaos of the Senses by (Baria Ahmar Sreih, 2004) and Chaos of the Senses by (Nancy Roberts, 2015) and examines the reception of both translations in the English-speaking communities where they were circulated. The study seeks to find out answers to questions about: the reasons for retranslating Fawda Al-Hawas after a relatively short period of time after its first translation, the roles of human agents such as the author, translators, and publishers in the production and reception of the two translations of Fawda Al-Hawas, how the retranslation tried to avoid previous problems, if any, that hindered the circulation of the first translation, the role of paratexts in the reception of the two translations. The study draws on major concepts from reception theory as adopted by (Brown, 1994) in her study of Latin American novels published in West Germany. Specifically, the current study draws a close comparison of the paratexts associated with the two translations of Mostaghenami's Fawda Al-Hawas as well as the roles of stakeholders. The study concludes that despite the use of more paratextual elements as well as textual improvements in the retranslation, it has not shown better results in terms of reception and circulation. © 2021 Musa Alzghoul and Tahani Alazzam.

Jamil Totanji Hospital, P.O. Box 20, Amman, 11511, Jordan

ABSTRACT: Objective: Methicillin-resistant Staphylococcus aureus (MRSA) represents a big challenge to the health system by causing hospital-acquired infection. It showed variation in epidemiology and anti-bacterial sensitivity with time and place. This study aimed to determine the distribution and rate of MRSA contamination of surfaces and the health care workers (HCWs) hands in the intensive care unit (ICU) and sensitivity pattern to antibiotics. Design: Cross-sectional study Setting: Faculty of Pharmacy, Al-Zaytoonah University and Jamil Totanji hospital Subjects: Samples were taken from 129 surfaces and HCWs hands. Intervention: Samples were taken with cotton swabs streaked on Mannitol Salt Agar, then on blood agar to isolate Staphylococcus aureus. Staphylococcus aureus were stained with gram stain and catalase and coagulase tests were performed. Disk diffusion and E-test were used to determine MRSA and resistance pattern. Polymerase chain reaction was used to confirm the presence of mecA gene. Main outcome measures: Prevalence and distribution of MRSA in ICU environment and HCWs hands and antibacterial susceptibility pattern Results: The prevalence of MRSA was 20% to the total number of samples and 30% of S. aureus samples. MRSA contamination of surfaces was determined. Among the 14 HCWs samples, the rate of MRSA isolates were 28%. No vancomycin-resistant MRSA could be isolated. Resistance to clindamycin and co-trimoxazole were 81% (including inducible resistance) and 29% respectively. All tested MRSA samples were positive for mecA gene. Conclusion: MRSA is prevalent significantly in the ICU and HCWs hands to represent a potential source of hospital-acquired infections in the ICU. © 2021, Kuwait Medical Association. Department of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Objectives: Research is crucial for improving patients' healthcare. Although pharmacists' important role in implementing research has been emphasized by different health organizations, pharmacist's participation in research is still suboptimal. This study aims to evaluate hospital pharmacists and assistant pharmacists' attitudes, barriers and motivators towards clinical research practice and research utilization in practice settings. Methods: This cross-sectional study used an online-validated questionnaire which evaluated socio-demographics, attitudes, barriers and motivators which Jordanian hospital pharmacists and assistant pharmacists have to implement clinical research and extent of its utilization in practice settings. Analysis of Covariance was modelled to evaluate the differences in the factors' scores between different groups. Multiple linear regressions were conducted to assess the effect of the attitudes and motivators scores on the research utility practice score. Key findings: A total of 316 responses were collected. The means for attitudes, motivators, and research utilization scores were 3.84, 3.84 and 3.80, respectively. The most agreed motivator was the role of research in the enhancement of the service to patients (mean = 4.19). The most reported research barriers were lack of time and support (57.6% and 44.3%, respectively). Linear regression analysis showed that attitudes (regression coefficient (b) = 0.34, P < 0.01) and motivators (b = 0.18, P < 0.01) were significant predictors of the extent of research utilization.

Conclusion: Jordanian hospital pharmacists and assistant pharmacists had a positive attitude towards research and they are willing to participate in research but they are confronting several obstacles. © 2021 The Author(s) 2021. What are the factors associated with nonadherence to medications in patients with chronic diseases?

(2021) Healthcare (Switzerland), .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115767497&doi=10.3390%2fhealthcare9091237&partnerID=40&md5=892b4b143b80810c72ba9cc54b35436e)

85115767497&doi=10.3390%2fhealthcare9091237&partnerID=40&md5=892b4b143b80810c72ba9cc54b35436e

ABSTRACT: Introduction: Adherence to medications is very crucial for an optimized clinical outcome in the management of chronic diseases. Beliefs about medications and other factors can significantly affect adherence to chronic medications. The objective of the present research was to identify the associated factors of adherence to medication in Jordanian patients with chronic diseases utilizing a stepwise binary logistical regression model. Methods: A cross-sectional study was carried out between November 2018 and March 2020. The participants were reached from secondary and tertiary care setting clinics in Jordan. The recruited patients were asked to report their attitudes of adherence to medications and beliefs about medications via filling out the MARS-5 and BMQ-specific tools.

Sociodemographic data were also collected from the recruited patients and included in the regression model. A stepwise binary logistical regression model was applied to identify the associated factors of adherence to chronic medications in the tested sample. Results: A total of 485 patients who met the inclusion criteria were recruited. The mean age of the participants was 57.14 (age ranged from 22 to 82 years). Around 39% of the participants were older than 65 years. Most of the patients were either hypertensive or diabetic (35.7% and 32.2%, respectively). The logistic regression model indicated that necessity beliefs are strongly associated with adherence (OR 4.22), while concerns beliefs, dosage frequency and having medical insurance were negatively associated with adherence (OR 0.73, 0.74 and 0.26, respectively), with a p-value ≤ 0.05. Conclusions: Both the MARS-5 and BMQ-specific questionnaires were applied successfully on the tested sample. Better attention should be paid to the logistic regression model variables that were associated with adherence in order to guarantee optimal treatment outcomes in the treatment of chronic diseases. © 2021 by the authors. ABSTRACT: Catheter-associated urinary tract infections (CAUTIs) are nosocomial infections, causing more than one million cases per year. CAUTIs cause serious health issues; in addition, the cost of replacement of the device constrains the employment of urological devices. Therefore, there is an urgent need to develop novel biomaterials for use in catheters. In this study, poly hydroxyethyl-methacrylate p(HEMA) and drugs-loaded p(HEMA) with ampicillin trihydrate (AMP), levofloxacin (LVX), and drug combinations were prepared using free radical polymerization. The characterization of the dried films included the determination of glass transition temperature (T_g), ultimate tensile strength, elongation percentage, and Young's modulus. Formulation toxicity, antimicrobial activity, and biofilm-formation ability were tested. Decreases in T_g value, U.T.S., and Young's modulus, and an increase in elongation percentage were observed in AMP-loaded p(HEMA). Different ratios of drug combinations increased the T_g values. The films exhibited a cell viability higher than 80% on HEK 293 cells. Antimicrobial activity increased when p(HEMA) was loaded with LVX or a combination of LVX and AMP. Biofilm-forming ability reduced after the addition of antimicrobial agents to the films. p(HEMA) impregnated with AMP, LVX, and drug combinations showed significantly increased antimicrobial activity and decreased biofilm-forming ability compared with p(HEMA), in addition to the effects on (HEMA) mechanical properties. © 2021 by the authors. ABSTRACT: Nostalgia and Alienation are defined as the feeling that one has when he finds himself alone without connection with the people around him. He considers himself as a stranger in the society where he lives. This is due to leaving the people and homelands. This is what happened to Arab-American poets, (Emigrant poets) who leave their homelands and people. The current paper presents Arab-American poets' longing, deep love, nostalgia and feeling of homesickness for their beloved countries in East. It also shows their adherence and alienation to their homelands by remembering the years and times they lived there. It emphasizes literary criticism of describing, analyzing and evaluating some of Arab-American poems. © 2021 ACADEMY PUBLICATION.

King Abdulla II School for Information Technology, University of Jordan, Amman, 11942, Jordan

ABSTRACT: Service-oriented architecture (SOA) has emerged as a flexible software design style. SOA focuses on the development, use, and reuse of small, self-contained, independent blocks of code called web services that communicate over the network to perform a certain set of simple tasks. Web services are integrated as composite services to offer complex tasks and to provide the expected services and behavior in addition to fulfilling the clients' requests according to the service-level agreement (SLA). Web service selection and composition problems have been a significant area of research to provide the expected quality of service (QoS) and to meet the clients' expectations. This research paper presents a hybrid web service composition model to solve web service selection and composition problems and to optimize web services' resource utilization using k-means clustering and knapsack algorithms. The proposed model aims to maximize the service compositions' QoS and minimize the number of web services integrated within the service composition using the knapsack algorithm. Additionally, this paper aims to track the service compositions' QoS attributes by evaluating and tracking the web services' QoS using the reward function and, accordingly, use the k-means algorithm to decide to which cluster the web service belongs. The experimental results on a real dataset show the superiority and effectiveness of the proposed algorithm in comparison with the results of the state-action-reward-state-action (SARSA) and multistage forward search (MFS) algorithms. The experimental results show that the proposed model reduces the average time of the web service selection and composition processes to 37.02 s in comparison to 47.03 s for the SARSA algorithm and

42.72 s for the MFS algorithm. Furthermore, the average of web services' resource utilization results increased by 4.68% using the proposed model in comparison to the resource utilization by the SARSA and MFS algorithms. In addition, the experimental results showed that the average number of service compositions using the proposed model improved by 26.04% compared with the SARSA and MFS algorithms. © 2021 by the authors. ABSTRACT: This study evaluates the impact of shifting from traditional learning to online learning during COVID-19 Pandemic on undergraduate students. It also examines the positive and negative aspects of online learning from students' perspectives. We conducted two online surveys to evaluate online learning, students' satisfaction, and identify the positive and negative aspects of online learning. Data is collected in the first survey from 483 participants directly after the emergency shifting to online learning. The second survey data is collected from 853 after students' experienced online learning for three academic semesters. Both surveys' analysis results show that students had several problems with shifting to online learning during COVID-19 Pandemic such as technological, mental health, time management, and balance between life and education. The results also show that more than a third of the surveyed students are dissatisfied with the online learning experience. Further investigation is conducted to explore and identify the factors behind the students' dissatisfaction from the online learning experience during COVID-19 Pandemic in January 2021 using focus group technique. The analysis results reveal that the most important factors behind the students' dissatisfaction during online learning are a distraction and reduced focus, psychological issues, and management issues. This study proposes various solutions and recommendations to enhance the online learning experience and increase students' satisfaction. © 2021 Elsevier Ltd

Department of Pharmaceutical Science, Al-Isra'a University, Amman, Jordan

ABSTRACT: Background: Pharmacogenomics testing aims to optimise therapy and reduce the inter-individual variation in drug response. One of the major barriers against the implementation of pharmacogenomics testing is the low level of knowledge on the topic. Aims: This study aimed to evaluate the need for pharmacogenomics education among pharmacists in the West Bank of Palestine. Methods: This study was cross-sectional and included 370 pharmacists, among different cities in the West Bank of Palestine between October and December 2020. The questionnaire consisted of 25 close-ended questions that evaluated the exposure to pharmacogenomics education, attitude toward the role of pharmacogenomics testing in clinical practice and self-capability of pharmacists in pharmacogenomics testing. Results: It was found that 60% of the respondents disagreed that pharmacogenomics was an integral part of the pharmacy school curriculum and/or experiential education. The vast majority of the respondents (94%) agreed that pharmacists should be required to have some knowledge of pharmacogenomics. The majority of the respondents (88.6%) believe that pharmacogenomics testing will improve pharmacists' ability to more effectively control drug therapy expenditures. However, only 38% of the respondents could identify medications that require pharmacogenomics testing, and only 35.1% could identify reliable sources of information regarding pharmacogenomics for healthcare providers and patients. Conclusion: It is seen from the results of this study that there is a high need to learn about pharmacogenomics testing, which can help the pharmacists make pharmacotherapy decisions. Additionally, current pharmacists have low self-confidence in making decisions depending on the results of pharmacogenomics testing. It is recommended to increase the exposure of pharmacogenomics knowledge by including the subject in

courses and workshops in pharmacy school curricula in the West Bank of Palestine. © 2021 John Wiley & Sons Ltd

ABSTRACT: Social phobia is one of the most common anxiety disorders in youth yet still under-recognized and undertreated. This study purposed to evaluate the level of social phobia and examine correlating selected socio-demographic factors (age, gender, marital status, working status, and educational level) among Syrian refugees' youth in Jordan. A cross-sectional, descriptive correlation design was selected to carry out this study. The convenience sample composed of 290 youth aged 15-25 years were recruited from Amman and Mafraq cities. The data was collected using a questionnaire which consists of socio-demographic data and social phobia scale. The findings found that the participants had a high level of social phobia. There was a correlation between social phobia and age ($r = 0.64$; $p < 0.001$), educational level ($r = -0.23$; $p < 0.001$), and gender ($r = -0.14$; $p < 0.05$). The youth being males, elder youth (>19-25 years), and having low educational level had a higher level of social phobia. Age was the main significant predictor of social phobia. The current findings confirm the necessity of developing social and psychological strategies and interventions to minimize this problem among youth affected by social phobia. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature.

ABSTRACT: Purpose: To explore the psychological problems (stress, depression, and anxiety) and the level of resilience among frontline healthcare workers (HCWs) who provide care for patients with coronavirus disease 2019 (COVID-19). Additionally, the current study identified the correlation among these problems, resilience, and demographics of participants. The study explored the main predictors of stress, depression, anxiety, and resilience. Methods: Both the descriptive cross-sectional correlational design and convenience sample technique were used to collect data from active Jordanian HCWs who directly deal with patients suspected or confirmed to be infected with COVID-19 and work at healthcare facilities in Jordan. Data were collected by using online questionnaires about the demographics, stress, anxiety, depression, and resilience of the participants. Results: Data were collected from 225 HCWs. Their mean age was 31.17 years (SD = 6.8). All the participants perceived different levels of stress, with most perceiving exposure to a high level of stress (distress) (46.2% with low level and 53.8% with high level of stress); approximately half of them (52.9%; $n = 119$) reported a high level of anxiety, and more than half (66.2%; $n = 149$) had a high level of depression. Additionally, an increased anxiety and depression level was significantly associated with the decreased resilience and increased stress level. Increased age and experience of HCWs are significantly correlated with increased stress levels. The participants having personal protection equipment (PPE) reduced anxiety and depression and increased resilience ($p > 0.05$). The predictors of the main variables were varied in the study. Conclusion: Frontline HCWs involved in treating the patients with COVID-19 are liable to have a high level of stress that is associated with increased anxiety and depression levels. These high levels affect their mental well-being and resilience. Healthcare institutions in Jordan must tailor appropriate psychological interventions and support that are congruent with the needs of HCWs during and after caring for patients with COVID-19. © Copyright © 2021 Alhalaiqa, Khalifeh, Al Omari, Yehia and Khalil.

ABSTRACT: This paper is concerned with the structure of quarters in traditional Arab Islamic cities. Previous studies have stressed the idea of an urban structure that corresponds to social groupings, in that it is seen as a collection of neighborhood quarters. This spatial model has often provided the rationale for the design of new housing layouts. The purpose of this study is to examine this issue and to argue that the structure of these cities presents a global whole. To achieve this purpose a general and a specific question are addressed. The general question is about the physically sub-areas within the city, and the specific question is about the issue of social groupings and the kind of relation that space has to society. The proposition thus invokes the idea of a physical structure which appears to correspond to a social pattern. The city of Damascus is used as a model of analysis in which the urban structure is described and characterised. The argument is advanced that the traditional Arab Islamic city has a sub-area structure which is historically generated, but whose morphological combination is fine-tuned and adjusted so that the whole comes to dominate and unify the parts. © 2021 The Author(s).

ABSTRACT: Breast cancer is one of the most prevalent cancers worldwide usually treated with Tamoxifen. Tamoxifen resistance development is the most challenging issue in an initially responsive breast tumor, and mechanisms of resistance are still under investigation. The objective of this study is to develop and validate a selective, sensitive, and simultaneous high performance liquid chromatography-tandem mass spectrometry method to explore the changes in substrates and metabolites in supernatant media of developed Tamoxifen resistance MCF-7 cells. We focus on the determination of lactate, pyruvate, and L-glutamine which enables the tracking of changes in metabolic pathways as a result of the resistance process. Chromatographic separation was achieved within 3.5 min. using a HILIC column (4.6 × 100 mm, 3.5 µm particle size) and mobile phase of 0.05 M acetic acid-ammonium acetate buffer solution pH 3.0: Acetonitrile (40:60 v/v). The linear range was 0.11–2.25, 0.012–0.227, and 0.02–0.20 mM for lactate, pyruvate, and L-glutamine, respectively. Within-and between-run accuracy was in the range 98.94–105.50% with precision (CV, %) of ≤0.86%. The results revealed a significant increase in both lactate and pyruvate production after acquiring the resistant. An increase in L-glutamine levels was also observed and could be attributed to its over production or decline in its consumption. Therefore, further tracking of genes responsible of lactate, pyruvate, and glutamine metabolic pathways should be performed in parallel to provide in-depth explanation of resistance mechanism. © 2021 by the authors. ABSTRACT: *Calamintha incana* (Sm.) Helder (Lamiaceae) is an aromatic herb used in folk medicine in Jordan and neighboring countries. This study aimed to isolate and characterize the chemical composition of essential oils extracted from the aerial parts of *C. incana* and to evaluate the total

phenolic and flavonoid contents, antioxidant activity, and cytotoxic potential. The essential oils from the aerial parts of *C. incana* (CIEO) were extracted by hydrodistillation, and GC/MS were performed for the chemical analysis of the oil. Total phenol and flavonoid contents were assessed using the colorimetric assay. The antioxidant activity of the oil was assessed using 2,2-Diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity and reducing power ability. The cytotoxic activity of CIEO against MCF-7, T47D, Caco-2 cancer cell lines, and normal fibroblast cell line (MRC-5) was investigated by 3-[4, 5-dimethylthiazol-2-yl]-2,5 diphenyl tetrazolium bromide (MTT) assay. The results demonstrated that the main constituents of CIEO were benzenamine-4-methyl-3-nitro-(34.11%), and (2S,4R)-p-mentha-6,8-diene 2-hydroperoxide (31.48%). The phenolic content of CIEO was higher than the flavonoid content. With respect to the DPPH radical scavenging activity, the IC₅₀ was 15.38 mg/mL, while for the reducing power ability the EC₅₀ was 9.79 mg/mL). Moreover, CIEO was cytotoxic against cancerous and non-cancerous cells at 200 µg/mL. In conclusion, the essential oil extract of *C. incana* is characterized by its non-terpenoid aromatic compounds. Phenols were more abundant than flavonoids, and CIEO had a good antioxidant capacity and non-selective cytotoxic activity. Therefore, additional investigations are required to understand the mechanism of the cytotoxicity of this plant. © 2021 Althaher et al.

ABSTRACT: Objective This study aims to assess medication adherence and explore its predictors in outpatients with type 2 diabetes. Method This cross-sectional study collected socio-demographics, disease-related information, and different biomedical variables for type 2 diabetes patients attending a Jordanian Diabetes center. The four-item medication adherence scale (4-IMAS) and the beliefs about medications questionnaire (BMQ) which includes necessity and concerns were used. Stepwise backward quartile regression models were conducted to evaluate variables associated with the Necessity and Concerns scores. Stepwise ordinal regression was conducted to evaluate variables associated with adherence. Results 287 diabetic patients participated in the study. Almost half of the participants (46.5%) reported moderate adherence and 12.2% reported low adherence. Significant predictors of the adherence were necessity score (OR = 14.86, $p < 0.01$), concern score (OR = 0.36, $p < 0.05$), and frequency of medication administration (OR = 0.88, $p < 0.01$). Education was a significant predictor of Necessity and Concerns scores ($\beta = 0.48, -0.2$, respectively). Conclusion Simplifying the medication regimen, emphasizing medication necessity and overcoming medication concerns should be targeted in future diabetes intervention programs to improve medication adherence and hence glycemic control among diabetic patients. © 2021 Al-Qerem et al. ABSTRACT: Magnetic refrigeration is a fascinating superior choice technology as compared with traditional refrigeration that relies on a unique property of particular materials, known as the magnetocaloric effect (MCE). This paper provides a thorough understanding of different magnetic refrigeration technologies using a variety of models to evaluate the coefficient of performance (COP) and specific cooling capacity outputs. Accordingly, magnetic refrigeration models are divided into four categories: rotating, reciprocating, C-shaped magnetic refrigeration, and active magnetic regenerator. The working principles of these models were described, and their outputs were extracted

and compared. Furthermore, the influence of the magnetocaloric effect, the magnetization area, and the thermodynamic processes and cycles on the efficiency of magnetic refrigeration was investigated and discussed to achieve a maximum cooling capacity. The classes of magnetocaloric magnetic materials were summarized from previous studies and their potential magnetic characteristics are emphasized. The essential characteristics of magnetic refrigeration systems are highlighted to determine the significant advantages, difficulties, drawbacks, and feasibility analyses of these systems. Moreover, a cost analysis was provided in order to judge the feasibility of these systems for commercial use. © 2021 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Background: Mefenamic acid (MFA), a commonly prescribed non-steroidal anti-inflammatory drug (NSAID), possesses a greater risk of dose-related central nervous system (CNS) toxicity than other NSAIDs. In this study, α -tocopherol and α -tocopherol acetate were selected as prodrug moieties for MFA in an attempt to reduce the CNS toxicity and enhance the therapeutic efficacy. Method: α -tocopherol monoester of MFA (TMMA) and α -tocopherol di-ester of MFA (TDMA) were synthesized by esterification reaction and were subjected to various in vivo characterizations. Results: Masking of the carboxylate group of MFA with the proposed pro-moieties significantly ($p < 0.05$) delayed the onset of tonic-clonic seizure in mice. Besides, the intraperitoneal administration of TMMA and TDMA in mice produced significantly ($p < 0.05$) stronger anti-inflammatory effects in the carrageenan-induced paw edema test and greater anti-nociceptive effect in the acetic acid-induced writhing test than MFA at an equimolar dose of 20 mg/kg. Treatment with TMMA and TDMA caused a significant ($p < 0.05$) inhibition of pain at 1st and 2nd phases of formalin-induced licking test in mice, whereas treatment with MFA inhibited the 2nd phase only. Pretreatment with naloxone and flumazenil significantly ($p < 0.05$) reversed the anti-nociceptive effect of MFA, TMMA and TDMA in the acetic acid-induced writhing test. In addition, treatment with TMMA and TDMA caused significantly ($p < 0.05$) a higher inhibition of pain in the glutamate-induced licking response in mice than MFA. Conclusion: Masking the carboxylate moiety of MFA by α -tocopherol and α -tocopherol acetate has a great potential for reducing CNS toxicity, enhancing the therapeutic efficacy and altering the mode of anti-nociceptive action. © 2021 Elsevier B.V.

ABSTRACT: Despite a growing interest in social media adoption by corporations, there is minimal knowledge about the drivers of social customer relationship management (SCRM). This study examines the determinants of SCRM entrepreneurship from an institutional perspective and specifically from the banking sector. Data on 19 banks were obtained from 183 responses to a questionnaire. These data were analyzed using Partial Least Square (PLS) path modeling. The findings show that organizational and technological contexts have a significant positive impact on SCRM entrepreneurship. The results also reveal a significant impact of institutional normative and coercive pressures on SCRM entrepreneurship. The findings of this study provide researchers and practitioners with a deeper understanding of how external institutional pressures and internal organizational and technological contexts can interact to create SCRM entrepreneurship. Furthermore, this study contributes to knowledge about the motivations and methods of SCRM adoption and evaluation. © 2021

ABSTRACT: This study aims to analyze the correlation between the daily confirmed COVID-19 cases in Jordan and metrological parameters including the average daily temperature ($^{\circ}\text{C}$), maximum ambient temperature ($^{\circ}\text{C}$), relative humidity (%), wind speed (m/s), pressure (kPa), and average daily solar radiation (W/m^2). This covers the first and the second waves in Jordan. The data were obtained from both the Jordanian Ministry of health and the Jordan Metrological Department. In this work, the Spearman correlation test was used for data analysis, since the normality assumption was not fulfilled. It was found that the most effective weather parameters on the active cases of COVID-19 in the initial wave transmission was the average daily solar radiation ($r = -0.503$; $p = 0.000$), while all other tests for other parameters failed. In the second wave of COVID-19 transmission, it was found that the most effective weather parameter on the active cases of COVID-19 was the maximum temperature ($r = 0.394$; $p = 0.028$). This was followed by wind speed ($r = 0.477$; $p = 0.007$), pressure ($r = -0.429$; $p = 0.016$), and average daily solar radiation ($r = -0.757$; $p = 0.000$). Furthermore, the independent variable importance of multilayer perceptron showed that wind speed has a direct relationship with active cases. Conversely, areas characterized by low values of pressure and daily solar radiation exposure have a high rate of infection. Finally, a global sensitivity analysis using Sobol analysis showed that daily solar radiation has a high rate of active cases that support the virus' survival in both wave transmissions. © 2021, The Author(s), under exclusive licence to Springer-Verlag GmbH, DE part of Springer Nature.

ABSTRACT: This study investigates the role of sense of community in harnessing the wisdom of the crowd and creating collaborative knowledge during the COVID-19 pandemic. It also explores the impact of collaborative knowledge creation on the perceived value of social media crowdsourcing in such crises. PLS-SEM was used to analyze the data and test the research model. The results show that sense of community has a significant role in harnessing the wisdom of the crowd and creating collaborative knowledge. The results confirm a significant impact of sense of community, the wisdom of the crowd, and collaborative knowledge creation on the perceived value of social media crowdsourcing in responding to the COVID-19 crisis. © 2020 Elsevier Inc.

ABSTRACT: In the recent era of digital revolution, life has become simple and more comfortable than it was before. Today, we are witnessing a revolution in the information technology domain where the Internet of Things is employed in various aspects of our life. The impact of this revolution is clearly seen in our homes where appliances are controlled and managed via voice commands, inspiration, hand signals, or by a command that results from analyzing the human behavior. Power conservation is one of the significant issues in smart homes and smart cities where buildings consume about 40% of the total energy. Another crucial issue is the user satisfaction. Achieving a balance between power conservation and the user satisfaction is a challenge. In this article, our contributions are: 1) a survey that sheds light on various techniques (the state of the art) used for reducing the power consumption based on monitoring the occupant's behavior; 2) a comparison between these techniques based on various factors elicited from the literature review; and 3) this study reveals the following gaps in the previous work: a) lack of integrity between the IoT systems; b)

lack of auto measuring of the user satisfaction; and c) lack of achieving a balance between the user satisfaction and the power saving. As an attempt to close the above gaps, this article proposes a smart and integrated IoT framework for automeasuring of the user satisfaction and thus, achieves a balance between the power conservation and the user satisfaction. Besides, it suggests future research directions for researchers. © 2014 IEEE.

ABSTRACT: Web applications are seen to play a vital role in the individual lives and even assist in the economic development of the country. However, many security vulnerabilities have been developed which can attack the web applications. One of the most common security threats which affect the web applications is the Structured Query Language Injection (SQL Injection or SQLi) attacks. The Open Web Application Security Project (OWASP) ranked them at the top out of the 10 most effective vulnerable attacks. This attack has been used for a long time for attacking different websites and webpages, due to which the victims had to suffer severe financial loss. In this study, the researchers investigated the different methods which could be used for detecting the SQLi attacks and their limitations.

Additionally, they have also highlighted the direction of research being conducted in this area. © 2021 IEEE.

ABSTRACT: The standard of e-learning is a compound of different quality factors quality dimensions. The researchers looked at the efficiency of e-learning from various angles and viewpoints. However, few works of literature study, specifically, the quality of e-learning portals or software. Besides, the students' or learners' opinions about this issue. In this research, we only focused on the quality of e-learning portals and technology and what factors and impact they have on e-learning in general from the students' perspectives. The results show that the students are more concerned about the usability and related factors because their learning process become depends fully on the e-learning portal as a result of the COVID-19 pandemic. © 2021 IEEE.

ABSTRACT: Big Data filed is an unsettled standard comparing with a traditional database, data mining, or data warehouse. Stability measure aims to acquire the quality dataset which encourages to use of preprocessing data method to handle instability that miniaturization missing data. Therefore, to increase the data quality in order to achieve an accurate prediction, significant rules are used to provide value and meaningful data. Through, three measures by support, confidence, and the lift to acquire frequently rules. These rules are used to conduct the objective extracting pattern, to estimate each browsing customer's likelihood of making a purchase, and to choose meaningful patterns from the discovered association rules. © 2021 IEEE.

ABSTRACT: Authenticated key exchange protocols are a fundamental cryptography building block for establishing a secret shared key among participating parties over an open network model. Mohamed et al. proposed a tightly-secure authenticated key exchange without NAXOS approach based on decision linear problem in order to solve an open problem for designing an authenticated key exchange protocol without using NAXOS trick. Mohamed et al.'s protocol has tight security proof in the eCK model under the random oracle problem and its security claims verified by using the games sequence tool. However, we show that Mohamed et al.'s protocol cannot withstand the key compromise impersonation attacks and man in the middle attacks. Furthermore, Mohamed et al.'s protocol cannot provide an implicit entity authentication property since it is a basic security property for an authenticated key exchange protocol. Therefore, the protocol is not secure in the eCK model. © 2021 IEEE.

ABSTRACT: The jigsaw technique is a cooperative learning method that makes students depend on each other to understand the concepts of any topic. Many faculties in engineering schools struggle to convey the concepts of their topics to students via online learning, especially during this Pandemic. Therefore, there is a need for suitable online activities that students can perform to better understand the concepts in engineering courses. A case study was done in a mechanical engineering course to test online group learning methods. The purpose of this study is to investigate the effects of the jigsaw group learning and conventional group learning methods on students' performances in a course assessment. A total of 80 students divided into two groups participated in this study. The harvested data from students' performances in a course assessment was analyzed statistically using multiple-way ANOVA. Also, a post course survey was conducted and a satisfaction index was calculated. The results showed that students who participated in the jigsaw groups scored a slightly higher average than students from conventional groups. Further, the results of the calculated satisfaction index showed that the application of jigsaw groups can highlight areas of improvements in students' understanding of the course material. © 2021 IEEE.

ABSTRACT: Data and image security is one of the most important aspects of information storage as well as the massive and still expanding internet. The frequent use of images of various types, especially images of documents, requires efficient encryption algorithms to ensure the security and stability of image storage and transmission. Among the various image encryption strategies proposed in the literature, this paper selected several algorithms with different characteristics to highlight the state-of-the-art attempts to meet the everincreasing demand for image protection. This paper briefly explains the cryptography algorithms and compares them in terms of usage, quality standards, security, and other metrics. © 2021 IEEE.

ABSTRACT: Recommender Systems have been used widely to provide suggestions to users based on their interests. Although many works have proposed recommender systems in the literature, the majority of these works did not consider the hidden user interests. Even those that considered the user latent interests did not resolve the conflict in interests that could occur. In our previous works, we proposed the use of intelligent agents to extract the interests of user categories such as the interests of a certain gender or the interests of those who work in a certain job. However, there could be some conflicting interests as the user would belong to many categories simultaneously. In this work, we rank the agents according to their ability to extract interests that best represent the users. For this sake, this work takes the user feedback about the most representative agent. Later, it uses classification to predict the most representative agent for new users given their user information. Experimental work proved that our method is efficient in terms of accuracy and training time. © 2021 IEEE.

ABSTRACT: There have been several PHP frameworks for developers to pick from in the latest years. Developers face problems choosing the most relevant frameworks and appropriate support functions to include in their project. For this reason, a clear understanding of the various frameworks is now becoming an important necessity for web developers. In this paper, we collected several research papers talking about different PHP frameworks, and we compared them with each other in several ways which are: Request per second, Memory usage, Response time and, Number of files using several PHP frameworks: Laravel, CakePHP, Codeigniter, symfony2, Phalcon, Symfony, and Yii. the Laravel outperforms other MVC framework in request per second, memory usage. On the other hand, phalcon outperforms other MVC frameworks in response time and number of files. © 2021 IEEE.

ABSTRACT: Short messages service (SMS) has been widely used for E-commerce authentications in the past years. It is utilized to authenticate users for Email password resetting process, authenticating online purchase process and even resetting the password of different E-government services. In this

work, a new simple hacking process has been implemented to show that SMS authentication can be cracked simply if smartphones users' grant permissions to any App without even reading these permissions or thinking why this App requires these permissions. An android App has been written with an underlying service to listen to SMSs and forward them to another smartphone. The application has been distributed among 20 persons as an experiment. 90% of the persons have downloaded the App and 80% of them have granted the permissions without reading it. Therefore we can Emails passwords 'phished it' simply. © 2021 IEEE.

ABSTRACT: This paper introduces singular value decomposition (SVD), a major matrix decomposition technique. SVD serves as the underlining computational engine of many other techniques such as principal component analysis (PCA), eigen decomposition, matrix decomposition, Cholesky decomposition and others. SVD is utilized in many applications such as data analysis and dimensionality reduction, image compression, Google's PageRank algorithm, Netflix's recommender system and many more. This paper overviews the mathematics behind SVD in a simple way. It also applies SVD technique in image compression and in dimensionality reduction as the underlining technique of the PCA and data analysis. © 2021 IEEE.

ABSTRACT: Researchers have presented new ideas to effectively handle the traffic jams on the roads and junctions throughout the world, which are expected to increase manifold in the upcoming decades. They have come up with the useful mechanisms, through which, traffic signals can be controlled through active traffic management aiming to bring efficiency in flow of traffic besides enhancing road capacity. The vehicle waiting time and traffic congestion can be curtailed through the smart traffic lights. Hence, gas emissions and fuel consumption can also be reduced. This work discovers the proposed techniques to reduce traffic congestion and optimize road traffic. © 2021 IEEE.

ABSTRACT: A wireless technology Mobile Ad hoc Network (MANET) that connects a group of mobile devices such as phones, laptops, and tablets suffers from critical security problems, so the traditional defense mechanism Intrusion Detection System (IDS) techniques are not sufficient to safeguard and protect MANET from malicious actions performed by intruders. Due to the MANET dynamic decentralized

structure, distributed architecture, and rapid growing of MANET over years, vulnerable MANET does not need to change its infrastructure rather than using intelligent and advance methods to secure them and prevent intrusions. This paper focuses essentially on machine learning methodologies and algorithms to solve the shortage of the first line defense IDS to overcome the security issues MANET experience. Threads such as black hole, routing loops, network partition, selfishness, sleep deprivation, and denial of service (DoS), may be easily classified and recognized using machine learning methodologies and algorithms. Also, machine learning methodologies and algorithms help find ways to reduce and solve mischievous and harmful attacks against intimidation and prying. The paper describes few machine learning algorithms in detail such as Neural Networks, Support vector machine (SVM) algorithm and K-nearest neighbors, and how these methodologies help MANET to resolve their security problems © 2021 IEEE.

ABSTRACT: one of the major challenges for Autonomous Driving (AD) system while adapting it in various environments at any time is the perception of and prediction of objects and road user behavior and their actions, A special attention is put into data and sensor fusion methods for object detection and identification and scene understanding. In addition, we highlight on the widely used deep learning network architectures in autonomous driving. In this research, we focus on different data fusion methods including early fusion and late fusion methods and how to implement the late data fusion technique from a source domain such as a reference vehicle or a stationary car with well-trained dataset and large amount of labelled data by using transfer learning at late stages of Neural Network on the target domain which has a few labelled data. In fact, the late fusion method is useful in enhancing the training rate for the target domain with assist of the well-trained source domain instead of training target domain from scratch. Also, the data fusion using transfer learning will increase the performance and accuracy level that can be achieved in the target domain while it learns the target task with assistance from the source domain. © 2021 IEEE.

ABSTRACT: The immediate availability of blood can save other lives in case of emergency needs. Blood transfusion is a continuous demand, as it is widely required for many medical surgeries and critical operations. Therefore, there is a need to manage the whole process of supplying blood from blood donors to the hospitals and transfusion centers as well as matching the blood compatibility between the donors and patients. This comparative study reviews the existing approaches for blood donation and blood assignment management systems which aim to provide a continuous supply of blood products to transfusion centers and hospitals by optimizing the process of blood donations and predicting the

future behavior of blood donation. The optimization process of blood donations is based on minimizing the wastage of blood units with regards to expiration. It also aims to reduce the additional importation of blood units from external sources by managing the critical blood shortage levels and monitoring the expiration of blood units. A discussion is proposed in this study as well, to highlight the main findings, limitations, and the unexplored issues of the existing approaches for blood donation management systems. Lastly, a set of suggestions is also presented to address the main limitations of these systems in order to point out alternative perspectives and the potential future work opportunities in the blood donation management domain. © 2021 IEEE.

ABSTRACT: Digital technologies such as the Internet play a vital role in the organization, operation, and management of the public and private sectors. Such technologies support the implementation of effective digital business strategies. Therefore, nowadays digital economy has become a very important factor for economic growth. By reviewing the extant literature, this paper aims to propose a framework for identifying acceptance factors of the digital economy based on the currently available Technology Acceptance Model (TAM). This research contributes to the existing understanding of digital economy by focusing on end users' overall understanding of digital economy services. The proposed digital economy service user acceptance model has created a research environment from which more research can be triggered and initiated. © 2021 IEEE.

ABSTRACT: Biometrics technologies achieved an important role in facilitating the identification process of persons and accessing the secure areas in its success levels rather than the traditional methods, such cards, passwords, etc. In this research, we designed a multi biometrics recognition and authentication system using a proposed deep learning algorithm, called convolutional neural network, that depends on finger vein and palm print to treat the shortcomings like contrast of light, time complexity and accuracy. Histogram equalization was used for enhancement of image. Moreover, to extract the best feature, Linear Discriminate Analysis (LDA) method was applied by reducing the redundant features. The result of the proposed system gave 99%, which is higher than using of KNN technique. © 2021 IEEE.

ABSTRACT: with the advancement of technology, the world is growing and developing rapidly, and the demand for software has become greater and more, and one of the most important steps in building any program is the requirements of the programs, and checking the requirements when applying them manually, requires great effort, time, cost and accuracy. Automated requirements were not sufficient. In this study, we will propose a technique for automatically checking software requirements by using machine learning to represent textual data from software requirements specifications, an overview of prototyping-based models in machine learning is presented in this paper. The framework, notes, i.e. data, are stored in terms of typical reps. the system can be used in conjunction with an appropriate similarity scale in the context of the unsupervised analysis of high-dimensional complex datasets. Supervised learning is represented in prototyping systems in terms of vector quantization learning. In most cases, The familiar Euclidean distance serves as a measure of difference. We present framework extensions to non-standard measures give an introduction to use adaptive distances in related learning, Briefly, the prototype is less costly from any other technical for validating the

requirement because it make in the first and the prototype too can reuse and customer involvement © 2021 IEEE.

ABSTRACT: In the recent era, the Internet of Things (IoT) technology contributes in the development of many activities and aspects in our life. One of these aspects is agriculture. Agriculture is important for communities to survive. The population is extremely growing up and thus people need large quantity of food to survive. However, providing food for billions of people requires huge quantity of water. Since the world suffering from water scarce, it is very important to provide high technology for monitoring and managing the water quantity around the world. In modern agriculture, the IoT cooperates with the Artificial Intelligence (AI), Machine Learning (ML) and Deep Learning (DL) in order to save water. This paper sheds light on various techniques for water managing and controlling in agriculture domain using IoT, AI and Machine Learning. This paper concluded that a few works is carried out in the direction of detecting water pipeline leakage. Thus, it proposes an IoT system for detecting water pipeline leakage. Besides, it concluded that most of the surveyed papers do not focus on security issues such as protecting the IoT irrigation system or water management from hackers. In addition, a few works considered power conservation techniques in the agriculture domain. © 2021 IEEE.

ABSTRACT: One of the most significant phases of software development is software testing, because of its value in identifying mistakes and gaps in the early stages of program development. In the past, software testing was done manually, and this is a tiring and inaccurate process that carries with it errors and gaps and requires time, effort, and money. At present, testers tend to perform the testing process automatically, to save time, effort, and money, and to obtain accurate results. However, there are few research works on the aspect of generating test cases from requirements specification especially generate test cases from use case description. An Approach to Generate Test Cases from Use Case description is proposed in this paper that consists of several processes. The input is the use case description of the use case diagram, which is being used as a basis for the approach. In the next step, each software summary of UML use cases is utilized to extract the necessary information for the development of the control flow graph and NLP table. A control flow graph and NLP table will be generated based on a specific algorithm after that generate test paths based on a specific algorithm. Then, the test cases will be generated from the test paths and NLP table. The proposed approach will enhance the process of generation of test cases and increase the accuracy and efficiency. © 2021 IEEE.

ABSTRACT: The work reported in this paper concerns a study of chaos control of fractional-order maps, especially the two-dimensional fractional-order Duffing map, which is outlined here in the sense of the Caputo h-difference operator. For the purpose of stabilizing the dynamics of the established map, some simple linear control laws are proposed and verified numerically. The chaos control is accomplished by introducing a novel result which its proof relies on selecting a suitable Lyapunov function and proper linear control law. Several numerical simulations are performed to emphasize the

influence of the established scheme. © 2021 IEEE.

ABSTRACT: The Covid-19 pandemic is affecting the entire world, and its consequences have been human and economic losses. Jordan is one of the countries affected by the Covid-19 pandemic, including human and economic losses. In this paper, we will explain the vaccines used and the mechanism for distributing the vaccines in Jordan, and explain the economic impact of the Covid-19 pandemic in Jordan, especially tourism. An economic solutions is introduced in this paper by stimulating tourism through the proposed Algorithm and the idea of the program that we have proposed for protection. © 2021 IEEE.

ABSTRACT: The MQV is an authenticated key agreement protocol which does not use any one-way hash functions in its block design, and it is standardized in (IEEE, ANSI, and ISO). However, its two-pass form cannot withstand an unknown key share attack. Krawczyk proposed a hashed version of MQV (HMQV) to overcome the attack on MQV, but HMQV is vulnerable to small subgroup attacks. LaMacchia et al presented a strong security definition for authenticated key exchange protocol as extended Canetti-Krawczyk (eCK) to catch new attacks from a strong adversary. Ustaoglu proposed a hashed ephemeral private key with static private key of HMQV (CMQV) to have a security proof in eCK. Sarr et al showed key compromise impersonation and man-in-the-middle attacks on HMQV under revealing a signature of Diffie-Hellman of public keys and proposed fully HMQV (FHMQV) and strengthen MQV (SMQV) to overcome those attacks. In this study, we show the known key security attack on the MQV protocol and its variants (MQV, HMQV, CMQV, FHMQV, eFHMQV and SMQV) protocols, if both ephemeral private keys and the ephemeral session key equation are revealed by an extremely adversary; the extremely adversary is able to obtain the shared static key between two-party participants. As consequence, we show the shared static-key compromise impersonation attack on the MQV protocol and its evolutions protocols. Moreover, we show that the MTI/A(0) key agreement protocol cannot withstand key compromise impersonation attacks against stronger adversary revelation attacks. © 2021 IEEE.

ABSTRACT: The world is growing and developing rapidly, and the demand for software has been increasing speedily, any software has many steps for building a program and all the steps are important for software requirements. Requirements classification can be applied manually, which requires great effort, time, cost and the accuracy may vary. Therefore, many previous researchv has been proposed to automate the classification process, but the automation process of the classification was not sufficient. In this study, we will propose a technique to automatically classify software requirements using machine learning to represent text data from software

requirements specification and classify requirement to group Functional Requirement and Non-Functional Requirement. The experimented dataset in this study was the PROMISE_exp, which includes labeled requirements. All the documents of software from the database were changed (cleaned) with a set of steps (normalization, extractions, selection any techniques that will be used. The BoW used SVM algorithm or KNN algorithm for classification. This study used data from the PROMISE_exp to do the work, the information of the steps used to re-performed the classification, and the Measurement BoW, when using SVM and KNN algorithms the classification of requirements making can serve as a way and resources for another study. It can be seen that the use of BoW with SVM is better than use KNN algorithms with an average F-measure of all cases of 0.74. In future work we intend to improve to technique with make merge and change some algorithms as Logiest Regression to improve the Accuracy (Precision) of our model. © 2021 IEEE.

ABSTRACT: The world is directed to use the huge data and use it in a beneficial way, this allowed researchers to think about how to classify these data, which have many shapes, speeds and sizes, as it was important to study the data that are in social media, analyse and benefit from it through its classification. We used more than 20 papers to compare how the researchers use different algorithms to classify the huge data that comes through social networking sites and the most important language they used to classify the text was the Arabic language. The researchers concluded that deep learning and convolution neural networks speed up the classification process. © 2021 IEEE.

ABSTRACT: Communication methods in the world are constantly evolving, this means that the amounts of data sent through open networks are in populated quantities, so there must be means to protect that data sent, and this could be done by information protection systems by encryption and coding of the data in order to protect the content of that data sent. The main aim of encrypting and encoding data is to protect the integrity of the data, and also to ensure the confidentiality of the data source, this is done through the use of algorithms for encryption and encoding the data, with the aim of changing its content using those algorithms and returning its original content with the same algorithms used to encrypt it, through a symmetric secret key for encryption and decryption. In this paper, the researcher highlights the weakness of the basic RC4 algorithm, which lies in the stability of the key used in scheduling the key, as a prelude to generating the stream keys used in serial byte encryption, so the RC4-Pr algorithm was modified by adding an additional permutation function by performing a key permutation operation to produce a different key in each 16-bytes (128-bits) cipher round. © 2021 IEEE.

ABSTRACT: Logical equivalences or as commonly known logical identities have always been applied in logical reasoning and propositional simplification. Investigating additional logical identities can contribute in making the simplification of complex logical propositions easier. Consequently, this paper presents eight new logical identities that have never been presented previously and are proved to be valid by two methods: truth tables, and the simplification method (logical identities method). Additionally, three examples are presented to show how the new set of identities can be applied. © 2021 IEEE.

ABSTRACT: It is well-known that fractional-order discrete-time systems have a major advantage over their integer-order counterparts, because they can better describe the memory characteristics and the historical dependence of the underlying physical phenomenon. This paper investigates chaos in the fractional-order Arnold map via θ -1 test algorithm for chaos. A number of chaotic attractors are generated from the system dynamics, indicating that the behaviour of the fractional-order map becomes unpredictable, independently of the fractional-order values. © 2021 IEEE.

ABSTRACT: In this paper we present a method for solving nonlinear evolution equations of fractional conformable derivatives in the sense of R. Khalil. The proposed method is based on some suitable transformations combined to the extended Tanh methods presented by A. Wazwaz in "Applied Mathematics and Computations, 2004", by E. Aksoy et al, for Jumarie derivatives, in "AIP Conference Proceedings, 2016", then by Pandir and Yildirim, with modified Riemann-Louville derivatives, in "Waves in Random and Complex Media, 2017". Some applications on Klein-Gordon equation with other examples are also discussed. © 2021 IEEE.

ABSTRACT: Recently, several types of research in Chatbot systems have been developed in the literature by their means of having a considerable number of languages such as English, French, and other languages, which serve in various fields of a number of real-life cases. Chatbots are considered unfamiliar besides their little usage. To the best knowledge of the research, no previous research has been conducted in improving an Arabic Chatbot in Jordanian universities. With the outbreak of the COVID-19 pandemic and its global effects, the need to reduce the load on the admissions director and possibly other users became critical. Hence, this paper aims to develop an

Intelligent Arabic Chatbot System that can reduce such a load. In particular, this system supports an Arabic spoken by using a Jordanian dialect with students, particularly at the Al-Zaytoonah Private University of Jordan. Therefore, the proposed system represents a primary Jordan chatbot that uses a Jordanian dialect. © 2021 IEEE.

ABSTRACT: Online video lectures and tutorials have been gaining a lot of attention especially during the year 2020. The main reason behind this massive popularity was the global transition towards E-learning and distance learning methods right after the pandemic. However, teachers and instructors have been facing the challenge of keeping students engaged through out these videos. In this study, the length and the entertainment level of video lectures are compared against the performance of students. Two groups of engineering students from one course were involved in the study. The first group were provided with relatively short lecture videos while as the second group were provided with longer lecture videos. The results showed that students in the first group had statistically significantly better performance in the course. Further, short videos were statistically significantly more entertaining than long videos. However, students who believed that the video lectures were not informative scored statistically significantly lower grades than other students. The findings also showed that the delivered information in videos, that were shorter than 3 minutes, were insufficient and incomplete. The results of the study also suggest that the optimum length for a lecture or a tutorial video is between 6 to 10 minutes for engineering students. © 2021 IEEE.

AFFILIATIONS: Al-Zaytoonah University of Jordan, Faculty of Business, Amman, Jordan

ABSTRACT: This study aimed to evolve the relationship between managing liquidity risk and the profitability among commercial banks (n=16) listed on the Amman Stock Exchange. The evolution was based on the annual reports from 2010 to 2019. A suitable multiple regression model was used to achieve this goal, which indicated no statistically significant relationship between the liquidity risk indicators and the majority of profitability indicators. However, the Cash Reserve Ratio (CRR) index was statistically significant with the Utilization Ratio (UR). Additionally, there was a statistically significant relationship between the return on equity and the legal reserve ratios and the funds' investment. This study recommends raising the awareness of the relationship between the indicators of liquidity risk and profitability among the financial policy planer in Jordanian commercial banks because the maintained level of liquidity will undoubtedly affect the volume of investments in banks. Thus, influencing the bank market value by increasing the share on the stock exchange. © 2021 IEEE.

ABSTRACT: The concept of logarithmic order in the unit disc forms a bridge between meromorphic functions of unbounded Nevanlinna characteristic and meromorphic functions of zero order of growth.

In this paper, we investigate some growth properties of meromorphic solutions of higher order linear difference $An(z)f(z + n) + A1(z)f(z + 1) + A0(z)f(z) = 0$, end where the coefficients $An(z), \dots, A1(z)$ and $A0(z)$ are meromorphic functions of finite logarithmic order in the unit disc such that $An(z)A0(z) \neq 0$. Our result improves the results obtained by Belaidi (Math. Vesnik, 66 (2014), No. 2, 213-222). © 2021 IEEE.

ABSTRACT: Different deep learning architectures have been developed to accommodate the non-linearity of time series datasets in the weather forecasting domain. This paper surveys the state-of-the-art studies of deep-learning-based weather forecasting according to the aspects of the design of Neural Network architectures, spatial and temporal scales, as well as the datasets and benchmarks. Then, it highlights the obtained results while focusing on the reported accuracy and the scale of prediction in terms of model generalization; i.e., whether the model is suitable for a local or a regional area, and also if it can be used for short-term or long-term predictions. Lastly, the paper outlines the independent and dependent variables for weather forecasting in each study and evaluates algorithms used for training the dataset based on their time efficiency. © 2021 IEEE.

ABSTRACT: Face recognition technology is a modern approach with many applications. This paper reviews and compares the latest literature addressing the methods that have been adopted to recognize and identify faces using a partial face recognition view. The study covers different methods of face recognition for static images that can be classified according to three main approaches, namely the holistic, feature-based, and hybrid approaches. The different methods and approaches are examined and their limitations are identified. © 2021 IEEE.

ABSTRACT: In this time the big data became an important part of all areas, it can be used in multiple industrials such as banking, education, government, networking, energy, health care, etc. So, because of that the huge amount of data became have problems or unnecessary data, and so that comes from the difficulty of measure the quality of these data. In this research we show the quality characteristic that can be help to increase the efficiency of quality measurement process of BDA by comparing it with other quality model of BDA and applying it on the 7V's of big data. © 2021 IEEE.

ABSTRACT: Network security risks are increasing at an exponential rate as Internet technology advances. Keeping the network protected is one of the most challenging of network security. Many security mechanisms were implemented to detect and identify any malicious activity on the network. Intrusion Detection System (IDS) one of the most used mechanisms to reduce the effects of these

risks. Machine Learning (ML) classifiers are widely begin used to classify the network traffic as normal or abnormal. In this paper a comparative evaluation of the following ML classifiers: LogisticRegression, Multinomial Naive Bayesian, Gaussian Naive Bayesian, Bernoulli Naive Bayesian, k-Nearest Neighbors, Decision Tree, Adaptive Boosting, Random Forest, Multilayer Perceptron, and GradientBoosting is performed to specify the best classifier in identifying intrusion detection. The used evaluation metrics are accuracy, precision, and F-measure. The UNSW-NB15 dataset is used to assess ML classifiers. The experimental results show that the RandomForest classifier outperforms the other classifiers in terms of accuracy at 87%, precision 98%, and F-measure 84%. © 2021 IEEE.

ABSTRACT: There has been a significant increase in the adoption of cloud computing, and Azure, AWS and Google Cloud are striving to become the best cloud providers. Various extraordinary changes have occurred in 2020 that have played a significant role in bringing about a shift towards the cloud. Enterprises and SMBs are increasing the scope of their cloud strategies in the midst of the global pandemic, economic crisis and all-remote operations so as to ensure business continuity. Choosing an appropriate cloud provider is the issue of concern here. A taxonomy and survey of cloud services that are provided by three major cloud infrastructure vendors, with respect to their revenue, is carried out in this paper to enable you to make an educated decision. An extensive cloud comparison summary is then developed for AWS vs. Azure vs. Google cloud. The cloud ecosystem is first examined, after which an extensive discussion of cloud delivery models and services is carried out. Cloud computing at Google, Amazon and Microsoft is then discussed. The paper concludes with a comparison of the three major cloud service providers. © 2021 IEEE.

ABSTRACT: The current paper aims to identify the effect of using the Cyber Hunt Strategy on the development of academic achievement and the retention of the impact of learning in mathematics among undergraduate students in Jordan. To achieve the aims of the study, a Cyber Hunt Strategy in a form of an educational website is designed and a test to measure academic achievement. The results show the effectiveness of this strategy in developing academic achievement in mathematics of students. © 2021 IEEE.

ABSTRACT: In this paper, we continue the classification of coordinate finite type Gauss map surfaces

in the 3-dimensional Euclidean space E^3 . To do this, we investigate an important family of surfaces, namely, tubes in E^3 of which its Gauss map N satisfies the condition $IIN = AN$, where $A \in \mathbb{R}^{3 \times 3}$ and II is the Laplace-Beltrami operator corresponding to the 2nd fundamental form II of the surface. We show that there is no such surfaces satisfying this property. © 2021 IEEE.

ABSTRACT: Big data has evolved to a ubiquitous part of today's society. However, despite its popularity, the development and testing of the corresponding applications are still very challenging tasks that are being actively researched in pursuit of ways for improvement. One newly introduced proposition is the application of test driven development (TDD) in the big data domain. To facilitate this concept, existing literature reviews on TDD have been analyzed to extract insights from those sources of aggregated knowledge, which can be applied to this new setting. After introducing the different studies, lessons for the application of TDD in the big data domain are deduced and discussed. Finally, avenues for future works are proposed. © 2021 IEEE.

ABSTRACT: Symmetric (secret) key encryption algorithms are formally used one key for encryption and decryption processes. One of the advantages of symmetric encryption is that it provides security at a much lower cost, both in term of key size and execution time. The algorithm adopted in this paper is the Advanced Encryption Standard (AES). This algorithm is considered official and secure for encryption due to the length of the encryption key. Therefore, the secret key for AES is generated by implementing Elliptic Curve Diffie Hellman (ECDH) based public key exchange protocol, while the communication process between sender and receiver is employed by using a light communication technology called light Fidelity (Li-Fi). Meanwhile, Li-Fi technology supposed to be very secure and fast much more than the Internet used in our daily life. © 2021 IEEE.

ABSTRACT: Smart grids networks carry critical and private data that may be employed by adversaries in learning about services running at home or its occupancy. It is therefore vital that robust protection be accorded to these complex infrastructures to thwart cyber-physical attacks. Although numerous cryptographic protocols have been developed for smart grid systems, majority of them do not consider de-synchronization attacks among others, or they lack conditional privacy and flexible key management. In terms of performance, they have high computation and communication overheads that are not ideal for resource constrained smart meters. In this paper, a lightweight privacy preservation protocol is proposed. Simulation results showed that it experienced the lowest computation and communication overheads among its peers. In addition, security evaluation using the widely known Dolev-Yao and Canetti-Krawczyk models showed that it offers backward secrecy, forward key secrecy, anonymity and is robust against de-synchronization and traceability attacks. © 2021 IEEE.

ABSTRACT: Image segmentation is the most important process in road sign detection and classification

systems. In road sign systems, the spatial information of road signs are very important for safety issues. Road sign segmentation is a complex segmentation task because of the different road sign colors and shapes that make it difficult to use specific threshold. Most road sign segmentation studies do good in ideal situations, but many problems need to be solved when the road signs are in poor lighting and noisy conditions. This paper proposes a hybrid dynamic threshold color segmentation technique for road sign images. In a pre-processing step, the authors use the histogram analysis, noise reduction with a Gaussian filter, adaptive histogram equalization, and conversion from RGB space to YCbCr or HSV color spaces. Next, a segmentation threshold is selected dynamically and used to segment the preprocessed image. The method was tested on outdoor images under noisy conditions and was able to accurately segment road signs with different colors (red, blue, and yellow) and shapes. Copyright © 2021, IGI Global.

ABSTRACT: The paper investigates estimation problem of the parameter of exponential distribution. The maximum likelihood (ML) estimator and Bayesian estimators are obtained based on eight sampling schemes, six families of prior distributions, and seven classes of loss functions. The estimators are compared based on absolute relative error, standard deviation, mean square error, relative error, and loss, risk, and Pitman closeness. The main objective is to select the loss function that yields an optimal estimator and optimal sampling scheme within a given class of estimators. © 2021 Natural Sciences Publishing. ABSTRACT: Cancer is a disorder characterized by an uncontrollable overgrowth and a fast-moving spread of cells from a localized tissue to multiple organs of the body, reaching a metastatic state. Throughout years, complexity of cancer progression and invasion, high prevalence and incidence, as well as the high rise in treatment failure cases leading to a poor patient prognosis accounted for continuous experimental investigations on animals and cellular models, mainly with 2D- and 3D-cell culture. Nowadays, these research models are considered a main asset to reflect the physiological events in many cancer types in terms of cellular characteristics and features, replication and metastatic mechanisms, metabolic pathways, biomarkers expression, and chemotherapeutic agent resistance. In practice, based on research perspective and hypothesis, scientists aim to choose the best model to approach their understanding and to prove their hypothesis. Recently, 3D-cell models are seen to be highly incorporated as a crucial tool for reflecting the true cancer cell microenvironment in pharmacokinetic and pharmacodynamics studies, in addition to the intensity of anticancer drug response in pharmacogenomics trials. Hence, in this review, we shed light on the unique characteristics of 3D cells favoring its promising usage through a comparative approach with other research models, specifically 2D-cell culture. Plus, we will discuss the importance of 3D models as a direct reflector of the intrinsic cancer cell environment with the newest multiple methods and types available for 3D-cells implementation. © 2021 by the authors. ABSTRACT: The coronavirus disease 2019 (COVID-19) pandemic, the most important public health problem in 2020, poses severe health and socioeconomic impact. Many people turn to herbal therapy to prevent infection with the virus or alleviate the symptoms caused by it. This study evaluates the patterns of phytotherapy-based product utilization in the prevention against SARS-COV-2 and their reported effectiveness. This cross-sectional survey used a convenience sample of 287 adults who had used any form of phytotherapeutics to help fight and/or treat COVID-19 infection. The majority (n = 194, 67.6%) of participants had used plants from the Rutaceae family (like lemon and oranges), followed by those of Amaryllidaceous (namely, Garlic and Onion). Participants said that physicians and pharmacists were the primary sources of information about phytotherapy (n=107, 37.3%), and their decision was driven by their positive attitude towards herbal medicine or plant-based products (n=133, 46.3%). Many participants did not notice any side effects of these remedies (n=270, 94%) and believed they were effective (n = 184, 64%). This study provides an overview of the many phytotherapeutic remedies used in the era of COVID-19 by Jordanian society, which could prompt the conduction of interventional trials to assess the effectiveness and safety of this modality of therapy, either as a stand-alone or adjuvant treatment. © 2021 the authors.

AFFILIATIONS: Al-Zaytoonah University of Jordan

ABSTRACT: This study aims to identify the impact of tax and accounting auditing systems on tax revenues at the Income and Sales Tax Department in Jordan. To achieve the objectives of the study and test hypotheses, the researcher used the descriptive and analytical approach, by designing a questionnaire and distributing it to the members of the study community, where the study population consists of a sample of the tax auditors accredited by the Jordanian Income and Sales Tax Department, who are the auditors of the following directorates, the Directorate of Large Taxpayer Office (LTO), the Directorate of Industrial Activity, the First Commercial Activity Tax Directorate, the Second Commercial Activity Tax Directorate, the Service Activity Tax Directorate. Where (150) questionnaires were distributed and (127) questionnaires were retrieved from them, it was found that (119) questionnaires were valid for statistical analysis; the statistical analysis program (SPSS) was used and analyzing them statistically through appropriate statistical methods. The study found a statistically significant effect of the tax audit on tax revenues at the Income and Sales Tax Department, in addition to the existence of a statistically significant effect of the accounting audit on tax revenues at the Income and Sales Tax Department. One of the most important recommendations that came out of the study is the necessity of having legal materials that stimulate the payment of tax, and the need to expand the application of electronic services, develop tax department's policies to collect the largest possible amount of taxes, and focus on conducting accounting auditing tests extensively, in addition to developing the auditor's enhanced tax skills and attains moral responsibility. © 2021. ABSTRACT: In this study, we proposed three simple approaches to forecast COVID-19 reported cases in a Middle Eastern society (Jordan). The first approach was a short-term forecast (STF) model based on a linear forecast model using the previous days as a learning data-base for forecasting. The second approach was a long-term forecast (LTF) model based on a mathematical formula that best described the current pandemic situation in Jordan. Both approaches can be seen as complementary: the STF can cope with sudden daily changes in the pandemic whereas the LTF can be utilized to predict the upcoming waves' occurrence and strength. As such, the third approach was a hybrid forecast (HF) model merging both the STF and the LTF models. The HF was shown to be an efficient forecast model with excellent accuracy. It is evident that the decision to enforce the curfew at an early stage followed by the planned lockdown has been effective in eliminating a serious wave in April 2020. Vaccination has been effective in combating COVID-19 by reducing infection rates. Based on the forecasting results, there is some possibility that Jordan may face a third wave of the pandemic during the Summer of 2021. © 2021 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: University Education in Jordan has adapted completely to Distance Education due to the corona virus (COVID-19) pandemic. The study aimed to assess students' satisfaction with distance education of chemistry courses during the COVID-19 pandemic at Aqaba University of Technology (AUT). The students' satisfaction was assessed by a survey consisting of 4 items as follows: interaction with e-learning, techniques, instruction, and website improvement. The statistical analyses have been done using descriptive and inferential analytical approaches by the Statistical Package for Social Sciences. The results indicated that students' satisfaction with using e-learning to learn chemistry in light of the COVID-19 pandemic at AUT was high. The interaction with e-learning and techniques reflected a high level of satisfaction while instruction and website improvement reflected a medium level of satisfaction. There was a significant difference ($\alpha \leq 0.05$) in students' satisfaction in terms of gender. Females were more significantly satisfied with the four items and overall satisfaction. © 2021 Eskisehir Osmangazi University. All rights reserved.

ABSTRACT: Lack of medication adherence among patients with dyslipidemia negatively affects health-related outcomes. This study aims to evaluate medication adherence; we also aim to investigate the predictors of non-adherence among patients with dyslipidemia in Jordan. Medication adherence was evaluated in a total of 228 dyslipidemia patients. The Beliefs about Medicines Questionnaire was also used to assess patients' beliefs about medications. The majority of the current study participants (73.2%) reported non-adherence to the prescribed medications. There were significant negative associations between medication adherence and concerns of prescription drug use ($B = -0.41$, p -value < 0.01), duration of dyslipidemia ($B = -0.22$, p -value < 0.01), and the number of medications ($B = -0.64$, p -value < 0.01). Positive associations were found between medication adherence and the necessity of prescription drug use ($B = 0.43$, p -value < 0.01), taking statin and fibrate ($B = 2.04$,

p-value < 0.01), and moderate-intensity statin (B = 2.34, p-value < 0.01). As for patients' beliefs about medications, the item "My medicine to lower my cholesterol disrupted my life" had the highest mean (3.50 ± 0.99). This study revealed a low adherence rate to medication among patients with dyslipidemia. It also demonstrates modifiable factors such as beliefs regarding perceived risk, medication harms, treatment duration, and the number of medications associated with poor adherence in patients with dyslipidemia. © 2021 by the authors. ABSTRACT: In the current work, a simple, economical, accurate, and precise HPLC method with UV detection was developed to quantify Favipiravir (FVIR) in spiked human plasma using acyclovir (ACVR) as an internal standard in the COVID-19 pandemic time. Both FVIR and ACVR were well separated and resolved on the C18 column using the mobile phase blend of methanol:acetonitrile:20 mM phosphate buffer (pH 3.1) in an isocratic mode flow rate of 1 mL/min with a proportion of 30:10:60 %, v/v/v. The detector wavelength was set at 242 nm. Maximum recovery of FVIR and ACVR from plasma was obtained with dichloromethane (DCM) as extracting solvent. The calibration curve was found to be linear in the range of 3.1–60.0 µg/mL with regression coefficient (r^2) = 0.9976. However, with acceptable r^2 , the calibration data's heteroscedasticity was observed, which was further reduced using weighted linear regression with weighting factor 1/x. Finally, the method was validated concerning sensitivity, accuracy (Inter and Intraday's % RE and RSD were 0.28, 0.65 and 1.00, 0.12 respectively), precision, recovery (89.99%, 89.09%, and 90.81% for LQC, MQC, and HQC, respectively), stability (% RSD for 30-day were 3.04 and 1.71 for LQC and HQC, respectively at -20° C), and carry-over US-FDA guidance for Bioanalytical Method Validation for researchers in the COVID-19 pandemic crisis. Furthermore, there was no significant difference for selectivity when evaluated at LLOQ concentration of 3 µg/mL of FVIR and relative to the blank. © 2021 by the authors. ABSTRACT: Objectives: The aim of this study was to explore the trend of ischemic heart disease (IHD) admission and the prescriptions of IHD medications in England and Wales. Methods: A secular trends study was conducted during the period of 1999 to 2019. We extracted hospital admission data for patients from all age groups from the Hospital Episode Statistics database in England and the Patient Episode Database for Wales. Prescriptions of IHD medications were extracted from the Prescription Cost Analysis database from 2004 to 2019. The chi-squared test was used to assess the difference

between the admission rates and the difference between IHD medication prescription rates. The trends in IHD-related hospital admission and IHD-related medication prescription were assessed using a Poisson model. The correlation between hospital admissions for IHD and its IHD medication-related prescriptions was assessed using the Pearson correlation coefficient. Results: Our study detected a significant increase in the rate of cardiovascular disease (CVD) medication prescriptions in England and Wales, representing a rise in the CVD medications prescription rate of 41.8% (from 539,334.95 (95% CI = 539,286.30–539,383.59) in 2004 to 764,584.55 (95% CI = 764,545.55–764,623.56) in 2019 prescriptions per 100,000 persons), with a mean increase of 2.8% per year during the past 15 years. This increase was connected with a reduction in the IHD hospital admission rate by 15.4% (from 838.50 (95% CI = 836.05–840.94) in 2004 to 709.78 (95% CI = 707.65–711.92) in 2019 per 100,000 persons, trend test, $p < 0.01$), with a mean decrease of 1.02% per year during the past 15 years and by 5% (from 747.43 (95% CI = 745.09–749.77) in 1999 to 709.78 (95% CI = 707.65–711.92) in 2019 per 100,000 persons, trend test, $p < 0.01$) with a mean decrease of 0.25% per year during the past two decades in England and Wales. Conclusion: The rate of hospitalisation due to IHD has decreased in England and Wales during the past two decades. Hospitalisation due to IHD was strongly and negatively correlated with the increase in the rates of dispensing of IHD-related medications. Other factors contributing to this decline could be the increase in controlling IHD risk factors during the past few years. Future studies exploring other risk factors that are associated with IHD hospitalisation are warranted. © 2021 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: This paper is centered towards examining whether innovation, social media marketing, and corporate social responsibility have any associations with firm performance in automotive sector. By reviewing the prior literature, it can be concluded that there are limited studies which focused on investigating the direct impacts of the above factors collectively on firm performance, particularly in automotive industry. Moreover, the performance of automotive industry in Malaysia has recently experienced slow growth. Therefore, a quantitative research method was employed for data collection and fulfilling the research objectives. In particular, the data were collected via survey instrument from many employees of automotive companies at the state of Pahang in Malaysia. The data was then analyzed by SPSS Version 19 to verify and test the hypotheses. Overall, the outcomes revealed that innovation has a significant positive impact on firm performance. But the influence of social media marketing on firm performance was found insignificant. Finally, the outcomes showed that the practice of corporate social responsibility has a positive impact on firm performance. Copyright © 2021, IGI Global.

ABSTRACT: This paper addresses a puzzle in the semantics of episodic free yalli relative clauses in Jordanian Arabic (henceforth, Y-FR). Despite the fact that the Y-FR functions as referential definite descriptions, especially when occupying the syntactic position of DP or PP argument, it can be interpreted non-referentially on a variety of other occasions. We resolve the puzzle by proposing a unified analysis of Y-FR based on the following assumptions: (i) the FY definite description is inherently a predicative structure. (ii) Such a predicate is interpreted via choice function. (ii) The function is represented by an epsilon term ϵ which is a function from sets of individuals into singleton sets. (iii) The output of the epsilon function undergoes further compositional operations to derive the referential and non-referential readings of the Y-FR definite description. © 2021 Elsevier B.V.

ABSTRACT: Background: The twenty first century can be called the genomic era referring to the rapid development of genetics, and the beginning of genomic medicine. An initial step towards genomic medicine is to evaluate the knowledge and attitude towards genetic testing among different populations. The aims of this study were to assess the genetic knowledge and attitude towards genetic testing among the Jordanian population and patients with immune diseases. In addition, we evaluated the association between knowledge, attitude and several demographic factors of the population. Methods: This study was performed using an online questionnaire that was distributed to respondents from different regions of Jordan. Results: A total of 1149 participants were recruited from the Jordanian population. Overall factual genetic knowledge of the participants was good (65.4%), with education level, working or studying in a health-related field and household average monthly income being significant predictors of factual knowledge scores ($P = 0.03$, $P < 0.001$ and $P < 0.001$, respectively). However, factual knowledge results revealed that scores of questions related to diseases were significantly higher than scores of gene-related scientific facts ($P < 0.01$). Participants of our study reported to have low perceived knowledge on medical uses (39.5%) and social consequences (23.9%) of genetic testing. Regarding the participants' attitudes, favorable attitudes towards genetic testing were prevailing (91.5%). Favorable attitudes were more prominent among higher educated participants, and participants with higher scores of factual knowledge. Conclusion: Despite the fact that our Jordanian-based study revealed a good level of genetic knowledge as well as a favorable attitude towards genetic testing, we realized an imbalance of knowledge between gene-related scientific facts and disease-related concepts as well as between factual and perceived genetic knowledge, which indicates the necessity of increasing the awareness about genetic testing in order to ensure that individuals can take informed decisions that help in the employment of personalized medicine. © 2021 The Author(s)

ABSTRACT: Introduction: Improvement in nurses' features such as self-awareness, empathy, and patient-centered care leads to positive patient outcomes. High fidelity simulation is one of the interventions which was used to enhance the mentioned nursing students' features. This study aimed to evaluate the effect of high-fidelity simulation on students' perception of self-awareness, empathy, and patient-centered care at pre and post-intervention in undergraduates' pediatric nursing students at Arab American University in Palestine. Methods: A group of pretest-posttest design was used. The accessible sample of all undergraduate pediatric nursing students ($N = 83$) who enrolled in the pediatric classes in the Faculty of Nursing was recruited. Results: The findings showed a significant difference between students' perceptions pre and post high-fidelity simulation intervention for self-awareness ($t = -31.74$, $p < 0.001$), empathy ($t = -18.24$, $p < 0.001$), and patient-centered care ($t = -17.36$, $p < 0.001$). There was a statistically significant improvement in self-awareness, empathy, and patient-centered care as a result of simulation. Conclusion: The findings of this study suggest infusing the nursing curriculum, particularly, pediatric course with simulation based-teaching intervention to increase self-awareness, empathy, and patient-centered care is a critical issue to fill gaps in these areas and to supplement traditional clinical learning. © 2021

ABSTRACT: The rapid growth in mobile technology has provided an opportunity for the design and development of mobile health technologies in the Arab region. Nonetheless, available literature has not been able to provide information on the types of systems, use patterns and challenges faced during the implementation of mobile Health (mHealth) systems in the Arab countries. This lack of evidence-based study to classify mHealth technologies, use and possible obstacles has an important role in the continuous development, implementation and future research trends of mHealth technologies in the Arab world. This study filled the gap by way of a systematic review of previous studies conducted within a decade from seven online databases to explore the current evidence on the use of mHealth in the Arab countries. The findings from a systematic review of 31 studies classified the main mHealth systems into four categories: self-healthcare management systems, assisted healthcare systems, supervised healthcare systems and continuous monitoring systems. Self-healthcare management systems were the dominant mHealth solutions while continuous monitoring systems were the least utilized. Generally, there was a low usage level of m-health systems in the Arab world underpinned by challenges such as User interface (UI), cloud storage, platforms, quality of service (QoS), security and data acquisition. © 2021, IUPESM and Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: In the recent decade, comprehensive research efforts have been carried out as the promising modality of bio metrics on humans' physical features for person recognition. Despite this, the main issue encountered in identifying individuals is obtaining rich representation for multi-modal data that is invariant to diverse physical traits. The shortcomings of uni-modal bio metric systems can be tackled by combining derived knowledge from several modalities of bio metric systems embedded with several physical characteristics like Ear, Face, Iris, and Gait. This paper proposes a novel multi-modal bio metric identification framework based on a hybrid multi-phase feature fusion to render compact knowledge from multiple model traits. We employed transfer learning through several pertained networks such as Resnet101, Resnet-Inceptionv2, Densenet201, AlexNet, and Inceptionv2 to fuse with handcrafted feature vectors extracted via Hog feature descriptor. The fusion is performed using Discriminant Correlation Analysis (DCA) and Canonical Correlation Analysis (CCA) at each single and hybrid phase. Three state of the art bio metric databases, namely Face, Gait, and Ear, was utilized to evaluate the proposed framework. The proposed framework based on multi-phase hybrid fusion achieved up to 96.6% of identification accuracy using multi traits. Experimental results confirm the superior results over other recent multi-modal bio metric variants. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: A simple, rapid and efficient method of preconcentration and determination of selected toxic heavy metals from herbal phytopharmaceutical product matrices using inductively coupled plasma and flame atomic absorption spectrometry after preconcentration with chelating resin (chelex-100) was developed. In this study, 24 samples representing phytopharmaceutical remedies in different dosage forms such as tablet, capsule, suppository, syrup and tea bag that are available in Pharmaceutical Jordanian companies were investigated for the presence of Pb, Cd, Al and As to establish their normal concentrations range and consider their levels according to some worldwide permissible limit guidelines. The %relative standard deviation was < 5%. Pb, Cd, and Al concentrations were ranged (0.01-30.84 µg/g), (0.001-0.85 µg/g) and (1.81-215.19 µg/g), respectively, whereas As level was below the detection limit. The percent contribution of raw material heavy metal content for tablet dosage forms was in the average of 88.39%, 79.85% and 83.13% for Pb, Cd and Al, respectively. Graphic

ABSTRACT: Purpose: A good understanding of children's emotions, activities, and needs should be promoted. This study assessed temper tantrum behaviour, including frequency, severity, duration, common behaviours, reasons, locations, contexts, and parent's strategies, among Jordanian children aged 24–48 months. Design and methods: A cross-sectional design was used to conduct this study. A non-probability convenience sample was adopted to recruit 213 parents of children aged between 24 months to 48 months. All parents completed the Parents' Experience of Temper Tantrums in Children's questionnaire. Results: Findings showed that about half of the children experienced weekly tantrums, however, half of the parents reported that mild tantrums were exhibited by their youngsters, with an average duration of minutes. The most frequently reported tantrum behaviour was 'screaming or shouting'. "Seeking attention" was the most frequent reason and most tantrums occurred when visiting someone else's home. Unfamiliar situations were the most commonly associated with tantrum episodes. The main strategies used by parents to lessen their child's tantrums were first, stating a consequence (e.g., timeout), and secondly, ignoring the behaviour. Conclusions: The results draw attention to significant aspects of tantrums, such as the duration, where children managed to maintain a tantrum episode for more than seven minutes on average. Tantrum behaviours, reasons, locations, context, and parents' strategies to control tantrums were significant in developing proper interventions. Practice implications: The findings of this study are of practical use in equipping parents and caregivers with the appropriate strategies to enable them to halt tantrums among children. © 2021 Elsevier Inc.

ABSTRACT: Purpose: This study examines the association between selected socio-demographic factors (gender, birth order, parents' educational levels, and parents' employment status) and reasons for vaccination delay among Jordanian children under two years of age. Design & methods: A cross-sectional, prospective study was conducted in the three comprehensive public health centres in Amman Governorate in Jordan from January–June, 2019. The electronic vaccination record was designed to collect socio-demographic information and reasons for vaccination delay in children. This data was collected from the medical records of those children. Results: The findings revealed that 150 (8.3%) children under two years of age were registered as vaccination-delayed cases. The factors associated with vaccination delay were age (Chi-square test [χ^2] [6150] = 15.02, p-value [p] < 0.01), birth order (χ^2 [6150] = 15.02, p < 0.01), mother's educational level (χ^2 [2150] = 9.27, p < 0.05), and father's and mother's employment (χ^2 [2150] = 7.89, p < 0.05; χ^2 [2150] = 10.54, p < 0.01, respectively). Conclusion: Timeliness of vaccination should be promoted to prevent illness outbreaks and provide specific protection for children, taking into consideration the significance of age and birth order. Practice implications: Interventions and strategies need to implementation to reduce vaccination delay and improve timeliness. © 2021 Elsevier Inc.

ABSTRACT: In cryptography, the previous research generally appears ambiguous and complex to the novice researcher due to the use of complex mathematical equations and rules of cryptography. Moreover, many research approaches lack flexibility in their key length or in their level of encryption. Consequently, combining simplicity, flexibility, and reliability is not easily obtainable in a cryptosystem, especially for larger and more complex data items. Therefore, a new system, called Flexible cryptosystem based on Cellular Automata (FcCA), is proposed here as a novel simplified flexible cryptosystem based on cellular automata (CA). FcCA presents simplified techniques for making CA reversible while creating a robust flexible cryptosystem that performs lossless encryption of three-dimensional (3D) objects and images of different types. It uses pure random CA as a diffusion technique, and it employs a modified existing confusion technique by substituting the static start point with proposed multi-dynamic intersected start points. In addition, FcCA novelty includes using a combination of aspects: random configuration with open boundary conditions, g-th order memory independent-cell technique, and classification of two parts of the encryption key into subkeys. The length and complexity of FcCA subkeys can be controlled easily because the subkeys depend on flexible parameters. Testing and validation of FcCA scrambling level were performed with several criteria including correlation, entropy, peak signal to noise ratio, and value difference degree. Experimental results showed that FcCA has high flexibility, a high level of scrambling, and higher robustness of keys compared to other methods of encryption. In addition, sensitivity analysis showed FcCA to be highly sensitive to changes in the encryption key and encrypted images and objects. Overall, the properties of FcCA demonstrated its effectiveness as a cryptosystem for images and 3D objects. © 2019 The Authors

ABSTRACT: Herein, the antiproliferative effect of surface-decorated gold nanorods (GNRs) was investigated against three different breast cancer cell lines. The results indicate that the cell lines exhibited different biological responses and death modalities toward the treatment. The cell lines exhibited similar cellular uptake of the nanoparticles; however, MDA-MB-231 demonstrated the highest cytotoxicity compared to other cell lines upon treatment with GNRs. The expression of the CDH1 gene, which is involved in cell adhesion and metastasis, was dramatically increased in treated MDA-MB-231 cells compared to other cell lines. Early apoptosis and late apoptosis are the dominant cellular death modalities of MDA-MB-231 cells upon treatment with GNRs. © 2021 The Authors. Published by American Chemical Society.

ABSTRACT: The synthesis, characterization, and protonation of $[\text{Fe}_2(\text{CO})_6\{\mu\text{-SCH}_2\}_2(\text{Et})\text{P}=\text{O}]$ (1) using the moderately strong acid $\text{CF}_3\text{CO}_2\text{H}$ ($\text{pK}_a\text{MeCN} = 12.7$) are reported. Digital simulations of the cyclic voltammetry of 1 in the presence of $\text{CF}_3\text{CO}_2\text{H}$ and DFT calculations have allowed us to obtain a detailed mechanistic picture of the processes underlying the catalytic hydrogen evolution reaction (HER) that 1 can mediate. Moreover, DFT has shed light on the role of the $\text{P}=\text{O}$ functionality in the whole catalytic cycle of proton reduction. The reductive behavior of 1 features a double electron transfer with potential inversion, which is associated with deep structural rearrangement of the catalyst. The double reduction appears also functional to the intramolecular proton transfer from the $\text{P}=\text{O}$ group to the diiron core, a crucial process for the H^+/H -heterocoupling yielding H_2 . The key intermediate for the H_2 formation and release is predicted to be a $3\text{H}^+/3\text{e}^-$ species, in which $\text{P}=\text{O}$ is perfectly poised to shuttle protons from solution to the Fe-H-Fe moiety. Therefore, the R-P=O bridgehead installed in a dithiolato linker of a diiron core proves a valid and versatile alternative to the natural nitrogen-based Fe_2strap . © 2021 American Chemical Society

ABSTRACT: Herein, a polymeric nanofiber scaffold loaded with Quercetin (Quer)-gold nanorods (GNR) was developed and characterized. Several parameters related to loading Quer into GNR, incorporating the GNR-Quer into polymeric solutions, and fabricating the nanofibers by electrospinning were optimized. GNR-Quer loaded into a polymeric mixture of poly(lactic-co-glycolic acid) (PLGA) (21%) and poloxamer 407 (23%) has produced intact GNR-Quer-nanofibers with enhanced physical and mechanical properties. GNR-Quer-nanofibers demonstrated a slow pattern of Quer release over time compared to nanofibers free of GNR-Quer. Dynamic mechanical thermal analysis (DMTA) revealed enhanced uniformity and homogeneity of the GNR-Quer-nanofibers. GNR-Quer-nanofibers demonstrated a high ability to retain water upon incubation in phosphate buffer saline (PBS) for 24 h compared to nanofibers free of GNR-Quer. A cellular toxicity study indicated that the average cellular viability of human dermal fibroblasts was 76% after 24 h of exposure to the nanofibers containing a low concentration of GNR-Quer. © The Royal Society of Chemistry 2021.

ABSTRACT: Objectives This study aims to explore home-treated COVID-19 patients' experiences and perceptions of pharmaceutical care services offered during their sickness. Methods This is a cross-sectional online questionnaire study, where a 30-item questionnaire was texted via a link to COVID-19 patients who were tested positive previously. A list of anonymised numbers was obtained from different COVID-19 testing centres. The study received ethical approval from the Institutional Review Board at the King Abdulla University Hospital/Jordan University of Science and Technology. Key findings A total of 268 patients who were previously diagnosed with COVID-19 agreed to participate in this study. Only 22.9% of patients reported taking medications regularly. Almost one-third of respondents (28.7%) indicated that pharmacists were involved in prescribing medicine to patients. Almost half the respondents (49.6%) stated that they or their caregivers obtained information and advice about their medicine from the pharmacists. Only 54.9% of the respondents agreed/strongly agreed that pharmacists have enough scientific information to provide the necessary medical assistance to COVID-19 patients. Patients who work in the medical field, and who always get their medication from the same pharmacy, showed better perception towards pharmaceutical care services that

might be provided to COVID-19 patients ($P < 0.01$). Conclusions Pharmacists had an unsatisfactory contribution to the management of the disease in outpatient settings. Moreover, there was a poor perception of the pharmacists' role including their knowledge, communication skills and counselling skills. Thus, it is essential to improve pharmacists' knowledge and practices about infectious diseases. © The Author(s) 2021. ABSTRACT: UDP-glucuronosyltransferases (UGTs) are phase II drug-metabolizing enzymes that metabolize endogenous fatty acids such as arachidonic acid metabolites, as well as many prescription drugs, such as opioids, antiepileptics, and antiviral drugs. The UGT1A and 2B genes are highly polymorphic, and their genetic variants may affect the pharmacokinetics and hence the responses of many drugs and fatty acids. This study collected data and updated the current view of the molecular functionality of genetic variants on UGT genes that impact drug responses and the susceptibility to human diseases. The functional information of UGT genetic variants with clinical associations are essential to understand the inter-individual variation in drug responses and susceptibility to toxicity. © 2021 by the authors. ABSTRACT: Objective: The message delivered to the public regarding vitamin D is unclear, and contradictory; particularly regarding sun exposure; previous studies in Jordan have revealed high prevalence of low vitamin D among university students. The aim of this study was to investigate university students' knowledge, attitudes and practice regarding vitamin D. Design: A web-based cross-sectional survey Setting: The survey was completed by students at a Jordanian university in 2019. Method: The survey collected sample characteristics data and information about university students' knowledge, attitudes, and practice toward vitamin D. The χ^2 test was used to assess the associations between the sample characteristics and their vitamin D knowledge and practices and to evaluate the association between participants' knowledge and practices. Binary logistic regression analysis was used to predict supplement use. Results: 496 students completed the questionnaire. The mean knowledge score was 31.3 (± 11.3) out of 100. Women had significantly higher beliefs that vitamin D deficiency is an escalating health issue ($p < 0.01$). Negative practices regarding sun exposure were significantly higher in women than men ($p < 0.01$). The majority of participants recognized that insufficient sun exposure was a cause of vitamin D deficiency, but 50.7 % avoid sun exposure, and 67.6% expose only their face and hands. The consumption of fortified foods (OR 3.59; $p < 0.001$) was the only studied variable associated with vitamin D consumption. Conclusion: There is a gap between knowledge, attitude, and practice regarding vitamin D which can be bridged by promoting Vitamin D related awareness. © 2021, Bahrain Medical Bulletin. ABSTRACT: This study aimed to improve the dissolution of the poorly soluble drug lopinavir (LPV) by preparing amorphous solid dispersions (ASDs) using solvent evaporation method. The ASD formulations were prepared with ternary mixtures of LPV, Eudragit® E100, and microcrystalline cellulose (MCC) at various weight ratios. The ASDs were subjected to solid-state characterization and in vitro drug dissolution testing. Chemometric models based on near infrared spectroscopy (NIR) and NIR-hyperspectroscopy (NIR-H) data were developed using the partial least squares (PLS) regression and externally validated to estimate the percent of the crystalline LPV in the ASD. Initially, the solid-state characterization data of ASDs showed transformation of the drug from crystalline to amorphous. Negligible fraction of crystalline LPV was present in the ASD (3%). Compared to pure LPV, ASDs showed faster and higher drug dissolution (<2% vs. 60.3–73.5%) in the first 15 min of testing. The ASD was stable against crystallization during stability testing at 40 °C/75% for a month. In conclusion, the prepared ASD was stable against devitrification and enhance the dissolution of LPV. © 2021 Elsevier B.V.

ABSTRACT: Objectives: The Validation of Global Lung Initiative (GLI 2012) equations is required prior to their application in clinical practice in different regions. This study validated the GLI 2012 equations in Middle Eastern preschool aged children, which was not previously conducted. Study design: Spirometry measures were collected from 765 (54% males) healthy 3 to 5-year-old Jordanian children. z scores, percent predicted values, and frequency of measures below lower limit than normal (LLN) were calculated using GLI 2012 equations for Caucasians and Other or Mixed. Results: The mean of z-scores produced by GLI 2012 equation for Caucasians in FEV_{0.75}, FEV₁, FVC, FEV₁/FVC% and FEF₂₅₋₇₅ in boys were 0.03, 0.02, -0.13, 0.26 and -0.08 respectively, while in girls it was -0.03, 0.01, 0.02, -0.01 and -0.04 respectively, and the mean of z-scores produced by GLI-2012 Other or Mixed equations in FEV₁, FVC, FEV₁/FVC% and FEF₂₅₋₇₅ in boys were 0.56, 0.51, 0.09 and 0.12 respectively, and in girls it was 0.56, 0.67, -0.22 and 0.18 respectively. The frequency of measures below LLN as produced by Caucasians equation were not significantly different from the expected 5% in any of the spirometry parameters. Conclusion: The GLI 2012 for Caucasians is a reasonable fit for Jordanian preschool aged children. © 2021 Elsevier Ltd

ABSTRACT: Recently, an outbreak of a fatal coronavirus, SARS-CoV-2, has emerged from China and is rapidly spreading worldwide. Possible interaction of SARS-CoV-2 with DPP4 peptidase may partly contribute to the viral pathogenesis. An integrative bioinformatics approach starting with mining the

biomedical literature for high confidence DPP4-protein/gene associations followed by functional analysis using network analysis and pathway enrichment was adopted. The results indicate that the identified DPP4 networks are highly enriched in viral processes required for viral entry and infection, and as a result, we propose DPP4 as an important putative target for the treatment of COVID-19. Additionally, our protein-chemical interaction networks identified important interactions between DPP4 and sitagliptin. We conclude that sitagliptin may be beneficial for the treatment of COVID-19 disease, either as monotherapy or in combination with other therapies, especially for diabetic patients and patients with pre-existing cardiovascular conditions who are already at higher risk of COVID-19 mortality. © 2021 Sciendo. ABSTRACT: This study aimed to assess the prevalence of smoking and associated sociodemographic and economic factors as well as students' knowledge about and attitudes towards smoking among university students in Oman. A proportionate random sampling technique recruited 401 students from three universities in a cross-sectional study. The prevalence of smoking was 9.0%. Significant differences in gender, place of residence, if participants had received medical advice, years spent at the university, student income/day, family members who smoked, knowledge and attitude scores were identified. Universities in collaboration with health care providers should be leading the development of strategies to reduce the prevalence of smoking and to sustain the current knowledge and attitude towards smoking. Gender-specific approaches to smoking interventions need to be developed. © 2020, The Author(s).

ABSTRACT: In Internet of things (IoT) era, every device in the world is generating and uploading data. These data has to reach end devices for analysis, analytics and visualization. Smartphones are part of IoT era where they can generate and manipulate data. However, the processing power and the storage capacity is limited for this devices to reduce their sizes and their power usage. However, the data generated from these devices have to be secured before transmitted to other end point. In this work, a new steganography image data hiding is proposed, named HidSave. The algorithm is proposed to increase the privacy of the data in one hand and to reduce the storage capacity of the data on the other hand. HidSave adopts Sudoku game in embedding the data in the cover images. HidSave has been implemented and compared to lest significant bit (LSB) and turtle shell hiding algorithm. HidSave has higher embedding capacity and higher PSNR. © 2021 IEEE.

ABSTRACT: This paper provides an overview of the popularity of some state-of-the-art technology trends in Arab countries. Technology trends include artificial intelligence, internet of things, 5G mobile networks, edge computing, quantum computing, and blockchain. The study is done utilizing Google trends search data for these technologies over a period of five years. Data are gathered as time series. The study shows that most of the current technology trends are not popular in most of

the Arab countries which leads to a technological gap with the rest of the world. The United Arab Emirates shows that the current technology trends are popular among their people compared to other Arab countries. © 2021 IEEE.

ABSTRACT: Image recognition in smart systems and internet of things applications is rapidly developing. Significant advances in mobile computing technology and machine learning are expanding horizons to use image recognition in smart systems and IoT applications. This paper use the smart system based image matching system utilizing genetic algorithm to design an integrated service to improve the management of image recognition. An efficient genetic algorithm used to match an unknown pattern which represents a partial image with original image. This technique uses a parameter, namely, chromosome. It transformed the spatial coordinates position into a sequence of bits of small length depending on the dimension of the original image, whereby the matching will be obtained in a short time. The system was tested on a sample images showed high matching rate (97%). © 2021 IEEE.

ABSTRACT: Tobacco exposure has been linked to neuroinflammation and adaptive/maladaptive changes in neurotransmitter systems, including in glutamatergic systems. We examined the effects of waterpipe tobacco smoke (WTS) on inflammatory mediators and astroglial glutamate transporters in mesocorticolimbic brain regions including the prefrontal cortex (PFC), nucleus accumbens (NAc) and ventral tegmental area (VTA). The behavioral consequences of WTS exposure on withdrawal-induced anxiety-like behavior were assessed using elevated plus maze (EPM) and open field (OF) tests. Male Sprague-Dawley rats were randomly assigned to 3 experimental groups: a control group exposed only to standard room air, a WTS exposed group treated with saline vehicle, and a WTS exposed group treated with ceftriaxone. WTS exposure was performed for 2 h/day, 5 days/week, for 4 weeks. Behavioral tests (EPM and OF) were conducted weekly 24 h after WTS exposure, during acute withdrawal. During week 4, rats were given either saline or ceftriaxone (200 mg/kg i.p.) 30 min before WTS exposure. WTS increased withdrawal-induced anxiety, and ceftriaxone attenuated this effect. WTS exposure increased the relative mRNA levels for nuclear factor κ B (NF κ B), tumor necrosis factor- α (TNF- α), and brain-derived neurotrophic factor (BDNF) in the PFC, NAc and VTA, and ceftriaxone treatment reversed these effects. In addition, WTS decreased the relative mRNA of nuclear factor erythroid 2 related factor 2 (Nrf2), glutamate transporter 1 (GLT-1) and cystine-glutamate transporter (xCT) in PFC, NAc and VTA, and ceftriaxone treatment normalized their expression. WTS caused neuroinflammation, alteration in relative mRNA glutamate transport expression, and increased anxiety-like behavior, and these effects were attenuated by ceftriaxone treatment. © 2021 IBRO

ABSTRACT: Solar cleaning techniques were used to improve the performance of photovoltaic panels. A new nanomaterial SurfaShield G, TiO₂ based, was used as innovative solution for effective photovoltaic panel surface cleaning by spraying onto the 150 W photovoltaic panel, the results were compared to the uncoated panel with the same features. The properties of the material were tested in a specialized laboratory and showed excellent photocatalytic and resistivity for dust and super-hydrophilicity, the transmittance of the coated surface was improved even without any dust accumulation. In the harsh climate conditions at the Levant area, the Kingdom of Jordan, the output of the coated and uncoated panels was monitored for three months to show the performance improvement by calculate the additional power produced from the coating, the findings showed a 20% and 2.3% improvement in the maximum power and efficiency, respectively. © 2021 Elsevier Ltd

ABSTRACT: The outbreak of the novel SARS-CoV-2 virus has an enormous impact on health. People's views about the virus impact public health efforts to mitigate the pandemic. In this study, we measured misconceptions toward coronavirus in the Jordanian population; 2,544 participants from the Jordanian population completed an online survey. Questions in the survey addressed misconceptions divided into four categories: optimism bias, pessimism bias, magical beliefs, and conspiracy theory beliefs. Questions were evaluated on a Likert scale, and average/median scores for each category were evaluated ("one"high misconception to "five"low misconception). Overall, the most common misconceptions involved conspiracy theory beliefs (2.68 ± 0.83), whereas the least common involved magical beliefs (2.25 ± 0.75). Females had more misconceptions than males (2.52 versus 2.47, P = 0.04). Participants who had attended a lecture on coronavirus, had a higher level of education, worked in a medical field, lived in urban area, or resided in Amman or northern Jordan had fewer misconceptions about SARS-CoV-2/COVID-19 (2.64, 2.34, 2.33, 2.50 and 2.50 versus 2.53, 2.73, 2.72, 2.64, and 2.66, respectively, P < 0.001). The use of social media appeared to be an important factor influencing the likelihood of false beliefs (2.61 versus 2.38, P < 0.001). Understanding of the factors influencing public perceptions surrounding the SARS-CoV-2/COVID-19 pandemic will help public health authorities improve public understanding and compliance with public health recommendations directed at combatting the virus, including the use of surgical masks, thorough handwashing, and avoiding close contact. These messages will be better received by the public through correcting misconceptions surrounding COVID-19. Copyright © 2021 by The American Society of Tropical Medicine and Hygiene.

Impact of solvent selection and absorptivity on dissolution testing of acetylsalicylic acid enteric-coated tablets

(2021) Dissolution Technologies, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112122842&doi=10.14227%2fDT280221P22&partnerID=40&md5=e4df830d83e38288bff4a623f04c23bd>

AFFILIATIONS: Department of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan;

Department of Pharmacy, Middle East University, Amman, Jordan

ABSTRACT: The objective of this study was to investigate the effect of physiological conditions on the dissolution rate of acetylsalicylic acid (ASA) from two commercial brands compared against compendial tests. All parameters of the analysis were chosen according to ICH (Q2(R1)) guidelines and were validated statistically. The maximum wavelength (λ_{max}) and absorptivity (ϵ) for ASA were determined in different solvents at different pH values (6.8 and 4.9) by a validated UV-Vis spectrophotometric method. When ethanol (EtOH) was used as co-solvent, ϵ was found to be 3.15, and when 0.1 N NaOH was used, ϵ was 18.50. Dissolution tests were conducted according to pharmacopeia specifications; however, the lack of a direct specification in determining ϵ in the pharmacopeia has permitted enormous probabilities of employing different solvents. Herein, when NaOH was used to dissolve ASA, ϵ was calculated to be 18.50, and upon conducting compendial dissolution tests for enteric-coated tablets, only 20% of ASA was released after 4 h. When analyzing the same data using ϵ of 3.15 (calculated from dissolving ASA in EtOH), the amount of released ASA was found to be 95% after 2 h. Furthermore, the effect of a fed and fasted state pH was not significant on the dissolution rate, and both brands met the compendial requirements. © 2021, Dissolution Technologies

ABSTRACT: Lactate dehydrogenase (LDH) is a key enzyme in the last step of glycolysis, playing a role in the pyruvate-to-lactate reaction. It is associated with the prognosis and metastasis of many cancers, including breast cancer. In this study, we investigated the changes in LDH gene expression and lactate concentrations in the culture media during tamoxifen resistance development in the MCF-7 cell line, and examined LDHB promoter methylation levels. An upregulation of 2.9 times of LDHB gene expression was observed around the IC50 concentration of tamoxifen in treated cells, while fluctuation in LDHA gene expression levels was found. Furthermore, morphological changes in the cell shape accompanied the changes in gene expression. Bisulfate treatment followed by sequencing of the LDHB promoter was performed to track any change in methylation levels; hypomethylation of CpG areas was found, suggesting that gene expression upregulation could be due to methylation level changes. Changes in LDHA and LDHB gene expression were correlated with the increase in lactate concentration in the culture media of treated MCF-7 cells. © 2021 by the authors. ABSTRACT: Purpose: To evaluate factors associated with anxiety and depression among pharmacy students before and during COVID-19 pandemic. Methods: The Beck Depression Inventory-II (BDI-II) and the State-Trait Anxiety Inventory (STAI) questionnaires were translated into Arabic and placed on the e-learning platforms of two Jordanian universities after conducting cognitive interviews. Validity and reliability of the two translated questionnaires were evaluated by conducting Exploratory Factor Analysis (EFA) and calculating Cronbach's alpha. T-tests and binary regression were conducted to evaluate factors associated with anxiety and depression among pharmacy students. Results: Several factors were associated with depression and anxiety including being an international student ($p < 0.05$), living alone and away from their primary country of residence ($p < 0.05$), female gender ($p < 0.01$), and being a fifth-year student ($p < 0.01$). Conclusion: A tool to evaluate anxiety and depression among pharmacy students in Jordan has been successfully validated. Also, the results show that pharmacy students suffered from high levels of anxiety and depression, particularly during the COVID-19 pandemic. © 2021 University of Benin. All rights reserved.

ABSTRACT: The transmembrane protease serine 2 (TMPRSS2) is a membrane anchored protease that primarily expressed by epithelial cells of respiratory and gastrointestinal systems and has been linked to multiple pathological processes in humans including tumor growth, metastasis and viral infections. Recent studies have shown that TMPRSS2 expressed on cell surface of host cells could play a crucial role in activation of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) spike

protein which facilitates the rapid early entry of the virus into host cells. In addition, direct suppression of TMPRSS2 using small drug inhibitors has been demonstrated to be effective in decreasing SARS-CoV-2 infection in vitro, which presents TMPRSS2 protease as a potential therapeutic strategy for SARS-CoV-2 infection. Recently, SARS-CoV-2 has been shown to be capable of infecting gastrointestinal enterocytes and to provoke gastrointestinal disorders in patients with COVID-19 disease, which is considered as a new transmission route and target organ of SARS-CoV-2. In this review, we highlight the biochemical properties of TMPRSS2 protease and discuss the potential targeting of TMPRSS2 by inhibitors to prevent the SARS-CoV-2 spreading through gastro-intestinal tract system as well as the hurdles that need to be overcome. © 2021, The Author(s), under exclusive licence to Springer Nature B.V.

ABSTRACT: School of Pharmacy, Queen's University Belfast, Belfast, United Kingdom Background Oral contraceptive pills (OCPs) are considered one of the most important birth control methods globally. However, these pills were designed for female administration rather than males. This study was designed to investigate patterns of OCPs use and abuse among Jordanian males, according to the community pharmacists' observations. Method A mixed-method explanatory sequential study was conducted using an online self-administered survey, followed by semi-structured in-depth interviews for registered pharmacists, assistant pharmacists and pharmacy interns. The interviews were utilized using a conceptual framework. Inductive thematic analysis and descriptive/regression analyses were completed using Nvivo and SPSS, respectively. Results A total of 158 questionnaire responses and 22 interviews were included in our analysis. Around half (48.4%) of the questionnaire responses confirmed that males could use OCPs for hair growth enhancement, muscle gain and acne treatment 12.7%, 31.7% and 4.4%, respectively. Through the interviews, the participating pharmacists highlighted that males use OCPs mostly for bodybuilding purposes, according to recommendations by their coaches at the gym. The most abused OCPs containing estrogen (Ethinyl estradiol) and progestins (Drospirenone or Levonorgestrel Conclusion This study provided insight into unexpected uses of OCPs by males in Jordan. Community pharmacists have a crucial role in the management of OCPs use and abuse. However, restricted regulations and monitoring must be released and implemented on the community to limit such practices. © 2021 Barakat et al. ABSTRACT: This article highlights the main aspects of Jordan's public health response in combating the COVID-19 pandemic. Also, it briefly describes the main characteristics of the pandemic waves. Although Jordan has successfully implemented various stringent control measures at the early stage of the pandemic which resulted in a slow pace of COVID-19 spread in the country, the dramatic and sudden surge in COVID-19 cases and deaths since September 2020 raises many concerns and questionable debates regarding the effectiveness of Jordan's COVID-19 mitigation strategies, the earlier epidemiological surveillance process, decision-making and decisions' execution at various sectors, as well as the degree of commitment to precautionary measures among the general population. Jordan has passed through three distinct pandemic stages so far, and each stage provides lessons that can be used to improve the national preparedness and response plan in the future. This pandemic has afflicted most life domains; thus, sharing the responsibility and efforts between the government and people in

combating it, is expected to be more efficient and effective than a one-sided response. Pandemic fatigue can act as a major risk factor for losing such a battle. The people of Jordan have been already through an unforgettable 2020 year that impacted them physically, emotionally, and even financially. Therefore, reliable actions should be considered by the decision-makers to provide sufficient support for the society. Also, strengthening the government-public partnership is a cornerstone for a successful, solid, and effective public health response, especially in times of an exhaustive pandemic crisis like the COVID-19. © 2021 The Authors

ABSTRACT: Background: Human soluble epoxide hydrolase plays a major role in cardiovascular homeostasis. Genetic variants in the EPHX2 gene among different ethnic groups are associated with cardiovascular complications, such as hypertension. However, no reports regarding the association of EPHX2 genotype with hypertension among type II diabetic (T2D) patients of Middle Eastern Jordanian origin exist. Objective: The current study aimed to elucidate the association of the EPHX2 allele, genotype and haplotype with T2D, hypertension and parameters of lipid profile parameters among Jordanian T2D patients. Methods: Ninety-three genomic DNA samples of non-diabetic controls and 97 samples from T2D patients were genotyped for EPHX2 rs4149243, rs2234914 and rs751142 genetic variants. The DNA samples were amplified using polymerase chain reaction (PCR) and then sequenced using Applied Biosystems Model (ABI3730x1). The functionality of intronic EPHX2 variants was predicted using the in silico Berkely Drosophila Genome Project software. Results: We found no significant ($P > .05$) association between the EPHX2 rs4149243, rs2234914 and rs751142 allele, genotype and haplotype and the incidence of T2D and hypertension. Additionally, no association ($P > .05$) between these EPHX2 genetic variants with the baseline total cholesterol, low- and high-density lipoproteins and triglycerides among both non-diabetic and diabetic volunteers was found. However, we found an inter-ethnic variation (χ^2 -test, P value $< .05$) in the allele frequency of the EPHX2 rs4149243 and rs2234914 variants between Jordanians and other ethnic populations. Also, the in silico Berkely Drosophila Genome Project software predicted that the intronic EPHX2 rs4149243 could alter the splicing of intron 7. Conclusions: It can be concluded from this study that EPHX2 rs4149243, rs2234914 and rs751142 genetic variants do not play a role in the development of T2D and hypertension among Jordanian T2D patients. Further genetic studies with larger sample sizes are needed to find out the association of other functional EPHX2 variants with cardiovascular diseases among T2D patients in Jordan. © 2021 John Wiley & Sons Ltd

Akour, A., Abuloha, S., Mulakhudair, A.R., Kasabri, V., Al-Tammemi, A.B. Complementary and alternative medicine for urinary tract illnesses: A cross-sectional survey in Jordan (2021) Complementary Therapies in Clinical Practice, .

ABSTRACT: The aim of this study was to assess the extent of Complementary and Alternative Medicine (CAM) usage, especially herbal preparations, in treating urinary tract illnesses, and their perceived efficacy. This was a cross-sectional survey that used a convenience sample of 278 adults who reported having any form of urinary tract illness. During the last 3 months, 105 (37.8%) of participants had used CAM for various urinary tract conditions, of which, 87 (82.9%) used herbal remedies. Urinary tract infections (UTIs) were the most reported urinary condition ($n = 77$, 73.3%) among CAM users. The most commonly used herbs were, parsley ($n = 54$, 19.2%), followed by chamomile ($n = 29$, 10.4%), barley

(n = 20, 7.4%) and ginger (n = 18, 6.7%). The study provides an overview of various CAM remedies used to treat urinary tract illnesses in the Jordanian society, which would draw attention to the necessity of conducting interventional studies to evaluate the efficacy and safety of CAMs in treating urinary tract illnesses, either as stand-alone or adjuvant treatment. © 2021 Elsevier Ltd

ABSTRACT: Background: Lipid control represents a cornerstone in the management of atherosclerotic cardiovascular disease (ASCVD). Nevertheless, little research has explored the factors associated with poor lipid control in patients with dyslipidaemia. Objective: The study aim was to investigate the variables associated with poor lipid control among patients with dyslipidaemia in Jordan. Method: In addition to socio-demographics, disease and medication-related variables, lipid profile including total cholesterol, LDL-C, HDL-C and triglyceride and other biomedical variables were collected for patients diagnosed with dyslipidaemia using hospital medical charts at three major outpatient clinics in Jordan. The validated 4-item medication adherence scale and the beliefs about medications questionnaire were used to evaluate medication adherence and medication beliefs among the study participants. The participants were classified to have controlled and uncontrolled dyslipidaemia using recent AHA guidelines. A stepwise forward conditional binary regression was conducted to explore the variables significantly and independently associated with dyslipidaemia control. A P-value of <.05 was considered statistically significant. Results: A total of 228 patients participated in the study. Most of the study participants (61%) were classified to have uncontrolled lipid profile and 60.1% of them were found to have ASCVD. Regression analysis revealed that increased necessity for dyslipidaemia medications increased the odds of dyslipidaemia control (OR = 1.14), whereas active smoking (OR = 0.42), low medication adherence (OR = 0.08) and the presence of ASCVD (odd ratio = 0.24) were significantly associated with poor dyslipidaemia control. Conclusion: Lipid profile has considerable scope for improvement in patients with dyslipidaemia in Jordan. Improving medication adherence by emphasising on medication necessity and simplifying the prescribed dosage regimen, particularly in smoking patients and those who have ASCVD, should be particularly considered in future clinical pharmacy service programmes aim at improving lipid control and health outcomes in patients with dyslipidaemia. © 2021 John Wiley & Sons Ltd

ABSTRACT: Background: The Global Lung Initiative 2012 (GLI-2012) spirometry equations are multi-ethnic equations that cover all ages between 3 and 95. However, there is a need to evaluate the suitability of these equations to a sample of Middle Eastern adolescents prior to being applied in clinical practice. The aim of this study is to evaluate the suitability of GLI-2012 equations and two regional equations to a sample of Jordanian adolescents. Methods: Spirometric measures were collected from 1036 healthy 14 to 17-year-old Jordanian children. z-scores, predicted values, percent predicted values, and frequency of measures below lower limit of normal (LLN) were calculated for each adolescent using the studied equations. Results: The means of z-scores produced by GLI-2012 equations for Caucasians in forced expiratory volume in the first second (FEV1), forced vital capacity (FVC), FEV1/FVC% and mid forced expiratory flow (FEF25-75) for boys were 0.12, -0.06, 0.34 and 0.09,

respectively, while for girls they were -0.09 , -0.16 , 0.19 and -0.05 , respectively. The mean of z-scores produced by GLI-2012 Other or Mixed equations in FEV1, FVC, FEV1/FVC% and FEF25-75 for boys were 0.74 , 0.72 , 0.21 and 0.33 , respectively, and for girls were 0.53 , 0.56 , 0.02 and 0.2 , respectively. The frequency of measures below LLN as produced by GLI 2012 for Caucasians were significantly different from the expected 5% in FEV1 and FEF25-75 in boys only, whereas Other or Mixed produced frequencies significantly different from the expected 5% in most of the parameters. Conclusion: Spirometry reference equations formulated for Jordanian adolescents may improve the diagnosis and treatment of asthma in Jordan. © 2021 John Wiley & Sons Ltd

ABSTRACT: Purpose: The study aim was to evaluate HRQOL and to explore the variables associated with poor HRQOL among patients with dyslipidemia in Jordan. Methods: The present study utilized the EQ-5D questionnaire which evaluates HRQOL in terms of mobility, self-care, usual activities, pain/discomfort, and anxiety/depression. Responses to the five dimensions were presented using the value set, which ranges from 1 for full health to -0.594 for severe problems in all five dimensions. Multiple linear regression analysis was implemented to identify the variables that best predicted the total EQ-5D score and hence HRQOL in the study population. Results: The mean age of the 228 participants was 60.23 (SD = 10.64). The mean of the total EQ-5D score was 0.675 (SD = 0.14). Regression analysis identified necessity for dyslipidemia medication (B = 0.18 , P < 0.01) and patients with controlled lipid profile (B = 0.28 , P < 0.01) were positively associated with HRQOL, while having concerns about dyslipidemia medications (B = -0.16 , P < 0.01), number of medication (B = -0.13 , P = 0.02), duration of dyslipidemia (B = -0.22 , P < 0.01), receiving high-intensity statin (B = -0.18 , P < 0.01) or statin in combination with fibrate (B = -0.15 , P < 0.01) were associated with lower HRQOL. Conclusion: HRQOL has considerable scope for improvement in patients with dyslipidemia in Jordan. Improving dyslipidemia medications' beliefs and simplifying medication regimen by prescribing less medications, particularly for patients with longer disease duration and those on statin therapy, should be considered in future management programs aim at improving HRQOL in patients with dyslipidemia. © 2021, The Author(s), under exclusive licence to Springer Nature Switzerland AG part of Springer Nature.

ABSTRACT: Image segmentation has proved its importance and plays an important role in various domains such as health systems and satellite-oriented military applications. In this context, accuracy, image quality, and execution time deem to be the major issues to always consider. Although many techniques have been applied, and their experimental results have shown appealing achievements for 2D images in real-time environments, however, there is a lack of works about 3D image segmentation despite its importance in improving segmentation accuracy. Specifically, HMM was used in this domain. However, it suffers from the time complexity, which was updated using different accelerators. As it is important to have efficient 3D image segmentation, we propose in this paper a novel system for partitioning the 3D segmentation process across several distributed machines. The concepts behind distributed multimedia network segmentation were employed to accelerate the segmentation computational time of training Hidden Markov Model (HMMs). Furthermore, a secure transmission has been considered in this distributed environment and various bidirectional multimedia security algorithms have been applied.

The contribution of this work lies in providing an efficient and secure algorithm for 3D image segmentation. Through a number of extensive experiments, it was proved that our proposed system is of comparable efficiency to the state of art methods in terms of segmentation accuracy, security and execution time. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Biomimic of the active site of [FeFe]-hydrogenase containing bicyclic dithiols as bridging linker has been synthesized and characterized using different spectroscopic methods. The influence of this linker on the redox properties and the catalytic behavior of the resulted binuclear complex was investigated using cyclic voltammetry, showing that it can catalyze the reduction of protons to H₂ in the presence of acetic acid (AcOH). Moreover, the results revealed that the bicyclic dithiolene linker has improved the chemical stability of the reduced species and caused a shift to less negative potential in comparison to the synthetic models that mimic the active site of [FeFe]-hydrogenase reported in the literature. In addition, the structure of the resulted binuclear complex mediated by bicyclic dithiols as bridging linker was confirmed by X-ray diffraction analysis. © 2021 The Authors. ABSTRACT: The identification of reliable and non-invasive oncology biomarkers remains a main priority in healthcare. There are only a few biomarkers that have been approved as diagnostic for cancer. The most frequently used cancer biomarkers are derived from either biological materials or imaging data. Most cancer biomarkers suffer from a lack of high specificity. However, the latest advancements in machine learning (ML) and artificial intelligence (AI) have enabled the identification of highly predictive, disease-specific biomarkers. Such biomarkers can be used to diagnose cancer patients, to predict cancer prognosis, or even to predict treatment efficacy. Herein, we provide a summary of the current status of developing and applying Magnetic resonance imaging (MRI) biomarkers in cancer care. We focus on all aspects of MRI biomarkers, starting from MRI data collection, preprocessing and machine learning methods, and ending with summarizing the types of existing biomarkers and their clinical applications in different cancer types. © 2021 by the authors. ABSTRACT: The aim of current study was to identify human phase I metabolites of omeprazole using mass spectrometry. An in-vitro assay was performed to generate metabolites by human liver enzymes. Fragmentation pathway of omeprazole was studied for the structure elucidation of metabolite by MS/MS and MS3 method using previously detected fragments. The base peak of omeprazole with m/z 198 was used for a precursor ion scan to detect possible metabolites containing m/z 198 as a fragment. Additional metabolites should be detected by the loss of a typical neutral group using m/z 148 for the offset of a neutral loss scan. The detected precursor ions (m/z 316, 330, 332, 346, 362) were analyzed by enhanced product ion scan in order to receive a mass spectrum for the comparison with the fragmentation of omeprazole. The three reactions (oxidation, reduction of the Sulphur and demethylation) were observed as phase I reactions. © 2021 Elsevier B.V.

ABSTRACT: In this study, neural network models, SVM, LSVM and multiple linear regression techniques were used to estimate the relation between PV power generated and the inputs variables of PV. Two Techniques were used to achieve this. The first technique is classical with multiple linear regression model, while the second one is neural network with two types of neural network (Multilayer Perceptron and Radial Basis Function (RBF)), Support Vector Machines (SVM) and Linear Support Vector Machines (LSVM). The work was conducted using SPSS software. The obtained estimated results were verified against measured data and it was found that using Multilayer Perceptron Network (MLP) model has good ability to recognize the relation between inputs and output variables, while the statistical error analysis showed the accuracy of data mining by using MLP model is acceptable. On the other hand, the obtained results indicate that SVM, RBF, LSVM and multiple linear regression, have the least ability for the estimation of the PV power generated respectively. © 2021 IEEE.

ABSTRACT: Electronic nicotine delivery systems (ENDs) are gaining popularity in Jordan as alternatives to tobacco cigarettes with an estimation of 10% of tobacco smokers switching to ENDs. Since nicotine is toxic and highly addictive substance, it is important to develop and validate an easy and rapid analytical method to accurately measure nicotine level in e-liquids. A simple high performance liquid chromatography- photodiode array detection (HPLC-PDA) method was developed and validated for rapid determination of the actual nicotine content in 11 of the most popular e-liquids brands available in the Jordanian market and compared to the nicotine levels appeared in the labeled packaging. The new method of analysis showed an excellent linearity with correlation factor equal to 0.9994 with analytical range between 100 and 1,000 µg/mL, and Limit of detection (LOD) and Limit of quantification (LOQ) of 32.6 µg/mL and 98.9 µg/mL, respectively. The results showed that the actual measured nicotine concentrations ranged from 0 to 25.81 mg/mL with percent deviation ranged from 63.1% less than to 3.24% more than the labeled concentration on packaging. And more than 10% deviation difference in actual nicotine concentrations versus labeled were found in 9 of the 11 e-liquid products (82%). In conclusion, nicotine labelling among e-liquids products have not accurately reflect the actual content which may have potential negative impact on users. © 2020 The Authors.

ABSTRACT: Purpose: To determine the effect of rosiglitazone on the levels of the cardiotoxic arachidonic acid metabolite, 20-hydroxyeicosatetraenoic acid (20-HETE), in the human liver hepatocellular carcinoma cell line, HepG2. Methods: HepG2 cells were treated with thiazolidinedione rosiglitazone and the mRNA and protein expressions of cytochrome P450 4F2 (CYP4F2) responsible for synthesizing 20-HETE were measured using quantitative real-time polymerase chain reaction (qRT-PCR) and western blotting. The levels of 20-HETE were evaluated using liquid chromatography/mass spectrometry (LC-MS). Results: Rosiglitazone significantly increased the levels of CYP4F2 mRNA and protein when compared with the control group ($p < 0.05$). This was correlated with significantly increased 20-HETE levels in the culture medium of rosiglitazone-treated cells in a dose-dependent manner ($p < 0.05$). The PPAR γ antagonist, GW9662, significantly repressed the increased production of 20-HETE and CYP4F2 mRNA protein ($p < 0.05$). Conclusion: Rosiglitazone increases the synthesis of 20-HETE via activation of PPAR γ receptor and upregulation of CYP4F2. These findings may provide an additional explanation, at least in part, for the unwanted side effects of rosiglitazone on the cardiovascular system. © 2021 The authors.

ABSTRACT: The mechanical strength, mass loss and dynamic elastic modulus of Portland cement concrete incorporating recycled glass powder (GP) as a cement replacement material or crushed glass aggregate (GA) as a fine aggregate replacement material subjected to different cycles of freezing and thawing were investigated. A series of 11 concrete mixing proportions was designed with a constant water/cement ratio of 0.5 including fractions of GP or GA. Tests were conducted on 100 x 100 x 100 mm cubes, 100 x 200 mm cylinders and 100 x 100 x 500 mm prisms. The tests of compressive strength, flexural strength and indirect tension were used to examine the impact of the inclusion of different percentages of glass (GP or GA) on the mechanical properties of concrete cured for 7, 28 and 60 d. Two non-destructive testing approaches (ultrasonic pulse velocity and resonance frequency) were used in the freezing and thawing test. The test results indicated that, compared with conventional concrete, the mechanical strength characteristics of concrete containing GP or GA were more enhanced. The use of GP decreased the deterioration of the concrete under the effect of frost action, whereas the use of GA had an adverse influence on the frost resistance of the concrete. © 2021 ICE Publishing. ABSTRACT: In this paper, the optimal network dimensions of clustered-routing three-dimensional (3D) wireless sensor networks is provided. The derivation for such dimensions is based upon the minimum energy consumption cost function in the network. Two 3D network geometries are considered, namely, cuboid and cylinder networks. Analysis and simulations have shown that the minimum energy consumption of the two 3D geometries occurs in special dimensions setup. First, for the cuboid network the optimal network dimensions occur at equal length width and height. We refer to this network as cube network. Second, for the cylinder network the optimal case occurs when the radius of the network is around 68.4% of its height. The results are verified using simulations. Low energy adaptive clustering hierarchy protocol has been used as the underlining routing protocol in 3D environment. Total network remaining energy, stable region and network throughput are utilized for performance evaluation of the results. It is shown that networks with optimal dimensions achieve maximum network lifetime and throughput with minimum energy consumption. Moreover, in the optimal network dimensions settings the cylinder network utilizes energy more efficiently and outperforms the cube network in terms of network lifetime and throughput. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature.

ABSTRACT: Advancement of the prediction models used in a variety of fields is a result of the contribution of machine learning approaches. Utilizing such modeling in feature engineering is exceptionally imperative and required. In this research, we show how to utilize machine learning to save time in research experiments, where we save more than five thousand hours of measuring the energy consumption of encoding recordings. Since measuring the energy consumption has got to be done by humans and since we require more than eleven thousand experiments to cover all the combinations of video sequences, video bit rate, and video encoding settings, we utilize machine learning to model the energy consumption utilizing linear regression. VP8 codec has been offered by Google as a free video encoder in an effort to replace the popular H.264 video encoder standard. This research model energy consumption and describes the major differences between H.264/AVC and VP8 encoders based on of energy consumption and performance through experiments that are machine learning-based modeling. Twenty-nine uncompressed video segments from a standard data-set are used, with several sizes, details, and dynamics, where the frame sizes ranging from QCIF(176x144) to 2160p(3840x2160). For fairness in comparison analysis, we use seven settings in VP8 encoder and fifteen types of tuning in H.264/AVC. The settings cover various video qualities. The performance metrics include video qualities, encoding time, and encoding energy consumption. © 2021 Institute of Advanced Engineering and Science. All rights reserved.

ABSTRACT: Many routing protocols, such as distance vector and link-state protocols are used for finding the best paths in a network. To find the path between the source and destination nodes where every node is visited once with no repeats, Hamiltonian and Hypercube routing protocols are often used. Nonetheless, these algorithms are not designed to solve the problem of a node failure, where one or more nodes become faulty. This paper proposes an efficient modified Fault-free Hamiltonian Cycle based on the Hypercube Topology (FHCHT) to perform a connection between nodes when one or more nodes become faulty. FHCHT can be applied in a different environment to transmit data with a high-reliability connection by finding an alternative path between the source and destination nodes when some nodes fail. Moreover, a proposed Hamiltonian Near Cycle (HNC) scheme has been developed and implemented. HNC implementation results indicated that FHCHT produces alternative cycles relatively similar to a Hamiltonian Cycle for the Hypercube, complete, and random graphs. The implementation of the proposed algorithm in a Hypercube achieved a 31% and 76% reduction in cost compared to the complete and random graphs, respectively. © 2021 Tech Science Press. ABSTRACT: Despite the fact that several studies have been conducted to study the adoption of

smartgovernment services, little consideration has been paid to exploring the main factors that influence the adoption of smart-government services at the three main stages of smart-government services (the static, interaction, and transaction stages). Based on the results of this study, each of these three stages has different requirements in terms of system compatibility, security, information quality, awareness, perceived functional benefit, self-efficacy, perceived image, perceived uncertainty, availability of resources, and perceived trust. In addition, the results demonstrate that the requirements and perceptions of users towards the adoption and use of smart-government services in the three stages significantly differ. This study makes a unique contribution to the existing research by examining the perceptions and needs of consumers, in terms of adoption throughout the three stages. © 2021 by the authors. ABSTRACT: The aim of this study was to assess the wound healing potential of *Schinus molle* L. aqueous and ethanol extracts. First, the antimicrobial activity of *Schinus molle* extracts was tested against six microorganisms (*Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus epidermidis*, *Enterococcus faecalis* and *Citrobacter freundii*). The growth of *Citrobacter freundii* and *Enterococcus faecalis* was totally inhibited by the aqueous extract at the lowest tested concentration (1.56 mg/mL). Next, in vitro wound healing assays were performed using human fibroblast cells' proliferation and scratch tests. Based on the obtained promising results, the aqueous extracts were further tested in an in vivo excision wound model in rats. Animals were treated with a hydrogel formula enriched with the plant aqueous extract in two different concentrations (2 % and 5 %). Re-epithelialization, fibrosis and neovascularization of the epidermis and sub-epidermal cells in the regenerated tissue was observed, accompanied by an increase in the tensile strength of the skin of the rats treated with the plant aqueous extract when compared to the negative control group. Our results strongly support the use of *Schinus molle* aqueous extracts in topical formulations to promote wound healing. © 2021 Indian Pharmaceutical Association. All rights reserved.

ABSTRACT: Forests are considered an essential part from the nature and the environmental system since it forms the key ecological contributor in the balance of the nature. Unfortunately, this balance is greatly affected by forest fires that regularly happen in all forest all over the world. These fires have a long-term effect on money, environmental and social aspects. There is usually a loss in human lives besides properties' destruction and hence uninterrupted effect on individual or collective level occur. A great deal of attention was recently given for developing the suitable systems that can reactively and proactively act against these fires. In fact, WSNs is considered one of the promising solution to be used in detecting and mentoring the forest fires efficiently. Different schemes for forests fire detection based on WSNs was proposed in the literature. our proposed system has a distinctive benefit since it gathers between detection and fire behavior prediction analysis. The early detection before its too late using novel designed system for sensor coverage and fire detection with a reduced faulty alarm and distinguishing ability between argnet alarm and no action required alarms. Our techniques extended the network life time almost 3 times in comparison with other techniques. © Al-Zaytoonah University of Jordan (ZUJ)

ABSTRACT: The rapid development of information and communication technologies (ICT) helps governments to enhance the communications between their agencies through gaining speed, capacity, simplicity, and precision, which improve the productivity and effectiveness. Digitalization of the services make a new insurmountable prospect for world economy which affecting different sectors such as energy, banking, retail, publishing, transportation, education, health and media. This study aims to construct a theoretical framework describe the relationships between different factors impacting the m-government services and digital economy. Through review the updated and available literature about m-government and digital economy implementation stages and its challenges. The results of this study provide more accurate and comprehensive understanding of the association between m-government development and digital economy, also this study offers a set of recommendations as well as suggestions for the digital economy and m-government services improvements. ABSTRACT: Nowadays, Electricity energy is considered the lifeblood of many companies and industrial institutions. Most of these companies and industrial institutions are suffering from the high cost of the electricity bills because of the large amount of power they consumed per day. Thus, many of the researches are now focusing on how to eliminate the power usage in order to reduce the cost of electricity bills. This issue become significant in the current era. Fortunately, in this era, we are witnessing a revolution in the Internet of Things field, which can provide various solutions for reducing the power consumption. These solutions are based on sensing modules, Artificial Intelligence, and Deep Learning. Any IOT system that attempts to reduce the power wastage must take in consideration achieving a balance between the power conservation and the user satisfaction. This paper contributes the following; first, it proposes an intelligent IOT system for offices that reduces the total power cost by 40% based on the Lecture Time-Table (LTT). The LTT is the instructor's weekly load (i.e. the LTT shows how many classes does the instructor have per week and the number of hours for each class). Second, it achieves a balance between the power conservation and the user satisfaction by allowing manual controlling of appliances (via voice commands) and auto controlling of appliances (based on the LTT). Third, it achieves a balance between the user satisfaction and the power conservation based on the percentage of the overlapped time intervals of the LTTs. Fourth; it eliminates the use of sound sensors by developing a java program that is capable of capturing and handling the human voice. We built the baseline system, and then we compared the results from the baseline system with the results from our proposed IOT system. Our results showed that the proposed system saved about 40% of the power cost. © 2021

ABSTRACT: In this work we attempt to study the turnover aspect in an organization located in a country in the Middle East, namely, Jordan. This organization consists of 1000 employees and it works in the service sector. A questionnaire was harvested from 280 employees in this organization throughout an entire year. Afterwards, a statistical study has been conducted. In addition, a soft clustering (SC) algorithm has been leveraged to construct a turnover prediction model. The model divides the employees into three clusters depending on the survey results. At the end of the year, the predicted clusters and the actual results from the company's records have been compared. 84% of the employees clustered in the mobile cluster voluntarily turned over. Moreover, our results showed that public sector and abroad contracts are the main criteria of turnover. This statistical study, also, indicated that the HR department should take serious steps to improve the quality of the work environment in order to reduce the turnover rate in this company. These steps vary from small

management gratitude to employees to financial incentives. Copyright © Al-Zaytoonah University of Jordan (ZUJ)

ABSTRACT: The present study tackles the influence of jurisprudence of the administrative judiciary on the cancellation lawsuit in order to highlight the great burden on the administrative judiciary in comparison with the criminal and civil courts. The topic is discussed by examining the effect of judicial jurisprudence on the external legitimacy of the administrative decision. Lack of jurisdiction, form, and procedures in the administrative decision show the effect of jurisprudence on the internal legitimacy of the decision. The prominent results of the present study are that the comparative administrative judiciary requires commensurate legislation with the administrative judge's tasks and judicial staffs whose qualifications, competence, and capabilities of those in charge of the administrative judiciary. © 2021

ABSTRACT: Background: The remarkably increasing number of graduated pharmacists necessitates exploring the current Pharmacy and Pharm D students' future career choices in order to help the health policy makers to enhance effective health and education workforce planning. Objective: To identify Pharmacy and Pharm D undergraduates' attitudes and preferences toward different career choices and the factors that influence their career choice. Methods: Across sectional study using the online survey web Question Pro was conducted on undergraduate Pharmacy and Pharm D students through the fall semester of the academic year 2019/2020 at four Colleges of Pharmacy in Jordan. In addition to demographics, the survey evaluated students' attitudes toward different career choices, career choices preferences and how different factors could influence this choice. Mann Whitney U test, Chi-square test, Friedman test, Wilcoxon and Multivariable linear regression were applied to analyze the data. Results: A total of 354 undergraduate Pharmacy and Pharm D students completed the survey. Medical coverage and insurance was the most important variable affecting the students' career choice. The total sample favorite career choice was Academic and Research Centers (mean = 2.57), followed by Pharmaceutical companies (mean = 2.38), Hospital Pharmacy (mean = 2.36), Industry (mean = 1.79), and lastly Retail or Community Pharmacy (mean = 1.78). Males were significantly more tended to have a higher favorability scores for the Pharmaceutical Companies career choice than females. PharmD students had a significantly more favorable attitudes towards Hospital Pharmacy than Pharmacy students, who had a significantly more favorable attitude towards Retail or Community Pharmacy and Industry than Pharm D students. Conclusion: The current study provides baseline data necessary to formulate strategies in the educational institutions by incorporating different programs and lectures to expand the capabilities of pharmacy students to meet the requirements of different market sectors and change their mindset about the different pharmacy sectors. © 2021 The Authors

Effect of Modulation of the Astrocytic Glutamate Transporters' Expression on Cocaine-Induced Reinstatement in Male P Rats Exposed to Ethanol

(2021) Alcohol and Alcoholism, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102322286&doi=10.1093%2falcalc%2fagaa104&partnerID=40&md5=e15e646e2647ec71bfcc7be31396e6d0)

85102322286&doi=10.1093%2falcalc%2fagaa104&partnerID=40&md5=e15e646e2647ec71bfcc7be31396e6d0

ABSTRACT: Aim: Reinforcing properties of ethanol and cocaine are mediated in part through the

glutamatergic system. Extracellular glutamate concentration is strictly maintained through several glutamate transporters, such as glutamate transporter 1 (GLT-1), cystine/glutamate transporter (xCT) and glutamate aspartate transporter (GLAST). Previous findings revealed that cocaine and ethanol exposure downregulated GLT-1 and xCT, and that β -lactam antibiotics restored their expression. Methods: In this study, we investigated the effect of ampicillin/sulbactam (AMP/SUL) (200 mg/kg, i.p.), a β -lactam antibiotic, on cocaine-induced reinstatement and locomotor activity in male alcohol preferring (P) rats using free choice ethanol (15 and 30%, v/v) and water. We also investigated the effect of co-exposure to ethanol and cocaine (20 mg/kg, i.p.) on GLT-1, xCT and GLAST expression in the nucleus accumbens (NAc) core, NAc shell and dorsomedial prefrontal cortex (dmPFC). Results: Cocaine exposure decreased ethanol intake and preference. Cocaine and ethanol co-exposure acquired place preference and increased locomotor activity compared to ethanol-exposed rats. GLT-1 and xCT expression were downregulated after cocaine and ethanol co-exposure in the NAc core and shell, but not in dmPFC. AMP/SUL attenuated reinstatement to cocaine as well as attenuated the decrease in locomotor activity and ethanol intake and preference. These effects were associated with upregulation of GLT-1 and xCT expression in the NAc core/shell and dmPFC. GLAST expression was not affected after ethanol and cocaine co-exposure or AMP/SUL treatment. Conclusion: Our findings demonstrate that astrocytic glutamate transporters within the mesocorticolimbic area are critical targets in modulating cocaine-seeking behavior while being consuming ethanol. © 2020 The Author(s) 2020. Strength-Dependent and Strength-Independent Dissolution Patterns of Poorly-Soluble Drugs. Case Example: Valsartan

(2021) Pharmaceutical Chemistry Journal, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102203679&doi=10.1007%2fs11094-021-02347-7&partnerID=40&md5=c3277c6a041e1d7bcc7b0cf3ac3ad02e>

AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study aims to investigate the strength-dependent dissolution pattern of two-dose strengths of valsartan: the low-dose strength of 80 mg and high-dose strength of 320 mg. For this purpose, the dissolution testing was carried out in media of buffer solutions that resemble physiological characteristics of the gastrointestinal fluid (GIF). The influence of various physiological GIF characteristics (pH, buffer capacity β , and ionic strength I) on the dissolution of a weakly acidic biopharmaceutical classification system (BCS) class II drug valsartan present in two-dose strengths was investigated. The strength-dependent and strength-independent dissolution pattern was determined based on the similarity/dissimilarity of the dissolution profiles of valsartan 80 and 320 tablets using the f2 similarity test. Valsartan dissolution showed either strength-dependent or strength-independent behavior for various values of pH, buffer capacity β , ionic strength I, and sink condition S of the tested media. Results of this study shed light on the importance of studying physiological characteristics of the GIF for multiple-strength drug products for better predicting the dissolution pattern of weak acids in vivo. © 2021, Springer Science+Business Media, LLC, part of Springer Nature.

Translation and Validation of the Arabic Version of the Caring Nurse-Patient Interaction Scale-Patient Version (CNPI-23P)

(2021) Cancer Nursing, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102153317&doi=10.1097%2fNCC.0000000000000755&partnerID=40&md5=a1fd306a4844aeadc4ba5a6f8bb17f8a>

AFFILIATIONS: Faculty of Nursing, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Background Importantly, little is known about the cancer patients' perceptions about nurses' caring behaviors in Arab countries (Jordan specifically). This is mainly related to a lack of short Arabic instruments that measure nurse-patient interaction from a caring perspective. Objective To translate and validate an Arabic version of the Caring Nurse-Patient Interaction Scale-Patient Version (CNPI-23P). Methods The CNPI-23 was translated into Arabic using Brislin's model of translation. A cross-cultural adaptation and psychometric testing were used to collect the data from patients with cancer through a self-administered questionnaire, which included the Arabic version of CNPI-23P and demographic characteristics. Descriptive statistics, inferential statistics, and exploratory factor analysis were used. Results One hundred fifty patients were recruited. A content validity involving experts and 20 patients indicated that the statements were clear, understandable, and in logical and easy order. Reliability analysis of CNPI-23P subscales ranged between 0.71 to 0.91 and 0.95 for the total Arabic version of CNPI-23P. Results of the exploratory factor analysis showed that the 23-item scale score reflecting 4 caring domains with Kaiser-Meyer-Olkin was 0.896, and Bartlett test of sphericity was significant ($P < .001$). Conclusion The Arabic version of CNPI-23P is reliable and valid and can be used in research, clinical, and educational settings in Arabic

countries. Implications for Practice The Arabic version of CNPI-23P may increase our understanding of cancer patients' perceptions about nurses' caring behaviors in Arab countries. © Wolters Kluwer Health, Inc. All rights reserved.

ABSTRACT: Phospholipid-modified gold nanorods (phospholipid-GNRs) have demonstrated drastic cytotoxicity towards MCF-7 breast cancer cells compared to polyethylene glycol-coated GNRs (PEG-GNRs). In this study, the mechanism of cytotoxicity of phospholipid-GNRs towards MCF-7 cells was investigated using mass spectrometry-based global metabolic profiling and compared to PEGylated counterparts. The results showed that when compared to PEG-GNRs, phospholipid-GNRs induced significant and more pronounced impact on the metabolic profile of MCF-7 cells. Phospholipid-GNRs significantly decreased the levels of metabolic intermediates and end-products associated with cellular energy metabolisms resulting in dysfunction in TCA cycle, a reduction in glycolytic activity, and imbalance of the redox state. Additionally, phospholipid-GNRs disrupted several metabolism pathways essential for the normal growth and proliferation of cancer cells including impairment in purine, pyrimidine, and glutathione metabolisms accompanied by lower amino acid pools. On the other hand, the effects of PEG-GNRs were limited to alteration of glycolysis and pyrimidine metabolism. The current work shed light on the importance of metabolomics as a valuable analytical approach to explore the molecular effects of GNRs with different surface chemistry on cancer cell and highlights metabolic targets that might serve as promising treatment strategy in cancer. © 2021 by the authors. Abu Sharour, L., Subih, M., Bani Salameh, A., Malak, M. Predictors of Chemotherapy Safe-Handling Precautions and Knowledge Among a Sample of Jordanian Oncology Nurses: A Model-Building Approach (2021) *Workplace Health and Safety*, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100190199&doi=10.1177%2f2165079920959991&partnerID=40&md5=08cbd23cfe366d5b5e388633b931bc8b>
AFFILIATIONS: Faculty of Nursing, AL-Zaytoonah University of Jordan, Jordan
ABSTRACT: Background: There are adverse side effects associated with handling chemotherapy; however, using safe-handling precautions can minimize or prevent these potential effects. Despite availability of international guidelines for chemotherapy handling, adherence to precautions is below expectations. This study examined knowledge of safe-handling precautions among a sample of oncology nurses in Jordan. Methods: A cross-sectional study was employed that included a convenience sample of 153 oncology nurses. Oncology nurses from two hospitals completed the Chemotherapy Handling Questionnaire. Descriptive analysis, Spearman rank correlation coefficients, and regression analyses were performed to determine the predictors of precaution use when handling hazardous drugs among participants. Findings: We observed that age, number of patients for whom the worker administered chemotherapy per day, the number of patients receiving chemotherapy per day in the participant's work unit, nurses' knowledge about safe-handling precautions, perceived risk, perceived barriers, self-efficacy, organization influence/workplace safety climate, conflict of interest, and interpersonal influences were predictors of use of safe-handling precautions (adjusted R² =.66, p <.001). Conclusion/Application for Practice: Several predictors for using safe-handling precautions were identified. Clinically, chemotherapy handling procedures should be evaluated frequently to identify barriers to safe practices and to improve worker safety. © 2021 The Author(s).

Dabbour, L.M. Morphology of quarters in traditional Arab Islamic city: A case of the traditional city of Damascus (2021) *Frontiers of Architectural Research*, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096995842&doi=10.1016%2fj.foar.2020.11.004&partnerID=40&md5=8408e531c6b982afc6a520f64e16bf69)

AFFILIATIONS: Department of Architecture, Faculty of Architecture and Design, AlZaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Studies on the quarters of traditional Arab Islamic cities have stressed the idea of an urban structure that corresponds to social groupings and to a collection of local regions or even of "inchoate" neighborhood units. This spatial model has often provided the rationale for the intervention in these cities and in the design of new housing layouts. This study aims to examine this issue through syntactic measures and observations to describe and analyze the structure and morphology of quarters through connectivity and visibility analysis of pedestrian movement through space syntax. Whether the structure of these cities presents a global whole in contrast to the assumptions of physical subareas of social groupings is discussed. The city of Damascus is used as a model of analysis in which the urban morphology of quarters is described and characterized. This study reports several findings that are potentially relevant to the understanding of traditional laws that relate the physical layout of quarters to the social structure and their local subareas to the global whole that dominate and unify the parts. On this basis, the design approach in these cities may be better understood. © 2020 The Author

Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Background: The COVID-19 pandemic necessitates collaborative teamwork by all healthcare providers including pharmacists. Since Pharmacy and Pharm. D students represent the future pharmacists, it is necessary to ensure that they have a good awareness about COVID-19 or any other pandemic that could happen in the future. Objective: The study aim was to evaluate Pharmacy and Pharm.D students' knowledge and information needs about COVID-19. Method: A cross-sectional web-based design survey was used to assess socio-demographics and knowledge about COVID-19 amongst Pharmacy and Pharm. D students. After being validated, the questionnaire was formatted into Google forms and distributed amongst undergraduate Pharmacy and Pharm. D students in accredited Universities in Jordan. Results: A total of 860 Pharmacy and Pharm.D students completed the questionnaire. Results revealed moderate students' knowledge about COVID-19 (mean knowledge score was 5.6 out of 10). Students had high correct response rates in questions asking about transmission method, treatment, zoonotic transmission and medications to be avoided. However, the students demonstrated low knowledge in questions asking about the incubation period and degree of contagion scores. Several factors were associated with students' level of knowledge including the field of study and academic year. Few students relied on their faculty as the main source of information about the infection and most of them relied on self-reading and social network. Conclusion: The results of this study clearly demonstrate unsatisfactory level of knowledge and a lot of information needs about COVID-19 amongst Pharmacy and Pharm. D students. More efforts should be deployed to educate pharmacy students about COVID-19, with an emphasis on the need for more active role by the universities to achieve this goal. © 2020 John Wiley & Sons Ltd

Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Background: The population worldwide is ageing. This has required the nursing profession to respond to the growing demands of providing nursing care to this population. Purpose: To identify predictors of job satisfaction among registered nurses providing care for older adults. Methods: A cross-sectional correlational design was used with a convenience sample of nurses. The Quality Work Competence Questionnaire, Job Satisfaction Scale and Nurses' Occupational Stress Scale were used to measure study variables. Descriptive statistics and multiple regressions were used to analyse the data. Results: The study included 500 nurses; and 68% dissatisfied with their job. Nurses were mostly dissatisfied with the physical conditions in which they work (55.2%) and the rate of payment (50.2%). Physical strain demonstrated the highest positive correlation with nurses' satisfaction ($r = .36$). More years of experience, skills and employee development, high nurses' competence, and more physical strain predicted high job satisfaction. Conclusion: Job dissatisfaction among nurses providing care

for older adults is high and is influenced by nurses' experience, professional development, competency and physical strain. Implications: Health care organisations should apply strategies that enhance the development of the professional competency of their nursing staff. © 2020 John Wiley & Sons Ltd

ABSTRACT: Objective: The Beta-Blocker Evaluation Survival Trial showed no survival benefit for bucindolol in New York Heart Association (NYHA) class III/IV heart failure (HF) with reduced ejection fraction, but subanalyses suggested survival benefits for non-Black subjects and Arg389 homozygotes.

We conducted an ex ante economic evaluation of Arg389 targeted treatment with bucindolol versus carvedilol, complementing a previous ex ante economic evaluation of bucindolol preceded by genetic testing for the Arg389 polymorphism, in which genetic testing prevailed economically over no testing.

Methods: A decision tree analysis with an 18-month time horizon was performed to estimate the cost effectiveness/cost utility of trajectories of 100%, 50%, and 0% of patients genetically tested for Arg389 and comparing bucindolol with empirical carvedilol treatment as per prior BEST subanalyses.

Incremental cost-effectiveness/cost-utility ratios (ICERs/ICURs) were estimated. Results: Race-based analyses for non-White subjects at 100% testing showed a loss of (0.04) life-years and (0.03)

quality-adjusted life-years (QALYs) at an incremental cost of \$2185, yielding a negative ICER of (\$54,625)/life-year and ICUR of (\$72,833)/QALY lost; at 50%, the analyses showed a loss of (0.27)

life-years and (0.16) QALYs at an incremental cost of \$1843, yielding a negative ICER of

(\$6826)/life-year and ICUR of (\$11,519)/QALY lost; at 0%, the analyses showed a loss of (0.33) life-years and (0.30) QALYs at an incremental cost of \$1459, yielding a negative ICER of (\$4421)/life-year

and ICUR of (\$4863)/QALY lost. Arg389 homozygote analyses at 100% testing showed incremental gains of 0.02 life-years and 0.02 QALYs at an incremental cost of \$378, yielding an ICER of 18,900/life-year

and ICUR of \$18,900/QALY gained; at 50%, the analyses showed a loss of (0.24) life-years and (0.09) QALYs at an incremental cost of \$1039, yielding a negative ICER of (\$4329)/life-year and ICUR of

(\$9336)/QALY lost; at 0%, the analyses showed a loss of (0.33) life-years and (0.30) QALYs at an incremental cost of \$1459, yielding a negative ICER of (\$4421)/life-year and ICUR of (\$4863)/QALY

lost. Conclusion: This independent ex ante economic evaluation suggests that genetically targeted treatment with bucindolol is unlikely to yield clinicoeconomic benefits over empirical treatment with carvedilol in NYHA III/IV HF. © 2020, Springer Nature Switzerland AG.

Can high-performance work systems (HPWS) promote organisational innovation? Employee perspective-taking, engagement and creativity in a moderated mediation model

(2021) Employee Relations, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084546682&doi=10.1108%2fER-09-2019-0369&partnerID=40&md5=e3140b8c2a9a111cfda3a1404be1be85>

AFFILIATIONS: Department of Business Administration, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Purpose: Reviewing Human Resource Management (HRM) and innovation literature, an identified gap exists in the mechanism in which the association between HRM and innovation is happen. To

respond, the current study has suggested a moderated mediated mechanism to explain the link between HRM, through its new High Performance Work Systems (HPWS) and organisational innovation, as employee

engagement mediates the relationship between HPWS and employee creativity. Then later one has subsequent influence on organisational innovation; moreover, the model also considers the moderating

role of employee perspective-taking between HPWS and employee engagement.

Design/methodology/approach: A quantitative-deductive causal method, along with a cross-sectional approach was adopted, and SMEs in Jordan were the focus for the present study, through targeting

employees in Research and Development centres. Data were collected through a self-administered questionnaire answered by 272 employees and Structural Equation Modelling using SMART-PLS was used for the statistical analysis. Findings: The results confirmed that employee engagement fully mediated the relationship between HPWS and employee creativity and accounted for 69.5% of the variance; additionally, perspective-taking as a moderator of the relationship between HPWS and employee engagement was confirmed. Moreover, employee creativity significantly predicted organisational innovation to moderate levels. Originality/value: The study suggested a unique mechanism for the link between HPWS and organisational innovation, contributing to the suggested gap that could have numerous variables acting as mediators or moderators which require further investigation to explore other possible mechanisms. © 2020, Emerald Publishing Limited.

ABSTRACT: Background: The Coronavirus disease 2019 (COVID-19) pandemic is a major threat to public health and has had a significant impact on all aspects of life. An effective vaccine is the most anticipated resolution. This study aims to evaluate Jordanian intent to be vaccinated. Methods: This is a cross-sectional web-based study. Sample characteristics were gathered, and the participants were classified according to the degree of COVID-19 risk based on the categories of the Centers for Disease Control and Prevention (CDC). Participants' KAP toward COVID-19 were assessed, and two scores were calculated: knowledge score and practice score. The association between different sample characteristics and these scores was identified using binary logistical regressions. The participants' vaccination intention was evaluated and multinomial logistic regression was applied to identify the predictors of vaccination intention. Finally, the reasons behind the participants' vaccination refusal/hesitation were determined and categorized into different groups. Results: 1,144 participants were enrolled in the study (females = 66.5%). 30.4% of the participants were at high risk of COVID-19 complications, and 27.5% were at medium risk. Overall, participants' knowledge of COVID-19 symptoms, transmission methods, protective measures, and availability of cure were high (median of knowledge score = 17 out of 21). High protective practices were followed by many participants (median of practice score = 7 out of 10). 3.7% of participants were infected, and 6.4% suspected they were infected with the COVID-19 virus. 36.8% of the participants answered "No" when asked if they would take the vaccine once it becomes available, and 26.4% answered, "Not sure." The main reasons for the participants' vaccination refusal or hesitancy were concerns regarding the use of vaccines and a lack of trust in them. Conclusion: Participants reported high refusal/hesitancy. Several barriers were identified, and efforts should be intensified to overcome these barriers. © Copyright © 2021 Al-Qerem and Jarab.

ABSTRACT: Plant polyphenols have attracted attention in recent years due to their ability to undergo oxidative coupling reactions enabled by the presence of multiple phenolic hydroxyl groups, forming chemically versatile coatings and biocompatible nanoparticles (NPs) for various applications. The aim of this study was to investigate whether coffee bean aqueous extracts, which are known to be rich in polyphenols, could serve as a natural source of NP building blocks. Extracts were prepared by heating ground Arabica beans of varying roasting degrees in water with or without the addition of sodium metaperiodate or copper sulfate as an oxidizing agent, followed by filtration. NP formation was verified by dynamic light scattering and transmission electron microscopy, which revealed the presence of nano-sized particles with varying sizes and polydispersities as a function of the coffee type and oxidizing agent used. NP colors ranged from light to medium to dark brown, and particle sizes were between 44 and 250 nm with relatively low polydispersity indices. In vitro antioxidant assays showed that oxidizing agent-treated coffee NPs had lower antioxidant potency compared to air-

oxidized NPs, but the free-radical scavenging activity was still retained. Coffee NPs exhibited no antimicrobial activity against common bacterial and fungal strains. Cell viability assays demonstrated that the NPs were biocompatible in human dermal fibroblasts, while exhibiting antiproliferative activity against MCF7 breast cancer cells, particularly copper sulfate-oxidized NPs. This study presents a facile and economical method to produce template-free antioxidant NPs that may be explored for various applications such as drug delivery and cosmetics. © 2021 The Authors. ABSTRACT: A user interface (UI) design that meets the preferences, differences, and needs of the group of users can potentially increase the usability of a system. Users, in general, feel more familiar with the context that reflects their cultural values and practices. The Arabic culture plays a significant role in how Arab users interact and communicate with technologies. The customs, artifacts, and traditions of the Arab world are different in nature from the Western cultures. Thus, it is essential to consider these differences when designing the UI prototype. This study investigated the role of certain cultural preferences in the design of UI for Arab users. A think-aloud approach and Hofstede's cultural dimensions were used on 23 Arab users to generate the necessary design guidelines for the UI of mobile health application. Then, 78 participants were recruited to evaluate the proposed UI design. The usability results showed high satisfaction among Arab users about the role of culture in the design of the UI. Findings from this study can be used by designers and developers to aid their design of UI for group-specific cultural preferences and values. Copyright © The Author(s), 2021. ABSTRACT: Objective: There is a high inter-individual variation in atorvastatin response. This study aimed to identify the influences of the CYP7A1 rs3808607, ABCG8 rs11887534, and ABCG8 rs4148217 genetic variants on the lipid profile and atorvastatin response among Arab Jordanian patients with type 2 II diabetes mellitus (T2DM). Materials and methods: 117 patients with T2DM and on atorvastatin therapy, the most common statin used at the University of Jordan Hospital, were genotyped for the CYP7A1 rs3808607, ABCG8 rs11887534, and ABCG8 rs4148217 genetic variants using PCR-restriction fragment length polymorphism. The baseline blood lipid and glycemic parameters were analyzed in the University of Jordan Hospital's laboratory before and after 3 months of atorvastatin administration. Results: Patients carrying the homozygote ABCG8 rs4148217 genotype have less total cholesterol (TC) (157.7 mg/dL) and low-density lipoprotein (LDL) (95.5 mg/dL) than the wild genotype (TC (192.4 mg/dL) and LDL (138.3 mg/dL)). Although these differences did not reach statistical significance (ANOVA, p-value > 0.17). There were no significant associations between the CYP7A1 rs3808607 and ABCG8 rs11887534 polymorphisms and baseline lipid and glycemic parameters (p > 0.12). Overall, no significant association was found between these polymorphisms and atorvastatin response (p > 0.13). Conclusion: It seems that the CYP7A1 rs3808607, ABCG8 rs11887534, and ABCG8 rs4148217 genetic variants do not explain the inter-individual variation in atorvastatin response and lipid baseline profile among Jordanian T2DM patients of Arabic origin. © 2021 Dustri-Verlag Dr. Karl Feistle. ABSTRACT: Background: Clopidogrel is an antiplatelet therapy that is widely used in pre and post percutaneous (PCI) coronary intervention procedures to prevent platelet aggregation and stent restenosis. However, there is a wide inter-individual variation in clopidogrel response and some patients showed resistance against the activity of Clopidogrel. Kinase insert domain receptor (KDR) gene is responsible for the transcription of vascular endothelial growth factor receptor 2 (VEGFR2) that plays a major role in the cardiovascular diseases (CVDs) and platelet aggregation. The aim of this study was to find out the association of KDR rs1870377 genotype with clopidogrel resistance (CR) in CVD patients, of Iraqi Arabic origin, hospitalized for elective PCI. Materials and methods: This study was a case-control study with a total of 324 PCI patients. Those patients were classified into 213 patients with non-clopidogrel resistant and 111 patients with CR, depending on the analysis of platelet activity phenotype after clopidogrel administration. KDR rs1870377 was genotyped for all patients using polymerase chain reaction-restriction fragment length polymorphism technique and confirmed by DNA Sanger sequencing through applying Biosystems Model (ABI3730x1). Results: KDR rs1870377 SNP is strongly associated (Chi-square, p value < 0.05) with CR under dominant, co-dominant and recessive models. Additionally, A allele in the rs1870377 SNP may have an impact on the serum levels of VEGFR2 and low density lipoprotein. Conclusions: KDR rs1870377 SNP is a potential genetic biomarker of CR among CVD patients of Iraqi Arabic origin. Further clinical studies, with larger sample, are required to confirm the findings of this study. ABSTRACT: The drag and side force coefficients of a half-submerged cylinder in a free-surface flow were calculated through numerical simulations, with the aim of supporting the numerical modelling of log transport in rivers. The variability of these coefficients with the yaw angle with respect to the flow direction and with the ratio between the flow depth and the diameter of the cylinder were investigated. Simulations were performed with the three-dimensional code ANSYS/CFX, employing the volume of fluid multiphase technique to reproduce the critical interaction between the free surface and the cylinder. The numerical tests, showing the rise of the drag force coefficient for increasing yaw angles passing from flow-parallel to flow-perpendicular cylinder and the peak of the side force coefficient for flow-oblique cylinder, were validated by comparison with the results of laboratory experiments. The simulations were then extended to conditions with significant blockage in the vertical direction which had not been previously experimented, revealing a strong increase in the force coefficients for decreasing ratios between the flow depth and the cylinder diameter. A detailed description of the reproduced flow features in the proximity of the cylinder for the different cases was furthermore obtained. Such report, in addition to the analysis of the force coefficients, could serve a much wider range than that of log transport, i.e., any case in which a floating cylinder interacts with free-surface flow. © 2021, China Ship Scientific Research Center.

ABSTRACT: An innovative solar desalination system was designed, constructed, and tested to produce more freshwater than a conventional solar still system. The new system consists of a basin type solar still and an external condenser. The condenser itself contains finned condensing pipes and a reservoir for the cooling water. The effects number of the fins, volume of cooling water, and flow rate in the condenser on the distilled output of the proposed solar desalination system were studied. As compared to the conventional basin type solar still system, the proposed system significantly produced more freshwater when cooling water volume, cooling water flow rate, numbers of fins in the condenser were increased. Furthermore, the number of fins exerted the most significant effect on freshwater productivity. The maximum daily freshwater produced was 12,350 mL when 250 L cooling water, 400 L/h flow rate, and 80 fins on the outer surface of the condensing pipe were used, which is about 300% more than the productivity of the conventional solar still. To use this solar desalination system efficiently, it was concluded that the optimum rate of cooling water must be about 50 L/h. Moreover, the remaining water volume in the condenser must be about 79 L. © 2021 Desalination Publications. All rights reserved.

ABSTRACT: Background: Research studies regarding nurses' knowledge attitudes and practice in the older adult are limited. Furthermore, none of these studies attempted to investigate the relationship between knowledge attitudes and practice. Furthermore, little studies compared nurses' knowledge, attitudes and practice between Eastern and Western countries. Aim: To describe the factors associated with nurses' acute pain management practice in the context of caring for older adult patients. Method: A quantitative, correlational, comparative and cross-sectional survey approach. Data collection: Data were collected using survey questionnaire. Sample: A sample of 267 registered nurses from Ireland and Jordan (one private hospital in each country). Results: A multiple linear regression analysis revealed that nurses' general knowledge and attitude towards pain management was associated with their pain management practice, with a regression coefficient of 0.14 ($p = 0.002$). However, knowledge of pain in the elderly failed to reach a statistically significant relationship with pain management practice. In regards to country and gender, Irish nurses had an average score that was 2.61 points higher than Jordanian nurses ($p < 0.001$), female nurses had an average score that was 0.67 points higher than male nurses ($p = 0.025$). The overall regression model was significant ($p < 0.001$) with an R^2 value of 43.2%, indicating that 43.2% of the variation in scores was explained by knowledge, attitude and practice. Conclusion: More research studies combining the three concepts (knowledge, attitude and practice) are recommended in the area of pain management. © 2020 Elsevier Inc.

ABSTRACT: Introduction: Girls married at an early age are more likely to be victims of violence from

their husbands or their in-laws. This may lead them to experience mental problems such as post-traumatic stress, depression, and/or anxiety. There are a lack of data related to the psychological reactions among teenage married girls living at the Palestinians refugee camps. Aim: This study aimed to evaluate depression, anxiety, and stress symptoms among teenage married girls in Palestinian refugee camps in Jordan. It also aimed to identify factors correlating with the study selected psychological reactions. Methods: A cross-sectional, descriptive correlational design was used. The participants were recruited using non-probability sampling methods. The mental health symptoms were measured using the Depression, Anxiety, and Stress Scale (DASS). Results: A total of 205 participants were included in the study. Their mean age was 16.90 (SD \pm 0.96) years. Of the participants, 39.6%, 35.6%, and 9.8% experienced moderate to extremely severe levels of depression, anxiety, and stress symptoms, respectively. There were significant relationships between all the mental health symptoms and participant age, parent's educational level, and exposure to previous trauma. Conclusion: A high proportion of females living in Palestinian refugee camps married in their teenage years experienced moderate to severe mental health symptoms, particularly anxiety and depression. These results inform the need for psychological support to girls who are affected by teenage marriage. © 2020, Springer-Verlag GmbH Germany, part of Springer Nature.

Umm Zakiyyah's If I Should speak and Updike's Terrorist: Two different views of Islam (2021) International Journal of Literary Humanities, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113971950&doi=10.18848%2f2327-7912%2fCGP%2fv19i01%2f23-33&partnerID=40&md5=12a50fb589dbaf6f486cc4c55cf6921b>

AFFILIATIONS: Al-Zaytoonah University, Amman, Jordan;

Al-Ahliyya Amman University, Amman, Jordan

ABSTRACT: Politics and social agendas have in many ways molded a variety of literary works and imposed their views either implicitly or explicitly on them. Updike's Terrorist and Umm Zakiyyah's If I Should Speak exemplify this tendency and fit snugly onto the cultural and political stage as they both tackle the issue of Islam's image in American society. In reading the two novels, we see that both writers attempt to prove their points of view using characters and sources of evidence that properly serve their respective agendas. This article explores both writers' points of view by evaluating the reliability of each writer's narrator based on the sources that both writers relied on. In so doing, we reveal how Updike upholds the Western stereotypical image of Muslims and presents his work in a political and religious framework that supports this image. By contrast, Umm Zakiyyah embodies the counterargument as she presents a moderate Islamic figure that corrects Updike's (and, by extension, American society's) misconceptions about Islam. The present article compares and contrasts the two novels to assess the reliability of each author's view and help reveal the gap between the real and misconceived Islam. A close reading of both texts shows that Updike relies mainly on vague sources about Islam to fabricate a plot grounded in a prejudicial tendency to frame Islam in its Westernized stereotypical image. Umm Zakiyyah's text, on the other hand, serves as a counterargument that manifests Islam in its authentic image. We believe that such exposition is critically needed to establish cultural bridges and mutual understanding between the East and the West. © 2021 Common Ground Research Networks. ABSTRACT: Equipping building envelopes with an additional layer is an effective measure for improving the overall thermal and daylighting performance and reducing the energy consumption of buildings. This study investigated the user acceptance of energy-saving retrofitting measures in office buildings, reporting on the view perception and emotional response towards ETFE double-skin façades (DSF). Virtual Reality (VR) and physics-based imaging techniques were used to evaluate the user experience of a window view in an office space equipped with a pneumatic ETFE cushion as a second building skin. Three DSF scenarios with different ETFE cushions, including a clear, fritted and switchable sample, were evaluated and compared to the original single-skin façade with double-glazed windows. The physical and luminous conditions of the office space were replicated in a virtual environment with a validated physically-based imaging technique and presented to a group of

volunteers (N = 22) using a virtual reality headset. While immersed in the virtual environment, participants responded to a questionnaire enquiring into their view perception and emotional states. The results revealed a preference for view clarity of clear ETFE in double-skin façades (Mdn = 5) and less satisfaction for fritted (Mdn = 4) and switchable foil cushions (Mdn = 1.75), yet double glazing was preferred in all measured parameters (Mdn = 6). Statistical significance was found for fritted in comparison to switchable ETFE in terms of spatial pleasure and control. The highest ratings were given to clear glazing across all investigated parameters of view perception and emotional response. The lowest ranking in all questions was given to the sample with the switchable ETFE cushion. The study concluded that view clarity is a major aspect for the user acceptance of ETFE double-skin façades. Overall, this study provides a better understanding of the visual and emotional implications of viewing through ETFE foil and contributes to forming criteria for the design of next-generation ETFE building envelopes. © 2020 The Authors

ABSTRACT: Coronavirus Disease 2019 (COVID-19) is a contagious disease that affects the respiratory system. In addition to the severe effects of the disease on health, the pandemic caused a negative impact on basic needs and services, employment, education, and economy worldwide. In Jordan, the whole country locked down, and quarantine was enforced by the military forces, which successfully controlled the spread of the disease. This research aims to study the influence of the COVID-19 pandemic and its associated quarantine on university students' beliefs about online learning practice in Jordan. An online descriptive survey involved questions that covered students' demographic information, student's basic and advanced knowledge about COVID-19, students' online learning experience during the quarantine, and finally students' views on the enforced quarantine practice in Jordan. Results showed that students have a good knowledge (>50%) about the COVID-19 basic information and a moderate knowledge (<50%) regarding COVID-19 advanced information. In general, students were pessimistic about the future of COVID-19 both locally and worldwide. Although some students acknowledged that they learned new skills in the fields of electronics, informatics, and computer software during the pandemic, most of them were unsatisfied about the quality and quantity of the given material, online exams, and the evaluation processes. Unfortunately, most of the students faced internet technical problems or challenges to electronic accessibility. The majority of the participants (>90%) supported the military-enforced quarantine implemented in the country despite the hard time the students had during the quarantine. We conclude that university students were able to protect themselves from COVID-19 through their good knowledge about the infectious disease and their commitment to follow the rules imposed by the Government of Jordan. Nevertheless, the challenges caused by the pandemic and its associated quarantine, combined with the sudden unprecedented online experience, negatively impacted students' thoughts and beliefs about the online learning experience during the quarantine. Further studies need to be performed in this context. We hope our results will help decision-makers better understand the students' attitudes and motivation toward online learning and how this will affect their future plans and decisions. © Copyright © 2021 Almomani, Qablan, Atrooz, Almomany, Hajjo and Almomani.

ABSTRACT: The synthesis and characterization of Fe₂(CO)₅(L){μ-(SCH₂)₂SnMe₂} (L = PPh₃ (2) and P(OMe)₃

(3)) derived from the parent hexacarbonyl complex $\text{Fe}_2(\text{CO})_6\{\mu-(\text{SCH}_2)_2\}\text{SnMe}_2$ (1) are reported. Whereas 1 exhibits a unique planar structure, X-ray crystallography showed that the apical orientation of L in complexes 2 and 3 results in a chair/boat conformation of the $\text{Fe}_2\text{S}_2\text{C}_2\text{Sn}$ fused six-membered rings, which is typical for diiron dithiolato complexes. In solution, NMR and FTIR spectroscopic techniques provide evidence for a dynamic process of apical-basal site exchange of the ligand L in 2 and 3. Protonation experiments on 2 and 3 in MeCN using $\text{CF}_3\text{CO}_2\text{H}$, HCl or $\text{HBF}_4 \cdot \text{Et}_2\text{O}$ suggest enhanced protophilicity of the Fe-Fe bond due to the presence of the electron donor ligands L as well as the stannylation effect. While the carbonyl ligands in 2 stretch at lower wavenumbers $\nu(\text{CO})$ than those in 3, the cyclic voltammetric reduction of 2 unpredictably occurs at less negative potential than that of 3. In contrast to 1, the presence of PPh_3 and $\text{P}(\text{OMe})_3$ in 2 and 3, respectively, allows protonation prior to reduction as shown by FTIR spectroscopy and cyclic voltammetry. ABSTRACT: Nicotine exposure increases the release of glutamate in part through stimulatory effects on pre-synaptic nicotinic acetylcholine receptors (nAChRs). To assess the impact of chronic electronic (e)-cigarette use on these drug dependence pathways, we exposed C57BL/6 mice to three types of inhalant exposures for 3 months; 1) e-cigarette aerosol generated from liquids containing nicotine (ECN), 2) e-cigarette aerosol generated from liquids containing vehicle chemicals without nicotine (Veh), and 3) air only (AC). We investigated the effects of daily e-cigarette exposure on protein levels of $\alpha 7$ nAChR and $\alpha 4/\beta 2$ nAChR, gene expression and protein levels of astroglial glutamate transporters, including glutamate transporter-1 (GLT-1) and cystine/glutamate antiporter (xCT), in the frontal cortex (FC), striatum (STR) and hippocampus (HIP). We found that chronic inhalation of ECN increased $\alpha 4/\beta 2$ nAChR in all brain regions, and increased $\alpha 7$ nAChR expression in the FC and STR. The total GLT-1 relative mRNA and protein expression were decreased in the STR. Moreover, GLT-1 isoforms (GLT-1a and GLT-1b) were downregulated in the STR in ECN group. However, inhalation of e-cigarette aerosol downregulated xCT expression in STR and HIP compared to AC and Veh groups. ECN group had increased brain-derived neurotrophic factor in the STR compared to control groups. Finally, mass spectrometry detected high concentrations of the nicotine metabolite, cotinine, in the FC and STR in ECN group. This work demonstrates that chronic inhalation of nicotine within e-cigarette aerosols significantly alters the expression of nAChRs and astroglial glutamate transporters in specific mesocorticolimbic brain regions. © 2020 Elsevier B.V.

ABSTRACT: The objectives of this study were to develop and characterize amorphous lopinavir (LPV) printlets and to quantify crystalline fraction of LPV in the printlets by X-ray powder diffraction (XRPD)-chemometric models. Amorphous printlets (4.5 mm diameter × 3 mm height) of various LPV concentrations were fabricated by selective laser sintering (SLS) 3D technique. The printlets were characterized for physicochemical properties. The XRPD data in conjunction with chemometric

method were used to quantify the crystalline fraction of the drug. The LPV content in the printlets was 95.2-100.9%, disintegration time was < 2 min, and dissolution was fast (>90% of LPV was dissolved in < 30 min). The porosity of the printlets increased with an increase in the LPV percentage. The differential scanning calorimetry (DSC) and XRPD data of the printlets demonstrated that the majority of LPV was present in amorphous form. The XRPD-chemometric models showed good linearity and low root mean squared error, standard error, and bias. Models validation showed that the actual values of crystalline and amorphous fractions of the drug were close to the predicted values. These results demonstrated the feasibility of fabricating amorphous printlets by SLS method, and the application of the XRPD-chemometric models to quantify low fractions of crystalline drug in the 3D formulations if they are formed due to process or environment related variables. © 2020

ABSTRACT: The increasing technological investments in companies, specifically in commercial banks, leads to the adoption of important frameworks in the information governance and management as well as the associated technology, which are issued by international organizations, such as COBIT. COBIT approach preserves information technology, maximizes its benefits, improves its outputs and ensures that the company's strategic goals are achieved. In this regard, the present study aimed at investigating the impact of information governance and management as well as the associated technology according to COBIT framework on the characteristics of primary accounting information in Jordanian commercial banks. The study used a questionnaire as a research tool and the study population consisted of all Jordanian commercial banks (13 banks). The study used the purposeful sample (managers, heads of departments and heads of units, who are working at the financial department, internal control and audit department, risk management department and information technology department in banks). Two hundred and eighty-six questionnaires were distributed, of which one hundred and seventy-four questionnaires were collected and finally one hundred and seventy-one questionnaires are used for hypothesis testing. The study concluded that information governance and management as well as the associated technology according to COBIT framework affect the characteristics of primary accounting information (relevance and reliability) in Jordanian commercial banks. The study recommended defining organizational relationships and separating jobs in Jordanian commercial banks. © 2021 University of Jordan, Deanship of Scientific Research. All rights reserved.

ABSTRACT: Objectives Inappropriate medication storage and disposal is a global problem and has a negative impact on public health, economy and the environment. One of the main causes of this problem is the lack of knowledge among the population about medication storage and disposal. This study aimed to develop a tool to measure knowledge and practice about medication storage and disposal and measure it among the Jordanian population. Methods This web-based cross-sectional study developed a tool to evaluate medication storage and disposal knowledge attitude and practice. Exploratory factor analysis, analysis of variance and t-test were conducted to analyze the data. Key findings 1132 responses were collected. The exploratory factor analysis suggested a three-factor model, the three models are knowledge-need, patient-related, and medication-related factors. Knowledge-need factor evaluates the participants' perceptions of the need for awareness and regulations regarding medication storage and disposal. The patient-related factor evaluates medication discontinuation behaviours. Medication-related factor evaluates the handling of damaged or expired medication practices. The highest mean of all three factors was for the knowledge-need factor (mean = 4.13), while the lowest was for the patient-related factor (mean = 3.22). The education level was negatively associated with patient-related factor indicating good behaviours. The means of the three factors were significantly associated with the respondents reporting that they know the correct medication storage and disposal behaviours, and the respondents believing that there are consequences of keeping medication at home. Conclusion The questionnaire was a valid and reliable tool to assess the

knowledge and practice of medication storage and disposal. This study's findings suggest that the lack of knowledge is the main reason behind the inappropriate medication storage and disposal practice. There is a need for awareness-improvement, which should involve healthcare awareness campaigns and governmental regulations. © The Author(s) 2021. ABSTRACT: The purpose of the present study was to identify, by gas chromatography (GC) and GC-mass spectrometry (GC-MS), the components of the spontaneously emitted volatile organic compounds (VOCs), obtained by Solid-Phase-Micro-Extraction (SPME) and that of the hydrodistilled oil of the fresh flowers and leaves of *Ononis natrix*, as well as to compare them. The hydrodistilled leaf oil was rich in non-terpenoid aldehydes, whereas its aroma profile contained mainly sesquiterpene hydrocarbons with α -copaene and germacrene D as their major components. The hydrodistilled oil of the fresh flowers, however, revealed nearly equal amounts of terpenoid and non-terpenoid compounds; 51.00% and 46.54%, respectively. The aroma profile of the fresh flowers was dominated by monoterpene hydrocarbons with α -pinene (42.96%) and α -thujene (20.17%) as the predominant two monoterpenes. Based on the high total phenol and flavonoid contents of the water and ethanol extracts, LC-MS analysis was carried out to identify the major compounds from each sample. From the water extract, eleven compounds were identified, whereas the ethanol extract contained eight, whereby luteolin (from the water extract) and apigenin (from the ethanol one) were named as the major flavonoids, respectively. © 2021, Yarmouk University. ABSTRACT: In the recent years, the term big data has attracted a lot of attention. It refers to the processing of data that is characterized mainly by 4Vs, namely volume, velocity, variety and veracity. The need for collecting and analysing big data has increased manifolds these days as organizations want to derive meaningful information out of any data that is available and create value for the business. A challenge that comes with big data is inferior data quality due to which a lot of time is spent on data cleaning. One prerequisite for solving data quality issues is to understand the reasons for their occurrence. In this paper, we discuss various issues that cause reduced quality of the data during the acquisition and management. Furthermore, we extend the research to categorize the quality of data with respect to the identified issues. © 2021 by SCITEPRESS - Science and Technology Publications, Lda.

ABSTRACT: BACKGROUND: Age-related alterations in the composition and function of gut microbiota may influence human health and disease mechanisms. However, connections between compositional changes in gut bacterial and fungal communities, and their role in the aging process, remain poorly understood. **OBJECTIVE:** Compare the gut microbiota and mycobiota composition in different age groups and evaluate the functionality. **METHODS:** In this study, we performed 16S rRNA and ITS2 gene-based microbial profiling analysis and shotgun metagenomics using the NextSeq platform. **RESULTS:** We observed a shift in compositional changes of human gut microbiota with age. Older individuals revealed a significantly different gut microbiota profile compared to younger individuals. For example, gut microbiota composition of the older individuals showed increase in genera Bacteroides, Blautia, Ruminococcaceae, and Escherichia coli. Additionally, older individuals had significant reduction in fungi belonging to saccharomyces cerevisiae and candida albicans in comparison to their younger counterparts. Moreover, metagenomics functional profiling analysis using shotgun metagenomics sequencing data showed substantial differences in the enrichment of 48 pathways between the young and older age groups. Metabolic pathways such as amino acid biosynthesis, carbohydrate metabolism, cell structure biosynthesis and vitamin biosynthesis were declined in the older age group, in comparison with the younger individuals. **CONCLUSIONS:** The identified differences provide a new insight to enrich our understanding of age-related changes in gut microbiota, their metabolic capabilities, and potential impact on health and disease conditions. © 2021 - The authors. ABSTRACT: Introduction: Fungi are one of the main approaches for synthesis of metallic nanoparticles (NPs), which can have medical and biotechnological applications such as their role in anti-bacterial, anti-cancer and various industrial activities. Objective: The current research focused on the biosynthesis of silver nanoparticles (AgNPs) using airborne fungi isolated from Al-karak general

hospital operation rooms. Materials and Methods: The fungal isolate was identified at the species level by sequencing ITS as *Aspergillus flavus*. The confirmation and characterization of biosynthesized AgNPs were conducted using UV-Vis spectrophotometer, Zeta potential, Zeta sizer, FT-IR, XRD and transmission electron microscope (TEM) analyses. Results: The average diameter of the resulting AgNPs was 499.3 nm with a PDI value of 0.28. The zeta potential was -34.9mV which reflects the ability of these nanoparticles to have a sufficient charge, because it is electrostatically stable and therefore resists self-assembly. TEM revealed that these biosynthesized AgNPs were regular and spherical in shape. The images of TEM showed that the size of AgNPs were smaller than those that were observed by DLS examination due the drying process that caused particle shrinkage. The average size of AgNPs were less than 40 nm. AgNPs exhibit different minimal inhibitory concentrations (MIC) against seven different bacteria (*K. pneumonia*, *E. coli*, *E. cloacae*, *S. aureus*, *S. epidermidis*, and *Shigella sp.*). The MICs ranged between 0.025 and 0.075 mg/mL with *P. aeruginosa* an exception which was the most resistant one, showing its MIC as > 0.125 mg/mL. Discussion and Conclusion: The results indicate that these molecules can be used as an important source for the treatment of many diseases caused by bacteria, in addition to testing these molecules in various fields such as cancer treatment and even in various biotechnological applications. © 2021 Khaled M Khleifat et al.

ABSTRACT: Due to the constantly increasing amount and variety of data produced, big data and the corresponding technologies have become an integral part of daily life, influencing numerous domains and organizations. However, because of its diversity and complexity, the necessary testing of the corresponding applications is a highly challenging task that lacks maturity and is still being explored. While there are numerous publications dealing with this topic, there is no sufficiently comprehensive overview to conflate those isolated pieces of information to a coherent knowledgebase. The publication at hand highlights this grievance by means of an unstructured literature review, proposes a starting point for a corresponding taxonomy to bridge this gap and highlights future avenues for research. © 2021 by SCITEPRESS - Science and Technology Publications, Lda.

ABSTRACT: The emergence of artificial intelligence, big data, and the Internet of Things (IoT) has shifted human-human, human-machine, and machine-machine interaction to a new level. This shift is affecting all aspects of society's behavior toward the adoption of technology. One important pillar of society that is especially impacted by this radical change is that of education. The advancement of new technologies as well as the occurrence of unexpected global events has forced education systems in many countries to look differently at traditional educational issues and work toward becoming a more agile education system. This means being responsive to any unpredicted changes that may occur in the education environment. Indeed, the agility of business schools and technological adaptability is one of the standards required by program accreditation organizations (i.e., AACSB). This paper discusses the application of IoT in business education, focusing on the opportunities, challenges, and paths forward this presents. © 2021 IEEE.

ABSTRACT: Battery Electric Vehicles (BEVs) have been receiving a great attention among the many different powertrain configurations of electrified vehicles. There is intense competition among

automakers in terms of optimizing the BEVs' powertrain and improving their fuel economy, range, and other performance criteria. It is essential to conduct extensive simulations and model tuning before prototyping and testing. Hence, in this study, a detailed comprehensive model is developed and tuned to simulate the BEV powertrain. The model is tuned to closely match a common commercial BEV, the 2019 Nissan Leaf, in terms of powertrain specifications and driving performance. The validity of the developed model is established by testing it using three US Environmental Protection Agency drive cycles. The simulation results show a close similarity between the performance of the simulated model and the performance of the selected commercial BEV, which supports the usefulness of the developed model for future powertrain improvements. Furthermore, the effect of energy losses on driving performance is highlighted. The simulation results of the developed BEV model show a superior performance in terms of fuel economy when compared with the conventional, hybrid fuel cell/ battery, hybrid series electric, and hybrid parallel electric vehicle models. ABSTRACT: Introduction: Biofilm formation has different stages and can be classified based on the bacterial strain, culture vessel, and the method employed. Biofilm formation is carried out in culture vessels to represent mode of infection in humans. Microbial concentration, growth medium, supplement, and incubation time are key factors to successfully form biofilm in a culture vessel. Objective: This study aimed to identify the optimum conditions for biofilm formation in a 96-well plate by culturing *Pseudomonas aeruginosa* and *Streptococcus pyogenes*. Materials and Methods: We utilized the infectious and pathogenic bacteria, *P. aeruginosa* and *S. pyogenes* strains. These bacteria were cultured in Mueller-Hinton Broth (MHB) and Tryptic Soy Broth (TSB) at two different optical densities (OD 0.05 and OD 0.1). After a certain incubation time, the formed biofilm was stained by using 0.1% crystal violet. The stained bacteria were disaggregated and measured using a microplate reader. Biofilm was then classified based on bacterial adherence to the plate. Results: Our results showed that *P. aeruginosa* and *S. pyogenes* biofilms were strongly formed on days 3 and 5 in MHB and TSB, respectively. However, the strongest biofilm formation was seen on day 3 after *P. aeruginosa* being incubated in MHB at OD 0.1 and after *S. pyogenes* being incubated in MHB at OD 0.05. Discussion: Biofilm formation is ranged between weak, moderate, and strong in accordance with the density of bacterial adhesion. Conclusion: *P. aeruginosa* and *S. pyogenes* biofilms were optimized at specific OD (0.1 and 0.05, respectively) for 3 days cultivation in MHB. © 2021 Mohammad A. ABSTRACT: Big data is term of dataset with characteristic volume, value and veracity that lead to confrontation unable proceed using traditional techniques to extract value, project management perspective is dynamic processing that utilizes the suitable resources of organization in many stages by measuring in four-factor scope, time, cost and quality. In this research aim improve data quality from big data via project management scope consist on high trust which is bring high accuracy from confidence level in volume of data, confidence get with context and value of data which lead to determine accuracy deeply in it and finally select from data depending on veracity of it, the experiment using three main factors time, cost and scope, strongest relation organizing between them start by project scope as strongest one then cost, product and Last one time is weakest between them, in the final when select best quality use two sides mostly from quality degree and be center of quality interval and in particular from closest distance with the strongest factor. © 2021 IEEE.

ABSTRACT: This paper aims to develop an automatic cleaning system for Photovoltaic (PV) solar panels installed on the roof of University Al-Zaytoonah faculty of IT in Jordan. The experiments were done at University Badji Mokhtar Annaba Algeria. We designed a dust detector and perform tests on it for calibration. The brain of the system is an Arduino Uno microcontroller, which gets data from the dust sensor then makes treatment and sends instructions to the system to perform the cleaning process. The cleaning process is based on-power circuit that controls the speed and direction of a motor to scan all surface of the PV panel. GUI was developed to monitor the system and sensor status. The collected data is transmitted to the central unit. Finally, the primary results obtained to meet our expatiations for optimizing the efficiency of the solar panels. © 2021 IEEE.

ABSTRACT: In this paper we investigate distributed localization of an intruder in wireless sensor networks (WSNs), in which the sensor nodes (SNs) censor their transmission to the fusion center (FC). The SNs locally detect the intruder and send their decision only if it is positive. The FC, on the other hand, uses those binary data to localize the intruder. We present the censored maximum likelihood (cML) localization algorithm, Furthermore, we derive two computationally simple localization algorithms, the quadratic approximate ML (QAML) and the linear approximate ML (LAML). The performance of the ML-based algorithms significantly outperforms the heuristics-based algorithms, such as the centroid method (CM) and the center of maximum enclosing rectangle (CMER), as the simulation results show. © 2021 IEEE.

ABSTRACT: In this paper we consider the distributed detection of intruders in clustered wireless sensor networks (WSNs). The WSN is modelled by a homogeneous Poisson point process (PPP). The sensor nodes (SNs) compute local decisions about the intruder's presence and send them to the cluster heads (CHs). Hence, the CHs collect the number of detecting SNs in the cluster. The fusion center (FC), on the other hand, combines the the CH's data in order to reach a global detection decision. We propose an optimal cluster-based linear fusion (OCLR), in which the CHs' data are linearly fused. Interestingly, the OCLR performance is very close to the optimal clustered fusion rule (OCR) previously proposed in literature. Furthermore, the OCLR performance approaches the optimal Chair-

Varshney fusion rule as the number of SNs increases. © 2021 IEEE.

ABSTRACT: Background and ObjectiveaaInsomnia is a common symptom that is experienced by the patientspost hematopoietic stem cell transplant that interfere with recovery outcomes and patients'quality of life. Little is known about insomnia among post hematopoietic stem cell transplant inJordan and in other Arab countries. The purpose of the current study was to identify the levels ofinsomnia and the related factors in post hematopoietic stem cell transplant.MethodsaaA descriptive cross-sectional correlational design was used to guide this study. Datawas collected from 163 patients by the Arabic version of the Insomnia Severity Index (ISI).ResultsaaThe participant's average ISI was 14.06 ± 7.71 indicating sub-threshold insomnia. Regardingthe insomnia levels, 23.9% of the participants reported no insomnia, 27.6% had subthresholdinsomnia, 31.3% had moderate clinical insomnia, and 17.2% had severe clinical insomnia.A significant difference in insomnia levels in some related factors was reported including thehigher educated patients ($t = 2.40$, $p = 0.018$), patients who received allogeneic transplants ($t = -2.932$, $p = 0.004$), and patients within a 30 days' post-transplant ($F(160, 2) = 61.03$, $p < 0.001$).ConclusionsaaIn conclusion, the overall prevalence of insomnia among post HSCT patients was48.5% ($n = 79$) that suggested clinical insomnia, and it was affected by several clinical variables.Further studies are needed to provide appropriate interventions to decrease insomnia levels amongpatients. © 2021 The Korean Society of Sleep Medicine

ABSTRACT: Noise-like artifacts, which are caused by incomplete and randomly sampled data, spread over the whole ambiguity domain, and thus seriously obscure the true time-frequency signature of the data. In this paper, a new design for the signal-dependent adaptive kernel is proposed, which is robust with missing data. The method relies on the properties of chirps whose auto-terms only reside in a fixed half of the ambiguity domain. The important thing is that this half excludes the Doppler axis, where the chirps' noise-like artifacts concentrate. By cutting out this region when performing the optimization problem, a better signal-dependent kernel for chirps is obtained, which efficiently suppresses not only the cross-terms but also the missing sample artifacts. Moreover, since any windowed non-stationary signals can be approximated as a sum of chirps, the proposed approach can be applied to other types of non-stationary signals. It is shown in the simulation that our method outperforms other reduced interference time-frequency distributions of incomplete observations. © 2021 IEEE.

ABSTRACT: The concept of investor sentiment deals with the psychological attitudes the investor has toward the security of the fiscal market or a related certain situation; accordingly, different antecedents and determinants make-off that attitudes. The current paper explores antecedents for investor sentiment (IS) in Amman Stock Exchange (ASE) using investor sentiment index (ISI) utilising SEM approach. Data was collected through surveying 401 current and potential investors in ASE through no probability purposive sampling using a self-administrated questionnaire. SEM using AMOS was employed and the result reported that the suggested ISI sufficiently predicted IS in Jordan setting as explained 62% of the achieved variance; moreover, IC was identified as the strongest antecedent along with PC, whereas SC and MC were identified as negative antecedents, and accordingly, the implication was discussed. ABSTRACT: In recent years, big data has become an important branch of computer science. However, without AI, it is difficult to dive into the context of data as a prediction term, relying on a large feature of improving the process of prediction is connected with big data modelling, which appears to be a significant aspect of improving the process of prediction. Accordingly, one of the basic constructions of the big data model is the rule-based method. Rule-based method is used to discover and utilize a set of association rules that collectively represent the relationships identified by the system. This work focused on the use of the Apriori algorithm for the investigations of constraints from panel data using the discretization preprocess technique. The statistical outcomes are associated with the improved preprocess that can be applied over the transaction and it can illustrate interesting rules with confidence approximately equal to one. The minimum support provided to the present rule considers constraint as a milestone for the prediction model. The model makes an effective and accurate decision. In nowadays business, several guidelines have been produced. Moreover, the generation method was upgraded because of an association data algorithm that works for dissimilar principles of the structures compared with fewer breaks that are delivered by the discretization technique. ABSTRACT: Background:: Fibromyalgia syndrome (FMS) is a chronic disease characterized by widespread body pain, weakness in certain parts of the body (critical points), low pain tolerance, sleep disturbances, and fatigue. This syndrome is considered rare in Jordan. Objectives: The research aimed to find out the association of the angiotensin converting enzyme, methylenetetrahydrofolate

reductase, and vitamin D receptor (ACE, MTHFR, and VDR, respectively) genotypes with FMS among Jordanian patients. Methods: This work included 22 FM patients and 22 healthy individuals of Jordanian Arabic origin. The ACE rs4646994, MTHFR rs1801133, and VDR rs2228570 genotypes were determined using polymerase chain reaction (PCR) followed by restriction fragment length polymorphism. Results: No associations between ACE rs4646994, MTHFR rs1801133, and VDR rs2228570 with the vulnerability of a person for the development of FMS were found. However, we found an association between the ACE rs4646994 genotype and restless leg among FM patients. Conclusion: Based on the result from this study, it appears that the ACE rs4646994 genotype is associated with restless leg among FMS patients of Jordanian origin. Further clinical investigations with larger sample sizes are required to confirm these findings and understand the molecular mechanism of ACE rs4646994 genetic variant in the restless leg syndrome among FM patients. © 2021 Bentham Science Publishers.

ABSTRACT: Like many countries, Jordan has resorted to lockdown in an attempt to contain the outbreak of Coronavirus (Covid-19). A set of precautions such as quarantines, isolations, and social distancing were taken in order to tackle its rapid spread of Covid-19. However, the authorities were facing a serious issue with enforcing quarantine instructions and social distancing among its people. In this paper, a social distancing mentoring system has been designed to alert the authorities if any of the citizens violated the quarantine instructions and to detect the crowds and measure their social distancing using an object tracking technique that works in real-time base. This system utilises the widespread surveillance cameras that already exist in public places and outside many residential buildings. To ensure the effectiveness of this approach, the system uses cameras deployed on the campus of Al-Zaytoonah University of Jordan. The results showed the efficiency of this system in tracking people and determining the distances between them in accordance with public safety instructions. This work is the first approach to handle the classification challenges for moving objects using a shared-memory model of multicore techniques. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: The E-learning standard is made up of several different quality elements and characteristics. Scholars examined the effectiveness of E-learning from a variety of perspectives. However, studies concerning the quality of E-learning mobile applications in particular are limited. Hence, the present study looks at the factors that influence the use of the E-learning mobile application by students and instructors of the Al-Zaytoonah University in Jordan throughout the academic year 2020-2021. The research instrument was initially validated. Subsequently, several quality factors were adopted to anticipate the factors affecting the adoption of the Elearning.ZUJ mobile application of nine hundred thirty-one students and one hundred nine instructors in this study. Regarding the actual usage of the E-learning mobile application for academic activities, in different proportions, the findings of this investigation were compatible with the adopted quality factors. Results revealed a significant positive relationship between the perceived reliability and demand for using E-learning applications. In addition to a significant positive relationship between the perceived benefit and behavioral intention to use E-learning mobile applications, the results show the following perceived quality factors: reliability, efficiency, integrity, usability, satisfaction, and supportability. The findings should be valuable to educational officials at the Al-Zaytoonah University of Jordan and elsewhere as existing technology could be improved or they could

embrace new technology for academic purposes. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Cloud computing is a model of technology that offers access to system resources with advanced level of services ability. These resources are measured reliable, flexible and affordable for several kinds of applications and users. Gaming manufacturing is one field that expands the profits of cloud computing as numerous new cloud gaming designs have been presented. Many advantages of cloud gaming have exaggerated the success of gaming based on the improvements on traditional online gaming. Though, cloud gaming grieves from several downsides such as the massive amount of needed video processing and the computational complexity required for that. This paper displays the original system drawbacks and develops a new and original algorithm to speed up the encoding process by reduces the computational complexity by exploiting the block type and location. Enhancements on the video codec led to 12.2% speeding up on the over-all encoding time with slight loss of users' satisfactions. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: -Current study focused on highlighting the influence of shockvertising (Disgusting Images, Sexual References, Profanity/Obscenity, Vulgarity, Impropriety, Moral Offensiveness and Religious Taboos) on consumer behavior in its two dimensions of repurchase intention and word of mouth. Through depending on quantitative approach and utilizing a questionnaire as a tool; researcher distributed on (431) Jordanian consumers within the online social platforms due to COVID 19 lockdown and quarantine. Through SPSS, results of study indicated that shockvertising - along with its variables - plays a role in negatively influencing consumer behavior, analysis also revealed that using religious taboos as advertisement material was the most influential aspect of shockvertising as people tend to act emotionally in reference to their religion, also, results indicated that shockvertising an influence consumer behavior variables and mostly repurchase intention as a consumer is willing to boycott a brand if it presented any offending ad. © 2021, World Scientific and Engineering Academy and Society. Predicting entrepreneurial intentions among postgraduate students using the theory of planned behaviour: Jordan case

(2021) International Journal of Entrepreneurship and Small Business, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120943941&doi=10.1504%2fIJESB.2021.119229&partnerID=40&md5=c337f19d063bb09b550cf1ca7abfdb47>

AFFILIATIONS: Department of Business Administration, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The current study used the theory of planned behaviour (TPB) to predict the intentions toward the entrepreneurship and identify insignificant antecedents for these intentions. The study targeted postgraduate students majoring in business and finance schools in the two top universities in Jordan. Through purposive sampling and completion of a self-administrated questionnaire, (308) respondents were included in the sample. Adopting a quantitative descriptive approach and structural equation modelling (SEM) with the use of partial least squares, results reported that TPB predicted (41%) of variance in respondents' intentions: Attitudes toward behaviour and subjective norms (SN) were seen to be moderate-level significant antecedents, while perceived behavioural control (PBC) was seen to be an insignificant antecedent; moreover, the entrepreneurship education programs (EEP) significantly influenced the three antecedents. Following the results, implications and suggestions are discussed; directions for further research are suggested. © 2021 Inderscience Enterprises Ltd..

ABSTRACT: Objectives: To demonstrate how medical purchasing power parities (mPPP) may harmonize economic evaluations from different jurisdictions and enable comparisons across jurisdictions.

Methods: We describe the use of mPPPs and illustrate this with an example of economic evaluations of nab-paclitaxel with gemcitabine (Nab-P + Gem) versus gemcitabine monotherapy in the setting of metastatic pancreatic cancer. Following a literature search, we extracted data from cost-effectiveness studies on these treatments performed in various countries. mPPPs from the Organization for Economic Co-operation and Development were used to convert reported costs in the jurisdiction of origins to US dollars for the most current year using two possible pathways: (1) reported costs first adjusted by mPPP then adjusted by exchange index; and (2) reported costs first adjusted by exchange index then adjusted by mPPP. Results: Despite many of the pharmaco-economic evaluations sharing similar assumptions and inputs, even after mPPP conversion, residual heterogeneity was attributable to perspectives, discount rate, outcomes, and costs, among others; including in studies conducted in the same jurisdiction. Conclusion: Despite the methodological challenges and heterogeneity within and across jurisdictions, we demonstrated that mPPP offers a way to compare economic evaluations across jurisdictions. © 2021 The Author(s). ABSTRACT: This study aims to explore the effect of intrinsic and extrinsic motivation on business school students' aspirations to become entrepreneurial managers in the future and whether the gender of their university instructor affects such a relationship. Gender equivalence proved to devour an instructive advantage over students (Aragonés-González, Rosser-Limiñana, & Gil-González, 2020), in addition to the idea that gender competence is a key element in the educational field (Palmén et al., 2020). The hypothesized paradigm is tested through multiple regression and univariate tests based on the responses of 321 Jordanian university students who finished entrepreneurship courses to pursue nexuses between the endogenous and exogenous variables. Results indicated that both intrinsic and extrinsic motivations affect students' aspirations to become entrepreneurial managers in the future in favor of their role models. Additionally, both intrinsic and extrinsic motivations are affected by female instructors. However, male instructors only inspired the intrinsic motivation of the students. As female academic instructors face challenges attributed to gender bias, especially in the Arab and Middle Eastern countries, the results of the study hope to help change the discerning negative perceptions of female instructors in Jordanian and Arab universities. Such problems in gender inspiration affect the prospect of the outcomes required and may have an indirect effect on the educational field in general. The study recommends focusing more on the effect of motivation and innovation efficiency based on gender type in addition to converging entrepreneurship educational research due to the COVID-19 pandemic (Ratten & Jones, 2021). © 2021 The Authors.

ABSTRACT: Phenol is one of the main pollutants that have a serious impact on the environment and can even be very critical to human health. The biodegradation of phenol can be considered an increasingly important pollution control process. In this study, the degradation of phenol by *Bacillus simplex* was investigated for the first time under different growth conditions. Six different initial concentrations of phenol were used as the primary substrate. Culture conditions had an important effect on these cells' ability to biodegrade phenol. The best growth of this organism and its highest biodegradation level of phenol were noticed at pH 7, temperature 28° C, and periods of 36 and 96 h, respectively. The GC-MS analysis of the bacterial culture sample revealed that further degradation of the catechol by 1,2-dioxygenase produce a cis, cis-mucconic acid via ortho-pathway and/or by 2,3-dioxygenase into 2-hydroxymucconic semialdehyde via meta-pathway. The highest biodegradation rate was perceived at 700 mg/L initial phenol concentration. Approximately 90% of the phenol (700 mg / L) was removed in less than 96 hours of incubation time. It was found that the Haldane model best fitted the relationship between the specific growth rate and the initial phenol concentration, whereas the phenol biodegradation profiles with time could be adequately described by the modified Gompertz model. The obtained parameters from the Haldane equation are: 1.05 h⁻¹, 9.14 ppm, and 329 ppm for Haldane's maximum specific growth rate, the half-saturation coefficient, and the Haldane's growth kinetics inhibition coefficient, respectively. The Haldane equation fitted the experimental data by minimizing the sum of squared error (SSR) to 1.36×10⁻³. © 2021 Mousa K. Magharbeh et al.

ABSTRACT: The current study discusses methodological issues for monitoring process to control the state of developing information system. The main goal of this evolutionary process is to achieve the optimal value for some criteria. The proposed approach is considered as a conception for the evolution of properties for system (object) at the planning phase. The study has proposed the evolution conception of system properties for planning (development) phase, concept of improving the system properties, the indicators of the functional maturity, and the technique of evaluation of functional maturity. The planning phase, the quality indicators named 'functional maturity' is a concept of the evaluation of functional maturity in which estimates of the functional maturity indicators and a technique for functional maturity evaluation monitoring conception are done. The implementation of this technique has developed a tier-based procedure. The results have demonstrated that network planning should follow integrated work practices along with the implementations of solid system design. Copyright © 2021 Inderscience Enterprises Ltd.

ABSTRACT: With the need for specialized civil engineers rising in local and regional markets, Al-Zaytoonah University of Jordan (ZUJ) had launched the Civil and Infrastructure Engineering (CIE) program in 2009. The CIE program has aspired to be among renowned universities worldwide through the recognition of the Accreditation Board for Engineering and Technology (ABET). The CIE curriculum was adapted to meet the requirements of ABET. As a consequence of preparing for the first-time accreditation of the CIE program, the authors have learned several valuable lessons. This article constitutes a roadmap to those seeking first-time ABET (or other) engineering accreditation for their programs by reviewing the work of other successful first-time accreditation efforts and analyzing similar processes that were necessitated at ZUJ in preparation for the accreditation. In particular, the article describes the processes used and corresponding results of the ABET Site Visit completed in November and provides a good resource for conducting a sustainable continuous improvement process. Throughout the self-assessment process, feedback was gathered and information was solicited from internal and external formal/informal sources. Periodic collections of specific inputs regarding the program educational objectives, curriculum, and outcomes were requested through meetings, discussions, questionnaires and archives of the CIE Department in the period from 2016 to 2019. Data analysis was performed using Likert scale, statistical analysis, qualitative analysis and judgment to evaluate and perform the necessary reviews and revisions in the accreditation process. © 2021 The Author(s). ABSTRACT: The paper disentangles gross savings into government and private savings and investigate their impact on gross investment. Our methodology is based on a balanced panel of four MENA countries (Tunisia, Jordan, Egypt and Lebanon) for the period 2000-2017 by employing the Panel Vector Autoregressive Model (PVAR). Our findings show that government savings as a ratio of GDP does not have any impact on investment while private savings as a ratio of GDP does. Both variables exhibit the correct signs. The results also show that mobility of private saving is high and seemingly statistically inconsistent with the Fielstein and Horioka (1980) puzzle. Our paper also reveals that even though OECD countries are more open than our sample countries, the higher capital mobility of our sample is driven by the economic and political instability in the region. © 2021, Hrvatsko Drustvo Ekonomista. ABSTRACT: Purpose: The interaction of Vitamin D and its receptor plays a crucial role in immune modulation. Therefore, the relationship between the pathogenesis of type 1 diabetes and the genetic variants of Vitamin D receptor, which is involved in the activity of Vitamin D, was studied extensively in different populations. The association of Vitamin D receptor gene polymorphisms with predisposition to type 1 diabetes revealed controversial and inconclusive results. The aim of this study was to examine the association of four Vitamin D receptor polymorphisms with type 1 diabetes in Jordanian patients. Patients and Methods: Analysis of the single nucleotide polymorphisms FokI (rs2228570), ApaI (rs7975232), TaqI (rs731236) and BsmI (rs1544410) in 100 Jordanian volunteers (50 control and 50 Type 1 diabetes patients) was performed using the highly specific New Generation Sequencing technology. Results: The distribution of allele, genotype as well as haplotype frequencies exhibited no significant ($P > 0.05$) differences between type 1 diabetes patients and controls. Furthermore, no differences ($P > 0.05$) in the frequency of the genotypes of the Vitamin D receptor genetic variants were found in relation to the age of disease onset. Conclusion: These findings

suggest these four single nucleotide polymorphisms of the Vitamin D receptor gene seem not to be associated with type 1 diabetes predisposition in Jordanian patients. Further wide genome studies are recommended to detect other genetic variant associations with type 1 diabetes among Jordanians. © 2021 Khdair et al.

ABSTRACT: This study investigates the effects of supply chain management (SCM) practices on organisational performance in pharmaceutical industries. The relationship between SCM practices and organisational performance based on performance metrics such as productivity, efficiency, profitability, market share, return on investment and sales are examined. We developed a novel methodology based on structural equation model by combining a qualitative and quantitative approach. We also considered 119 pharmaceutical companies as we formulated set of hypotheses based on the positive influence of supply chain management practices on organisational performance and SCM practices and supply chain performance. The results show that strategic purchasing, customer relationship management, strategic supplier relationship, information sharing and internal lean practices are significant predictors of organisational performance. In addition, we find that information sharing, although relevant in the supply chain, does not impact organisational performance. © 2021 Inderscience Enterprises Ltd.

ABSTRACT: Steel slag usage in concrete can be a promising and sustainable approach to reduce natural resources shortages, landfill costs and potential pollution. In this work, the behavior of concrete prepared with varying replacements of recycled Steel Slag Aggregate (SSA) of natural aggregate ranging from 0% to 75% was investigated. Concrete behavior was evaluated using different tests; namely, compressive and flexural strengths, mass loss, water absorption, permeability and freezing/thawing (F/T) effect. The incorporation of SSA into concrete improved the strength and durability of mixtures prepared with high replacement ratios of SSA. The compressive strength was increased at about 12% for the 75% replacement ratio of fine aggregate compared to the control specimens, while concrete containing SSA as coarse aggregate showed the highest compressive strength at about 49.2 MPa. The flexural strength of the present mixtures was increased by about 13% and 15% for concrete with substitutions of 75% SSA of fine and coarse aggregate, respectively. The replacement of SSA for natural coarse aggregate at 75% was fundamental in enhancing the resistance to F/T noticeably as indicated by ultrasonic pulse velocity measurements. © 2021 JUST. ABSTRACT: Many T2D use CAO as a laxative. We did not find sufficient research to explain CAO's potential effect on the levels of HbA1c in T2D patients. This study will study this effect. Rats (n=80) were divided into eight groups (n=10). Five groups (n=50) were injected with streptozotocin intravenously to induce T2D. One group was given CAO with empagliflozin, and the second was assigned

CAO only daily. The third was assigned CAO every two days, with empagliflozin, which was given daily. A fourth was assigned CAO alone daily. Also, the fifth was given empagliflozin alone. In the healthy groups, one group was given CAO, and the other was given empagliflozin. Also, the last healthy group was not assigned any drug. CAO's result on HbA1c in healthy rats was noted to decrease when delivered alone for eight weeks. HbA1c of the diabetic groups showed no significant difference (P -value <0.05) when comparing the rats given CAO with empagliflozin, and the rats were given CAO only. There was also no noticeable effect among the groups of rats given CAO daily and every two days. This study explains that CAO does not lead to a significant difference in HbA1c levels in diabetic rats, even it did for healthy rats, and if given alone, CAO could affect HbA1c levels if given over a long period. Also, CAO has a noticeable impact on experimental rats that co-administered Empagliflozin on HbA1c levels, and that Empagliflozin effect is not significantly affected if taken with CAO. © 2021 DSR Publishers/The University of Jordan. ABSTRACT: In this study, an inexpensive simple method for the fabrication of efficient hydrogen (H₂) gas sensor based on carbon nanotubes (CNTs) was presented. The CNTs were synthesized using microwave oven and deposited onto SiO₂ substrate by a dielectrophoretic method. The as-grown CNTs showed an n-type behavior because CNTs possess the characters of both metallic and semiconductor when placed between the two electrodes, meanwhile, the current was directed mostly by metallic tubes. Upon exposure to H₂ gas at room temperature, the CNTs exhibited high sensitivity up to 315% at 140 ppm H₂, and relatively good sensitivity of 40% at a very low H₂ gas concentration of 20 ppm. To the best of our knowledge, this is the first work involving the fabrication of CNTs for detecting a low H₂ gas concentration of 20 ppm at RT with high sensitivity comparing with other previous studies. © 2021 The Author(s). ABSTRACT: Periodontitis comprises a chronic inflammation that is initiated by microbiota biofilm. If left untreated, periodontitis may lead to permanent tooth loss. Herein, we propose to design and improve a localized form of therapy comprising a chlorhexidine-impregnated hydrogel. Hydrogel films were prepared by varying the ratio between cellulose (MCC) and carboxymethylcellulose sodium (CMC) using the crosslinker epichlorohydrin (ECH). The hydrogel was loaded with chlorhexidine. Increasing the CMC ratio led to a reduction in the number of pores, an increase in their size, lower glass transition temperature (T_g), decreased Young's modulus, and increased film stretching and affected the time of release. Bacterial and fungal zones of inhibition showed similar activity and were not affected by the CMC and MCC ratio. Hydrogels loaded with chlorhexidine prevented the growth of *S. oralis* and *C. albicans* microorganisms and may provide a promising local delivery system for treating periodontitis. © 2021 Ola Tarawneh et al.

ABSTRACT: Decreased levels of collagen is a primary cause for skin aging. Collagen is produced from dermal fibroblasts. During photo aging, matrix metalloproteinases (MMPs) break down collagen fibers resulting in severe loss of skin elasticity. This manuscript lists the different types of botanicals that have been shown to provide dermatological benefits for skin regeneration. The literature of the last twenty years—with special attention for the last five years—concerning the different antiaging

medicinal plants was reviewed. © 2021, SILAE (Italo-Latin American Society of Ethnomedicine). All rights reserved.

ABSTRACT: World wide, and in Jordan specifically, date palm fruit production has been steadily increasing. Recently, various dates extracts have been used functionally as antioxidants or anticancer agents. In addition, Jordanian date palm fruit of Barhi variety at two maturity stages (Rutab) and (Tamr) inhibited chemically-induced mammary cancer in animal model. The aim of this study is to strengthen the scientific evidence on the effect of dates on mammary cancer via assessing the effect of different concentrations of water extracts of three varieties of dates grown in Jordan (Barhi, Belle Huwaimil, and Medjool) at two maturity stages (Rutab and Tamr) on the viability of MCF-7 breast cancer cell line. The effects of different extracts on MCF7 inhibition/proliferation was analyzed using MTT assay. Percentage of inhibition was calculated. The most effective concentration was 100 mg/ml for all varieties. At this concentration, Medjool variety at the Tamr stage exhibited the highest inhibition. At the 12.5 and 25 mg/ml concentrations of the extracts, the most effective date palm fruit varieties were Belle Huwaimil and Barhi at the Tamr stage respectively. At lower concentrations (3.125 and 6.25 mg/ml), Medjool at the Tamr stage and Belle Huwaimil respectively were the most effective extracts were Barhi at the Tamr and Rutab stages were the least effective ($P=0.000^{**}$). It is concluded that water extract of palm fruit reduced MCF-7 cell viability. © 2021, Enviro Research Publishers. All rights reserved.

The Elite Home Accounting Consulting Company, Jordan

ABSTRACT: The main objective of this study was to investigate the impact of the exchange rates fluctuation of foreign currencies in the official and black markets on the results of financial statements of the private banks in Syria, through using the ratios of Liquidity and Profitability and the gains on foreign currencies revaluation as independent variables during the period from 2010 to 2017. For the purposes of achieving the objectives of this study, the descriptive research approach was adopted, and the researcher analyzed the financial statements data via E-Views software ninth edition, and the normal distribution was tested through the coefficient of Skewness and a Multicollinearity test, in addition to the Pearson correlation matrix and unit root tests. The conclusions of the study clarified that it was a statistically significant effect of exchange rates fluctuation in the official market on the profitability and the revaluation gains, while it was no effect on the liquidity, and also showed that there was no statistically significant effect of exchange rates fluctuation in the black market on the liquidity and the revaluation gains, while it was an effect on the profitability. The researcher recommends to study other sectors than banks, such as financial brokerage companies and exchange companies, to determine the effect of fluctuations in exchange rates on their performance, and to conduct this study in other countries suffering from conflicts and wars, and extend the study through comparative studies before 2011 and current years © 2021, Academy of Accounting and Financial Studies Journal. Liquidity, leverage, and solvency: what affects profitability of industrial enterprises the most?

(2021) *Investment Management and Financial Innovations*, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115426069&doi=10.21511%2fifimfi.18%283%29.2021.22&partnerID=40&md5=e31d0563e5ff6af677726a8e1269f36b)

[85115426069&doi=10.21511%2fifimfi.18%283%29.2021.22&partnerID=40&md5=e31d0563e5ff6af677726a8e1269f36b](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115426069&doi=10.21511%2fifimfi.18%283%29.2021.22&partnerID=40&md5=e31d0563e5ff6af677726a8e1269f36b)

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: The purpose of this paper is to show the relative impact of liquidity, leverage, and solvency on profitability of industrial enterprises listed on the Amman Stock Exchange to ascertain which of them has the most effect on profitability. To reach the objectives of this study, 44

Jordanian industrial companies are examined from 2012 to 2018. Return on assets (ROA) and return on equity (ROE) are examined as measures of performance, current ratio and quick ratio as measures of liquidity, debt ratio and debt to equity ratio as measures of leverage, and the interest coverage ratio as a measure of financial solvency. Multiple regression analysis was used to check the hypotheses. A negative and statistically significant impact was found at the 1% level between financial leverage and profitability. At the same time, findings did not show the same for the effect of liquidity and solvency on profitability. In addition, leverage has the highest relative impact among independent variables on profitability, followed by solvency and then liquidity. Moreover, it is indicated that company size is a control variable of the effect between liquidity, leverage, and solvency on performance. Thus, it is concluded that management of industrial companies should reduce dependence on debt to finance companies to achieve the highest possible returns; it is recommended to maintain an acceptable level of liquidity to ensure the continuity of companies and attention to the level of solvency within companies to maintain a high financial performance. © 2021 LLC CPC Business Perspectives. ABSTRACT: Background: Diabetes mellitus is a serious global health issue, currently affecting 425 million people and is set to affect over 690 million people by 2045. It is a chronic disease characterized by hyperglycemia due to relative or absolute insulin hormone deficiency. Dipeptidyl peptidaseIV (DPP-IV) inhibitors are hypoglycemic agents augmenting the action of the incretin hormones that stimulate insulin secretion from the pancreatic beta cells. Objective: In this study, synthesis and biological evaluation of seven piperazine derivatives 3a-g was carried out. Methods: The synthesized molecules were characterized using proton-nuclear magnetic resonance, carbon-nuclear magnetic resonance, infrared spectroscopy and mass spectrometry. Results: In vitro biological evaluation study showed comparable DPP-IV inhibitory activity for the targeted compounds ranging from 19%-30% at 100 µM concentration. Furthermore, the in vivo hypoglycemic activity of 3d was evaluated using streptozotocin-induced diabetic mice. It was found that compound 3d significantly decreased the blood glucose level when the diabetic group treated with 3d was compared to the control diabetic group. Quantum-Polarized Ligand Docking (QPLD) studies demonstrate that 3a-g fit the binding site of DPP-IV enzyme and form H-bonding with the backbones of R125, E205, E206, K554, W629, Y631, Y662, R669, and Y752. Conclusion: Piperazine derivatives were successfully found to be new scaffolds as potential DPP-IV inhibitors. © 2021 Bentham Science Publishers.

ABSTRACT: This study aims at developing models to predict the operating speeds of passenger cars on horizontal curves of rural multi-lane highways. A total of 16 compound curves and 35 simple curves located on two major rural multi-lane divided highways in Jordan were selected for the study. Continuous speed data were collected using an affordable (low cost) speedometer application loaded on smartphones equipped with Global Positioning System (GPS) technology. A stepwise multiple linear regression analysis at a 95% confidence interval has been performed to develop the speed prediction models. The obtained model at the beginning of the compound curve indicated that the 85th percentile speed at the midpoint of approach independent tangent and the deflection angle of the first curve is found to be statistically significant to predict operating speed. At both points of the compound curve and end of the curve, the significant variables were the radius of the first curve and the total length of the compound curve. For simple curves, the obtained models indicated that the curve radius and the 85th percentile speed at the midpoint of approach independent tangents were positively correlated with the operating speed at beginning of curve, while the degree of curvature was negatively correlated with the operating speed at both middle and end of the curve. © 2021 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: Image analysis is an important technique that can help specialists localize, detect, and segment objects in different types of medical images such as MRI, CTs, and ultrasounds (US). In this research, we use US images to identify and segment the enlarged veins in the pampiniform venous plexus, which is called varicocele. The proposed method aims to determine whether a potential patient is affected or not. This method was evaluated using 90 US images that were taken of the left testicles of 90 patients in the Supine position. This system analyzes US images in three stages which are; preprocessing, processing, and edge detection. The Region Of Interest (ROI) of the pampiniform plexus area was extracted using Otsu segmentation with different parameters (0.1, 0.2, 0.17) and different color modes (Grayscale, YCbCr, RGB). In the processing stage, different denoising filters were used. Eventually, in the edge detection stage, four edge detectors were applied which are Canny, Sobel, Prewitt, and Roberts. Results showed that the best accuracy in detecting varicocele was 78% when the YCbCr color mode yellow (y) channel was used with 0.1 Otsu segmentation and the Canny edge detector. The system also showed a Sensitivity of 91%, as the test was able to detect 91% of the people with Varicocele, and the Specificity value was 39%. © 2013 IEEE.

ABSTRACT: Empagliflozin, pioglitazone, and metformin are antidiabetic drugs used alone or together to treat diabetes. An economical, simple, precise, selective, and stability-indicating RP-HPLC method has been established and validated to evaluate these drugs in bulk and tablet dosage forms. ICH guidelines were followed, where the separation of the drugs using a mobile phase prepared by mixing orthophosphoric acid buffer and acetonitrile (30: 70 v/v) adjusted to pH 2.7 was followed. An ACE C18 - (250 mm x 4.6 mm), 5 µm column at a flow rate of 0.5 mL/min at 25°C, and detection monitored at 230 nm were used. The R² was not < 0.9998 in the range of 20-250 ppm. For stability study, drugs were studied using variant stress conditions such as base, acid, neutral, oxidation, and thermal degradation. Results were validated for the limit of detection, the limit of quantification, precision, accuracy, and linearity. The method also proved robust concerning variations in pH of the mobile phase, detector-wavelength, temperature, and mobile phase composition. The retention time of empagliflozin, metformin, and pioglitazone was 3.2 min, 2 min, and 2.6 min, respectively, with a runtime of 7 min. Detector linearity was obtained at 10-100 ppm, with the correlation coefficient for empagliflozin, pioglitazone, and metformin being 0.9994, 0.9993, and 0.9998, respectively. The low relative standard deviation, i.e., <2%, validated results, and high recovery% affirm the suitability of this method for being employed for the routine analysis of bulk and tablets containing these drugs in pharmaceutical formulation. © 2021 by Polish Pharmaceutical Society. ABSTRACT: In this study, we continue the classification of finite type Gauss map surfaces in the 3-dimensional Euclidean space E³. To do this, we investigate an important family of surfaces, namely, tubular surfaces in E³. We show that the Gauss map of a tubular surface is of an infinite type regarding the second fundamental form. © 2021 Helder Mann Verlag.

ABSTRACT: This paper seeks to investigate the effect of top management support and none accounting ownership on organisational performance, based on a literature review showed shortage in effect adoption of ABC for many of manufacturing companies are weak. The scope of the study encompasses the manufacturing companies in Jordan, and the financial managers were identified as the respondents for the questionnaire survey. Therefore, the managers and decision-makers should take these factors into consideration when making their decisions. Equally, the findings could facilitate policies formulation among the relevant bodies in developing countries, particularly those policies concerning manufacturing. In addition enriching the knowledge of organizational performance for manufacturing organizations', this study can become a starting point for further investigation and analysis of organisational performance among Jordanian manufacturing companies. © 2021

Graduate School of Business, Universiti Sains Malaysia, Malaysia

ABSTRACT: The objective of this paper is to examine the impacts of stock market segmentations (SMS) and surplus free cash flow (SFCF) on income-increasing discretionary accruals. The study also provides the initial evidence regarding the influence of audit quality (AQ) as a moderating variable on those relationships. A sample of non-financial firms was taken from the list of Amman Stock Exchange over the period 2013-2019. Using Huber-White's sandwich estimator for pooled OLS regression, the current research presents empirical evidence harmonious with the prediction in all hypotheses. Further, the findings documents that a Big 4 auditor weakens the SMS-DAC and SFCF-DAC associations, which suggests that the role of Big 4 audit firms is effective in mitigating management's opportunistic behaviour. However, the reported results provide beneficial information to investors, regulators, external auditors, policymakers, shareholders, and other countries with similar institutional environment. © 2021, University of Wollongong. ABSTRACT: Concentrations of emitted pollutants in the atmosphere are influenced by the emission sources and metrological data. In Jordan, diesel fuel is considered to be a main source of SO₂, which has a negative impact on the air quality. In this work, the SO₂ emitted during the burning of desulfurized diesel fuel using activated carbon is conducted using three types of Artificial Neural Network (Elman, NARX and Feedforward models). In order to accomplish this, the previous experimental work on desulfurization of diesel fuel using two types of activated carbon was adopted. The metrological data involved the average daily temperature (T), relative humidity (RH), wind speed (WS), pressure (P), concentration of Particulate Matter (PM₁₀) and average daily solar radiation (SR) over the period from 2/1/2020 to 30/12/2020. It was found that NARX is the most accurate model in the forecasting process of SO₂, followed by Elman and feedforward, which was found to be the least capable model in predicting the SO₂ emitted concentration. © 2021, Polish Society of Ecological Engineering (PTIE). ABSTRACT: The conducted research aims to attain the optimal approach for a certain control unit, namely the Proportional-Integral-Derivative-controller (or simply PID-controller), which typically monitors the blood sugar level of a diabetic patient. This would be implemented through introducing a fractional-order PID-controller (or PIyDP-controller) instead of the already classical one. Two optimization algorithms, Particle Swarm Optimization (PSO) and Bacteria Foraging Optimization (BFO) algorithms, together with two different approximations, the Continued Fraction Expansion (CFE) and the Outstaloup's approaches, will be used to complete the design process. Several numerical comparisons will be performed to reach the best approach to meet the optimal needs of this industrial application. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: This book deals with two important branches of mathematics, namely, logic and set theory. Logic and set theory are closely related and play very crucial roles in the foundation of mathematics, and together produce several results in all of mathematics. The topics of logic and set theory are required in many areas of physical sciences, engineering, and technology. The book offers solved examples and exercises, and provides reasonable details to each topic discussed, for easy understanding. The book is designed for readers from various disciplines where mathematical logic and set theory play a crucial role. The book will be of interested to students and instructors in engineering, mathematics, computer science, and technology. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: With the advent of social networks, the users have obtained a golden opportunity to express their opinions using text and multimedia. However, some users abused these platforms by introducing acts such as Cyber-Bullying and Cyber-Harassment. Despite the various negative health and social effects, the works proposed toward the detection of these acts are still limited, especially in non-English languages. In Arabic, few works studied this phenomenon. These works had limited datasets. As the number of available training datasets are limited, it is still hard to train classifiers to detect these acts. Therefore, clustering has posed as an alternative solution to tackle this difficulty. In this work, we propose the use of clustering to detect Cyber-Bullying and Cyber-Harassment. We adopted various clustering algorithms including K-Means and Expectation Maximization (EM). Moreover, we used various natural language processing (NLP) tools for this objective. The results illustrate that the training time of K-Means is significantly smaller than that of EM in all the conducted experiments. As for the accuracy, the two clustering methods showed different performance based on the variance in the used NLP settings. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Abstract. During the past decades, enormous works by different researchers have been carried out in fixed point theory on metric spaces. In this paper, we prove some common fixed point theorems in bicomplex valued metric space for two mappings and for six mappings. Also, we have introduced the concept of bicomplex valued b-metric space and coupled fixed point theorem in bicomplex valued b-metric space. © 2021, Turkish World Mathematical Society Journal of Applied and Engineering Mathematics. ABSTRACT: Passive earth pressures play an important role in soil-structure interaction problems. They provide stabilizing forces for anchor blocks, laterally loaded pile foundations and retaining walls. Quite often, passive earth pressures are used to resist lateral movement of structures. The passive earth pressure behind retaining walls depends on the strength of the backfill material, the wall-soil frictional angle and the stress history of the soil. The stress history, which is represented by the so-called over-consolidation ratio (OCR), is a major governing parameter in the determination of passive earth pressure on the wall. The present paper presents a theoretical model to predict the coefficient of passive earth pressure for the case of normally consolidated or over-consolidated cohesionless backfill overlaying deep deposit. The theory utilizes the method of slices and the limit equilibrium method of analysis. Design theory, design charts and design examples are presented. Coefficients of passive earth pressure as deduced by the present study and Yong and Qian (2000) method were very close for example at low friction angles, such as ϕ of 10° and δ of 10° . The present study estimates K_p at 1.67, while it was estimated by Yong and Qian to be 1.66. At higher values of friction as ϕ of 30° and δ of 15° , the present study estimates K_p at 4.29, while it was estimated by Yong and Qian to be 4.61. © 2021 JUST. All Rights Reserved.

Department of Computer Science, Yarmouk University, Irbid, Jordan

ABSTRACT: This work investigates the use of the Moth-Flame Optimisation (MFO) algorithm in solving the Permutation Flow Shop Scheduling Problem and proposes further optimisations. MFO is a population-based approach that simulates the behaviour of real moths by exploiting the search space randomly without employing any local searches that may stick in local optima. Therefore, we propose a Hybrid Moth Optimisation Algorithm (HMOA) that is embedded within a local search to better exploit the search space. HMOA entails employing three search procedures to intensify and diversify the search space in order to prevent the algorithm's becoming trapped in local optima. Furthermore, HMOA adaptively selects the search procedure based on improvement ranks. In order to evaluate the performances of MFO and HMOA, we perform a comparison against other approaches drawn from the literature. Experimental results demonstrate that HMOA is able to produce better-quality solutions and outperforms many other approaches on the Taillard benchmark Copyright 2021 Inderscience Enterprises Ltd.

ABSTRACT: The current study aims to investigate the influence of accounting information system (AIS) elements, including human resources, physical resources, and financial data, in delivering the organization to a suitable decision-making process through the mediating role of well-built accounting disclosure. The study applies its model to the commercial banks listed in the Jordanian market at the end of 2019. A quantitative approach was adopted and a questionnaire was applied on 171 financial managers and accounting department heads within 21 commercial banks in Jordan. Based on the results of a structural equation model, the main hypothesis was accepted referring to the positive influence of AIS elements of human resource, physical resource, and financial data on organizational decision-making that is attributed to accounting disclosure within commercial banks in Jordan. These results show the importance of AIS in decision-making and encourage companies to adopt modern AIS in order to help them improve the quality of accounting information. The study recommended focusing on increasing skills and knowledge of accounting and financial managers within banks on the multiple ways of benefitting from AIS applications, this can include holding conferences, seminars, and workshops. © 2021 The Authors.

ABSTRACT: In this article, we present an argument based on empirical evidence from Levantine Arabic in favor of the fact that the (ya)illi relative clause (YRC) has a head-external structure (e.g., a matching). A set of state-of-the-art diagnoses that speak against the head NP raising in YRCs is fully demonstrated and analyzed in the context of some grammatical structures. As confirmed by the evidence, if the possibility of raising syntax in YRCs is ruled out in such restricted contexts, it follows that some variant of head external analysis for the YRC is in order; at least as another structure that characterizes this type of relative clauses in addition to head NP raising structure that was approved in the representative literature such as Ouhalla (2004) and Aoun, Benmamoun and Choueiri (2010). © 2021 DSR Publishers/The University of Jordan. ABSTRACT: Background: The 2019 coronavirus outbreak (COVID-19) has been declared a pandemic and has greatly affected both patients and healthcare workers. This study was conducted to explore the extent of posttraumatic stress disorder (PTSD) experiences among nurses as a result of the COVID-19 pandemic in Jordan. Method: This study used a cross-sectional study design with a convenience sampling approach. A sample of 259 participants completed the study questionnaires, including a socio-demographic questionnaire and the Posttraumatic Stress Disorder Checklist for DSM-5, between May and July 2020. Result: The prevalence of PTSD among the study participants was 37.1%. The majority of study participants who exhibited PTSD symptoms presented the lowest level of PTSD (17%). The results indicated significant differences in overall COVID-19-related PTSD according to the participant's age ($F = 14.750$, $P = .000$), gender ($F = 30.340$, $P = .000$), level of education ($F = 51.983$, $P = .000$), years of experience ($F = 52.33$, $P = .000$), place of work ($F = 19.593$, $P = .000$), and working position ($F = 11.597$, $P = .000$), as determined by one-way ANOVA. Conclusion: Nurses must be qualified and accredited to cope with reported PTSD cases and their consequences in relation to COVID-19 outbreaks. A close collaboration with a multidisciplinary team is required to recognise, manage, and encourage safety literacy among health care professionals and individuals diagnosed with or suspected of PTSD due to COVID-19 outbreaks or any other viral outbreaks. © 2021 Society for Disaster Medicine and Public

ABSTRACT: Objective: Care needs among Arabic cancer patients have not been assessed previously due to the lack of translated instrument that can determine the care needs among the cancer patients in Arab countries. The aim of this study was to translate and validate an Arabic version of the Cancer Needs Questionnaire-Short Form (CNQ-SF). Methods: A cross-cultural adaptation and psychometric testing was used. Brislin's model of translation was used to translate the CNQ-SF from English to Arabic. A cross-cultural adaptation and psychometric testing was used. A sample of 113 participants with different types of cancer completed the study surveys including the CNQ-SF (Arabic version) and Functional Assessment of Cancer Therapy-General (FACT-G). Descriptive, bivariate statistics and exploratory factor analysis (EFA) were performed. Results: Content validity was evaluated by a panel of experts and 20 participants and showed that translated scale was clear, understandable, and logical in order. Reliability analysis of CNQ-SF domains ranged from 0.85 to 0.93 and 0.94 for the total Arabic version of CNQ-SF. Convergent analysis showed a significant relationship between CNQ-SF (Arabic version) and FACT-G. Results of EFA indicated that the CNQ-SF scale has 32-items. It consists of five domains, the results indicated that Kaiser-Meyer-Olkin was 0.851, and Bartlett's Test of Sphericity was significant (significant ($P < 0.001$)). Conclusions: The current study indicates that the Arabic version of CNQ-SF is valid, reliable, and applicable. It can be used by researchers, clinical practitioners, and health educators in Arab countries. © 2021 Wolters Kluwer Medknow Publications. All rights reserved.

ABSTRACT: Pharmacogenomics (PGx) testing optimizes pharmacotherapy and reduces interindividual variation in drug responses. However, it is still not implemented in clinical practice in the West Bank of Palestine (WBP). The aim of this study was to determine the need for PGx education and testing among physicians from different specialties in WBP. This study used a cross-sectional survey that was administered to 381 physicians from different cities in WBP. The questionnaire consisted of 27 closed-ended questions that evaluate the exposure and attitude toward PGx education, the role of PGx testing in clinical practice, and the capabilities of physicians in PGx testing. It was found that exposure to PGx education is low, with most of the respondents (81.1%) answering that PGx was not an integral part of their medical education. The majority (>90%) of the participants agreed that PGx should be included in the medical school curriculum. It was also found that 58.5% of the participants agreed that PGx testing is relevant to their current clinical practice. In addition, most of the participant physicians (>60%) think that they are currently not capable of prescribing and making decisions for pharmacotherapy based on PGx testing. It is concluded that there is a high need for PGx education and implementation in clinical practice in WBP. We recommend adding PGx courses to the curricula of medical schools and going forward with the implementation of PGx testing in clinical practice in WBP. © 2021

Towards the adoption of enterprise resource planning systems (ERP) as an effective teaching tool in higher education institutions

(2021) *Academy of Strategic Management Journal*, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107747797&partnerID=40&md5=1dc3434d71ce91cf5d60020977817d22)

[85107747797&partnerID=40&md5=1dc3434d71ce91cf5d60020977817d22](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107747797&partnerID=40&md5=1dc3434d71ce91cf5d60020977817d22)

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: Enterprise resource planning systems are considered as a key to gain competitive advantage and excellence. The purpose of this study is to find out the effect of enterprise resource planning systems as a teaching tool on the quality of teaching process. For the said purpose the available literature over ERP in general and its impact on higher educational institutions has been reviewed. Based on literature four variables have been identified which are supposed to be critical for gaining advantages from the implementation of enterprise resource planning systems as a teaching tool. For the said purpose, the questionnaire was developed, and the data was collected randomly. A sample of 100 was utilized for conducting the analysis. Smart PLS was used for structural equation modelling and the model has been analyzed. The findings of the study revealed that all the independent variables namely, perceived usefulness, awareness, ease flow of data, and facilitating conditions have a significant impact over the teaching quality. The calculated value of Construct Cross Validated Redundancy showed that model has a significant predictive relevance. The findings are significant for teaching staff, top management and for the policy makers in higher educational institutions. The future researchers are guided to identify the pre- and post-impact of enterprise resource planning systems as a teaching tool over the teaching process and quality of learning outcomes within higher educational institutes. © 2021

Dyslexic Arabic Students in the Arab Countries: A Systematic Review of Assistive Technology Progress and Recommendations

(2021) International Journal of Early Childhood Special Education, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107700085&doi=10.9756%2fINT-JECSE%2fv13i1.211014&partnerID=40&md5=b222ad2e1264359f2111567973827b4b>

AFFILIATIONS: Department of Multimedia Technology, Al-Zaytoonah University of Jordan, Amman, Jordan; Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: Dyslexia is quite possibly the most widely recognized learning troubles. Literacy is a critical life skill; low literacy skills inhibit educational advancement. Even a few dyslexic students may affect the broad educational experience of all students. Unfortunately, dyslexia is a relatively unknown phenomenon in Arabic academic communities. Arab countries are experiencing a rapid increase in dyslexic students; consequently, there is an urgent need to investigate dyslexia and its associated student assistive technology (AT). A systematic review was conducted on AT developed for dyslexic Arabic students to understand AT's benefits and challenges. Our research found that in addition to learning strategies, several other factors contributed to the adoption (or lack thereof) of AT in Arab classrooms, including environmental, social and cultural factors. This study's findings can assist AT developers and educational policymakers in efficiently designing and implementing AT. © 2021. All Rights Reserved.

ABSTRACT: The aim of this pilot psychometric study was to develop and assess the reliability, validity, and applicability of a nursing clinical assessment tool (NCAT) to assess students' clinical performance in the clinical training. Total of 325 forms were completed by 36 clinical raters for undergraduate nursing students who were selected using convenience sampling. International quality and safety education for nurses (QSEN) and Benson and Clark's (Benson, J., & Clark, F. (1982). A guide for instrument development and validation. The American Journal of Occupational Therapy, 36(12), 789-800) model guided the construction of the NCAT. Following literature review, a cross-cultural adaptation and psychometric testing were used. This newly developed tool showed substantial overall internal consistency reliability (Cronbach's alpha = 0.74). Three factors (i.e. Care Provider, Leadership & Team Work and Professionalism and Ethical Considerations) were identified for construct validity using exploratory factor analysis (EFA). This study suggests that the NCAT is a reliable, valid and applicable tool. It can be used in clinical and educational settings. Further testing of the tool in similar and different cultures is recommended. © 2021 2021 Walter de Gruyter GmbH, Berlin/Boston.

ABSTRACT: There are many studies that have focused on the Albrecht model of organizational intelligence (OI) and its seven dimensions (strategic vision, shared fate, appetite for change, heart, alignment and congruence, knowledge deployment, and performance pressure), but the current study presents a new attempt to study OI using the Yolles model in its three dimensions (self-reference, self-regulation, and self-organization) (2005). This study sought to determine the effect of organizational intelligence on market expansion (new markets and new product) in the Jordanian pharmaceutical industry, and it examined the effect of transformational leadership as a mediating variable on the relationship between organizational intelligence and market expansion. The study sample consisted of 231 respondents taken from six pharmaceutical companies divided into three categories according to their size as small, medium and large companies. The results confirmed that there is a significant positive effect of the two dimensions (self-regulation and self-organization) on new markets, while three dimensions of OI have a significant effect on new products in the pharmaceutical companies. © 2021 Najim Abood, Amany A. ABSTRACT: OBJECTIVE: Coronavirus 2019 (COVID-19) has now been declared as a worldwide pandemic.

Currently, no drugs have been endorsed for its treatment; in this manner, a pressing need has been developed for any antiviral drugs that will treat COVID-19. Corona-viruses require the SARS-CoV-2 3CL-Protease (3CL-protease) for cleavage of its polyprotein to yield a single useful protein and assume a basic role in the disease progression. In this study, we demonstrated that punicalagin, the fundamental active element of pomegranate in addition to the combination of punicalagin with zinc (Zn) II, appear to show powerful inhibitory activity against SARS-CoV-2. MATERIALS AND METHODS: The 3CL protease assay kit was used to quantify 3CL protease action. The tetrazolium dye, MTS, was used to evaluate cytotoxicity. RESULTS: Punicalagin showed inhibitory action against the 3CL-protease in a dose-dependent manner, and IC₅₀ was found to be 6.192 µg/ml for punicalagin. Punicalagin (10 µg/ mL) demonstrated a significant inhibitory activity toward 3CL-protease activity (p < 0.001), yet when punicalagin is combined with zinc sulfate monohydrate (punicalagin/Zn-II) extremely strong 3CL-protease activity (p < 0.001) was obtained. The action of 3CL-protease with punicalagin/Zn-II was decreased by approximately 4.4-fold in contrast to only punicalagin (10 µg/ mL). Likewise, we did not notice any significant cytotoxicity caused by punicalagin, Zn-II, or punicalagin/Zn-II. CONCLUSIONS: We suggest that these compounds could be used as potential antiviral drugs against COVID-19. © 2021 Verduci Editore s.r.l. All rights reserved.

ABSTRACT: In this paper, the process of training an artificial neural network (ANN) on predicting the hysteresis of a viscoelastic ball and ash wood bat colliding system is discussed. To study how the material properties and the impact speed affect the hysteresis phenomenon, many experiments were

conducted for colliding three types of viscoelastic balls known as sliotars at two different speeds. The aim of the study is to innovate a neural network model to predict the hysteresis phenomenon of the collision of viscoelastic materials. The model accurately captured the input data and was able to produce data sets out of the input ranges. The results show that the ANN model predicted the impact hysteresis accurately with <1% error. © 2021 The Author(s) 2021. States

ABSTRACT: Even after one year of its first outbreak reported in China, the coronavirus disease 2019 (COVID-19) pandemic is still sweeping the World, causing serious infections and claiming more fatalities. COVID-19 is caused by the novel coronavirus SARS-CoV-2, which belongs to the genus Betacoronavirus (β -CoVs), which is of greatest clinical importance since it contains many other viruses that cause respiratory disease in humans, including OC43, HKU1, SARS-CoV, and MERS. The spike (S) glycoprotein of β -CoVs is a key virulence factor in determining disease pathogenesis and host tropism, and it also mediates virus binding to the host's receptors to allow viral entry into host cells, i.e., the first step in virus lifecycle. Viral entry inhibitors are considered promising putative drugs for COVID-19. Herein, we mined the biomedical literature for viral entry inhibitors of other coronaviruses, with special emphasis on β -CoVs entry inhibitors. We also outlined the structural features of SARS-CoV-2 S protein and how it differs from other β -CoVs to better understand the structural determinants of S protein binding to its human receptor (ACE2). This review highlighted several promising viral entry inhibitors as potential treatments for COVID-19. IAS/IFRS in Jordan: Adoption, implementation and determinants

(2021) Universal Journal of Accounting and Finance, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85107054583&doi=10.13189%2fUJAF.2021.090213&partnerID=40&md5=a21de65e1849326b97c134391e5ef427

Jordan

ABSTRACT: This study examines the current status of accounting standards among Jordanian firms. In particular, it examines the adoption level of IAS/IFRS. In addition, it examines the implementation process in terms of difficulties and challenges. Further, the study tests empirically the effect of international institutional pressures, local legal enforcement bodies and accounting education level on accounting standards adoption level. The results of the study are based on the descriptive and multiple regression analysis technique. Based on 62 usable responses, the study reveals that the adoption level of IAS/IFRS among Jordanian firms is moderate. For example, IFRS 7 (Financial Instruments: Disclosure) is the most adopted standard. This is followed by IAS 32 (Financial Instruments: Presentation) and IFRS 15 (Revenue from Contracts with Customers) respectively, while IFRS 2 (Share-based Payment) is the least adopted standard. In general, the study reveals that the implementation process of some standards is easy such as IFRS 7 (Financial Instruments: Disclosure), while others such as IAS 36 (Impairment of Assets) and IFRS 13 (Fair Value Measurement) need additional efforts to properly implement. In addition, several challenges were detected, which could prevent the proper implementation of some accounting standards such as the shortage in the governmental and IT supports. Further, the study shows that international institutional pressure and local legal enforcement bodies have a positive and significant relationship with the adoption level of accounting standards, while the effect of accounting education level is insignificant. JACPA should coordinate and collaborate with IASB and the government to offer all the necessary financial, technical and legal support for Jordanian firms to fully adopt and apply accounting standards. Several recommendations were offered for future research to enrich this vital topic in Jordan and other developing countries. © 2021by authors.

ABSTRACT: Introduction: Sickle cell disorders are the most frequently encountered hemoglobin variants in Jordan. Both alpha and beta thalassemias are also prevalent in this population. However, studies on the interaction between these hemoglobin disorders are lacking. Aim: To determine the genotypes responsible for Sickle cell disease in Jordan, by retrospectively reviewing the data from a major referral center in the country's capital. Methods: A total 29,712 peripheral blood samples referred and investigated for hemoglobinopathies over a 10-year period at Princess Iman Center at Amman, Jordan were retrospectively reviewed. In addition to full blood counts, high performance liquid chromatography, those who were identified with sickle cell hemoglobin were studied using polymerase chain reaction and reverse hybridization to determine the various sickle cell disease genotypes. Results: Out of the (29,712) blood samples, 450 were sickle cell trait, while 216 had sickle cell disease. Of the latter: 120 were found to be cases of Sickle cell anemia (Hb SS), 66 were compound heterozygous for Sickle cell and a beta thalassemia mutation (Sickle/ β -thalassemia), while 30 had concomitant alpha thalassemia (HbSS/alpha thalassemia). The most frequent genotype associated with sickle/ β -thalassemia was HbS/ IVS-110 (G>A), followed by Hb S/ IVS-I-6 (T>C), HbS/IVS-II-745 (C>G) and HbS/ IVS-II-1 (G>A). While the most frequent alpha genotype detected in HbSS/ α -thalassemia samples was (- α 3.7/ $\alpha\alpha$) followed by (- α 3.7/- α 3.7). Hb SS patients had the severest hematological phenotype compared to those with sick-le/ β -thalassemia and sickle/ α -thalassemia. Furthermore, within the sickle/ β -thalassemia subgroup the least severe hematological phenotype was encountered in HbS/IVS-1-6 (T>C), while the most severe in HbS/IVS-II-1 (G>A) genotype. Conclusion: The most frequent Sickle cell disease genotype in Jordanians is Sickle cell anemia (HbSS), followed by Sickle/ β -thalassemia and least frequent is HbSS/alpha thalassemia. The concomitant identified thalassemia mutations were consistent with their spectrum among the Jordanian population. © 2021 Raida I. Oudat, Heba S. Abualruz, Nazih KH. Abu Al-Shiek, Eman A. ABSTRACT: The purpose of this study is to assess the health-promoting lifestyle behaviors of nursing students at Arab American University Palestine, Palestine. A cross-sectional design was used, 350 participants filled the Health Promoting Lifestyle Profile II. The total HPLP score was 138.57 ± 22 . Spiritual growth had the highest mean and physical activity had the lowest subscale. A significant relationship between the age of students and the sub-scales of stress management as well as physical activity. However, gender and spiritual growth subscale differed significantly. Also, there was a significant difference between students' year level and physical activity. University administrators and staff should provide guidance to progress with more actual strategies to improve nursing students' health-promoting behaviors. © The Author(s) 2021.

ABSTRACT: This study aimed to determine the volatile oil composition of the fresh leaves of dill, celery, coriander, and fennel, grown in Jordan, and to evaluate the antimicrobial activity of the essential oils individually and in binary (50:50) and quaternary (25:25:25:25) mixtures. The volatile oils, obtained by hydrodistillation, were analysed by gas chromatography (GC) and gas chromatography-mass spectrometry (GC-MS). In vitro antimicrobial activities of the essential oils were evaluated against *Escherichia coli*, *Bacillus subtilis*, *Pseudomonas aeruginosa*, and *Candida albicans*. Using the microtiter plate dilution method minimal inhibitory concentrations (MICs) of the essential oils were determined and the checkerboard method was then used to investigate the antimicrobial efficacy of the essential oil combinations by means of the fractional inhibitory concentration index (FICI). Dill and celery samples were rich in monoterpene hydrocarbons, while the oils of fennel and coriander were dominated by non-terpenoid compounds. In antimicrobial experiments, the essential oil of dill yielded the best activity against all tested microorganisms. In binary combination of the essential oils, best results were detected in a combination of dill with coriander against *B. subtilis* and *P. aeruginosa*, and fennel with coriander against *E. coli* and *P. aeruginosa*. The present study is the first evaluation of the volatile oil composition and determination of the antimicrobial activities of the fresh leaves of dill, celery, coriander, and fennel in binary and quaternary combinations. Additive or synergistic effects were detected in certain binary oil combinations while indifferent and antagonist effects were noticed in other mixtures. © 2021 Har Krishan Bhalla & Sons.

ABSTRACT: Introduction: The phosphatidylinositol 3-kinase/protein kinase-B/mammalian target of rapamycin (PI3K/AKT/mTOR) signaling pathway plays a central role in regulating cell growth and proliferation and thus has been considered as effective anticancer drug targets. Many PI3K inhibitors have been developed and progressed to various stages of clinical trials, and some have been approved as anticancer treatment. In this review, we discuss the drug design and clinical development of PI3K inhibitors over the past 4 years. We review the selectivity and potency of 47 PI3K inhibitors. Structural determinants for increasing selectivity toward PI3K subtype-selectivity or mutant selectivity are discussed. Future research direction and current clinical development in combination therapy of inhibitors involved in PI3Ks are also discussed. **Area covered:** This review covers clinical trial reports and patent literature on PI3K inhibitors and their selectivity published between 2016 and 2020. **Expert opinion:** To PI3K α mutants (E542K, E545K, and H1047R), it is highly desirable to design and develop mutant-specific PI3K inhibitors. It is also necessary to develop subtype-selective PI3K α inhibitors to minimize toxicity. To reduce drug resistance and to improve efficacy, future studies should include combination therapy of PI3K inhibitors with existing anticancer drugs from different pathways. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Purpose: The main goal is to investigate the effect of size and location of opening and column size on the punching shear strength. Openings are often needed in order to install mechanical and electrical services. This process takes away part of the concrete volume which is responsible for resisting the shear forces and any unbalanced moment. Furthermore, the application of rectangular columns in flat slabs is commonly used in practice as they provide lateral stiffness to the building. They are also utilised in garages and multi-storey buildings where these elongated cross-sectional columns reduce the effective span length between adjacent columns. **Design/methodology/approach:** This research is a numerical-based investigation that is calibrated based on a thirteen previously tested and numerically calibrated slab specimens with no openings. A parametric study is conducted in this study to consider the effect of other parameters, which are the size and location of opening and the rectangularity ratio of column in order to evaluate their effect on the punching shear capacity. A

total of 156 models are developed to study these factors. Additionally, the predicted shear carrying capacity of the simulated slabs is calculated using the ACI318-19 and Eurocode (EC2-04) equation. Findings: The presence of openings reduced the punching shear capacity. The small opening's location and orientation have almost no effect except for one slab. For slabs of large openings, the presence of openings reduced the punching capacity. The punching capacity is higher when the openings are farther from the column. The numerically obtained results of slabs with rectangular columns show lower punching capacity compared to slabs of squared columns with the same length of the punching shear control perimeter. The punching capacity for all slabs is predicted by ACI318-19 and Eurocode (EC2-04) and it is found that Eurocode (EC2-04) provided a closer estimation. Originality/value: The slabs considered for calibration were reinforced with four different punching shear reinforcement configurations, namely; ordinary closed rectangular stirrups, rectangular spiral stirrups, advanced rectangular spiral stirrups and circular spiral. Generally, there has been limited research on concrete flat slabs with openings in comparison with other subjects related to structural engineering (Guan, 2009) and no research on punching shear with openings of slabs reinforced with these reinforcement schemes. The available research focussed on the effects of openings on the flexural behaviour of reinforced concrete slabs includes Casadei et al. (2003), Banu et al. (2012) and Elsayed et al. (2009). In addition, experimental tests that examined slabs supported on rectangular columns are very limited. © 2021, Emerald Publishing Limited.

ABSTRACT: Background: The Diabetes Quality of Life (DQoL) questionnaire has been used frequently among people with diabetes. Aims: To develop and validate a revised Arabic version of the DQoL questionnaire for patients in Jordan with type 2 diabetes. Methods: We recruited patients with type 2 diabetes from 3 public health clinics in Jordan. The original DQoL questionnaire was translated to Arabic and then back-translated by a different translator, and the 2 versions were compared. Prior to circulating the final version of the questionnaire, a cognitive validity test was applied to ensure that all the questions were clear. The final Arabic version of the DQoL questionnaire, along with a questionnaire that included demographic and other health-related questions, were circulated to the participants. The questionnaire data were analysed using exploratory factor analysis and confirmatory factor analysis after excluding duplicated questions and questions that included > 10% missing data. Cronbach's α was also conducted to confirm internal consistency. Results: Analysis validated an Arabic version of DQoL questionnaire that included 29 items divided into 3 factors: worries, impact and satisfaction. Different variables were associated with DQoL scores including insulin administration, low income status, marital status, and presence of diabetic complications. Conclusions: We validated an Arabic tool that can be used to evaluate QoL among Arabic-speaking patients with type 2 diabetes. © World Health Organization (WHO) 2021. Open Access. ABSTRACT: Total serum immunoglobulin E (IgE) is elevated in multiple allergic diseases and is considered a good predictor of atopy. Several studies have been performed on the association of IgE levels with the polymorphism of the ADAM33 gene in asthmatic patients. The aim of this study was to determine whether there is an association between IgE levels and the genetic polymorphisms of the ADAM33 gene (T1, T2, T + 1, V4, S1, S2, and Q-1) in both healthy and asthmatic patients among Jordanians. The clinical data were collected for this case-control study from 267 asthmatic patients and 225 control subjects. Seven genetic polymorphisms (T1, T2, T + 1, V4, S1, S2, and Q-1) of the

gene ADAM33 were analyzed using the polymerase chain reaction/restriction fragment length polymorphism method. The minor alleles (G) of T1, (A) of T2, T + 1, and (G) of V4 polymorphisms were associated with a significant increase in total serum IgE levels in adults but not children. The V4 genetic polymorphism, however, showed a significant association with IgE levels in both adults and children. The S1 polymorphism was significantly associated with the codominant module only in the adults. The S2 polymorphism showed a significant association (p-value < 0.05) in both codominant and recessive models. However, in the dominant model for both pediatric control and asthmatic patients, the association between the IgE and S2 polymorphism was insignificant (p-value = 0.7271 and 0.5259, respectively). This study found a statistically significant association between multiple ADAM33 genetic polymorphisms and IgE levels. Such findings add to the growing evidence that the ADAM33 gene has a major impact on IgE levels among asthmatic patients of Jordanian origin. © 2021 by the authors. Risks of adopting automated AIS applications on the quality of internal auditing
(2021) WSEAS Transactions on Business and Economics, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105201324&doi=10.37394%2f23207.2021.18.73&partnerID=40&md5=5186a64297cf5825ddb40a6ef2ecf8c6>

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: -The current study aimed at examining the impact of AIS risks (IT Infrastructure, Data Entry and Outcome, Internal Operations, Control procedures and tools and Data Security) on quality on internal auditing as a comparison study between Jordan and England. Study adopted quantitative approach and distributed a questionnaire on (133) internal auditors in Jordan and (331) internal auditors in England. Through SPSS results of study indicated that all adopted risks were found within both samples responded to questionnaire. Both sample also indicated that "internal operations" and "data security" are the most influential risks that may jeopardize quality of internal auditing. Results also indicated differences between impacts of such risks on quality of internal auditing; such risks were attributed to the large population of England compared to Jordan and the intensity of internal auditing in England as higher than Jordan due to the intensity of operations within the country. However, "IT infrastructure" and "data security" appeared to be higher in England compared to Jordan which helped in easing the negative impacts of AIS risks on quality of internal auditing. Study recommended applying restrictions on users to limit the possibility of changing and manipulating data whether by parties inside or outside the organization, in addition to presenting extra efforts in choosing internal auditors in terms of qualifications, experiences and abilities. © 2021, World Scientific and Engineering Academy and Society. ABSTRACT: In recent years, the use of social media has rapidly increased and developed significant influence on its users. In the study of the behavior, reactions, approval, and interactions of social media users, detecting the polarity (positive, negative, neutral) of news posts is of considerable importance. This proposed research aims to collect data from Arabic social media pages, with the posts comprising the main unit in the dataset, and to build a corpus of manually-processed data for training and testing. Applying Natural Language Processing to the data is crucial for the computer to understand and easily manipulate the data. Therefore, Stop-Word removal, Stemming, and Normalization are applied. Several classifiers, such as Support Vector Machine, Naïve Bayes, K-Nearest Neighbor, Random Forest, and Decision Tree are used to train the dataset, and their accuracy is determined by data testing. These two steps are carried out using the open-source WEKA tool. As a result, each post is categorized into three different classes: positive, negative, and neutral. This research concludes that among the classifiers, SVM reaches the highest level of accuracy with a percentage of 83% for the F1-measure. © 2021, Tech Science Press. All rights reserved.

Department of Computer Science, Faculty of Science and Information Technology, Al-Zaytoonah University of Jordan, Amman, 11733, Jordan

ABSTRACT: Most software systems have different stakeholders with a variety of concerns. The process of collecting requirements from a large number of stakeholders is vital but challenging. We propose an efficient, automatic approach to collecting requirements from different stakeholders' responses to a specific question. We use natural language processing techniques to get the stakeholder response that represents most other stakeholders' responses. This study improves existing practices in three ways: Firstly, it reduces the human effort needed to collect the requirements; secondly, it reduces the time required to carry out this task with a large number of stakeholders; thirdly, it underlines the importance of using of data mining techniques in various software engineering steps. Our approach uses tokenization, stop word removal, and word lemmatization to create a list of frequently accruing words. It then creates a similarity matrix to calculate the score value for each response and selects the answer with the highest score. Our experiments show that using this approach significantly reduces the time and effort needed to collect requirements and does so with a sufficient degree of accuracy. © 2021 Tech Science Press. The impact of using outsourcing strategy by humanitarian organizations on logistical performance: An empirical investigation from a developing country

(2021) Journal of Governance and Regulation, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85104825415&doi=10.22495%2fjgrv10i2art11&partnerID=40&md5=afbc2284753966832dd40080c4e0e6eb

AFFILIATIONS: Department of Business Administration, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This paper empirically investigates the potential benefits of outsourcing humanitarian logistics activities to commercial logistics service providers (LSPs) to improve rescue missions in the Al Zaatari Syrian refugee camp in Jordan. The study uses a quantitative research approach, a survey data set of 140 questionnaires was collected from the managers and managerial staff dealing with logistical activities. First, a comprehensive review of related literature was performed to guide this research and then to test the main hypotheses of this study, correlation and regression analysis were carried out. The findings confirmed that humanitarian organizations in Al Zaatary camp can get benefits from collaborating with LSPs on delivering primary logistic services (shelter, food, medicine, transportation, etc.) (Nurmala, de Leeuw, & Dullaert, 2017). Moreover, the findings showed that outsourcing is preferred in the response phase (Vega & Roussat, 2015). This paper contributes to the growing body of knowledge on humanitarian logistics in ways that fills a gap by empirically investigate the phenomenon, as well as it is considered well timed in the context of the still current situation due to political instability in the region. As far as the authors are aware, this research represents the first study within the humanitarian logistics sector in Jordan. © 2021 The Authors.

ABSTRACT: The present study deals with the gas chromatography/mass spectrometry (GC/ MS) analysis of the aroma profile of different aerial organs obtained by solid-phase microextraction (SPME) and that of the hydro distilled essential oil of the fresh leaves and flowers of *Salvia greggii* A. Gray grown in Jordan. Oxygenated sesquiterpenes dominated the hydrodistilled oils of the leaves and flowers with guaio1 (35.60 % and 31.92 %, respectively) and patchouli alcohol (16.30 % and 16.88 %, respectively) as the main constituents. Alpha-pinene, camphene, limonene, and γ -terpinene were detected as the major hydrocarbon monoterpenes and 1,8-cineol, camphor, and isobornyl acetate as the major oxygenated monoterpenes. The antiproliferative activity of the leaf essential oil was screened on MCF-7 and HCT116 cell lines. The essential oil exhibited a promising dosedependent inhibition of cell growth with low IC₅₀'s (MCF-7: 35.35 μ g/mL; HCT116: 23.57 μ g/mL) with a high safety profile against the normal Vero cell line compared to the positive control Doxorubicin. © 2021 Har Krishan Bhalla & Sons.

Investigating the causal relationship between financial development and carbon emission in the emerging country

(2021) Journal of Governance and Regulation, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104686977&doi=10.22495%2fjgrv10i2art5&partnerID=40&md5=cd8494698e018bb44d02b207866710ac>

AFFILIATIONS: Accounting and Finance Department, College of Administrative Sciences, Applied Science University, Bahrain;

Banking and Finance Department, Faculty of Business, Al-Zaytoonah University of Jordan, Jordan; Environmental Engineering Department, Faculty of Engineering, University of North Sumatera, Indonesia

ABSTRACT: The current study investigates the causality relationship between financial development and carbon dioxide (CO₂) emission in Bahrain by adopting time series data from 1980–2018. The vector error correction model (VECM) is employed as an appropriate model in order to analyse the data. While the augmented Dickey-Fuller (ADF) test was used in order to detect the stationary variables. However, the domestic per capita has been used as a proxy of economic growth, while financial development is measured by domestic credit provided by the financial sector. The results indicate that there is a long-term association amongst all intended variables at a 5% significant level. Meanwhile, only financial development has an impact on carbon emission in the short term. For the Granger causality test, only financial development and population led positive impact on CO₂, while carbon emission does not Granger-cause financial development and population. However, the study findings did not support the hypothesis of the environmental Kuznets curve (EKC), and these findings are in line with other previous empirical findings (Saidi & Mbarek, 2017). These findings are essential and contribute to policymakers controlling credit policies that confirm that the loans availed by the financial sector to the domestic firms are used as friendly machinery tools for the environment that can decrease CO₂ emission. © 2021 The Authors.

Department of Mathematics, Al-Zaytoonah University of Jordan, P. O. Box 130, Amman, Jordan

ABSTRACT: For $K_0, K_1 \geq 0$, $\lambda > - (1/2)$, we examine $L_r^*(\lambda, K_0, K_1)(x)$, generalized shifted Gegenbauer orthogonal polynomials, with reference to the weight $W(\lambda, K_0, K_1)(x) = ((2\lambda\Gamma(2\lambda))/(\Gamma(\lambda + (1/2))^2))(x - x^2)^{\lambda - (1/2)}I(x \in (0, 1))dx + K_0\delta_0 + K_1\delta_1$, where the indicator function is denoted by $I(x \in (0, 1))$ and δ_x indicates the Dirac δ . measure. Then, we construct a bivariate generalized shifted Gegenbauer orthogonal system $C(\lambda, K_0, K_1)_{n,r,d}(u, v, w)$ over a triangular domain T , with reference to a bivariate measure $W(\lambda, \gamma, K_0, K_1)(u, v, w) = ((\Gamma(2\lambda + 1))/\Gamma(\lambda + (1/2))^2)u^{\lambda - (1/2)}(1 - v)^{\lambda - (1/2)}(1 - w)^{\lambda - (1/2)}I(u \in (0, 1 - w))I(w \in (0, 1))dudw + K_0\delta_0(u) + K_1\delta_w^{-1}(u)$, which is given explicitly in the Bézier form as $C_{n,r,d}(\lambda, K_0, K_1)(u, v, w) = \sum_{i+j+k=n} a_{n,r,d,i,j,k} n_{i,j,k}(u, v, w)$. In addition, for $d = 0, k, r = 0, 1, \dots, n$, and $n \in \{0\} \cup \mathbb{N}$, we write the coefficients $a_{n,r,d,i,j,k}$ in closed form and produce an equation that generates the coefficients recursively. Client relationship management in banking: A case of emerging market

(2021) Journal of Governance and Regulation, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104544744&doi=10.22495%2fjgrv10i2art1&partnerID=40&md5=bbdefc47d75542b4308c7b0d6376fb4f>

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The aim of this study is to identify the level of gap extended between management perceptions of clients' expectations, and clients' expectations for service quality dimensions in the Jordanian commercial banks. The study also investigates the impact of combined service quality dimensions (tangibility, reliability, responsiveness, assurance, empathy, and online services) on management's and clients' expectations. In order to achieve the objectives of the study, a quantitative study was conducted and a convenience sampling was taken by distributing questionnaires to commercial bank managements and clients during the period of 2018–2019. In total, the researchers had: 362 clients and 168 managers. The study findings were analyzed by using the statistical packages for social sciences (SPSS Statistics V22.0). After testing the hypotheses using various techniques, it was found that there is a difference between management perceptions of clients' expectations and clients' expectations of service quality dimensions (tangibility, reliability, responsiveness, assurance, empathy, and online services). Also, it found that combined service quality dimensions as independent variables have a significant impact on management perceptions of clients' expectations and clients' expectations of service quality dimensions as dependent variables. © 2021 The Authors.

ABSTRACT: Coronaviruses (CoVs) are enveloped positive-stranded RNA viruses with spike (S) protein projections that allow the virus to enter and infect host cells. The S protein is a key virulence factor determining viral pathogenesis, host tropism, and disease pathogenesis. There are currently diverse corona viruses that are known to cause disease in humans. The occurrence of Middle East respiratory syndrome coronavirus (MERS-CoV) and Severe Acute Respiratory Syndrome coronavirus (SARS-CoV), as fatal human CoV diseases, has induced significant interest in the medical field. The novel coronavirus disease (COVID-19) is an infectious disease caused by a novel strain of coronavirus (SARS-CoV-2). The SARS-CoV2 outbreak has been evolved in Wuhan, China, in December 2019, and identified as a pandemic in March 2020, resulting in 53.24 M cases and 1.20M deaths worldwide. SARS-CoV-2 main proteinase (MPro), a key protease of CoV-2, mediates viral replication and transcription. SARS-CoV-2 MPro has been emerged as an attractive target for SARS-CoV-2 drug design and development. Diverse scaffolds have been released targeting SARS-CoV-2 MPro. In this review, we culminate the latest published information about SARS-CoV-2 main proteinase (MPro) and reported inhibitors. © 2021 Bentham Science Publishers.

ABSTRACT: The main purpose of this paper is to investigate the impact of organizational agility on the competitive advantage in Jordanian telecommunication companies. Data were collected from 460 participants through a survey questionnaire. Likert scale was used to measure the concepts of organizational agility and competitive advantage. The findings of the study indicated that organizational agility is related positively and significantly to the company's competitive advantage. Results of the study confirmed that organizational agility is increasingly becoming a critical factor in achieving sustained competitive advantage in such IT and the knowledge-intensive industry as the telecommunication sector. Telecommunication companies are advised to focus on developing organizational agility to acquire a competitive advantage. © 2021 The Author.

ABSTRACT: The process of extraction of software entities such as system, use case, and actor from an English natural language description of a user's software requirements is a linguistic and semantic process of a natural language processing application. Entity extraction is known to be a complicated and challenging problem by researchers in the fields of linguistics or computation, due to the ambiguities in natural languages. This paper presents a named entity recognition method called SyAcUcNER (System Actor Use-Case Named Entity Recognizer), for extracting the system, actor, and use case entities from unstructured English descriptions of user requirements for the software. SyAcUcNER uses one of the Machine Learning (ML) approaches, that is, the Support Vector Machine (SVM) as an effective classifier. Also, SyAcUcNER uses a semantic role labeling process to tag the words in the text of user software requirements. SyAcUcNER is the first work that defines the structure of a requirements engineering specialized NER, the first work that uses a specialized NER model as an approach for extracting actor and use case entities from English language requirements description, and the first time an SVM has been used to specify the semantic meanings of words in a certain domain of discourse; that is the Software Requirements Specification (SRS). The performance of SyAcUcNER, which utilizes WEKA's SVM, is evaluated using a binomial technique, and the results gained from

running SyAcUcNER on text corpora from assorted sources give weighted averages of 76.2% for precision, 76% for recall, and 72.1% for the F-measure. © 2021. All Rights Reserved.

ABSTRACT: Background: The concept of pharmaceutical care was introduced to the literature by helper and strand before around thirty years, they defined it as "the provision of drug therapy for the purpose of achieving definite outcomes that improve a patient's quality of life". Jordan is still moving slowly toward implementing this service which showed numerous health and economic benefits since its implementation. Objectives: This study aimed to measure pharmacy the knowledge and perception of pharmacy students approaching the completion of their studies towards pharmaceutical care and their readiness to implement it in their practice after graduation. Methods: An electronic questionnaire was distributed via the internet to pharmacy and doctor of pharmacy students in public and private universities in Jordan. The questionnaire was composed of 35 question and was divided into three sections. Section one measured knowledge, while section two explored respondents' perceptions of pharmaceutical care. The final section collected respondents' demographic details. Results: A total of 215 respondent took part in the study. The knowledge score of pharmaceutical care among respondents was 45%, although the vast majority of them stated that they completed at least one module regarding pharmaceutical care during their studies. On the other hand, almost 75% of respondents had a positive perception of pharmaceutical care in Jordan. Results showed statically significant differences among students regarding university type and academic year. Conclusion: Though respondents completed pharmaceutical care courses during their studies, they had low knowledge regarding the term and its implementation. Combining didactic and experiential education in crucial to build proper practice capacities among future pharmacists. © 2021 DSR Publishers.

Folic acid-hydrophilic polymer coated mesoporous silica nanoparticles target doxorubicin delivery

(2021) Pharmaceutical Development and Technology, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85103895910&doi=10.1080%2f10837450.2021.1904258&partnerID=40&md5=6d17fa08291bf58b6c51b091e068e828

ABSTRACT: Mesoporous silica nanoparticles (MSNs) gained significant attention, particularly in the pharmaceutical field. Folic acid (FA) shows marked promise as a targeting agent for its specific interaction with the folate receptor. This receptor is over-expressed on the cell surface of several cancerous cells like breast cancer. Polyethylene glycol (PE), as well as polypropylene glycol (PEG), is used to decorate nanoparticles to improve their biodistribution. Moreover, carboxymethyl beta-cyclodextrin (CM- β -CD), is used as a complexation molecule. In this study, we described the chemical synthesis, in vitro drug release and antiproliferative activity of doxorubicin-loaded/decorated MSNs further coupled with FA in two conditions: chemically bound or as a complex with CM- β -CD. Fourier Transform Infrared Spectroscopy with Transmission Electron Microscopy confirmed the successful surface change. Dynamic Light Scattering confirmed the change in surface characters like zeta potential, polydispersity index (PI), and size. PI improved from 0.58 to 0.23 while the size enlarged from 200 to 348 and 532 nm. Functionalized nanoparticles demonstrated more significant drug entrapment with (97%) while undecorated MSNs only showed (63%). Accordingly, we effectively synthesized FA-PEG2000-MSNs with IC50: 0.015 mg/mL targeting HeLa cells. This approach may allow potential applications as a drug delivery system in cancer chemotherapy. Highlights Mesoporous silica nanoparticles (MSNs) with a carboxylic acid or amine surface group can be successfully decorated with long-chain hydrophilic polymer via an amide bond. Carboxymethyl- β -cyclodextrin coupled with long-chain polymer as host to form a complex with targeting molecule folic acid. Folic acid can be anchored directly to a polymer coat. TEM; DLS and FTIR confirmed the surface modification. The drug encapsulation efficiency; cytotoxicity and selectivity of functionalized nanoparticles with PEG and conjugated with FA were the best. Chemical modification has improved cytotoxicity of doxorubicin and selectivity against Hela cells. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: In this study, the Artificial Neural Network (ANN) models and multiple linear regression

techniques were used to estimate the relation between the concentration of total coliform, E. coli

and Pseudomonas in the wastewater and the input variables. Two techniques were used to achieve this

objective. The first is a classical technique with multiple linear regression models, while the

second one is data mining with two types of ANN (Multilayer Perceptron (MLP) and Radial Basis

Function (RBF). The work was conducted using (SPSS) software. The obtained estimated results were

verified against the measured data and it was found that data mining by using the RBF model has good

ability to recognize the relation between the input and output variables, while the statistical error

analysis showed the accuracy of data mining by using the RBF model is acceptable. On the other hand,

the obtained results indicate that MLP and multiple linear regression have the least ability for

estimating the concentration of total coliform, E. coli and pseudomonas in wastewater. © 2021,

ABSTRACT: Partial b-metric spaces are characterised by a modified triangular inequality and that the

self-distance of any point of space may not be zero and the symmetry is preserved. The spaces with a

symmetric property have interesting topological properties. This manuscript paper deals with the

existence and uniqueness of fixed point points for contraction mappings using triangular weak α -

admissibility with regard to η and C-class functions in the class of partial b-metric spaces. We also

introduce an example to demonstrate the obtained results. © 2021 Haitham Qawaqneh et al.

ABSTRACT: Objective: Fatigue among older adults has not received empirical attention in the Arabic region. Thus, this study aimed to assess the levels of fatigue and its related psychosocial factors and examine the predictors of fatigue in older Jordanians aged 60 years and more. Methods: This study used a cross-sectional design and our sample was 250 older adults receiving health services at comprehensive healthcare centers in Amman Governorate, the capital of Jordan. The study used the following scales: Fatigue scale, Rosenberg Self-Esteem Scale, Perceived Stress Scale, Multidimensional Social Support Scale, and sociodemographic and lifestyle behaviors datasheet. Results: The results showed that approximately 57% of the participants experienced severe fatigue. Nearly 90% of the older adults reported having moderate to high levels of stress, around 97% experienced moderate and high levels of social support, and almost 68% had normal self-esteem. The significant predictors of the total fatigue scores were, consuming soft drinks, practicing exercise, perceived levels of stress, and social support levels. Conclusions: Awareness of the magnitude and the factors predicting fatigue among elderlies in Jordan should inform the practice and encourage clinicians to implement individualized care plans that include fatigue reduction strategies, to elderlies visiting healthcare centers. © 2021 Taylor & Francis Group, LLC.

ABSTRACT: The present paper is dealing with a new direction in the Caputo-Hadamrd approach. It is concerned with the solvability of an integro differential problem of type Lane and Emden. The studied problem involves Caputo-Hadamard derivative with new different fractional orders. The main results of existence of solutions are based on the contraction principle of Banach, however, for the existence of solutions, the use of Scheafer fixed point theorem is applied to prove the result. Three examples are discussed at the end of this work. © 2021 the author(s).

ABSTRACT: The global spread of COVID-19 has motivated many universities to adopt online distance learning systems. Mobile learning applications could play a crucial role during this pandemic. Mobile learning applications are increasing popularity among learners due to their benefits and effectiveness. However, the acceptance of mobile learning system among university students is limited. Therefore, this study seeks to understand the main factors influencing the acceptance of mobile learning applications by proposing a hybrid model by combining the TAM with new constructs of TUT model. Machine learning algorithms were employed to analyze the hypothesized relationships among the constructs in the proposed model. The research findings found that RandomForest and IBK algorithms are the best two algorithms in predicting the main determinants of mobile learning

acceptance as comparison with other machine learning algorithms with an accuracy of 81.3%. The results of machine learning predictive algorithms showed that constructs of perceived enjoyment, perceived ease of use, perceived usefulness, effectiveness, efficiency, behavioural intention to use and utilization could predict the acceptance of mobile learning within accuracy rate of 87%. The results of this paper will offer valuable directions for mobile learning designers and developers to better promote mobile learning application utilization in universities. © 2021, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: Recently, higher education sector has been affected by Covid-19 pandemic significantly. Where, several universities have started to adopt online distance learning tools such as mobile learning applications. However, in order to success mobile learning applications during this pandemic, it is important to understand the necessary factors that ensure the actual use among students in post implementation. The findings showed that factors of technology, awareness, training and experience had a significant and positive influence on the actual use of mobile learning applications. While, the results indicated that psychological factors had a negative effect on the actual use. Furthermore, the results also revealed that technological and individual factors play a crucial role in solving the psychological issues among students. The findings of this research will offer useful recommendations for educational institutions in order to encourage the use of mobile learning applications effectively during Covid-19 pandemic. © 2021, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The aim of this study is investigating the impact of the main dimensions of employee empowerment (power, knowledge, self-determination and work-impact) on the basic types of organisational commitment (affective, normative and continuance) at Zajil International Telecom Company of Jordan. A sample of 220 employees (the whole technical and managerial staff) was withdrawn from a total population of 300 employees working at the Zajil International Telecom Company. A six-part questionnaire was developed, academically refereed, modified and then distributed. 217 questionnaires were correctly filled in and returned, that were later used for conducting validity, regression and correlation statistical testing using SPSS package. The main results of this study have plainly indicated that employee empowerment in terms of (power, knowledge, self-determination and work-impact) has a significant positive impact on the key types of organisational commitment (affective, continuance and normative). This result represents the originality of this study. It would be reasonable to state that the main objective of this study (determining to what extent that the employee's job title and nationality moderated the impact of employee empowerment on organisational commitment at Zajil International Telecom Company) was attained. ABSTRACT: Prostate cancer is one of the most common cancers in men. Cell invasion is an important step in the process of cancer metastasis. Herein, gold nanorods (GNRs) and polyethylene glycol (PEG)-coated GNRs were conjugated with polydopamine (PDA). The PDA-nanoconjugates demonstrated excellent colloidal stability upon lyophilization and dispersion in cell culture media with or without the addition of fetal bovine albumin (FBS), compared to unconjugated GNRs. PDA-nanoconjugates exhibited a considerable cytotoxicity against DU-145 and PC3 prostate cancer cell lines over a concentration range of 48 µg/mL-12 µg/mL, while they were biocompatible over a concentration range of 3.0 µg/mL-0.185 µg/mL. Furthermore, PDA-nanoconjugates demonstrated possible antiinvasion activity towards prostate cancer cell lines, particularly DU-145 cell line, by reducing cell migration and cell adhesion properties. The PDA-nanoconjugates could be considered a promising nano-platform toward cancer treatment by reducing the invasion activity; it could also be considered a drug delivery system for chemotherapeutic agents. © 2021 by the authors.

ABSTRACT: Background: Diabetes prevalence at Palestine was 10%, with a rising fund crisis, and diabetes healthcare problems. There was a limited research concerning diabetes healthcare dimensions including organizational factors and their predictors. Objective: This study described patient characteristics and organizational factors, and assessed relationships among organizational factors of type 2 diabetes health care in Palestine. Methods: This study is a retrospective cross sectional study, recruited by convenience sampling method in 330 participants from a type 2 diabetes patients list. It was carried out at Ramallah, Pales-tine. The Statistical Package for Social Sciences (SPSS v 19) was used to analyze data on patient characteristics and organizational factors collected from personal interview and medical records review. Results: The results showed that 51.2% were males, and 88.5% had additional chronic diseases. Pre-ventive healthcare and patient-healthcare professionals' relationship were the most prominent organizational factors in statistically significant relationships among organizational factors. Conclusion: This study reflected the need for reviewing prescription mode, and educational programs that emphasize the diabetes self-care management and the health care providers' role that would be of great benefit in health outcomes further. © 2021 Bentham Science Publishers.

ABSTRACT: Background: Hypoxia (deprived oxygen in tissues) may induce molecular and genetic changes in cancer cells. Objective: To Investigate the genetic changes of glucose metabolism in breast cancer cell line (MCF7) after exposure to continuous hypoxia (10 and 20 cycles exposure of 72 hours continuously on a weekly basis). Methods: Gene expression of MCF7 cells was evaluated using real-time polymerase chain reactionarray method. Furthermore, cell migration and wound healing assays were also applied. Results: It was found that 10 episodes of continuous hypoxia activated the Warburg effect in MCF7 cells, via the significant up-regulation of genes involved in glycolysis (ANOVA, p value < 0.05). The molecular changes were associated with the ability of MCF7 cells to divide and migrate. Interestingly, after 20 episodes of continuous hypoxia, the expression glycolysis mediated genes dropped significantly (from 30 to 9 folds). This could be attributed to the adaptive ability of cancer cells. Conclusion: It is concluded that 10 hypoxic episodes increased the survival rate and aggressiveness of MCF7 cells and induced the Warburg effect by the up-regulation of the glycolysis mediating gene expression. © 2021 Bentham Science Publishers.

ABSTRACT: Recent technological advancements have had a substantial impact on consumer buying behavior. This research aims to determine the factors affecting consumer behavior related to the adoption of self-service technologies (SSTs). The intended findings of this study are expected to contribute to understanding consumer behavior towards the adoption of SSTs taking into account the logic of two main theories in this regard: the Technology Acceptance Model (TAM) and the assumptions of the Behavioral Perspective Model (BPM). This research follows a triangulation approach. Consequently, a number of semi structured interviews were conducted with experts and executive directors from selected SSTs providers in Jordan. In addition, the convenience sampling technique was employed focusing on current (or) previous users of SSTs in the public and private sectors in Jordan using a self-administrative questionnaire (66% response rate). The results confirmed the influence (direct and indirect) of previous experience and personal initiatives and characteristics on consumer intention to use SSTs. In addition, the results indicated the important role of the mediator variables namely: perceived ease of use (EOU), perceived risk (PR), and perceived usefulness (PU) on consumer attitude towards SSTs which in turn will positively affect consumer intention to use SSTs. © 2021 The Author(s). ABSTRACT: Background: Endothelial nitric oxide synthase (eNOS) plays a major role in the response of anti-hypercholesterol statin drugs. Genetic polymorphisms in the eNOS gene affect the activity of eNOS thereby modulating the statin response. Objective: This study investigated the influence of major functional eNOS gene polymorphisms (rs2070744, rs1799983, and rs61722009) on the lipid profile of type 2 diabetes mellitus (T2DM) Jordanian patients treated with atorvastatin. Methods: The sample comprised 103 T2DM patients who attended the diabetes clinic of Jordan University Hospital. The T2DM patients had regularly been taking 20 mg atorvastatin. The atorvastatin response was calculated by measuring the lipid profile before and after three months of atorvastatin treatment. The eNOS genotypes of the subjects were analyzed using polymerase chain reaction (PCR) followed by restriction fragment length polymorphism (RFLP) assay. Results: No significant association was found between eNOS genetic polymorphisms and the response to atorvastatin (ANOVA, $p > 0.05$). In addition, no significant difference in the frequency of eNOS genotypes was found between T2DM patients and healthy subjects. However, patients with eNOS rs1799983, 4a/4a, and rs61722009 G/G genotypes showed significantly lower levels of baseline total cholesterol (TC) and low density lipoprotein (LDL) than did patients carrying the rs1799983 4b/4b or rs61722009 T/T genotype ($p < 0.05$). The eNOS rs1799983 and rs61722009 polymorphisms were in complete linkage disequilibrium ($D' = 1$). Conclusion: Although no association was found between eNOS genetic polymorphisms and atorvastatin response, there was a significant association between the rs1799983 and rs61722009 genotypes and baselines levels of TC and LDL in Jordanian T2DM patients. These genetic variants affect cholesterol levels and may play a role in the susceptibility to cardiovascular diseases in T2DM patients. Further studies are needed to validate these findings. © 2021 Bentham Science Publishers.

ABSTRACT: Preventive and control measures implemented by many countries to mitigate the spread of COVID-19 may negatively impact medication and chronic disease management, which can interfere with achieving patients' therapeutic goals. This study aims to evaluate the effect of the COVID-19 lockdown on these aspects, while exploring the role of community pharmacists. A cross-sectional study was conducted via a web-based questionnaire that targeted individuals who suffer from chronic diseases in Jordan. Participants were recruited by convenience sampling and were asked to self-report their ability to access medication, and the perceived role of community pharmacists. Among the 431 participants, the mean age \pm SD (years) was 53.8 \pm 13.7 and 60.1% (n= 259) were females. Participants mainly reported difficulties in accessing medication (n=198, 45.9%), reduced supplies or unavailability of medications (n=213, 49.4%), nonadherence to medications due to lack of access (n=98, 22.7%) and high costs (n=85, 19.7%). Participants avoided follow-ups due to a fear of infection (n=367, 82.5%) or prolonged waiting time in clinics (n=322, 74.7%). An increased reliance on the community pharmacy for medical advice was reported by 39.9% (n=172) of the participants, with half of them (n=217, 50.3%) depending on the pharmacists for advice regarding over-the-counter medications and COVID-19-related information (n=119, 27.6%). There is an urgent need to involve community pharmacists in medication and chronic disease management with a focus on patient adherence to ensure the optimal management of such vulnerable patient groups. Future studies to assess the effect of pharmacists' contributions towards enhancing medication/disease management are warranted. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: The primary goal of corporate governance is to create a balance of power-sharing among shareholders, directors, and management to enhance shareholder value and protect the interests of other stakeholders. The main aim of this study is to find out the effect of internal corporate governance in improving the confidence of investors and minimizing stock fluctuations risk. In order to achieve the objectives of the study, a questionnaire has been designed and distributed randomly to 200 traders at the Amman Stock Exchange (ASE). Regression data were analyzed using the statistical program (Smart PLS), in addition to other statistical methods. The study concluded that there is a significant statistical effect of internal corporate governance mechanisms in improving the confidence of investors and minimizing stock fluctuations risk. Also, the study recommended to maintain the current level of investors' confidence and to work on developing the legal framework for corporate governance in the light of the proposed development of a conceptual framework, and economic growth. © 2021 The Authors.

ABSTRACT: Objective: Seven prospective real-world studies conducted in general practices in Belgium of antihypertensive treatment with valsartan-centric regimens were pooled to examine similarities and differences in determinants of blood pressure (BP) values (mmHg) and BP control rates between female and male patients. Methods: Pooled analysis of a total evaluable sample of 17,044 patients, including 8273 (48.5%) women and 8771 men (51.5%) treated over approximately 90 days with valsartan-centric regimens in second or later line. Hierarchical linear and logistic regressions were applied to identify patient- and physician-related determinants of BP outcomes and a potential physician class effect. Results: Reductions in BP (mmHg) over 90 days were similar for women and men, and so were changes in BP control rates. Approximately a quarter of the variance in 90 day BP values was attributable to a physician class effect. Both gender groups shared some patient- and physician-related determinants of BP outcomes, though often varying in degree of influence. Analyses also revealed gender-specific determinants. Among others, modifiable/manageable patient-related determinants included BP at hypertension diagnosis (proxy for time of diagnosis), risk factors, antihypertensive treatment and adherence; while among the physician-related determinants clinical experience in hypertension treatment was modifiable/manageable. Conclusion: Valsartan-centric treatment regimens are associated with significant reductions in BP level and improvement in BP control in both women and men. The determinants revealed in modeling provide guidance to clinicians in the common and differential management of hypertension in female and male patients. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: 4-O-Podophyllotoxin sulfamate derivatives were prepared using the natural lignan podophyllotoxin. The prepared compounds were afforded by reacting O-sulfonyl chloride podophyllotoxin with ammonia or aminoaryl/heteroaryl motif. Biological evaluation was performed in human breast cancer (MCF7), ovarian cancer (A2780), colon adenocarcinoma (HT29), and normal lung fibroblast (MRC5) cell lines. Compound 3 exhibited potent inhibitory activity and good selectivity margin. Compounds 2, 3, and 7 exerted apoptotic effect in MCF7 cells in a dose-dependent manner. The cytotoxicity of the verified compounds was inferior to that of podophyllotoxin. © 2021 Ammar Bader et al.

ABSTRACT: Aims: Six prospective real-world studies of antihypertensive treatment with valsartan-

centric regimens were pooled to: (1) examine the effectiveness of ~90 days of second- or later-line valsartan treatment in hypertensive patients with known comorbidities; and (2) identify physician- and patient-related determinants associated with systolic (SBP) and diastolic blood pressure (DBP) outcomes in these patients. Methods and materials: A pooled analysis was performed of an evaluable sample of 11,999 hypertensive patients with known comorbidities treated ~90 days with valsartan-centric regimens. We applied hierarchical linear and logistic regression models to identify determinants of blood pressure (BP) outcomes and a potential physician class effect. Results: Valsartan regimens resulted in mean (SD) SBP and DBP reductions of 18.0 (15.8) mmHg and 9.5 (10.1) mmHg, respectively, at ~90 days, yielding SBP, DBP and combined SBP/DBP control rates of 44.0%, 67.2% and 39.3%, respectively. About a quarter of the variance in 90 day BP values was attributable to a physician class effect. BP outcomes declined with physicians' increasing years in practice and being male. At the patient level, BP outcomes declined with SBP and DBP at diagnosis; diabetes; higher cholesterol and BMI; lower valsartan and hydrochlorothiazide (HCTZ) doses; and concomitant anti-hypertensives. Older age was associated with improved DBP. A proxy of physician vigilance, cardiovascular disease history, was associated with improved BP outcomes, as were patient adherence and higher doses of valsartan in combination with HCTZ. Conclusions: Valsartan-centric regimens have significant BP lowering benefits in this pooled sample of patients with known comorbidities. Many observed determinants of BP outcomes are modifiable or manageable. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Nutricosmetics have emerged to indicate the health benefits of the products that create beauty from inside to outside. Nutricosmetic is the latest trend in the beauty industry. Cosmeceuticals are commonly used in skincare regimens to maintain healthy skin and improve visible signs of aging. Natural products that target skin have gained great attention due to the general belief that they are harmless. A review of the biomedical literature was conducted using peer-reviewed journal articles to identify laboratory, animal, and clinical studies that have evaluated recent breakthroughs in the biological properties and potential dermatologic uses of the different natural bioactive ingredients used in nutricosmetics and Cosmeceuticals. Bioactive ingredients used in Nutri-cosmeceutical products are derived from collagen, peptides, proteins, vitamins, carotenes, minerals, omega-3 fatty acids and plant extracts. These ingredients have been shown to provide dermatologic benefits with potential applications for skin regeneration, photoprotection, wound healing, and more. The information provided by this article is valuable to get the picture of the latest trends. In addition, it might be helpful for clinicians and related manufacturing companies. Despite several developments in this field, extensive research is required for performing successful and precise clinical trials in the future. Further improvements would enable the researchers to develop new products in this field. © 2021 The Authors.

ABSTRACT: Background and Aim: Interest in plants with antimicrobial properties has been revived due to emerging problems associated with using antibiotics to eradicate Helicobacter pylori. Accordingly, this study aims to assess the antibacterial effects of Punica granatum and the possible synergistic effect of its extract along with metronidazole against H. pylori. Materials and Methods: Pomegranate peel ethanol extracts (PPEE) was tested against a control strain of H. pylori (NCTC 11916) in vitro and in vivo in female Wistar rats. Moreover, the synergistic effect of PPEE in combination with metronidazole was tested in vitro. Results: The PPEE exhibited a remarkable activity against H. pylori with a minimum inhibitory concentration (MIC) of 0.156 mg/mL. Furthermore, the extract

exhibited a pronounced urease inhibitory activity (IC₅₀~6 mg/mL) against the tested strain. A synergistic effect between PPEE and metronidazole was also observed (fractional inhibitory concentrations ≤ 0.5). Oral treatment of rats with PPEE for 8 days produced a significant reduction in *H. pylori* gastritis and a significant decrease in both lymphocytic and positive chronicity. Conclusion: Pomegranate extract is probably safe and represents a potential alternative and complementary therapy for reducing *H. pylori* associated with gastric ulcers. © 2021 Veterinary World. ABSTRACT: In "The Sheltering Sky," Paul Bowles does acknowledge the failure of the imperialist project but does not see in the natives, whom he ossifies and whose land he romanticizes, a possibility of an alternative epistemology to that of Western culture. On the contrary, his romantic ethos echoes that of an Orientalistic discourse. While most critics believe that Bowles was mostly interested in questioning all existence and not in comparing civilizations, we strongly argue that this kind of reading obfuscates the text's deep structure. On the surface, Bowles provides an opportunity for one world view that manifests itself in existentialism, but on a deeper level, this manifestation happens at the expense of a real native presence and in the absence of the possibility of the natives' being a source of knowledge. © Common Ground Research Networks, Mahmoud Zidan, Asad Al-Ghalith, All Rights Reserved.

Consistency of interchange outer connection ramps

(2021) Canadian Journal of Civil Engineering, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099565696&doi=10.1139%2fcjce-2019-0828&partnerID=40&md5=4d004bdda572fa230decd18e0728f153>

AFFILIATIONS: Civil Engineering Department, Jordan University of Science and Technology, Irbid, Jordan;

Civil and Infrastructure Engineering, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Interchange ramps need a proper and consistent geometric design to avoid possible traffic accidents. The objective of this study is to develop guidelines for consistent design of outer connection ramps. As such, 47 ramps were selected from 18 different interchanges in Jordan. Free-flow speed measurements, for different vehicle classes, were taken along ramps and at predefined points. Also, traffic accidents, geometric variables, and traffic volumes were obtained. For circular ramps, the analysis indicated that the operating speed reduction is strongly affected by radius and deflection angle of the curve. The radius of the first curve had the greatest impact on speed reduction on curve-straight-curve ramps. For reverse-curve ramps, the ratio of the radii should be 6:4:9 to achieve a good consistent design for cars, provided that the radius of the first curve exceeds 110 m. Further analysis indicated that speed reduction, geometric variables, and traffic volume influenced the occurrence of accidents. © 2021, Canadian Science Publishing. All rights reserved.

ABSTRACT: The purpose of the study is to explore any nexus between Amman Stock Exchange (ASE) governance required disclosures based on auditors' determinants on the audit reporting lag (ARL) to construct an integrated financial report (IFR). The study's audit determinants are revealed by terms of audit meetings, number of audit members, audit opinion, and type of audit company. Meanwhile total

assets and bank performance indicated any non-audit determinants affecting the disclosure of IFR. The hypothesised paradigm is tested to pursue nexuses between the endogenous and exogenous variables for the years 2014, 2015 and 2016. Multivariate analysis revealed a positive nexus between the exogenous variables in the model as a whole and ARL. However, a negative influence of the audit committee number of meetings and type of audit opinion performed on ARL. Meanwhile, audit committee meetings and type of audit company had a positive effect on the ARL, all with significant nexuses. Copyright © 2021 Inderscience Enterprises Ltd.

ABSTRACT: Cancer is a multifactorial disease and the second leading cause of death worldwide. Diverse factors induce carcinogenesis, such as diet, smoking, radiation, and genetic defects. The phosphatidylinositol 3-kinase (PI3K α) has emerged as an attractive target for anticancer drug design. Eighteen derivatives of N-phenyl-6-chloro-4-hydroxy-2-quinolone-3-carboxamide were synthesized and characterized using FT-IR, NMR (^1H and ^{13}C), and high-resolution mass spectra (HRMS). The series exhibited distinct antiproliferative activity (IC_{50} μM) against human epithelial colorectal adenocarcinoma (Caco-2) and colon carcinoma (HCT-116) cell lines, respectively: compounds 16 (37.4, 8.9 μM), 18 (50.9, 3.3 μM), 19 (17.0, 5.3 μM), and 21 (18.9, 4.9 μM). The induced-fit docking (IFD) studies against PI3K α s showed that the derivatives occupy the PI3K α binding site and engage with key binding residues. © 2020 by the authors. ABSTRACT: Matching algorithms are working to find the exact or the approximate matching between text "T" and pattern "P", due to the development of a computer processor, which currently contains a set of multi-cores, multitasks can be performed simultaneously. This technology makes these algorithms work in parallel to improve their speed matching performance. Several exact string matching and approximate matching algorithms have been developed to work in parallel to find the correspondence between text "T" and pattern "P". This paper proposed two models: First, parallelized the Direct Matching Algorithm (PDMA) in multi-cores architecture using OpenMP technology. Second, the PDMA implemented in Network Intrusion Detection Systems (NIDS) to enhance the speed of the NIDS detection engine. The PDMA can be achieved more than 19.7% in parallel processing time compared with sequential matching processing. In addition, the performance of the NIDS detection engine improved for more than 8% compared to the current SNORT-NIDS detection engine. © 2021, Zarka Private University. All rights reserved.

ABSTRACT: This study examines the impact of big crisis data on the contradictions, trust and perceived value of social media crowdsourcing in pandemics. The study also examines the impact of contradictions on trust and the perceived value of social media crowdsourcing. Finally, the study explores the impact of trust on the perceived value of social media crowdsourcing during pandemics. Data were collected from 405 respondents to an online survey. PLS-SEM was used to analyse the data and test the research model. The results show that big crisis data has a significant positive impact

on contradictions and a significant negative impact on the perceived value of social media crowdsourcing. The results also confirm a significant negative impact of contradictions and a significant positive impact of trust on perceived value. © 2020 The Author(s). ABSTRACT: Coronavirus (COVID-19) pandemics has spread rapidly around the world, sending millions of people into quarantine and lockdown. Based on that, the management of higher educational institutions had to use Internet technology in teaching as the only option to continue all the academic activities across all higher education institution worldwide. This paper aims to investigate how engineering students are coping with the e-learning methods adopted by Al-Zaytoonah University of Jordan during the pandemic. A total of 470 have participated in this study from the faculty of engineering and technology at Al-Zaytoonah University of Jordan. From the findings of the survey, it was clear that students are satisfied with the online teaching and learning instituted by Al-Zaytoonah University of Jordan, despite few identified challenges. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: Jordan is relatively poor in conventional energy resources and it is dependent on foreign energy sources to cover its energy needs. At the same time the low percentage of freshwater along with the rapidly growing population urge to drag the attention to water desalination. This study presents an investigation and assessment of renewable energy resources to operate a reverse osmosis desalination plant located in arid remote area Sail El hasaa, Jordan with a capacity of up to 100 m3 of daily. The HOMER Hybrid Optimization Model Tool has been used to create optimal designs for these renewable energy systems. The photovoltaic system, wind turbine system, diesel generator, and hybrid system are evaluated in terms of each system's net present cost and cost of energy. Different configurations are suggested for each system and compared to meet the analysis requirements. Results showed that the hybrid system is the most optimum system with the configuration of photovoltaic modules, diesel generator, wind turbine, and DC/AC converter. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: Document Management System (DMS) is always known to be vital for management of the complexity of construction projects. This study aims at investigating the opinions of DMS practitioners regarding the use of an Electronic Document Management System (EDMS) in construction projects. A questionnaire survey was conducted with 91 respondents involved in the construction projects. The respondents were asked to evaluate the extent, motivations and challenges of applying EDMS in the construction projects in Jordan. According to the survey results, only 8.8% of the respondents described the document system in their construction projects as mostly electronic, while 38.5% described their document system as using an almost similar percentage of electronic and paper-based documents. The results also showed that the top motivation to the application of EDMS in the construction projects is the improvement of search and retrieval of information, while the top

challenge is the high expected financial cost of EDMS. This study helps to evaluate the existing DMS, and investigate the motivations, challenges and opportunities to improve EDMS implementation and application in the construction projects. © 2021, The Editor(s) (if applicable) and The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: Background: The chemical composition of Handal (*Citrullus colocynthis* L.) seed oil cultivated in Jordan deserts was characterized, and its bioactivity was evaluated. Methods: The oil was extracted from the grinded seeds in 500 ml Soxhlet extractor for 24 hr using n-hexane, and the recovered fatty acids were methylated with methanolic-HCL. The fatty acid methyl esters (FAMES) composition was analyzed using GC-MS and GC-FID. The anticancer activity associated with the oil was assessed against colon cancer cell lines (Caco-2 and HCT-116) and compared to its cytotoxicity on the human skin fibroblast. Multivariate analysis was used to determine relationship of the fatty acid composition with that of the anticancer activity. Results: The results demonstrated that fatty acid composition of *Citrullus colocynthis* seed oil chiefly contains Linoleic acid, denoted as C18:2n6 (75%), followed by Palmitic acid C16:0 (8%), Stearic acid C18:0 (5%), and Oleic acid C18:1n9 (9%). It is demonstrated as an excellent source of essential fatty acids omega-6 (e.g., Linoleic acid), whereas omega-3 (e.g., α -Linolenic acid) and hydroxy polyunsaturated fatty acids are found at small level. Interestingly, the oil exhibited reasonable anticancer effects against colorectal cancer cell lines with IC50 values varying between 4 and 7 mg/ml. The correlation test revealed a relationship between the fatty acid composition and the effectiveness on treatments. Conclusions: Handal plant from Jordan appears to have very high level of Linoleic acid compared to other oils measured in different geographic locations and that there appears to be some anticancer activities associated with the fatty acid content of Handal seed oil. © 2020 The Authors. ABSTRACT: Background: In the Arab world, little is known about cancer patient's satisfaction with the care provided by the oncology nurses. The only explanation for this dearth of knowledge is lack of a specified, valid and reliable tool that can be utilized with all types of cancer. This regional study was conducted to translate and validate the Arabic version of quality of oncology nursing care scale (QONCS). Methods: Brislin's model of translation was used with a cross-sectional, cross-cultural and psychometric design. A convenience sample of 517 from three countries (Jordan, Oman and Egypt) completed the study's surveys. Results: The results indicated that the total QONCS-Ar was reliable with Cronbach's alpha 0.88 and 0.84, 0.87, 0.83, 0.89 and 0.86 for being supported and confirmed, with the religious and spiritual care, belonging, being valued and being respected domains respectively. Exploratory factor analysis supported the dimensional structure of the 34-item scale with five domains with Kaiser-Meyer-Oklin (KMO) measuring 0.872 and Bartlett's Test of Sphericity being significant (significant $p < 0.001$) Conclusion: QONCS-Ar is a relatively short, valid, reliable and easy to use instrument that can be applied with all types of cancer, research and educational

institutions in the Arabic region. © 2020 FECA

ABSTRACT: Objectives: To date, predictive and risk factors for depression among older patients with cancer have not been adequately studied in the Middle Eastern countries including Jordan. Therefore, this study aimed to assess the levels of depressive symptoms, anxiety, and hope among older Jordanian patients with cancer aged 60 years and over who are currently undergoing treatment, and to identify the relationship between selected factors (socio-demographic, treatment, and psychological) and depressive symptoms. Methods: A cross-sectional design was conducted on a convenience sample consisting of 150 patients with cancer from one of the biggest governmental hospitals in Jordan. Results: The findings revealed that almost 34% and 27% of the patients experienced anxiety and depression and had a moderate level of hope. Correlating factors with depression were age, duration of treatment, hope, anxiety, educational level, and health insurance. However, low duration of treatment, high anxiety, and low hope were the significant predictors of high depression. Conclusion: Understanding the risk factors correlated with depression could help develop early interventions to enhance the psychological consequences for patients with cancer at risk for depression. Clinical implications: Health-care providers need to develop psychological care for older patients with cancer and interventions directed at minimizing depression. Also, nurses should focus on providing holistic care including physical, social, psychological, and spiritual dimensions. Depression care should be an important part of the comprehensive treatment care plan for older patients undergoing cancer treatment. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: The increasing emergence of multidrug-resistant bacteria is a huge problem to society providing significant risks to public health. This has been further escalated by a decline in the clinical translation of new antibacterial drug classes since the 1980s. In this article, we describe the synthesis, antibacterial/antibiofilm activity and in vitro toxicity of synthetic low molecular weight lipopeptides mimetics of polymyxin. C12-KTKCKFLKCC-NH₂ and C14-KTKCKFLKCC-NH₂ lipopeptides demonstrated activity against both planktonic and biofilm forms of *Staphylococcus epidermidis*, *Staphylococcus aureus*, MRSA, *Escherichia coli*, and *Acinetobacter baumannii*. Peptide-outer membrane interaction was studied using lipopolysaccharide neutralization and N-phenyl-1-naphthylamine assays. C12-conjugated peptide significantly neutralized lipopolysaccharide at concentrations lower than minimum inhibitory concentration values against Gram-negative *E. coli*, by an average of 90% and demonstrated up to double the outer membrane permeabilization ability of 10 mg/mL polymyxin B. Polymyxin-mimetic lipopeptides have the potential to undergo further in vitro and in vivo study to enable clinical translation and help alleviate the current antimicrobial crisis. © 2020 Wiley Periodicals LLC.

ABSTRACT: This study aims to theorize the relationship between acculturation and consumer ethnocentrism for ethnic group minorities. Our study seeks to achieve two interrelated goals. The

first is to explore key factors (ethnic identification, religious commitment, and patriotic feelings toward home country) that shape Arab-Muslim Americans' acculturation level. The second is to extend the conceptual boundaries of consumer ethnocentrism by exploring acculturation impacts on Arab-Muslim Americans' ethnocentric tendencies toward their home country, and toward Arab countries (co-ethnic countries). Data were collected from 168 Arab-Muslim Americans living in the US Northeast Region. We found that Arab-Muslim Americans' ethnic identification, religious commitment, and patriotism drive significant negative influences on their acculturation process. The findings lend credence to our postulation of a negative influence of the level of Arab-Muslim Americans' acculturation on their ethnocentric tendencies toward home country, thus further corroborating the notion that immigrants' home-country ethnocentrism can be predicted on their acculturation levels. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: The behaviors of bioactive compounds treating gaseous pollutants in biofilters and in the compost used as soil amendment and in green roof buildings are controlled by their thermal properties. There is a lack of information on thermal conductivity of olive cake compost (OCC), K as affected by water content and bulk density. Thermal conductivities (K) of 40 samples of (OCC) were determined experimentally at bulk densities (400–950 kg/m³) and moisture contents (10%–90%) using a single thermal probe method. The results showed that thermal conductivity increased linearly as water content, and bulk density increased and with a decrease in air filled porosity. Simple linear relationships were developed between compost thermal conductivity and dry bulk density and the degree of saturation. The experimental values were close to those reported recently for leaf compost and green roof soils. The compost at water content of 90% showed the highest thermal conductivity (K) of 0.60 W/m.k, which indicate that compost, can be used as good cheap insulator in geothermal heat storage application and as an additional eco-friendly insulation layer in green roof building which might be considered as a good means of passive energy saving there. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: In this paper, a numerical examination of propagating nonlinear dissipative dust-acoustic breathers and rogue waves (RWs) in electron depleted dusty plasmas having two superthermal ions of different temperature has been made. An important ingredient in this study is the inclusion of the dissipative effect due to the viscosity of the dust grains in the evolution wave equation. Accordingly, a damped/modified nonlinear Schrödinger equation (DNLSE), i.e. the standard nonlinear Schrödinger equation (NLSE) in addition to the damping term, is obtained using a reductive perturbation (the derivative expansion) method. Without taking into account the effect of dust viscosity, the standard NLSE is also examined, and the effect of relevant physical parameters on the breathers and rogue waves is examined. Moreover, the impact of dust kinetic viscosity on both breather structures and RWs is investigated by solving DNLSE numerically with the Dirichlet boundary conditions. This model may be useful to understand the excitation of dust-acoustic waves in the

Earth's magnetotail. © 2019 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: To date, there is no specific, valid, and reliable scale in the Arabic language to measure CIPN. The purpose of this study was to translate and validate the Arabic version of the EORTC QLQ-CIPN20. A cross-cultural adaptation and psychometric testing were used. A Convenience sample of 100 Arabic cancer patients completed the study's surveys. A content validity involving experts and ten patients indicated that the statements were clear and in logical and easy order. Reliability analysis that the QLQ-CIPN20 subscales were internally consistent (Cronbach's Alpha of 0.84, 0.79, and 0.81, respectively), as was the total QOL-CIPN20 (0.83). The results showed that there was a strong relationship between total QLQ-CIPN20 and total FACT/GOG-Ntx (-0.88, $p < 0.001$). Moderate negative relationships between total QLQ-CIPN20 and QLQ-C30- Global health status and QLQ-C30-Functional (-0.62 and -0.65, $p < 0.001$) were found. A positive relationship was found between total QLQ-CIPN20 and QLQ-C30- Symptom (0.63, $p < 0.001$). Results of the EFA showed that the 20-item scale reflecting three subscales including sensory, motor, and autonomic symptom and functioning. The Arabic version of the EORTC QLQ-CIPN20 can be used in clinical, research, and education settings in Arab countries. © 2019 Taylor & Francis Group, LLC.

ABSTRACT: This work was conducted to investigate the effect of augmentation of incident solar radiation (UV portion of the spectrum) on speeding up of the disinfection of contaminated water. The experiments were conducted using three treatment units, the first unit is a base unit, which is simply a transparent bottle contains the contaminated water; the second unit is the same as the base one, but flat mirror (FM) is located below this unit to reflect solar radiation back to the unit. A concave mirror (CM) is used with the third unit to concentrate the reflected solar radiation onto the unit. Both mirrors were used to reflect and redirect the incident UV radiation onto the units and hence the incident UV is augmented. The efficiency of each unit was indicated by its potential to decrease the amounts of Total coliform, E. coli and P. aeruginosa, all of which were measured using the IDEXX unit. The measurements of these contaminants were conducted on an hourly basis. The contaminated water was taken from a sewage treatment unit located at AL-Zaytoonah University of Jordan in Amman. It was found that the disinfection unit with the FM was the most efficient one in water disinfection, such that after 150 min of exposure time of the unit to solar radiation the counts of total coliform, E. coli and Aeruginosa were reduced by 96.8%, 99.6%, 96%, respectively. This was followed by the CM fitted unit, such that and after 150 min of exposure time, the total counts of total coliform, E. coli, and Aeruginosa were reduced by 96%, 99.2%, 95%, respectively. Finally, the base unit was the least efficient, such that total counts of total coliform, E. coli, and Aeruginosa were reduced by 95.9%, 97.2%, 90%, respectively, under same exposure time of the solar radiation. Comparing the obtained results with previous results, it may be concluded that this solar water disinfection method, which is based on the augmentation of the UV portion of the solar spectrum, is a promising one to be used to disinfect contaminated. © 2019 Taylor & Francis Group, LLC.

ABSTRACT: Solar intensity and surface temperatures have a major impact on the performance of solar photovoltaic modules. Light spectrum has different wavelengths, and energy levels where each of them can affect the solar panel differently. The goal of this study is to investigate the effect of color filters and thermal insulating Nano films on the solar panel output characteristics. Two indoor experiments were conducted where four color filters and three types of insulating Nano films were tested on a photovoltaic module. The results showed that red color filters and Nano films, with a blocking rate of 20%, generated more electrical power than other solar filters. The results also showed that the surface temperature of the photovoltaic module was significantly decreased by applying certain color and Nano film filters. This research aims to improve the overall performance of the solar cell by controlling the solar intensity and decreasing the surface temperature through applying color and Nano film filters. © 2019 Taylor & Francis Group, LLC.

ABSTRACT: Oxandrolone is a testosterone derivative with a weak androgenic properties. There are previous controversial results regarding the safety of using oxandrolone in human and animal models. Aim: The present study aimed to find out the safety of using clinical therapeutic dose of oxandrolone on rats liver. Fourteen rats were divided into 2 groups, which was administrated oxandrolone in a dose equivalent to that used for human treatment (0.28 mg/kg), for continuous 14 days. Subsequently, liver and blood samples were isolated from the rats for morphological, biochemical and histological examination. The results showed no significant differences (p value > 0.05, t-test) in the levels of hepatic transaminase enzymes, ALT, AST, in the blood. The relative liver weights of oxandrolone-treated rats were in comparable values (p value>0.05) to those of the control animals. In addition, the histological examination revealed that oxandrolone had no harmful effect on the liver tissue of rats. In conclusion, this preliminary study found that clinically equivalent therapeutic dose of oxandrolone is safe for the rat livers, which might indicate that oxandrolone is not hepato-toxic to human livers. Further clinical studies are needed to confirm these findings. © 2020, SILAE (Italo-Latin American Society of Ethnomedicine). All rights reserved.

Recent studies regarding the use of medicinal plant extracts as skincare photoprotective cosmeceuticals: A review

(2020) Pharmacologyonline, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104646356&partnerID=40&md5=d6e4c1cd3f38ac06879ea2cd9a0f1c27>

AFFILIATIONS: Department Of Pharmacy, Al-Zaytoonah University Of Jordan, Amman, Jordan

ABSTRACT: Cosmeceuticals are commonly used in skincare regimens to maintain healthy skin and improve visible signs of aging. Natural products that target the skin have gained a great attention due to the general belief that they are harmless. Recently, the therapeutic potential of medical plants used in dermatology has been explored, and some of them have been developed as drugs for the treatment of various skin disorders. A review of the literature was conducted using a peer-reviewed journal articles to identify laboratory, animal, and clinical studies that have studied recent breakthroughs in the biological properties and potential dermatologic uses of the different bioactive medicinal plants that could be potentially used in formulation of various cosmeceuticals that could attack the photoaged skin. The information provided by this article is valuable to get the picture of the latest trends and it might be helpful for dermatologists and cosmeceutical manufacturing companies. Despite the several developments in this area, further improvements would enable the researchers to develop new products in this field. © 2020, SILAE (Italo-Latin American Society of Ethnomedicine). ABSTRACT: The non-idealities of full-duplex devices of the transceiver chain is not well known despite of the intensive recent research on wireless single-channel full-duplex communications. However, in spite of the use of efficient analog and digital cancellation and suitable physical antenna isolation they turn out to be among main practical reasons for observing residual self-interference. In this paper the implementation and simulation of RF transceiver Duplex Filter and noise isolation improvement using Matlab/SIMULINK environment is done, as well as quantifying the dynamic range of required signal and the reduction of these IF-interference due to the analog-to-digital interface. The Transfer Function calculation results are provided by the help of a White Noise Source and Simulation results of frequency response in the Tx and Rx channels. The simulation and measurement results comparison for new duplexer and the marks and values of frequency response at the critical frequency points have improved isolation due to the effect of optimized external inductor. It has been observed in a full-duplex transceiver that the transmitter power amplifier (PA) produces a nonlinear distortion that is considered to be a significant issue. © 2020 IEEE.

Faculty of Pharmacy, Al-Zaytoonah University of Jordan Amman11733, Jordan

ABSTRACT: Diabetes mellitus is a predominant cause of mortality and morbidity worldwide. One of its serious health problems is cardiovascular complications. Advanced glycation end products (AGEs) are a group of heterogeneous toxic oxidant compounds that are formed after a non-enzymatic reaction between monosaccharides and free amino groups of proteins, compound lipids, and nucleic acids. AGE interacts with various types of cells through a receptor for AGE (RAGE). The interaction between AGE and RAGE is responsible for a cascade of inflammation, oxidative stress, and disruption of calcium homeostasis in cardiac cells of diabetic patients. There is striking evidence that the AGE/RAGE axis with its consequences on inflammation and oxidative stress plays a major role in the development of cardiovascular complications. Therefore, considering AGE as a therapeutic target with foreseeable results would be a wise direction for future research. Interestingly, several studies on nutraceutical, pharmaceutical, and natural products have begun to reveal promising therapeutic results, and this could lead to better health outcomes for many diabetic patients worldwide. This article discusses the current literature addressing the connection between protein glycation and diabetes cardiovascular complications and suggests future avenues of research. © 2020 Mousa Numan Ahmad et al., published by Sciendo.

ABSTRACT: This study aims to investigate the direct relationship between ownership structure, earnings manipulation, and organizational performance, and then examine the mediating effect of earnings manipulation in the relationship between ownership structure and organizational performance. This study collected and analyzed secondary data published in financial reports related to all insurance organizations listed in the Jordanian market during the study period (from 2009 until 2018). A panel data analysis was conducted, giving a total of 200 observations. The findings of this study concluded that ownership concentration, foreign ownership, and organization size affect organizational performance proxied by ROA, ROE, and EPS, more specifically, ownership concentration and organization size have a positive effect, whereas foreign ownership has a negative effect. At the same time, board of director ownership, organizational ownership, and CEO compensation did not affect organizational performance. Next, the board of director ownership, ownership concentration, foreign ownership, and CEO compensation affect earnings manipulation separately. In addition, earnings manipulation positively affects organizational performance proxied by ROA, ROE and EPS. This means

that the higher the earnings manipulation is, the higher the organizational performance is. Finally, earnings manipulation mediates the relationship between ownership concentration and foreign ownership of ownership structure, and organizational performance. © 2020. All Rights Reserved.

Upregulation of PI3K/AKT/PTEN pathway is correlated with glucose and glutamine metabolic dysfunction during tamoxifen resistance development in MCF-7 cells
(2020) Scientific Reports, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098475816&doi=10.1038%2fs41598-020-78833-x&partnerID=40&md5=fb34e3ab1e222f31455add10dcdb50dd>

AFFILIATIONS: Faculty of Pharmacy, AL-Zaytoonah University of Jordan, Amman, 11733, Jordan
ABSTRACT: Tamoxifen resistance is emerging as a big challenge in endocrine therapy of luminal A breast cancer patients. In this study, we aimed to determine the molecular changes of PI3K/AKT/PTEN signaling pathway during tamoxifen-resistance development using gradually increased doses of tamoxifen in one model, while fixing tamoxifen treatment dose at 35 µM for several times in the second model. An upregulation of AKT/PI3K genes was noticed at 30 µM tamoxifen concentration in cells treated with a gradual increase of tamoxifen doses. In the second model, significant upregulation of AKT1 was seen in cells treated with 35 µM tamoxifen for three times. All genes studied showed a significant increase in expression in resistant cells treated with 50 µM and 35 µM six times tamoxifen. These genes' upregulation was accompanied by PTEN and GSK3 β genes' down-regulation, and it was in correlation to the changes in the metabolic rate of glucose in tamoxifen-resistant models. A significant increase in glucose consumption rate from culture media was observed in tamoxifen resistant cells with the highest consumption rate reported in the first day of culturing. Increased glucose consumption rates were also correlated with GLUL significant gene expression and non-significant change in c-MYC gene expression that may lead to increased endogenous glutamine synthesis. As a result, several molecular and metabolic changes precede acquired tamoxifen resistance could be used as resistance biomarkers or targets to reverse tamoxifen resistance. © 2020, The Author(s).

ABSTRACT: A concentrating solar power (CSP) unit was designed to work as a hybrid system to supply the required energy for heat water and high intensity light. The system consists of a parabolic solar dish that reflected light in a set of optical fiber light inside a receiver. In turn, this light was transmitted to an indoor photovoltaic (PV) panels to produce electrical energy or used directly as a source of light during the day. This study revealed the following points: (i) the increased number of fiber optics, the improved efficiency of solar panel and power generated; (ii) the efficiency of the hybrid solar system was 23.62%. (iii) when the separation distance between the fiber optics and the PV module was closed, the level of the power generated becomes higher; and finally; (v) this application is more suitable for a limited area in the roof of the building. © 2020 The Authors

ABSTRACT: The COVID-19 pandemic has struck many countries globally. Jordan has implemented strict nationwide control measures to halt the viral spread, one of which was the closure of universities and shifting to remote teaching. The impact of this pandemic could extend beyond the risk of physical harm to substantial psychological consequences. Our study aimed at assessing 1) psychological status, 2) challenges of distance teaching, and 3) coping activities and pandemic-related concerns among university teachers in Jordan in the midst of COVID-19-related quarantine and control measures. We conducted a cross-sectional study using an anonymous online survey. The measure of psychological distress was obtained using a validated Arabic version of the Kessler Distress Scale (K10). Other information collected included sociodemographic profile, methods used to handle distress, motivation to participate in distance teaching, and challenges of distance teaching as well as the most worrisome issues during this pandemic. Three hundred eighty-two university teachers returned completed surveys. Results of K10 showed that 31.4% of respondents had severe distress and 38.2% had mild to moderate distress. Whereas gender was not associated with distress severity, age had a weak negative correlation ($Rho = -0.19$, $P < 0.0001$). Interestingly, most teachers had moderate to high motivation for distance teaching. Engagement with family was the most reported self-coping activity. More than half of the participants were most concerned and fearful about SARS-CoV-2 infection. In conclusion, university teachers have shown to exhibit various levels of psychological distress and challenges during the implementation of precautionary national measures in the battle against COVID-19 in Jordan. ABSTRACT: This paper proposes fractional-order systems for Hopfield Neural Network (HNN). The so-called Predictor-Corrector Adams-Bashforth-Moulton Method (PCABMM) has been implemented for solving such systems. Graphical comparisons between the PCABMM and the Runge-Kutta Method (RKM) solutions for the classical HNN reveal that the proposed technique is one of the powerful tools for handling these systems. To determine all Lyapunov exponents for them, the Benettin-Wolf algorithm has been involved in the PCABMM. Based on such algorithm, the Lyapunov exponents as a function of a given parameter and as another function of the fractional-order have been described, the intermittent chaos for these systems has been explored. A new result related to the Mittag-Leffler stability of some nonlinear Fractional-order Hopfield Neural Network (FoHNN) systems has been shown. Besides, the description and the dynamic analysis of those phenomena have been discussed and verified theoretically and numerically via illustrating the phase portraits and the Lyapunov exponents' diagrams. © 2020 World Scientific Publishing Company.

ABSTRACT: With the rapid increasing of technology devices and the development of In-ternet, cyber-attacks are changing quickly and more and more attackers appear which lead more difficult threats in cybersecurity. Moreover, the world is facing Internet of Things devices which generate large volumes of data that cause a lot of new cyber threats. Cyber-crimes cost a lot and make companies lose millions of dollars every year. Cybersecurity is a top concern at many companies. So, we need smart approaches to protect data a-against different threats which are difficult to know. Recently, researchers are developing systems based on Artificial Intelligence (AI) and machine learning to

create defense approaches and protect data with high level of security and less cost. AI can help companies to identify threats automatically and find links between potential risks fast. This form of identification eliminates human errors from the process. This paper discusses AI-based cybersecurity various models that focus on machine learning and deep leaning algorithms. The results of this study show that machine learning and deep learning that simulate the human mind are more effective approaches than the traditional ones to solve security problems. © ICIC International 2020.

ABSTRACT: Behavior of nanoparticles in biological media is crucial in predicting their cellular responses. In this study, gold nanorods (GNR) were chosen as a model to evaluate the influence of nanoparticle's surface modification and the composition of cell culture media on the colloidal stability and dispersibility of the nanoparticles in media. Optical spectra, zeta potential and hydrodynamic size were measured to evaluate the colloidal stability. The results indicate that incorporation of fetal bovine serum (FBS) into the cell culture media drastically enhanced their colloidal stability by protein adsorption, while nanoparticles dispersed in serum-free media demonstrated obvious aggregation. Nanoparticles dispersed in serum-free media showed high rate and extent of cellular internalization and dose-independent cytotoxicity compared to those dispersed in serum-containing media. Flow cytometry revealed that both late apoptosis and necrosis are responsible for the cellular death of breast cancer cells exposed to well-dispersed GNR in serum-containing media, while cells exposed to nano-aggregates experienced necrosis as the major modality of their cellular death. © 2020 Elsevier B.V.

ABSTRACT: Vinyl selenocarboxylato iron complexes of the formula $CpFe(CO)_2SeCOCH=C(R_1)(R_2)$ { $R_1 = H$, $R_2 = Me$, $R_1 = R_2 = Me$, $R_1 = H$, $R_2 = CH=CHMe$ } are synthesized by the reaction of $(\mu-Se)[CpFe(CO)_2]_2$ with the corresponding vinyl acid chlorides $ClCOCH=C(R_1)(R_2)$. Photolytic substitutions of $CpFe(CO)_2SeCOCH=CMe_2$ with EPH_3 gave the monosubstituted complexes $CpFe(CO)(EPH_3)SeCOCH=CMe_2$ ($E = P, As, Sb$) in good yields. The new complexes have been characterized by UV-Vis, IR, ^1H-NMR , $^{13}C\{^1H\}-NMR$, $^{77}Se\{^1H\}-NMR$, $^{31}P\{^1H\}-NMR$ spectroscopy and elemental analysis. The solid state structures of $CpFe(CO)_2SeCOCH=CMe_2$ and $CpFe(CO)(AsPh_3)SeCOCH=CMe_2$ were determined by X-ray crystallography. The cyclic voltammetric measurements of $CpFe(CO)_2SeCOCH=CMe_2$ were recorded. Graphic abstract: Vinyl selenocarboxylato iron complexes of the formula $CpFe(CO)_2SeCOCH=C(R_1)(R_2)$ { $R_1 = H$, $R_2 = Me$, $R_1 = R_2 = Me$, $R_1 = H$, $R_2 = CH=CHMe$ } are synthesized by the reaction of $(\mu-Se)[CpFe(CO)_2]_2$ with the corresponding vinyl acid chlorides $ClCOCH=C(R_1)(R_2)$. ABSTRACT: Purpose: Conventional organogel and microemulsion-laden organogels (microemulsion organogels) were developed to deliver the lipophilic drug, lidocaine, topically. Methods: Optimized formulations of lidocaine microemulsions of oil, water, and surfactant:cosurfactant (Tween® 20:ethanol), at ratios 4:1 and 2:1 v/v, were selected based on the droplet size and physical stability of microemulsions. Microemulsions were then loaded into organogels. Lidocaine conventional organogel was prepared without the addition of microemulsion and used as a reference. The rheological properties and release profiles of lidocaine organogels were investigated. Results: Lidocaine conventional and microemulsion organogels displayed viscoelastic properties with more elastic behavior. Lidocaine conventional organogel exhibited the highest viscoelastic properties and lowest rate of release, whereas microemulsion organogel containing Tween® 20:ethanol (4:1 v/v) exhibited lower viscoelastic properties and higher rate of release compared to those of microemulsion organogel containing Tween® 20:ethanol (2:1 v/v). Conclusion: Type and composition of organogels dictated the viscoelastic properties and rate of release of lidocaine. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

Chemocentric informatics analysis: Dexamethasone versus combination therapy for covid-19

(2020) ACS Omega, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096689206&doi=10.1021%2facsomega.0c03597&partnerID=40&md5=50a7cda4828d2cb92a195421fc205413>

Department of Pharmaceutical Sciences, School of Pharmacy, University of Jordan, Amman, 11942, Jordan

ABSTRACT: COVID-19 is a biphasic infectious disease with no approved vaccine or pharmacotherapy. The first drug that has shown promise in reducing COVID-19 mortality in severely-ill patients is dexamethasone, a cheap, well-known anti-inflammatory glucocorticoid, approved for the treatment of inflammatory conditions including respiratory diseases such as asthma and tuberculosis. However, about 80% of COVID-19 patients requiring oxygenation, and about 67% of patients on ventilators, are not responsive to dexamethasone therapy mainly. Additionally, using higher doses of dexamethasone for prolonged periods of time can lead to severe side effects and some patients may develop corticosteroid resistance leading to treatment failure. In order to increase the therapeutic efficacy of dexamethasone in COVID-19 patients, while minimizing dexamethasone-related complications that could result from using higher doses of the drug, we applied a chemocentric informatics approach to

identify combination therapies. Our results indicated that combining dexamethasone with fast long-acting beta-2 adrenergic agonists (LABAs), such as formoterol and salmeterol, can ease respiratory symptoms hastily, until dexamethasone's anti-inflammatory and immunosuppressant effects kick in. Our studies demonstrated that LABAs and dexamethasone (or other glucocorticoids) exert synergistic effects that will augment both anti-inflammatory and fibronectin-mediated anticoagulant effects. We also propose other alternatives to LABAs that are supported by sound systems biology evidence, such as nitric oxide. Other drugs such as sevoflurane and treprostinil interact with the SARS-CoV-2 interactome and deserve further exploration. Moreover, our chemocentric informatics approach provides systems biology evidence that combination therapies for COVID-19 will have higher chances of perturbing the SARS-CoV-2 human interactome, which may negatively impact COVID-19 disease pathways. © 2020 American Chemical Society.

ABSTRACT: Localisation is one of the most important services in sensor networks. The impact of the used localisation technique used reflects on wireless sensor network services such as coverage or event detection. Accuracy is considered to be one of the factors that is related to successful network performance in most sensor network applications. Communication ranging is one of the practical applicable technique for localisation on short-range communication nodes with no additional components. This study proposes an enhanced communication ranging localisation technique with high accuracy. The authors evaluated and validated the proposed technique in a forest environment using 20 Wasmote Nodes and Meshlium router (Spanish product). The novelty of the proposed localisation technique is based on controlling communication range by manipulating the XBee transmitter power changing ability on four rounds to provide the best-predicted location. The results demonstrated the locations of nodes were found with error range between 0 and 22 m. The network location error decreased starting with 30 m in round 1 down to 8 m in round 4. The technique can be applied to different types of networks and technologies as long as the transmission power can be set to different values and the communication range is known or can be measured manually. © 2020 Institution of Engineering and Technology. ABSTRACT: The efficient utilization of the radio-electric spectrum (or simply spectrum) is essential to satisfy the ever-increasing amount of bandwidth required by future wireless communications networks. Cognitive radio (CR) networks aim to improve this efficiency by dynamically exploiting the underutilized spectrum (also called spectrum opportunities). To identify these transmission opportunities, cognitive users might draw on spectrum sensing, although this task increases the energy consumption. For battery-powered terminals, this increment might represent a challenge, also considering that spectrum sensing must be recurrently performed. For a scenario in which the CR user first senses the spectrum and then, if allowed, transmit data, the average energy consumption depends on the time used for spectrum sensing and for data transmission, which also impacts the spectrum-efficiency. Thus, improving the energy-efficiency might implicate a reduction on the spectrum-efficiency. This paper analyses the energy-efficiency in the context of spectrum sensing of superimposed training-based transmissions, showing the advantages of using an enhanced spectrum sensing method in terms of the relationship between the spectrum and energy-efficiency. © 2020 IEEE.

ABSTRACT: Acceptable error rate, low quality assessment, and time complexity are the major problems in image segmentation, which needed to be discovered. A variety of acceleration techniques have been applied and achieve real time results, but still limited in 3D. HMM is one of the best statistical techniques that played a significant rule recently. The problem associated with HMM is time complexity, which has been resolved using different accelerator. In this research, we propose a methodology for transferring HMM matrices from image to another skipping the training time for the rest of the 3D volume. One HMM train is generated and generalized to the whole volume. The concepts behind multi-orientation geometrical segmentation has been employed here to improve the quality of HMM segmentation. Axial, saggital, and coronal orientations have been considered individually and together to achieve accurate segmentation results in less processing time and superior quality in the detection accuracy. © 2019 John Wiley & Sons, Ltd.

ABSTRACT: Background: Since the spread of COVID-19 on a global scale, most of efforts at national and international levels were directed to mitigate the spread of the disease and its physical harm, paying less attention to the psychological impacts of COVID-19 on global mental health especially at early stages of the pandemic. Objectives: This study aimed to assess and explore (i) The levels of psychological distress and its correlates (ii) Motivation for distance learning (iii) Coping activities and pandemic related concerns, among university students in Jordan in the midst of COVID-19 pandemic. Methods: A cross-sectional study was conducted using an online self-administered questionnaire. The measure of psychological distress was obtained using the 10-item Kessler Psychological Distress Scale, while other questions have explored our study's second and third aims. Results: A total of 381 completed questionnaires were included in the analysis. Female participants slightly predominated the sample (n = 199, 52.2%). The respondents aged 18–38 years (mean 22.6 years, SD: 3.16). Concerning distress severity, most of respondents were regarded as having severe psychological distress (n = 265, 69.5%). 209 students (54.9%) reported that they had no motivation for distance learning. Ordinal logistic regression revealed a significant correlation between distress severity and many predictors. Among the predictors that were found to act as protective factors against higher levels of distress included older age (aOR = 0.64, P = 0.022; 95% CI: 0.44–0.94), and having a strong motivation for distance learning (aOR = 0.10, P = 0.048; 95% CI: 0.01–0.96). In contrary, being a current smoker (aOR = 1.99, P = 0.049; 95% CI: 1.10–3.39), and having no motivation for distance learning (aOR = 2.49, P = 0.007; 95% CI: 1.29–4.80) acted as risk factors for having higher levels of psychological distress among the students. The most common coping activity reported was spending more time on social media platforms (n = 269, 70.6%), and 209 students (54.9%) reported distance learning as their most distressing concern. Conclusion: The COVID-19 pandemic and related control measures could impact the mental health of individuals, including students. We recommend a nationwide psychological support program to be incorporated into Jordan's preparedness plan and response strategy in combating the COVID-19 pandemic. © Copyright © 2020 Al-Tammemi, Akour and Alfalah.

ABSTRACT: This study aims to investigate the importance of earnings quality as a determinant of companies' performance. It provides some empirical evidences from an emerging market, specifically from the Jordanian market. This study developed an econometric model for the effect of earnings quality on the companies' performance using empirical evidence. The study employs a panel data analysis method by using a sample of all Jordanian industrial public shareholding companies listed on Amman Stock Exchange (ASE) during 2010-2018. The results reveal that Return on Assets (ROA), Return on Equity (ROE), and Earnings Per Share (EPS) as proxies of company's performance are affected by the earnings quality. This provides the importance of positive earnings quality that eventually influences the companies' performance. The results of this study suggest that the higher control level on the managers' behavior and its outcome will have an effect on earnings quality, and thus the company's performance increases. As well as, high relevance of accounting information will improve earnings quality, and thus earnings quality with the interaction factors of the company's environment work on improving performance. As a conclusion, this study can work as a reference to assist standard setters, security analysts, regulators and other accounting-information users in appraising relation between the earnings quality and companies' performance. © 2020. ABSTRACT: The purpose of this study is to examine the effect of financial factors on earnings management and earnings quality. Moreover, the study examines the role of earnings management as a mediator in the effect of the financial factors on earnings quality. It provides some empirical evidences from an emerging market, especially from the Jordanian market. The study uses a panel data analysis method over a ten-year period (2009-2018). The study population includes all Jordanian insurance companies listed in Jordanian market at the end of the year 2019, and the study sample consists of 20 Jordanian insurance companies (a complete population), giving a total of 200 observations for each variable. The results indicate that all financial factors in the model combined affect the earnings management and earnings quality. In addition, earnings management negatively affects earnings quality, and earnings management fully mediates the effect of financial factors on earnings quality. The study advises that policy makers ought to follow good legislation to curb the company's earnings management activities. Hence, the policy makers need to apply regulations which enrich the company's effectiveness and efficiency whilst protecting the investors and other interested parties from risk. © 2020 by the authors.

ABSTRACT: The emergence of phosphatidylinositol 3-kinase (PI3K α) in cancer development has accentuated its significance as a potential target for anticancer drug design. Twenty one derivatives of N-phenyl-4-hydroxy-6-methyl-2-quinolone-3-carboxamide were synthesized and characterized using NMR (1 H and 13 C) and HRMS. The derivatives displayed inhibitory activity against human epithelial colorectal adenocarcinoma (Caco-2) and human colon cancer (HCT-116) cell lines: compounds 8 (IC₅₀ Caco-2 = 98 μ M, IC₅₀ HCT-116 = 337 μ M) and 16 (IC₅₀ Caco-2 = 13 μ M, IC₅₀ HCT-116 = 240.2 μ M). Results showed that compound 16 significantly affected the gene encoding AKT, BAD, and PI3K. The induced-fit docking (IFD) studies against PI3K α demonstrated that the scaffold accommodates the kinase domains

and forms H-bonds with significant binding residues. © 2020 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Purpose: Coronavirus disease 2019 (COVID-19) is expected to continue to cause worldwide fatalities until the World population develops ‘herd immunity’, or until a vaccine is developed and used as a prevention. Meanwhile, there is an urgent need to identify alternative means of antiviral defense. Bacillus Calmette–Guérin (BCG) vaccine that has been recognized for its off-target beneficial effects on the immune system can be exploited to boost immunity and protect from emerging novel viruses. Methods: We developed and employed a systems biology workflow capable of identifying small-molecule antiviral drugs and vaccines that can boost immunity and affect a wide variety of viral disease pathways to protect from the fatal consequences of emerging viruses. Results: Our analysis demonstrates that BCG vaccine affects the production and maturation of naïve T cells resulting in enhanced, long-lasting trained innate immune responses that can provide protection against novel viruses. We have identified small-molecule BCG mimics, including antiviral drugs such as raltegravir and lopinavir as high confidence hits. Strikingly, our top hits emetine and lopinavir were independently validated by recent experimental findings that these compounds inhibit the growth of SARS-CoV-2 in vitro. Conclusions: Our results provide systems biology support for using BCG and small-molecule BCG mimics as putative vaccine and drug candidates against emergent viruses including SARS-CoV-2. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The six dimensions have been described separately: (δ 1) cost-effectiveness

analysis and cost-utility analysis-based pricing; (δ2) willingness-to-pay-based pricing; (δ3) reference-based pricing; (δ4) safety-based pricing; (δ5) risk of efficacy failure-based pricing; and (δ6) adherence-based pricing. The final step is to integrate the various dimension-specific pricing estimates into a composite estimate termed the All-Dimensional Price (ADP). We describe the methodology for this integration and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: For better accuracy in estimating the ADP, we used the prices generated from the six dimensions at scenario levels, not at the dimension-specific price (DSP) level. We pooled the price estimates and performed Monte Carlo Simulations (MCS) for the price scenarios generated by the six dimensions. We used the results of the proof-of-concept exercise involving osimertinib in NSCLC with EGFR mutation to estimate the ADP in two hypothetical contracts: 1-year (2019–2020) and 2-year contract (2019–2021). Results: The average of the 30-day prescription estimates from the six dimensions averaged \$10,819 (SD=\$8,486) for the 1-year contract and \$10,730 (SD=\$8,500) for the 2-year contract. MCS yielded for the 1-year contract an ADP of \$10,959 (or -25.02% the 2018 WAC price) and an ADP for the 2-year contract was \$10,788 (or -26.19% the 2018 WAC price). Conclusions: We demonstrated that the integration of the prices from the six dimensions of the Six Delta platform and market conditions is feasible and yields multidimensional prices estimates to support outcome-based pricing/contracting. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The second dimension (δ2) estimates prices on the basis of four willingness-to-pay (WTP) thresholds. We describe this dimension's methodology and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: Eight WTP scenarios based on four levels of real gross domestic product per capita (GDP/capita, 1 × GDP/capita, 3 × GDP/capita, and >math>3 \times \text{GDP/capita}</math>) and two market conditions (monopolistic versus competitive) were assumed. The incremental cost-utility ratio (ICUR) was applied to differently to both markets. In the monopolistic market, assuming no competitors, the cost/QALY ratio for a drug was used; whereas in the competitive market, assuming competitors, the incremental cost-utility ratio (ICUR) was applied. One-way sensitivity analyses were performed and predictive equations were specified to estimate the prices of treatment for the resulting eight WTP scenarios; for which subsequently the average and standard deviation were calculated. A gamma distribution was specified and Monte Carlo Simulation (MCS) was applied to estimate the dimension-specific price based on WTP (DSPWTP). A proof-of-concept exercise with osimertinib in NSCLC was performed for two hypothetical outcome-based contracts: 1-year (2019–2020) and 2-year (2019–2021). The 2018 wholesale acquisition cost (WAC) of \$14,616 (30-day prescription) was used to estimate the DSPWTP for each contract. Results: The 1-year estimates averaged \$4,654 (SD=\$6,462) and the MCS yielded a DSPWTP of \$4,547 or -68.89% of the 2018 WAC for a 30-day prescription. The 2-year estimates averaged \$4,7667 (SD=\$6,480) with the MCS generating a DSPWTP of \$4,704 or -67.82% of the WAC. Conclusions: We demonstrated that WTP-based methods that include various WTP thresholds and market conditions generate price estimates across these thresholds and market conditions that can be integrated into our proposed Six Delta platform for outcome-based pricing/contracting. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The first dimension (δ_1) estimates prices on the basis of cost-effectiveness (CEA) and cost-utility analysis (CUA). We describe this dimension's methodology and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: CEA and CUA were performed using established methods. Probabilistic sensitivity analyses (PSA) were performed to generate cost-effectiveness acceptability curves (CEAC), specifically the PSA incremental cost-effectiveness (PSA ICER) and incremental cost-utility ratio generated CEACs (PSA ICUR). Price of treatment was estimated at three certainty levels (0%, turning point%, 100%). The marketed drug price at turning point was used to estimate prices at 0% and 100% certainty levels, as per PSA ICER and PSA ICUR-generated CEACs. The resulting prices were pooled, inflated, and simulated by Monte Carlo Simulation (MCS) methods to estimate the dimension-specific price based on CEA and CUA (DSPCEA/CUA). A proof-of-concept exercise with osimertinib in NSCLC was performed for two hypothetical outcome-based contracts: 1-year (2019-2020) and 2-years (2019-2021). Results: Turning points were estimated at the 50% certainty level in both PSA ICER and ICUR-generated CEACs. At these points, the wholesale acquisition cost for osimertinib was \$14,616 (30-day prescription); inflated by 0.44% for 1-year and by 0.72% for 2-year contracts. Additional prices at 0% and 100% certainty levels were quantified based on the PSA ICER and ICUR-generated CEACs. The MCS yielded a DSPCEA/CUA of \$16,391 for the 1-year contract and a DSPCEA/CUA at \$16,677 for the 2-year contract for a 30-day prescription. Conclusions: We demonstrated that conventional CEA and CUA methods generate price estimates at varying levels of certainty that can be integrated into our proposed Six Delta platform for outcome-based pricing/contracting. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The sixth dimension (δ_6) estimates prices on the basis of adherence to the prescribed regimen, whereby manufacturers provide payers with adherence-enhancing programs and whereby payers implement these programs and provide adherence data to the manufacturer. We describe this dimension's methodology and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: We propose two paybacks based on adherence: in-advance (based on clinical trial data) and in-arrear (based on real-world data). The risk of efficacy failure pricing dimension utilizes a 7-step method: 1) defining efficacy endpoints; 2) extracting data; 3) predicting models; 4) estimating in-advance and in-arrear paybacks; 5) suggesting ranges for in-advance and in-arrear paybacks; 6) adjusting for medical inflation; and 7) performing Monte Carlo Simulation (MCS) to estimate the DSPAdherence. A proof-of-

concept exercise with osimertinib in NSCLC was performed for two hypothetical outcome-based contracts: 1-year (2019–2020) and 2-year (2019–2021). The 2018 wholesale acquisition cost (WAC) for a 30-day prescription was used and inflated as needed. Herein, the DSPAdherence is estimated exclusively in terms of in-advance payback because real-world data about osimertinib are not yet available and thus the in-arrear payback cannot yet be estimated. Results: For the 1-year contract, the average price for osimertinib was \$13,798 (SD=\$1,265) and the DSPAdherence was \$13,785 (or -5.69% of the 2018 WAC) for a 30-day prescription. For the 2-year contract, the average price was \$12,555 (SD=\$2,847) and the DSPAdherence was \$12,582 (or -13.92% of the 2018 WAC). Conclusions: We demonstrated that adherence-based pricing methods can be integrated into our proposed Six Delta platform for outcome-based pricing/contracting. The proof-of-concept exercise needs to be expanded with the in-arrear pricing method based on real world data to be secured. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The fifth dimension (δ_5) estimates prices on the basis of the risk of efficacy failure of a drug. We describe this dimension's methodology and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: The risk of efficacy failure pricing dimension utilizes a seven-step method: (1) defining risk; (2) extracting data; (3) predicting models; (4) performing Monte Carlo Simulation (MCS) to estimate risk of efficacy failure; 5) estimating ranges for a payback; (6) adjusting for medical inflation; and (7) performing Monte Carlo Simulation (MCS) to estimate the DSPRisk of efficacy failure. A proof-of-concept exercise with osimertinib in NSCLC was performed for two hypothetical outcome-based contracts: 1-year (2019–2020) and 2-year (2019–2021). We estimated the risk of efficacy failure for osimertinib in terms of overall and progression-free survival versus standard of care. We used the estimated risk to estimate the price reduction on the wholesale acquisition cost (WAC) for the two hypothetical contracts: a 1-year (2019–2020) and 2-year contract (2019–2021). From this we estimated the DSPRisk of efficacy failure. Results: Based on the risk of OS and PFS efficacy failure for osimertinib in OS and PFS, in the 1-year contract, the DSPRisk of efficacy failure was estimated at \$12,652 (or -13.44% the 2018 WAC) for a 30-day prescription. For the 2-year contract (2019–2021), the DSPRisk of efficacy failure was estimated at \$13,019 (or -10.93% the 2018 WAC). Conclusions: We demonstrated that pricing methods based on risk of efficacy failure methods can be integrated into our proposed Six Delta platform for outcome-based pricing/contracting. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The fourth dimension (δ_4) estimates prices on the basis of assessments of the safety of the drug using an ex ante analysis based on clinical trial data. We describe this dimension's methodology and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: The safety-based pricing dimension utilizes a four-step method: 1) pooling adverse events (AE), standardizing, estimating 95% CIs, and adjusting for time; 2) estimating correction factors and corrected probabilities of AEs; 3) estimating the probability of at least one adverse event (AE) occurring and leading to treatment discontinuation; and 4) estimating ranges for payback percentages and performing Monte Carlo Simulation to estimate a DSPSafety. A proof-of-concept exercise with osimertinib in NSCLC was performed for two hypothetical outcome-based contracts: 1-year (2019–2020) and 2-year (2019–2021). We estimated the DSPSafety based on the grade 3/4 AEs observed for osimertinib and standard of care. The 2018 wholesale acquisition cost (WAC) of osimertinib at \$14,616 for a 30-day prescription was used. Results: AEs 3/4 were retrieved from the FLAURA trial. In the 1-year contract, the DSPSafety of osimertinib was estimated at \$14,627 (or +0.08% the 2018 WAC) for a 30-day prescription. In the 2-year contract, the DSPSafety of osimertinib was estimated at \$14,516 (or –0.68% the 2018 WAC) for a 30-day prescription. Conclusions: We demonstrated that ex ante pricing methods-based paybacks for safety issues leading to treatment discontinuation can be integrated into our proposed Six Delta platform for outcome-based pricing/contracting. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Aims: Six Delta is a six-dimensional independent platform for outcome-based pricing/contracting. The third dimension (δ_3) estimates prices on the basis of international drug price referencing methods. We describe this dimension's methodology and present a proof-of-concept application to the treatment of non-small cell lung cancer (NSCLC) with EGFR mutation with osimertinib. Materials and methods: The reference-based pricing dimension utilizes a six-step method: (1) selecting foreign countries based on a set of four criteria (drug is available in the foreign country, price information is available in the foreign country, foreign countries are members within the organization for Economic Co-operation and Development, pricing methods in the foreign countries involve value assessment); (2) adjusting for exchange rates; (3) generating reference price (RP) scenarios; (4) adjusting with the medical inflation rate; (5) pooling all generated RP scenarios and calculating average and standard deviation (SD); (6) and Monte Carlo Simulation (MCS) to estimate the dimension-specific DSPReference. A proof-of-concept exercise with osimertinib in NSCLC was performed for two hypothetical outcome-based contracts: 1-year (2019–2020) and 2-year (2019–2021). Results: The United Kingdom and Canada met the four criteria. For the osimertinib 1-year contract price, the average of eight RP scenarios, adjusted for inflation by 0.44%, was \$8,892 (SD = \$2,606) for a 30-day prescription. MCS yielded a DSPReference estimate of \$9,395 or –35.72% of the wholesale acquisition cost (WAC) of \$14,616. For the 2-year contract, the average, adjusted for inflation by 0.72%, was \$8,928 (SD = \$2,610). MCS yielded a DSPReference estimate of \$9,442 or –35.40% of the WAC of \$14,616. Conclusions: We demonstrated that international price referencing methods can be integrated into our proposed Six Delta platform for outcome-based pricing/contracting. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Substitution of carbonyl ligands of the hydrogenase model complex $[\text{Fe}_2(\mu\text{-SeCH}_2\text{CH}(\text{Me})\text{CH}_2\text{Se-}\mu)(\text{CO})_6]$ (A), by 1,1'-bis (diphenylphosphino)ferrocene (dppf), 1,2-bis (diphenylphosphino)benzene (dppbz) or 1,2-bis (diphenylphosphino)acetylene (dppac) is investigated. It is found that the reaction product depends on the diphosphine used. In the case of dppf, the product is an intramolecular bridged disubstituted complex $[\text{Fe}_2\{\mu\text{-SeCH}_2\text{CH}(\text{Me})\text{CH}_2\text{Se-}\mu\}(\text{CO})_4\{\mu, \kappa 1, \kappa 1(\text{P}, \text{P})\text{-dppf}\}]$ (1), while the dppac-reaction produces an intermolecular bridged tetra-iron model $[\text{Fe}_2\{\mu\text{-SeCH}_2\text{CH}(\text{Me})\text{CH}_2\text{Se-}\mu\}(\text{CO})_5]_2\{\mu, \kappa 1, \kappa 1(\text{P}, \text{P})\text{-dppac}\}$ (2). However, the dppbz-reaction gives $[\text{Fe}_2\{\mu\text{-SeCH}_2\text{CH}(\text{Me})\text{CH}_2\text{Se-}\mu\}(\text{CO})_4\{\kappa 2(\text{P}, \text{P})\text{-dppbz}\}]$ (3) in which the dppbz ligand is bonded to one Fe atom in a chelated manner. The newly prepared complexes (1-3) have been characterized by elemental analysis, IR, $^1\text{H-}$, $^{13}\text{C}\{\text{H}\}\text{-}$, $^{31}\text{P}\{\text{H}\}\text{-}$, $^{77}\text{Se}\{\text{H}\}\text{-}$ NMR spectroscopy and X-ray structure determination. The electrochemical behavior of 2 and 3, in absence and presence of acid, is described by cyclic voltammetric measurements in CH_2Cl_2 . © 2020 John Wiley & Sons, Ltd.

ABSTRACT: Metallic nanoparticles (NPs) are widely used in medical preparations. The present study aims to find out the influence of widely used five metallic NPs on the expression of major hepatic drug-metabolizing enzyme (DME) genes. Six groups of BALB/C mice, 7 mice each, were exposed to: Gold NPs, silver NPs, copper oxide NPs, silicon dioxide NPs and zinc oxide NPs, for 21 days. Liver biopsies from all mice were subjected to mouse *cyp3a11*, *cyp2c29*, *ugt2b1* and interleukin-6 (*il6*) gene expression quantification using real-time polymerase chain reaction, in addition to inflammatory cell infiltration examination. All tested NPs caused a sharp and significant (ANOVA, p value < 0.05) downregulation in the expression of DME genes, with the highest influence was observed in mice exposed to copper oxide NPs. Additionally, all NPs induced hepatic inflammation and upregulated the expression of *il6* gene, which were inversely correlated with the expression of DMEs. It is concluded that all tested NPs downregulated the expression of DME genes, with the highest influence exhibited by copper oxide NPs, in correlation with inflammation and *il6* gene induction in the liver. Further studies are needed to find out the effect of anti-inflammatory compounds against the alterations induced by metallic NPs exposure on hepatic DMEs. © 2020 Elsevier B.V.

ABSTRACT: The provision and usage of online and e-learning system is becoming the main challenge for many universities during COVID-19 pandemic. E-learning system such as Blackboard has several fantastic features that would be valuable for use during this COVID-19 pandemic. However, the successful usage of e-learning system relies on understanding the adoption factors as well as the main challenges that face the current e-learning systems. There is lack of agreement about the critical challenges and factors that shape the successful usage of e-learning system during COVID-19 pandemic; hence, a clear gap has been identified in the knowledge on the critical challenges and factors of e-learning usage during this pandemic. Therefore, this study aims to explore the critical

challenges that face the current e-learning systems and investigate the main factors that support the usage of e-learning system during COVID-19 pandemic. This study employed the interview method using thematic analysis through NVivo software. The interview was conducted with 30 students and 31 experts in e-learning systems at six universities from Jordan and Saudi Arabia. The findings of this study offer useful suggestions for policy-makers, designers, developers and researchers, which will enable them to get better acquainted with the key aspects of the e-learning system usage successfully during COVID-19 pandemic. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Code inspection is the way to ensure the quality and the control of products and software by detecting, correcting or reducing defects. Nowadays, several methods of code inspection emerged, most of which consisted of processing, preparation, analysis, meetings, and reform. However, each code inspection method may face problems in terms of number of developers, whether large or small, ease of attendance at meetings, and defects coverage. Moreover, some uses of the programs do not tolerate errors during implementation. In this paper, we will propose a new code inspection model that integrates the program slicing technique with code inspection process. We create reports that facilitate the implementation of the code review process and reduce its time, costs, and team size. The proposed model supposed to be more accurate detection and resolution of existing defects. © 2020 IEEE.

ABSTRACT: In recent years, palliative care practice has shifted toward community-based palliative care. The complex care needs of older adults and people requiring palliative care are increasing due to the increase in life expectancy. However, it remains limited in the Middle East, which has Muslim-majority populations. Various barriers to successful establishment of palliative care services in community settings were identified. © Springer Nature Switzerland AG 2021. All rights reserved.

ABSTRACT: This work presents an innovative approach for solving the problem of unbalance in three-phase induction motors (IM). The presented contribution is based on optimal controller operating with a quantized swarm-intelligence algorithm. The work starts by modeling and investigating the effects of unbalance factors on a three-phase IM operation. The mathematical model of the IM is based on steady state symmetrical component analysis which represents the discrete Fourier transform governing the estimation of control voltages fed into the swarm. The three-phase power input of an IM is controlled by a DSP controller with three-phase current sensors and an output stage that controls the power level of each phase fed into the motor. The controller measures the currents, estimates the current unbalance factor, searches for voltage levels that reduces the unbalance based on a cost functional, therefore, generates control signals on power electronics stage. The swarm-intelligence algorithm searches solutions in a stochastic space for three-phase voltages that minimize and even nullify the unbalance and reacts instantaneously. The algorithm shows very fast convergence to IM input voltages solution in less than 80 ms. The present work is concerned with the design and analysis of applying swarm intelligence control to implement unbalance compensation in three-phase IMs. © 2020 Taylor & Francis Group, LLC.

ABSTRACT: The objective of this study was to develop novel topical drug delivery systems of the nonsteroidal anti-inflammatory drug diclofenac diethylamine (DDEA). Toward this objective, DDEA was loaded into two nanosystems, the oil in water (O/W) nanoemulsion (DDEA-NE) and the gold nanorods (GNR) that were conjugated to DDEA, forming DDEA-GNR. The DDEA-NE and DDEA-GNR were characterized in terms of particle size, zeta potential, morphology, thermodynamic stability, DDEA loading efficiency, and UV-Vis spectroscopy. These nanosystems were then incorporated into the biphasic gel-based formulations (bigels) for topical delivery. The rheological characterization and release studies of the DDEA NE- and DDEA GNR-incorporated bigels were performed and compared to those of DDEA traditional bigel. DDEA-NE exhibited a droplet size 15.2 ± 1.5 nm and zeta potential -0.37 ± 0.06 mV. The particle size of GNR was approximately 66 nm \times 17 nm with an aspect ratio of approximately 3.8. The bigels showed composition-dependent viscoelastic properties, which in turn play a vital role in determining the rate and mechanism of DDEA release from the bigels. Bigels showed a controlled-release pattern where 61.6, 91.7, and 50.0% of the drug was released from DDEA traditional bigel, DDEA NE-incorporated bigel, and DDEA GNR-incorporated bigel, respectively, after 24 h. The ex vivo permeation studies showed that the amount of DDEA permeated through excised skin was relatively low, between 2.7% and 18.2%. The results suggested that the incorporation of the nanosystems NE and GNR into bigels can potentially improve the topical delivery of DDEA. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: In this work, we implemented density function theory to investigate the structural and the electronic properties of nitrogen doped single walled carbon nanotube under different orientations of Stone Wales defect. We have found that, the doped defected structures are more stable than the non-doped defected structures. Furthermore, doping defected carbon nanotubes with a nitrogen atom has significantly narrowed the band gap and slightly shifted the Fermi level toward the conduction band. Moreover, nitrogen substitution creates new band levels just above the Fermi level which exemplifies an n-type doping. However, the induced band gap is indirect band gap compared to direct band gap as in pristine carbon nanotubes. Furthermore, the electronic and structural properties of nitrogen doped carbon nanotube with Stone Wales defects is crucially affected by the dopant site as well as the orientations of Stone Wales defects. © 2020, © 2020 Taylor & Francis Group, LLC.

ABSTRACT: Comprehensive analysis of traffic behavior requires continuous studies to develop traffic theories explaining that behavior at the microscopic level. The study aims to develop a microsimulation program to evaluate the freeway weaving performance depending on the observed data. FWASIM represents a microscopic analysis of the freeway traffic features. It scans events periodically. The developed FWASIM involves the formulation of driver and vehicle behavior at freeway link, on-ramp, off-ramp, and combine them to produce a flexible, friendly use simulation model. Its concept is mainly depending on the car following and lane change theories. Analytical model validation was conducted based on a comparison of FWASIM output with the VISSIM output. Tests consider the important factors that may affect the traffic behavior for a given segment

configuration. The obtained results show agreement between FWASIM and VISSIM outputs. Besides, the field data were used to validate FWASIM. Graphical and t-test methods were used to examine the results. The results are statistically significant which implies that the model provides reasonably accurate measures of effectiveness for the validated range of input data. © 2020 by authors, all rights reserved.

ABSTRACT: Background: Nosocomial bacteremia caused by *Acinetobacter baumannii* is of increasing presence in critically ill patients and has been found naturally in soil and implicated in causing a wide range of clinical conditions in hospitals. *Acinetobacter baumannii* is resistant to a wide range of antimicrobial agents, i.e. multidrug resistant Gram-negative bacteria. Objectives: The aim of the study is to find out the predominant *Acinetobacter baumannii* through its prominent role in cases of neonatal bacteremia as compared to other bacterial isolates from the same clinical conditions. It is also aimed to find out the multidrug-resistant *Acinetobacter baumannii*. Methods: This work was conducted on neonates attending the Central Child Hospital and Al-Yarmouk teaching hospital laboratories at Baghdad, Iraq during the period January 2017- January 2018 two hundred and fifty neonates attending the above mentioned hospitals were the sources of 2-3 ml of blood samples collected aseptically from each newborn. Each blood sample was subjected to established microbiological standard methods for blood culturing and final identification of each isolate. All isolates were tested for whether sensitive or resistant to the commonly used antimicrobial according to manufacture instructions. Results: In this study in which 250 neonates were the source of 180 bacterial isolates (72%) from which *Acinetobacter baumannii* are 75(41.7%) isolates, followed by Group B Beta Hemolytic Streptococci which is 35(19.4%) and *Streptococcus pneumoniae* 32(17.8%) bacterial isolates, while *E.coli* is 14(7.8%), *Pseudomonas aeruginosa* as 13(7.2%) and the least of the isolates is *Staphylococcus epidermidis* which is 11(6.1%). Multidrug resistant were documented in this work in which *Acinetobacter baumannii* were almost completely resistant for Amoxicillin (94.4%), Penicillin G (93.4%), Vancomycin (91.9%), followed by Imipenem (88%) and all of the remaining drugs as in table (2). The only drug for which *Acinetobacter baumannii* reveals the least resistance is Colistin (20%). Conclusion: It seems that *Acinetobacter baumannii* plays the major role in causing neonatal bacteremia, followed by GB β HS. It is also concluded that multidrug-resistance in *Acinetobacter baumannii* is confirmed. This necessitates the advice for future work to find a modified antimicrobials specific treatment for *Acinetobacter baumannii* infections in neonate. © 2020 Wolters Kluwer Medknow Publications. ABSTRACT: The purpose of this study is to explore the role of social capital and collaborative knowledge creation in achieving e-business proactiveness in responding to the COVID-19 crisis. An online survey was used to collect data from industries that had to continue working during the crisis, such as the pharmaceutical and cleaning materials sectors. The sample consisted of 198 managers. The findings show that social capital and collaborative knowledge creation have a significant role in achieving e-business proactiveness in responding to the pandemic. The results also show the positive impact of collaborative knowledge creation and e-business proactiveness on organizational agility during the crisis. The present study opens broad horizons for the exploration of emerging themes in information technology studies, including the role of collaborative knowledge creation and e-business proactiveness and their impact on organizational agility in responding to global pandemics. An understanding of the pivotal impact of social capital and collaborative knowledge creation on e-business proactiveness provides managers with valuable insights into managing

the pressures of pandemics. © 2020 Journal of Innovation & Knowledge

ABSTRACT: Atorvastatin is commonly used among type 2 diabetic (DM2) patients at the University of Jordan Hospital to prevent cardiovascular complication. However, we noticed that there is a wide inter-individual variation in the efficacy and toxicity of atorvastatin. This study aimed to find out the effects of major genetic variants in 3-Hydroxy-3-Methylglutaryl-CoA Reductase (HMGCR), Apolipoprotein E (APOE), and Solute Carrier Organic Anion (SLC01B1) genes on atorvastatin response among DM2 patients. A sample of 139 DM2 patients on 20 mg of atorvastatin was included in this study. The lipid and glycemic profile and the levels of hepatic enzymes alanine aminotransferase (ALT) and aspartate transaminase were recorded before and after 3 months of atorvastatin treatment.

Additionally, the genetic variants HMGCR rs17244841, APOE rs7412 and rs429357, and SLC01B1 rs2306283 and rs11045818 were genotyped using an Applied Biosystems DNA sequencing method (ABI3730x1). We found that atorvastatin reduced total cholesterol and low-density lipoprotein (LDL) more significantly (p-value < 0.05) in patients with wild genotype than variant alleles APOE rs7412C > T and SLC01B1 rs2306283A > G. Furthermore, the ALT level was elevated significantly (p-value < 0.05) by 27% in patients with heterozygous SLC01B1 rs11045818 G/A genotype, while it was not elevated among wild genotype carriers. Additionally, atorvastatin reduced total cholesterol more significantly (p-value < 0.05) in patients with SLC01B1 rs2306283A and rs11045818G haplotypes and increased ALT levels by 27% (p-value < 0.05) in patients with SLC01B1 rs2306283G and rs11045818A haplotypes. In conclusion, it was found in this study that APOE rs7412, SLC01B1 rs2306283, and rs11045818 genotypes can be considered as potential genetic biomarkers of atorvastatin response among DM2 patients of Jordanian Arabic origin. Further clinical studies with larger sample numbers are needed to confirm these findings. © 2020 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Objectives: To conduct a cost analysis of adjunctive hydrocortisone therapy for severe septic shock from the perspective of a third-party payer in the United States. Design: Estimates of outcomes were aggregate data from the Adjunctive Corticosteroid Treatment in Critically Ill Patients with Septic Shock and Activated Protein C and Corticosteroids for Human Septic Shock trials. In these trials, the outcomes of interests were ICU length of stay, vasopressor-free days, ventilation-free days, and the proportion of patients receiving blood transfusion. Each outcome was monetized into a set of mutually exclusive components and was aggregated to estimate the cost-per-patient based on each trial. Cost inputs for each outcome were obtained from literature and adjusted based on the medical care consumer price index. To estimate the budget impact using adjunctive hydrocortisone therapy, per-patient avoided cost was multiplied by expected septic shock annual incidence.

Deterministic one-way sensitivity analysis evaluated the robustness of the findings, and Monte Carlo

simulation estimated 95% CI of the findings. Setting: A total of 103 medical-surgical ICU (69 for Adjunctive Corticosteroid Treatment in Critically Ill Patients with Septic Shock and 34 for Activated Protein C and Corticosteroids for Human Septic Shock). Patients: Adults greater than or equal to 18 years old with septic shock. Interventions: Adjunctive hydrocortisone therapy (hydrocortisone at a dose of 200 mg/d for 7 d for Adjunctive Corticosteroid Treatment in Critically Ill Patients with Septic Shock and hydrocortisone at a 50 mg IV bolus every 6 hr and fludrocortisone as a 50 µg tablet once daily). Measurements and Main Results: Per Adjunctive Corticosteroid Treatment in Critically Ill Patients with Septic Shock, adjunctive hydrocortisone therapy showed a 90-day monetized benefit of \$8,111 (95% CI, \$3,914-\$12,307) per patient, driven by improvements in ICU-free days, vasopressor-free days, ventilation-free days, and blood transfusion proportion. The total estimated annual impact of adjunctive hydrocortisone therapy, in 2019 dollars, was \$750 million. Per Activated Protein C and Corticosteroids for Human Septic Shock, adjunctive hydrocortisone therapy showed a 90-day monetized benefit of \$25,539 per patient (95% CI, \$22,853-\$28,224), driven by improvements in ICU free-days, vasopressor-free days, and ventilation-free days. The total estimated annual impact of adjunctive hydrocortisone therapy, in 2019 dollars, was \$2.3 billion. The deterministic one-way sensitivity analysis showed the cost of ICU stays to be the most influential factor in both analyses. The sensitivity analysis using the reported median showed a greater monetized benefit of \$10,658 (Adjunctive Corticosteroid Treatment in Critically Ill Patients with Septic Shock) and \$30,911 (Activated Protein C and Corticosteroids for Human Septic Shock) per patient. Conclusions: Using adjunctive hydrocortisone therapy yields a significant monetized benefit based on inputs from the Adjunctive Corticosteroid Treatment in Critically Ill Patients with Septic Shock and Activated Protein C and Corticosteroids for Human Septic Shock trials. © 2020 Lippincott Williams and Wilkins. ABSTRACT: Alfuzosin is a medication approved by the US Food and Drug Administration to treat benign prostatic hyperplasia symptoms. Bioequivalence studies are demanded by regulatory authorities to evaluate the expected in vivo biological similarity of 2 formulations of a medication. The aim of this study is to assess the bioavailability of the generic (test) and branded (reference) formulations of 10-mg alfuzosin extended-release tablets after oral administration to healthy adults under fed conditions. The study used a comparative randomized, single-dose, 2-way crossover open-label study design. Thirty-three participants were recruited and completed the clinical assessment. The pharmacokinetic parameters maximum plasma concentration (C_{max}), area under the plasma concentration-time curve (AUC_{0-t}), AUC extrapolated to infinity (AUC_{0-∞}), time to maximum concentration, and elimination half-life were estimated to prove bioequivalence. The confidence intervals for the log-transformed test/reference ratios for alfuzosin 110.7% (98.0-124.9) and 112.0% (101.9-123.1) for C_{max} and AUC_{0-t} respectively, which are within the allowed limits specified by the regulatory authorities (80-125% for C_{max} and AUC_{0-t}). The test formulation can therefore be prescribed as an alternative to the reference for symptomatic treatment of benign prostatic hyperplasia. © 2020, The American College of Clinical Pharmacology

ABSTRACT: The aim of this finite element study was to analyze effect of supporting implants inclination on stress distribution in the bone for a four-unit fixed partial denture. A three-dimensional finite element model of mandibular molar section of the bone to receive implants was constructed. Three implant-supported fixed partial dentures, with null, moderate and wide tilting, of 0° , 15° and 30° implant inclinations, respectively, were modeled. A mechanical load of 10 MPa was applied in coronal-apical direction on bridge framework at the regions of crowns positions. The finite element analysis was performed, and von Mises stress levels were calculated. Peak stress concentration in the cortical bone was observed mostly around the implant necks, in inter-implants line. There was favorable stress distribution during loading, with peak stress being 90.04 MPa for 0° , which decreased to 54.33 MPa for 15° and 46.36 MPa for 30° inclination. The supporting implants inclination in fixed partial denture plays an important role in stress distribution and may be helpful in preventing bone loss and implant failure. This phenomenon is likely to be more pronounced in bones of poor quality. Within the limitation of this study, it seems that the inclination of implants in fixed partial denture has a favorable effect on stress distribution pattern values around the supporting implants. © IMechE 2020.

AOA-based drone localization using wireless sensor-doublers
(2020) Physical Communication, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85088227163&doi=10.1016%2fj.phycom.2020.101160&partnerID=40&md5=0d0cd6c5adfc9afea0946a6ffd3c4db9

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: In this paper, we introduce a method to estimate the drone location in a wireless sensor field (SF). The sensors are assumed to be installed in a field in a doublers form (i.e., each two sensors are combined to form a doublet). Each doublet in the near drone location can be used to estimate the angle between the doublet axis and the line connecting the drone to doublet's vertex. The locus of this angle will form a cone. Using six sets of different doublers, one can locate the drone by considering the intersection of the corresponding six cones. Cramer-Rao bound (CRB) is derived for the proposed estimator. Also, simulation results are provided to illustrate the estimator's performance. © 2020 Elsevier B.V.

ABSTRACT: The essential oil of the fresh leaves of *Platycladus orientalis* (L.), grown in four different biogeographic zones of Jordan, - (the Mediterranean, Irano-Turanian, Saharo-Arabian, and Sudanian penetration) -, were obtained by hydrodistillation and analysed by gas chromatography (GC) and gas chromatography-mass-spectrometry (GC/MS). The actual composition of the spontaneous emitted volatiles was obtained using the solid-phase-micro-extraction (SPME) method and investigated using the same chromatographic and spectroscopic methods. Hydrocarbon monoterpenes dominated the hydrodistilled oils and emissions of all regions. Bicyclic monoterpenes (sabinene, α -pinene, and α -thujene) and monocyclic α -terpinene were detected as the major constituents of the oils and emissions. Additionally, hierarchical cluster analysis (HCA) revealed that the clustering is based on the region of collection rather than the applied methodology. Differences were observed in the quantity of the obtained oils (P-values <0.01); the highest amount of volatile oil was obtained from samples grown in the Irano-Turanian biogeographic zone. © 2020 Elsevier Ltd

ABSTRACT: Spirituality is an important factor that may mediate the detrimental impacts of hemodialysis on mental health. Lack of research examining spirituality and mental health in the Arab world in general and Jordan in particular encouraged this research. The study examined levels of spirituality, depression and anxiety and explored the association between them among patients receiving hemodialysis treatment in Jordan. A cross-sectional design was used to recruit 202 patients receiving hemodialysis treatment. Self-administered questionnaires including spiritual well-being scale, depression and anxiety and a demographic data sheet were used. The data were analyzed using SPSS and descriptive, inferential statistics and linear multivariate regression. The majority of respondents reported moderate mean levels of spirituality well-being (62.4%), while 60.9% and 80.2% scored low-to-moderate levels of depression, respectively. Only 22.3% reported moderate-to-severe anxiety levels. Increasing anxiety and number of co-morbid conditions were predictors of depression. No significant correlations were found between spirituality neither with the sample characteristics nor with depression and anxiety. It was found that depression and anxiety are common among respondents. Spirituality was of medium importance to them, yet it was not significantly associated with depression and anxiety. The implications of this study for holistic clinical practice are explored. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Recommender systems are used to suggest items to users based on their interests. They have been used widely in various domains, including online stores, web advertisements, and social networks. As part of their process, recommender systems use a set of similarity measurements that would assist in finding interesting items. Although many similarity measurements have been proposed in the literature, they have not concentrated on actual user interests. This paper proposes a new efficient hybrid similarity measure for recommender systems based on user interests. This similarity measure is a combination of two novel base similarity measurements: the user interest-user interest similarity measure and the user interest-item similarity measure. This hybrid similarity measure improves the existing work in three aspects. First, it improves the current recommender systems by using actual user interests. Second, it provides a comprehensive evaluation of an efficient solution to the cold start problem. Third, this similarity measure works well even when no correlated items exist between two users. Our experiments show that our proposed similarity measure is efficient in terms of accuracy, execution time, and applicability. Specifically, our proposed similarity measure achieves a mean absolute error (MAE) as low as 0.42, with 64% applicability and an execution time as low as 0.03 s, whereas the existing similarity measures from the literature achieve an MAE of 0.88 at their best; these results demonstrate the superiority of our proposed similarity measure in terms of accuracy, as well as having a high applicability percentage and a very short execution time. © 2019 John Wiley & Sons, Ltd

ABSTRACT: The coronavirus disease 2019 (COVID-19) pandemic is being considered one of the most challenging global crises that the world has experienced in recent history, causing ripple effects and major disruption across all aspects of our daily lives, especially education. Many countries around the world, including Jordan, have instituted shutdown of academic institutions as an early measure to curb the spread of the virus. The rapid response came at a price: Having to transition to remote teaching and learning without the proper tools and technological support. Here we present a glimpse of the efforts undertaken by chemistry instructors at a Pharmacy School in Jordan to ensure the continuity of student learning and achieve educational outcomes during these unprecedented times. By sharing our experiences, we hope to contribute to the collective insights of chemistry instructors around the world in the face of this universal struggle, so that we may all be better prepared for future disruptive events. ABSTRACT: The effects of surface tension and surface viscoelastic properties on the formation of aerosol droplets generated from mucus-like viscoelastic gels (mucus mimetics) during shearing with a high velocity air stream were investigated. Mucus mimetic samples were formulated with similar composition (94% water and 6% dissolved solids, consisting of mucins, proteins, and ions), surface tension (via the addition of surfactant to the mimetic surface) and bulk viscoelastic properties (via crosslinking of mucin macromolecules in the mimetic) to that of native non-diseased tracheal mucus. The surface tension of the mucus mimetic was decreased by spreading one of two surfactants, dipalmitoyl phosphatidylcholine (DPPC) or calf lung surfactant (Infasurf®), on the mimetic surface. Aerosols were generated from the mimetic surfaces during simulated coughing using an enhanced simulated cough machine (ESCM) operating under controlled environmental conditions. The size distribution of aerosol droplets generated during simulated coughing from the surfactant-coated mimetic surfaces was multimodal, while no droplets were generated from the bare mimetic surface due to its high surface viscoelastic properties and high surface tension. The concentration of aerosols generated from the DPPC-coated mimetic was higher than that of the Infasurf®-coated mimetic, even though the surface tension of the two interfaces was the same. The experimental results suggest that a balance of surface elastic behavior and surface viscous behavior is required for the generation of aerosols from the viscoelastic surfaces. ABSTRACT: Reactions of α,β -unsaturated aromatic thioketones 1 (thiochalcones) with $\text{Fe}_3(\text{CO})_{12}$ leading to η^4 -1-thia-1,3-diene iron tricarbonyl complexes 2, [FeFe] hydrogenase mimics 3, and the thiopyrane adduct 4 are described. Obtained products have been characterized by X-ray crystallography and by computational methods. Completely regio- and diastereoselective formation of the five-membered ring system in products 3, containing four stereogenic centers, can be explained by an unprecedented, stepwise (3+2)-cycloaddition of two thiochalcone molecules mediated by $\text{Fe}_3(\text{CO})_{12}$. Quantum chemical calculations aimed at elucidation of the reaction mechanism, suggest that the formal (3+2)-cycloaddition proceeds via sequential intramolecular radical transfer events upon homolytic cleavage of one carbon-sulfur bond leading to a diradical intermediate. © 2020 The Authors. ABSTRACT: The nineteenth-century American novelist, Herman Melville, is oftentimes viewed as a multi-cultured innovator who possibly anticipated post-modernism. In his epic romance, *Mardi*, Melville incorporates aspects of Orientalism within a Westernized framework, thereby eroding cultural borders. This article focuses on *Arabian Nights* as one possible parent text for *Mardi* on the one hand, and on Melville's naturalization of certain Orientalist concepts in his novel on the other. Furthermore, it explores the question of whether Melville "whitewashes" the Eastern narrative to naturalize the text and thus familiarize Westerners with a foreign culture in the spirit of multi-culturalism, or whether he simply subscribes to the Orientalist stereotypes prevalent in nineteenth-century America. © 2020 Pluto Journals. ABSTRACT: The surface temperature of a photovoltaic panel has a major impact on its efficiency and performance. Therefore, it is essential to keep the temperatures of a photovoltaic module within an optimum operating range and avoid abnormal distribution of temperatures on the panel. This paper investigates a forced convective cooling method using different cooling paths and directions on the backside of a PV panel. The cooling paths (or patterns) have been generated using five DC power fans that have worked as inlets and outlets of coolant air. The experiments have been conducted indoors and outdoors where five cooling patterns have been studied. The results have showed that certain cooling patterns have generated a significant decrease in surface temperatures between 27.5% and 32.8% with a uniform distribution of temperatures while other cooling patterns have only ranged between 12.5% and 17% and non-uniform distribution of temperatures. The results have also showed similarities between the indoor and the outdoor experiment results in terms of electrical and thermal efficiencies, power output, and best pattern types. © 2020 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: This study is aimed at identifying the effect of emotional intelligence with its dimensions (self-awareness, self-regulation, empathy, motivation, and social skills) on the performance of working teams with its dimensions (task performance, contextual performance, and counterproductive performance) among employees on the operational lines of industrial companies operating in the Jordanian city of Sahab. The analysis is limited to employees in those companies, and the questionnaire is used as a data collection tool, taking a simple random sample to represent the study population. In addition to the analysis of 216 questionnaires, the SPSS program is used as a data analysis tool in the study. The study emphasizes the importance of emotional intelligence dimensions for operational team leaders, especially motivation and social skills dimensions because they have a higher effect on the task performance and contextual performance levels, while all dimensions of emotional intelligence have a negative effect on counterproductive performance for operational team members. © 2020 Sciedu Press.

ABSTRACT: Thymoquinone (TQ) is a water-insoluble natural compound isolated from *Nigella sativa* that has demonstrated promising chemotherapeutic activity. The purpose of this study was to develop a polymeric nanoscale formulation for TQ to circumvent its delivery challenges. TQ-encapsulated nanoparticles (NPs) were fabricated using methoxy poly(ethylene glycol)-b-poly(ϵ -caprolactone) (mPEG-PCL) copolymers by the nanoprecipitation technique. Formulation variables included PCL chain length and NP architecture (matrix-type nanospheres or reservoir-type nanocapsules). The formulations were characterized in terms of their particle size, polydispersity index (PDI), drug loading efficiency, and drug release. An optimized TQ NP formulation in the form of oil-filled nanocapsules (F2-NC) was obtained with a mean hydrodynamic diameter of 117 nm, PDI of 0.16, about 60% loading efficiency, and sustained in vitro drug release. The formulation was then tested in cultured human cancer cell lines to verify its antiproliferative efficacy as a potential anticancer nanomedicine. A pilot pharmacokinetic study was also carried out in healthy mice to evaluate the oral bioavailability of the optimized formulation, which revealed a significant increase in the maximum plasma concentration (C_{max}) and a 1.3-fold increase in bioavailability compared to free TQ. Our findings demonstrate that the versatility of polymeric NPs can be effectively applied to design a nanoscale delivery platform for TQ that can overcome its biopharmaceutical limitations. © 2020 by the authors. ABSTRACT: Most of reservation systems are working on traditional methods and they are user dependent. The requirements engineering process (REP) in these systems also works based on traditional elicitation methods to build the user interface reservation system. These traditional methods are aimed to ensure that systems meet the needs of stakeholders including users, sponsors, and customers. Most reservation systems are based on traditional requirements that meet the stakeholder's needs as they entered the systems. This makes the novel users face some problems relative to their choices in reservation and mostly they did not select the optimal solution. This research proposed a new reservation model based on intelligent requirements elicitation features; these features are stored in a predefined dataset in order to be used in classification process. The support vector machine (SVM) classifier is used to speed up the classification process of finding the optimal solution based on trained intelligent reservation system. The proposed model shows significant improvements in the reservation system based on intelligent feature requirements. The intelligent reservation system is implemented and tested on Al-Zaytoonah University halls and classrooms for reservations of different lectures and meetings. The proposed model shows significant results with high accuracy. © 2020 ICIC International.

ABSTRACT: Understanding mechanisms of the novel SARS-CoV2 infection and progression can provide potential novel targets for prevention and/or treatment. This could be achieved via the inhibition of viral entry and/or replication, or by suppression of the immunologic response that is provoked by the infection (known as the cytokine storm). Probiotics are defined as 'live microorganisms that, when administered in adequate amounts, confer a health benefit on the host'. There is scarcity of evidence about the relationship between COVID-19 and gut microbiota. So, whether or not these supplements can prevent or ameliorate COVID-19-associated symptoms is not fully understood. The aim of this study is to provide an indirect evidence about the utility of probiotics in combating COVID-19 or its associated symptoms, through the review of its antiviral and anti-inflammatory properties in vitro, animal models and human trials. Significance and Impact of the Study: The role of probiotics in alleviation of the novel COVID-19 has not been established. This review provides an insight about the anti-inflammatory, antiviral effects of probiotics in vitro, animal models and human. The latter can provide an indirect evidence and/or hypothesis-driven approach to investigate the use of probiotics as adjunctive therapy in the prophylaxis and/or alleviation of COVID-19 symptoms. © 2020 The Society for Applied Microbiology

ABSTRACT: Aims: To examine levels of social support and quality of life (QOL) and to examine the association between social support and QOL in patients receiving haemodialysis (HD) treatment.

Design: A cross-sectional study. Method: social support and QOL were measured using the Multidimensional Scale of Perceived social Support (MSPSS) and the World Health Organization QOL-BREF questionnaires, respectively. A convenience sample of 195 patients receiving HD from different dialysis units across Jordan completed the questionnaires. Results: Respondents scored highest on the social relationships domain of QOL (55.5 SD 21.4) compared with the lowest mean scores of the physical and environmental domains (48.6 SD 20.4; 46.2 SD 17.3, respectively). social support had a positive significant association with quality of life. Multiple linear regression identified age and social support as influencing factors, explaining 24.6% of the total variance in the social domain of quality of life. Understanding the relationship between social support and QOL in patients receiving HD may provide guidance to the healthcare providers, family members and social services about the importance of social support to this group of patients. © 2020 The Authors. ABSTRACT: Objectives: The purpose of this study was to assess public knowledge on the safety, efficacy, proper storage conditions and other physiochemical properties of different dosage forms. Methods: This study was based on a cross-sectional design. A structured quantitative survey, which included five sections, was used as an instrument for data collection. The first section addressed the demographic characteristics of the sample, whereas the second section assessed public knowledge on medications. The third section inquired about participants' preferred dosage forms. The fourth section was related to the perceived effects of physiochemical properties of medicines on their safety and efficacy. The fifth section addressed participants' thoughts on appropriate ways for medications usage and storage. A total of 752 participants completed the questionnaire. Data were analysed using SPSS (20.0) software. Key findings: Although our study findings pointed out some knowledge gaps based on participants' answers, most of the participants (87%) reported that physicians or pharmacists were the main sources of their medicine-related information. There was a great variation in participants' responses regarding perceived onset of action, proper storage conditions and other properties of different dosage forms. Conclusion: The study findings demonstrated the need to educate the public about basic information related to different dosage forms

of medications. © 2020 Royal Pharmaceutical Society

ABSTRACT: The objectives of the present study were to identify CYP4V2 genetic variants and characterize their functional consequences. A total of 26 CYP4V2 genetic variants were identified, including seven novel variants in 60 randomly selected healthy subjects. Six protein-coding variants were studied, including three novel variants (L22V, R287T, and G410C) and three previously reported variants (R36S, Q259K, and H331P). The cDNA sequences encoding each amino acid variant and the wild-type CYP4V2 protein were cloned into the pcDNA/PDEST40 expression vector and transfected into eukaryotic 293T cells for overexpression of the CYP4V2 coding variants. CYP4V2 H331P and CYP4V2 G410C exhibited significant decreases in activity for lauric acid oxidation (20–30% of wild-type activity), when compared to the wildtype, which was correlated with low expression of CYP4V2 H331P and G410C substituted proteins. The other four CYP4V2 amino variants were comparable to wild-type CYP4V2 for lauric acid metabolism. The CYP4V2 H331P and G410C substitutions were predicted to cause a structural change through in silico analysis. In conclusion, the present study provides functional information about CYP4V2 genetic variants. These findings will be valuable for interpreting individual variations in phenotypes associated with CYP4V2 function in the clinical setting. © 2020 John Wiley & Sons Ltd/University College London

ABSTRACT: Introduction: can cause significant tissue damage; alter limb function, pain and decreasing quality of life. Nurses play a significant role in the prevention, identification and follow-up of the complications. Objectives: This study was conducted to evaluate the oncology nurses' knowledge about chemotherapy related - extravasation injuries, risk factors, preventive measures, and management practices. Methods: A descriptive cross-sectional design with a convenience sample was used. A sample of 110 oncology nurses completed the knowledge test. European Society for Medical Oncology (ESMO) - European Oncology Nursing Society (EONS) management of chemotherapy extravasation Clinical practice guidelines were used to develop the knowledge test. Results: The oncology nurses' knowledge of chemotherapy related-extravasation's definition and signs and symptoms was satisfactory. However, knowledge about risk factors was limited. Generally, the results showed that high percentage of the participants had correct information regarding the procedure domain. However, knowledge deficit regarding site of insertion, and cannula characteristics were reported. The results showed that there was knowledge deficit among the participants regarding all specific treatment practices. Conclusions: The current study provides a baseline data about oncology nurses knowledge and practice regarding chemotherapy related-extravasation care. Continues education, seminars, and workshops should be conducted for oncology nurses to increase their knowledge and strengthen their competencies. © 2020 INDIACLEN

ABSTRACT: Big Data applications are widely used in many fields such as artificial intelligence, marketing, commercial applications and health care, as demonstrated by the role of Big Data in coping with the COVID-19 pandemic. Therefore, it is essential to ensure the quality of the generation and use of Big Data applications. Consequently, Big Data applications must satisfy quality factors suited

for these applications. Furthermore, quality frameworks need to be applied and tested for the quality factors of Big Data applications. Nevertheless, the quality measurement process needs to overcome some challenges for it to become applicable and trustworthy. This research lists different quality factors and dimensions and describes quality frameworks that are commonly used to measure the quality of Big Data. Furthermore, it lists the frequent challenges that researchers and data scientists face throughout the Big Data quality measurement process. Finally, it outlines the solutions that need to be developed for confronting the challenges of Big Data quality. © 2020 National Institute of Science Communication and Information Resources (NISCAIR). ABSTRACT: Our objective was to determine the relationship between cancer-related fatigue (CRF), laboratory markers, and nutritional status among patients with colorectal cancer (CRC). A cross-sectional design was used. A sample of 80 participants diagnosed with CRC participated and completed the study's surveys including the patient-generated subjective global assessment (PG-SGA), cancer fatigue scale (CFS), laboratory markers sheet, and patient-related factors sheet. Positive relationships were identified between PG-SGA and CRF, physical fatigue, cognitive fatigue, WBC, and calcium level ($r = 0.781, 0.820, 0.751, 0.680, \text{ and } 0.710$; $P = 0.001$ respectively). Negative relationships were found between PG-SGA and sodium, potassium, and hemoglobin levels ($r = -0.801, -0.761, \text{ and } -0.810$; $P = 0.001$ respectively). The regression analysis revealed an $R^2 = 0.610$ (adjusted $R^2 = 0.590$), $F(4.58, P < 0.001)$. Finally, the above-mentioned independent variables accounted for 61.0% of the variance in PG-SGA. Patients with CRC are experiencing nutritional problems during their treatment. Cancer-related fatigue and other laboratory markers are considered indicators for nutritional status. Clinical dietitians and oncology nurses can work together to monitor these parameters and provide clinical treatment when needed. © 2019, © 2019 Taylor & Francis Group, LLC.

ABSTRACT: Melanin-mimetic polydopamine nanoparticles (PDA NPs) are emerging as promising candidates for topical and transdermal drug delivery because they mimic melanin, a naturally occurring skin pigment. However, our knowledge of their interactions with human skin remains limited. Hence, we set out to investigate the role of PDA NP surface chemistry in modulating their skin deposition. PDA NPs were synthesized by base-catalyzed oxidative self-polymerization of dopamine and functionalized with poly(ethylene glycol) (PEG) bearing different termini to obtain neutral, anionic, cationic, and hydrophobic PEGylated NPs. NPs were characterized by dynamic light scattering, transmission electron microscopy, Fourier transform-infrared spectroscopy, and X-ray photoelectron spectroscopy. The NPs were then labeled with rhodamine B, and their skin interactions were investigated both in vitro, using a Strat-M membrane, and ex vivo, using excised whole thickness human skin. In vitro diffusion studies revealed that the NPs did not permeate transdermally, rather the NPs accumulated in the Strat-M membrane after 24 h of incubation. Membrane deposition of the NPs showed a strong dependence on surface chemistry, with anionic (unmodified and carboxyl-terminated PEGylated) NPs achieving the highest accumulation, followed by neutral and cationic NPs, whereas hydrophobic NPs achieved the lowest degree of accumulation. In ex vivo permeation studies, we observed that surface modification of PDA NPs with PEG serving as an antifouling coating is essential to maintaining colloidal stability upon skin contact. Moreover, anionic PEGylated NPs were able to achieve 78% skin accumulation, which was significantly higher than neutral and cationic NPs (51 and 34% accumulation, respectively). Our findings provide important insights into the role of surface chemistry in enhancing the skin accumulation of melanin-mimetic PDA NPs as potential sunscreens and carriers for skin-targeted treatments. © 2020 American Chemical Society.

ABSTRACT: In this paper, we consider tubes in the Euclidean 3-space whose Gauss map n is of coordinate finite I-type, i.e., the position vector n satisfies the relation $\Delta I n = \Lambda n$, where ΔI is the Laplace operator with respect to the first fundamental form I of the surface and Λ is a square matrix of order 3. We show that circular cylinders are the only class of surfaces mentioned above of coordinate finite I-type Gauss map. © 2020 Allahabad Mathematical Society.

Department of Physics, Faculty of Science, Port Said University, Port Said, 42521, Egypt

ABSTRACT: In the present work, a new method for solving a strong nonlinear oscillator equation of the form $\ddot{x} + F(x) = 0$, where $F(-x) = -F(x)$, is carried out. This method consists of approximating function $F(x)$ by means of a suitable Chebyshev polynomial: $F(x) \approx P(x) = px + qx^3 + rx^5$, and then, the original oscillator is replaced by the cubic-quintic Duffing equation $\ddot{x} + px + qx^3 + rx^5 = 0$ with arbitrary initial conditions, which admits the exact solution in terms of elliptic functions. The efficacy of the present method is demonstrated through the fluid multi-ion plasma equations and a generalized pendulum problem. For the generalized pendulum problem, the governing motion is directly reduced to the cubic-quintic Duffing oscillator with the help of the Chebyshev polynomial, and the approximate analytical and exact solutions are obtained. In addition, the comparison between our solutions and the Runge-Kutta numerical solution is examined. Moreover, the periodic time formula of the oscillations for both the approximate analytical solution and the exact solution is deduced, and the comparison between them is implemented. With respect to the plasma application, the fluid plasma equations of its particles are reduced to the Extended Korteweg-de Vries (EKdV) equation utilizing a reductive perturbation method. Then, we proved for the first time that any undamped polynomial oscillator of the n th degree can be reduced to a $(2n - 1)$ th odd parity Duffing. Accordingly and after applying the previous theory to the EKdV equation, it was converted to the cubic-quintic Duffing equation. Finally, we can deduce that our new solutions and theory help us to understand and investigate many nonlinear phenomena in various branches of science. © 2020 Author(s).

ABSTRACT: The aim of this study is assessing Healthcare Professionals (HCPs) knowledge on Chronic Kidney Disease (CKD) and inspecting their attitude regarding referral and perceptions towards statins use in non-dialysis CKD patients. A cross-sectional design was employed using a self-administered questionnaire that was constructed and validated before the study. The questionnaire was distributed to HCPs at two accredited hospitals. A total of 187 individuals including, 48.1% were pharmacists, 40.6% were physicians, and 11.2% were medical students. Female respondents slightly exceeded males, 56.7% vs. 43.3% respectively. Thirty-nine percent of study participants chose medical journals as their fundamental source for updated CKD information. More than 87% of respondents reported that the available CKD Continuing Medical Education (CME) programs are not sufficient. Almost 93% of participants appreciated the benefit of early referral of CKD patients to a nephrologist and 84.5%

believed that non-dialysis CKD patients might benefit from using statins. The overall knowledge of participants was average with no significant differences in overall knowledge scores based on their age, gender, profession, experience or monthly salary. In conclusion, HCPs hold a positive attitude towards the early referral of CKD patients to nephrologists and appreciate the considerable value of statins use in improving CKD patients' outcomes. © 2020 EManuscript Technologies. ABSTRACT: Background: The behavior of the general public in Jordan will likely have an important effect on the how the coronavirus disease 2019 (COVID-19) epidemic spreads. Human behavior is influenced by people's knowledge and awareness. The aim of the study is to determine the knowledge and awareness of COVID-19 among the general public in Jordan. Method: Cross-sectional online survey conducted between March 17 and March 23, 2020. A sample of 3,791 adults in Jordan who were representative of the general population by gender, age, occupation, marital status, employment status and educational level. Measurements: Response to 23 survey questions. Results: Participants generally had satisfactory knowledge of the main mode of disease transmission and the common symptoms of COVID-19, as half of the participants confirmed that transmission is via droplets from sneezing or coughing and from contaminated surfaces. In addition, most (77%) of the respondents stated that more than one category could be at high risk of complications from COVID-19, including the elderly, people with weak immune systems, those with heart problems, and diabetic patients. However, a substantial proportion of participants had misconceptions about how to prevent infection. For instance, about 80% of participants thought that wearing a mask was effective in protecting them from acquiring COVID-19. Conclusion: These findings can guide government information campaigns that will be covered by media. Rapid online surveys could be an important tool in tracking the public's knowledge and misperceptions of COVID-19 over time. © 2020 EManuscript Technologies. All rights reserved.

ABSTRACT: Background Caregivers experience high strain related to care giving. There is increasing interest in examining the caregiver burden of cardiac patients and studying the characteristics of caregivers. Purpose To explore the correlation between quality of life cardiac patients and caregiver's burden. Methods A cross-sectional design using a convenience sample of caregivers and patients with cardiac conditions. Sociodemographic sheet, Dutch Objective Burden Inventory (DOBI), and Quality of Life (QLI-Cardiac 4). Linear regression was used to explore the predictors. Results 200 caregivers and 200 patients with cardiac diseases completed the study. The overall mean scores of both DOBI and QLI-4 indicated moderate results 1.51(SD 0.4), 19.8 (SD 4.7) respectively. Predictors of caregiver burden were young, less educated caregivers and high QoL of cardiac patients. Conclusion Caregivers should receive more support and training from healthcare providers to develop their coping and resilience skills in a way that decreases their care burden and improves their quality of care and self-confidence. © 2020 Subih et al. ABSTRACT: Window views are an important design feature in buildings. Views can impact the cognitive attention, psychological and physiological well-being of building occupants due to their ability to provide recovery in stressful working environments. The impact of viewing position on view perception as a result of the visual parallax effect resulted from occupants seeing a window from different relative positions in any given room has not been comprehensively investigated. In this study, view perception was evaluated using a physically-based 360° virtual environment at three different viewing locations: close, middle, and far. The three conditions were presented to thirty-two participants. The study employed a comprehensive method by collecting subjective and physiological evaluations. A stress-recovery methodology to assess restorativeness effects was used by presenting a window view observing period after a stressful task was performed. Subjective assessments included questions on view restorative ability, view content and size preferences, view valance/arousal, and positive and negative affects. Physiological measures included skin conductance, heart rate, and heart rate variability. Results showed significant differences in subjective parameters and measures of skin conductance. Decreased view quality was reported as participants observed the view from the further viewing locations compared to the close position. The study highlights the importance of the informative content seen in the window view such as the sky and ground, which may impose limitations on recommended room depth and windows design. The results of this study show that the design of window views has important implications on the health and well-being of building occupants. © 2020 The Authors

ABSTRACT: Severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) is a new viral disease that has gained global attention owing to its ability to provoke community and health-care-associated outbreaks of severe infections in human populations. The virus poses serious challenges to clinical management because there are still no approved anti- SARS-CoV-2 drugs available. In this mini-review, we summarize the much updated published reports that demonstrate the mechanism of SARS-CoV-2 entry into host cells, and discuss the availability and development of attractive host-based therapeutic options for SARS-CoV-2 infections. © 2020 Elsevier B.V. and Société Française de Biochimie et Biologie Moléculaire (SFBBM)

ABSTRACT: Gold nanorods (GNR) and gold nanospheres (GNS) of different surface charges; neutral -poly ethylene glycol (PEG), negatively charged poly acrylic acid (PAA), and positively charged poly allyl amine hydrochloride (PAH), were synthesized and characterized, and their colloidal stability was investigated using UV-Vis absorption spectra and zeta potential measurements. Gold nanoparticles (GNP) were loaded at different concentrations (from 1.0 to 6.0 nM) into two hydrogels prepared in water; 18% w/v Poloxamer 407 and 1.5% w/v hydroxypropyl methylcellulose (HPMC). The GNP hydrogels were characterized in terms of GNP colloidal stability, and the rheological properties of the GNP hydrogels. GNP loaded into HPMC hydrogel demonstrated poor stability and exhibited separation into two layers. On the contrary, colloidal stability of the GNP was preserved upon loading into Poloxamer 407 hydrogel. The rheology study demonstrates that Poloxamer 407 hydrogel was able to accommodate GNR or GNS at concentrations lower than 6.0 nM with no apparent change in the measured rheology parameters. PAH-coated GNP caused the largest decrease in the low shear rate viscosity values. The elastic modulus was higher than the viscous modulus at the entire concentration range and the values of the phase shift angle did not exceed 10 degrees indicating prevail elastic property. As a

conclusion, Poloxamer 407 hydrogel is a good candidate as a topical vehicle for both GNR and GNS at concentrations lower than 6.0 nM. © 2020, Springer-Verlag GmbH Germany, part of Springer Nature.

User acceptance model of open source software: an integrated model of OSS characteristics and UTAUT (2020) Journal of Ambient Intelligence and Humanized Computing, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074362949&doi=10.1007%2fs12652-019-01524-7&partnerID=40&md5=88790016954e3c4f26af155224bd63a8>

AFFILIATIONS: Department of Software Engineering, Alzaytoonah University of Jordan, Amman, Jordan; Department of Computer Science, Alzaytoonah University of Jordan, Amman, Jordan; IT-Department, Al-Huson University College, Al-Balqa Applied University, Irbid, Jordan; Department of Multimedia, Alzaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Globally, the acceptance of Open Source Software (OSS) varies among the users of a company. Despite the substantive software, social, and infrastructure-related implications of OSS acceptance, the research on the acceptance of OSS across organizations inhabitants remains surprisingly limited. To propose a model for the acceptance of OSS; investigate the influence of the OSS characteristics, UTAUT constructs, and infrastructure factors on the acceptance of open source software system. It also examines the validity of UTAUT in the open source software context. Quantitative design has been used following the distribution of questionnaire among a sample of 255 individuals employed at public and private organizations (172 males and 83 females). Software quality, software interoperability, and software security had a significant impact on the performance expectancy (PE) ($\beta = 0.445$, $P < 0.001$), ($\beta = 0.302$, $P < 0.001$), ($\beta = 0.139$, $P < 0.05$), respectively. Moreover, PE, cost, facilitating conditions, social influence SI and self-efficacy had a notable impact on the behavioral intention ($\beta = 0.275$, $P < 0.05$), ($\beta = 0.229$, $P < 0.01$), ($\beta = 0.136$, $P < 0.01$), ($\beta = 0.220$, $P < 0.01$) and ($\beta = 0.174$, $P < 0.01$) respectively. A new path appears to exist between EE (effort expectancy) and PE ($\beta = 0.215$, $P < 0.01$). The outcomes indicated that users perceive that OSS user-friendliness must be upgraded for optimizing its benefits. It showed that performance expectancy, effort expectancy, social influence, self-efficacy, software security, software quality, software interoperability, and software cost are important indicators in the acceptance and implementation of OSS. Further research can be conducted in organizations to observe the implementation of OSS and its effectiveness. © 2019, Springer-Verlag GmbH Germany, part of Springer Nature.

Effect of Heat Treatment on the Grain Size, Microhardness and Corrosion Behavior of the Cold-Working Tool Steels Aisi D2 and Aisi 01

(2020) Materiali in Tehnologije, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098576126&doi=10.17222%2fmit.2020.035&partnerID=40&md5=bf0ef6860564e188b3c021d2da46feea>

ABSTRACT: The current work focuses on the effect of heat treatment on the grain size, microhardness and corrosion behavior of AISI D2 and 01 tools steels. Samples of the investigated steels were subjected to different heat treatment (quenching and tempering) regimes. The hardening temperatures for AISI D2 steel were in the range 850–1000 °C with 50 °C step and in the range 780–870 °C with 30 °C step for AISI 01 steel. The tempering temperatures were fixed for AISI D2 and 01 specimens at 550 °C and 450 °C, respectively, to investigate the influence of the hardening temperature only. The results show that the grain size of heat-treated steels decreased by increasing the hardening temperature and thus the microhardness number increased due to the dense grain-boundary areas in the fine structures. The corrosion behaviors of the steel specimens were assessed in 0.1-M HCl solution using a potentiostatic polarization technique. The immersed AISI D2 specimens showed better corrosion resistance than that of AISI 01 due to the presence of high alloying elements, which may help in forming a protective layer against corrosion. The corrosion rates of the coarse-grained structures were less than that of the fine-grained structures, because the finer the grains, the greater the anodic areas, which leads to higher corrosion rates.

ABSTRACT: Herein, a nanotechnology-based approach was adopted to develop a facile and effective nanoplatfrom for the treatment of superficial fungal infections. Gold nanorods (GNR) functionalized with thiolated poly ethylene glycol (PEG-SH) or thiolated PEGylated cholesterol (Chol-PEG-SH) moieties were conjugated with Fluconazole and loaded into poloxamer 407 hydrogel. The obtained nanocomplexes; PEG-Fluc-GNR and Chol-Fluc-GNR were characterized by optical spectroscopy, hydrodynamic size and effective surface charge. The anti-fungal activity of the nanocomplexes was investigated by estimating the minimum inhibitory concentration (MIC) and the percentage reduction of fungal viable count against *Candida (C.) albicans*. PEG-Fluc-GNR and Chol-Fluc-GNR resulted in 5-fold and 14-fold reduction in MIC of GNR, and in 9-fold and 12-fold reduction in MIC of Fluconazole, respectively. The average log-reduction of the viable fungal cells upon treatment with the nanocomplexes was 5 log cycles, and it ranged from 1.3-3.7 log cycles when loaded into poloxamer 407 hydrogel. Transmission electron microscope imaging of the treated *C. albicans* revealed an enhanced uptake of the nanoparticles into the fungus's cell wall within the first 120 min of exposure. The nanocomplexes demonstrated low cytotoxicity towards human dermal fibroblasts which represent the human skin dermal cells. Conjugating Fluconazole with GNR is a promising approach for the effective treatment of superficial fungal infections. © The Royal Society of Chemistry.

ABSTRACT: With the number of cars clogging the roads and junctions around the world and expected to double in the next decades, new ways have been introduced by researchers. controlling traffic signals through active traffic management targeted to increase road capacity and road traffic flows more efficient. Smart traffic lights have the ability to reduce traffic congestion and vehicle waiting time, thus reducing fuel wasting and gas emissions. This work explores proposed solutions and techniques for traffic signal to optimize road traffic and reduce traffic congestion impacts. © 2020, Engg Journals Publications. All rights reserved.

ABSTRACT: This work presents performance study of a concentrating photovoltaic/thermal (CPV/T) collector and its efficiency to produce electric and thermal power under different operating conditions. The study covers a detailed description of flat photovoltaic/thermal (PV/T) and CPV/T systems using water as a cooling working fluid, numerical model analysis, and qualitative evaluation of thermal and electrical output. The aim of this study was to achieve higher efficiency of the photovoltaic (PV) system while reducing the cost of generating power. Concentrating photovoltaic (CPV) cells with low-cost reflectors were used to enhance the efficiency of the PV system and simultaneously reduce the cost of electricity generation. For this purpose, a linear Fresnel flat mirror (LFFM) integrated with a PV system was used for low-concentration PV cells (LCPV). To achieve the maximum benefit, water as a coolant fluid was used to study the ability of actively cooling PV cells, since the electrical power of the CPV system is significantly affected by the temperature of the PV cells. This system was characterized over the traditional PV systems via producing more electrical energy due to concentrating the solar radiation as well as cooling the PV modules and at

the same time producing thermal energy that can be used in domestic applications. During the analysis of the results of the proposed system, it was found that the maximum electrical and thermal energy obtained were 170 W and 580 W, respectively, under solar concentration ratio 3 and the flow rate of the cooling water 1 kg/min. A good agreement between the theoretical and experimental results was confirmed. © 2020 by the authors.

ABSTRACT: The objective of this work was to study the effect of the physiologically relevant enzymes pepsin, pancreatin, and the synthetic surfactant sodium lauryl sulfate (SLS) on the surface tension of the dissolution media and the solubility and dissolution of the weakly basic drug carvedilol. Compendial dissolution media and buffer solutions that simulate the gastrointestinal fluid, prepared with and without the addition of SLS, were used in this study. The surface tension of the dissolution media; critical micelle concentration (CMC) of SLS in buffer solutions; and size, polydispersity index, and zeta potential of SLS micelles loading carvedilol were determined. The solubility and dissolution of carvedilol were investigated and compared with those of the corresponding media prepared without the addition of pepsin, pancreatin, and SLS. Results showed that the addition of pepsin, pancreatin, and SLS lowered the surface tension of the dissolution media to 54.8, 55.7, and ~ 30 mN/m, respectively. The solubility of carvedilol was significantly enhanced with pepsin and SLS; however, no significant difference was found with pancreatin. The dissolution rate of carvedilol was fast in simulated gastric fluid with and without pepsin. The dissolution was further enhanced in media with pancreatin and SLS. The dissolution data were corroborated with the molar micellar solubilization (X) of SLS, ranging between 0.02 and 3.09. Understanding the effect of pepsin, pancreatin, and SLS on the surface tension of the dissolution media and the solubility and dissolution of poorly soluble drugs can improve our knowledge of the performance of these drugs in vivo. © 2020, American Association of Pharmaceutical Scientists.

Mobile crowdsourcing technology acceptance and engagement in crisis management: The case of syrian refugees

(2020) International Journal of Technology and Human Interaction, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083587670&doi=10.4018%2fIJTHI.2020070101&partnerID=40&md5=56a50b8220d9a6866c82afc774979a2f>

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: The purpose of this study is to examine the determinants of the intention for the continuous acceptance and use of mobile crowdsourcing to participate in refugee crisis management. A questionnaire was developed to collect data from 389 Syrian refugees in Jordan's Za'atari camp. Smart PLS was used to analyze the data. The findings indicated that the individual and crowd performance expectancy, the social influence, and perceived risks on the individual and crowd levels have a significant influence on the intention for the continuous acceptance and engagement in mobile crowdsourcing to participate in refugee crisis management. In addition, the results revealed that cultural values of masculinity, power distance, and long-term orientation have no effect on the intention. At the same time, cultural values of collectivism and uncertainty avoidance have a significant effect. Copyright © 2020, IGI Global.

ABSTRACT: With the recent development in mobile devices and mobile services, mobile learning (m-learning) has become one of the most common research topics across Arab Gulf countries (AGC). The literature showed an inconsistent usage of m-learning in these countries. This paper sheds light on the progress of m-learning use in AGC, as well as offering recommendations to improve its adoption

success. A systematic literature review was conducted to identify the current evidence on the use of m-learning in AGC across several groups of instructors and students. The results from reviewing 31 previous studies showed that students' and instructors' acceptance and use of m-learning were the main topics of concern. In addition, the lack of research on leadership and policy practices in AGC may lead to technology failure. The key recommendations on best practices related to the use of m-learning in AGC were presented and discussed. © 2020, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: This study aims at investigating, the mediating role of business organization sustainability in the relationship and impact of the use of IT Tools on Organizational performance. A selective sample of 110 managers from 30 Jordanian business organizations were the participants of this study. Four parts, 22 statements questionnaire was used to gather the required data. The statistical testing and analysis results of the collected data have indicated that there is a strong positive and statistically significant relationship between the use of IT tools and organization performance. Its tool utilization also has a strong positive impact on organizational performance. The mediating role of organization sustainability was positive in terms of the relationship and impact of using IT tools and business organization performance. The results of this study were consistent with many other previous studies. © 2020, Pro Global Science Association. All rights reserved.

AFFILIATIONS: Accounting Department, Faculty of Business, Al-Zaytoonah University of Jordan, Jordan; Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: The audit committee plays a major role in corporate governance regarding the organization's direction, control, and accountability. As a representative of the board of directors and the main part of the corporate governance mechanism, the audit committee is involved in the organization's both internal and external audits, internal control, accounting, and financial reporting, regulatory compliance, and risk management. This study aims to provide and explain the relationship between audit committee roles and voluntary disclosure, and how audit committee tries to enhance her role in voluntary disclosure among Jordanian insurance companies listed in Amman stock exchange (24 company). We concentrated on two roles, reviewing accounting policies and risk management used to improve the voluntary disclosure, through questionnaires distributed to all audit committee members in insurance companies (84 members), (75) questionnaire was accepted and used in the pilot analysis of the originally distributed questionnaires at (percentage of 89.3%) through use One-Sample T-Test and verify the validity of this hypothesis, the arithmetic means and standard deviations of the items concerning for the audit committee role we found that these two roles influence the level of voluntary disclosure among insurance companies. audit committee followed specific procedures in reviewing, supervising, and control of the company accounting policies to improve the voluntary disclosure. Moreover, about risk management, the study concluded that the audit committee covers all aspects of the company's operations and sets clear methods for each type of risk and how to deal with them by the voluntary disclosure of the company. © 2020, Pro Global Science Association. ABSTRACT: The current study aims to investigate the effect of earnings quality on the market value of the share price, and then the role of liquidity as a mediating effect in the relationship between earnings quality and the market value of the share price. This study provides some empirical evidence from an emerging market, especially from Jordanian market. The framework of this study is developed by the classical valuation theory that discusses the factors that affect the market value of the shares prices. Also, this study is a quantitative study using a panel data analysis. The study population includes all Jordanian industrial public shareholding companies listed in the Amman Stock Exchange (ASE) during the year 2012 to the year 2017, where there are 62 industrial companies listed in ASE during this period. The study sample is all targeted companies that are included in the study population. In other words, it uses a comprehensive sample method. In conclusion, a high earnings quality and more liquidity in Jordanian industrial public shareholding companies increase their market value of the shares prices. At the same time, liquidity mediates the relationship between earnings quality and the market value of the shares prices of those companies. Moreover, the level of Jordanian market controlling of earnings quality and liquidity is a good one. The study recommended to continually investigating the relationship between organizational factors and earnings management, which may have a positive effect on the market value of the shares prices. © 2020, Pro Global Science Association. ABSTRACT: The energy demand for cooling and air conditioning systems is increasing worldwide, especially in regions with high solar radiation intensity. One of the reasons for this is the increase of comfort demands worldwide. The most cooling and air conditioning systems are the conventional electrically driven one type such as compression refrigeration machines and air conditioning systems. Through the huge electricity consumption for cooling and air conditioning, the environmental problems get bigger and bigger, because of carbon dioxide (CO₂) and other pollutant emissions. One of the possibilities to reduce the primary energy consumption is through the use of solar energy for driving the thermal driven absorption or adsorption refrigeration systems, or desiccant cooling. Another possibility is using solar energy to produce electrical energy and this can be used to drive the conventional refrigeration systems. Many research and developmental efforts in the last years have been done to enforce the spreading of solar-driven cooling systems. This paper will illustrate the state of the art about the energy consumption for cooling and air conditioning systems, available solar-driven cooling systems and the potential of the utilization of such systems in comparison to the conventional ones. Moreover, this paper highlights some different methods of optimization, which used to maximize the performance and minimize the cost. © 2020 Elsevier Ltd

ABSTRACT: Objectives: The objective of this study is to identify the relationship between sleep quality (SQ) and related factors among nurses working in an emergency room (ER) in Jordan. Methods: A cross-sectional descriptive correlational design was employed. Data were collected from a convenient sample of nurses working in ER based on a specific inclusion criteria from a number of referral hospitals located in Amman. Eligible participants were required to complete a demographic and work-related variables sheet, and the Pittsburgh Sleep Quality Index (PSQI). Results: A total of (186) nurses working in ER participated in the study. Participants reported an SQ mean score of (M = 8.76, SD = 3.18) indicating poor sleep. In classifying good versus poor sleepers, 7.9% (n = 14) had PSQI scores (< 5) which indicate good sleep quality, and 92.1% (n = 172) had PSQI scores (≥ 5) which indicate poor sleep quality. In addition, there were no statistically significant differences in PSQI score in regarding to the others demographic and work-related variables except for salary (F = 3.35, p = 0.02). Conclusion: The results of this study reported a noticeable alteration in sleep quality

among nurses working in ER. The nurses were poor sleepers. In addition, the results emphasized on the importance of conducting further interventional research studies in the future to establish effective measures to enhance nurses SQ. © 2019, Springer Nature Singapore Pte Ltd.

ABSTRACT: In this study, energy and exergy analysis was performed for a refrigerator display cabinet (RDC) unit equipped with a variable speed DC-compressor and electronic expansion valve. Economic impact and energy saving were also investigated. Two identical refrigeration systems were built and tested experimentally to find the most efficient and feasible one. The first system was built using the existing commercial way of building up the refrigeration cycle of the RDC unit using an on/off switch for the compressor, and mechanical traditional thermal expansion valve (TEV). The other system was equipped with a variable refrigerant flow (VRF) DC-compressor, with inverter and electronic expansion valve (EEV) instead of the mechanical expansion valve. Complete specifications of each component and measurement devices used in this work are included in this study. It was found that the new RDC unit equipped with the VRF system provided 32% energy saving, and less exergy destruction than the commercial cabinet. So, the use of the new suggested RDC units will reduce the energy bill of such sector by 32%. © 2020 International Information and Engineering Technology Association. All rights reserved.

ABSTRACT: David Copperfield shows an advance in Dickens's treatment of stained women in his earlier works. In this novel he takes the subject inside the closed doors of respectable people to influence their attitudes and to bring a shift in society's attitude towards them. Dickens's presentation of stained women is lapped by romantic pathos and supported by a number of devices which aim at securing the sympathy of his readers. In saving them from public retribution, Dickens has turned the bitterest aspect of conventions to a more generous end trying to indicate that it requires sympathy and an ameliorating Christian response, rather than downright condemnation. He supports reformation which leads to rehabilitation and a return to respectability. In his treatment of Emily, Martha Endell, Rosa Dartle and other tarnished women, Dickens could reconcile his charitable inclinations with the imperatives of respectability and could also show the necessity of giving stained women a second chance at home or abroad. © 2020 Taher Badinjki, published by Sciendo 2020.

AFFILIATIONS: Al-Zaytoonah University of Jordan, Faculty of Business, Jordan

ABSTRACT: This study aims to identify the impact of the external auditor's analytical procedures on the financial statements and reports for the detection of material misstatements of the Jordanian commercial banks. The impact of independent variables (profitability, liquidity, capital solvency and the employment of funds ratios) on the dependent variable (the detection of material misstatements) was measured. The dependent variable is represented by the earnings management, which is measured by the discretionary accruals. The quantitative standard method was used to analyse the financial statements and analytical procedures; moreover, the Jones Model was used to measure earnings management. Additionally, the multivariate linear regression model was used to test the hypothesis of the study, and to indicate the relationships between the variables. The study population consisted of five Jordanian commercial banks. The data was collected from 2011 to 2017. This study concluded that there is no statistically significant impact of the analytical procedures relating to the ratios of

liquidity, profitability, solvency, and employment of funds that the external auditor could undertake to discover material misstatement of the financial statements of Jordanian commercial banks. Finally, the study recommended that auditors should be highly competent and deeply knowledgeable in using the analytical procedures to judge the fairness of financial data and be free of material misstatements. © 2020, Hrvatsko Drustvo Ekonomista. ABSTRACT: The aim of this study is to determine the impact of cultural intelligence in its four dimensions (metacognitive, cognitive, motivational and behavioural) on organisational performance based on three criteria: productivity, profitability and market share in Jordanian pharmaceutical companies. The study is sought to provide a broad review of the literature of cultural intelligence and administrative practices in the field of business administration and research in different parts. The results of the study confirmed that there is an impact of three dimensions of cultural intelligence (metacognitive, cognitive, behavioural) on organisational performance (productivity, profitability, market share), while the motivational dimension has no impact on all three performance criteria in Jordanian pharmaceutical companies. © 2020 World Scientific Publishing Co.

ABSTRACT: In this paper, we introduce a method to estimate the range of an intruder and track its trajectory by utilizing the received signal strength of the heat flux for pyroelectric infrared (PIR) sensors. To this end, we first develop a mathematical model of the received heat flux signal strength and the corresponding PIR signal for a moving intruder. The algorithm uses only two PIR sensors and the geometry of the field of views (FOVs) to perform the estimation and tracking process without any knowledge of the intruder's parameters. The tracking algorithm shows remarkable performance in estimating the intruder's parameters. The intruder heat flux was accurately estimated even at large separation distances as was the intruder path angle. Finally, the intruder's location was also very accurately estimated with sub-meter error for large separation distances. © 2001-2012 IEEE.

ABSTRACT: Acid-secreting intercalated cells of the collecting duct express the chloride/bicarbonate kidney anion exchanger 1 (kAE1) as well as SLC26A7, two proteins that colocalize in the basolateral membrane. The latter protein has been reported to function either as a chloride/bicarbonate exchanger or a chloride channel. Both kAE1 and SLC26A7 are detected in the renal medulla, an environment hyper-osmotic to plasma. Individuals with mutations in the SLC4A1 gene encoding kAE1 and mice lacking Slc26a7 develop distal renal tubular acidosis (dRTA). Here, we aimed to (i) confirm that SLC26A7 can function as chloride/bicarbonate exchanger in Madin-Darby canine kidney (MDCK) cells, and (ii) examine the behavior of SLC26A7 relative to kAE1 wild type or carrying the dRTA mutation R901X in iso- or hyper-osmotic conditions mimicking the renal medulla. Although we found that SLC26A7 abundance increases in hyper-osmotic growth medium, it is reduced in low pH growth conditions mimicking acidosis when expressed at high levels in MDCK cells. In these cells, SLC26A7 exchange activity was independent from extracellular osmolarity. When SLC26A7 protein was co-expressed with kAE1 WT or the R901X dRTA mutant, the cellular chloride/bicarbonate exchange rate was not additive

compared to when proteins are expressed individually, possibly reflecting a decreased overall protein expression. Furthermore, the cellular chloride/bicarbonate exchange rate was osmolarity-independent. Together, these results show that (i) in MDCK cells, SLC26A7 is a chloride/bicarbonate exchanger whose abundance is up-regulated by high osmolarity growth medium and (ii) acidic extracellular pH decreases the abundance of SLC26A7 protein. © 2020 Elsevier B.V.

ABSTRACT: Hao proposed the YAK as a robust key agreement based on public-key authentication, and the author claimed that the YAK protocol withstands all known attacks and therefore is secure against an extremely strong adversary. However, Toorani showed the security flaws in the YAK protocol. This paper shows that the YAK protocol cannot withstand the known key security attack, and its consequences lead us to introduce a new key compromise impersonation attack, where an adversary is allowed to reveal both the shared static secret key between two-party participation and the ephemeral private key of the initiator party in order to mount this attack. In addition, we present a new security model that covers these attacks against an extremely strong adversary. Moreover, we propose an improved YAK protocol to remedy these attacks and the previous attacks mentioned by Toorani on the YAK protocol, and the proposed protocol uses a verification mechanism in its block design that provides entity authentication and key confirmation. Meanwhile, we show that the proposed protocol is secure in the proposed formal security model under the gap Diffie-Hellman assumption and the random oracle assumption. Moreover, we verify the security of the proposed protocol and YAK protocol by using an automatic verification method such as the Scyther tool, and the verification result shows that the security claims of the proposed protocol are proven, in contrast to those of the YAK protocol, which are not proven. The security and performance comparisons show that the improved YAK protocol outperforms previous related protocols. © 2020 John Wiley & Sons, Ltd.

AFFILIATIONS: Department of Civil and Infrastructure Engineering, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The design of crane bridge girders requires many revisions to ensure strength and stability, and limit the deflection of girders, so design aids are needed. This research aims to develop mathematical models for the optimal design of crane bridge girders by minimizing their weight and thus reducing the operating energy. I- and H-shaped crane girders with compact sections of A36 steel are studied according to the American Institute of Steel Construction-Allowable Stress Design method. A code was written to optimize girder sectional dimensions for spans of 5–50 m with crane capacities of 50–500 kN. The design criteria are the allowable bending, shear stresses and deflections. The obtained dimensions were utilized as target values to propose neural models for girder design using a back-propagation network method. The models were validated using two network training performance parameters: the mean square error and regression plots. The obtained results of the mathematical models were used as input for finite-element analysis of double crane girders. The generated models should aid crane designers in efficiently selecting the lightest girders and crane manufacturers in providing cost-effective design solutions for a variety of crane configurations to suit the different needs of end users. © 2020, Springer Nature Switzerland AG.

ABSTRACT: Background: There is still no concrete guidance for assessing malnutrition risk in the critically ill. Nutrition Risk in the Critically Ill (NUTRIC) score is undertaken cautiously compared with other validated tools such as bioelectrical impedance analysis (BIA). This study aimed to assess the malnutrition risk in the critically ill using NUTRIC score and assess its congruency with the

BIA. Methods: In this cross-section observational study, intensive care unit (ICU) patients from various etiologies were assessed using the earlier tools in addition to other prognostic markers (Acute Physiologic Assessment and Chronic Health Evaluation II [APACHE II] and Sequential Organ Failure Assessment [SOFA] scores), caloric attainment, and feeding complications. Results: Of a total 411 assessed patients, 313 (76.2%) were enterally fed, and 318 (77.4%) were mechanically ventilated. Mean age was 60.7 years, and the median of the assessment since admission was the 12th day. Of those enterally fed patients, 57.9% attained the caloric requirements. Both APACHE II and SOFA scores were compatible in ascertaining ICU mortality at a moderate level (17.88 and 7.17, respectively). The NUTRIC score and phase angle (PA) measured by BIA revealed no differences in the malnutrition risk between patients with and without enteral nutrition. However, regression indicated that the NUTRIC score has explained only 1.1% of the variance of PA after controlling other covariates ($\beta = -0.222$, $P = .009$, confidence interval = -0.31 to -0.05). Conclusions: NUTRIC score has a limited prediction to the urgency of aggressive nutrition therapy within the early period of ICU admission. © 2019 American Society for Parenteral and Enteral Nutrition

ABSTRACT: Background: Pain is one of the most common and undesired symptoms in cancer patients, affecting patients' physical and psychological well-being. Barriers to effective pain management in cancer patients need to be identified and addressed by clinicians. Aims: The purpose of this study was to explore the barriers to effective cancer pain management from the perspective of cancer patients and their family members. Methods: A qualitative research design was employed. Semistructured interviews were conducted with 10 patients and 10 family caregivers to elucidate their perspectives regarding the barriers to effective cancer pain management in Jordan. Results: Regulatory factors, knowledge deficit, and the use of religious and cultural strategies to cope with pain were major barriers to effective cancer pain management. Although effective cancer pain management is highly recommended, the participants' cultural beliefs deeply appreciated pain tolerance and discouraged effective treatment of cancer pain. Conclusion: Tailoring culturally appropriate educational programs regarding effective cancer pain management could facilitate pain management among patients with cancer. © 2019 American Society for Pain Management Nursing

ABSTRACT: Purpose: Designers of mobile applications have long understood the importance of users' preferences in making the user experience easier, convenient and therefore valuable. The cultural aspects of groups of users are among the key features of users' design preferences, because each group's preferences depend on various features that are culturally compatible. The process of integrating culture into the design of a system has always been an important ingredient for effective and interactive human computer interface. This study aims to investigate the design of a mobile health (mHealth) application user interface (UI) based on Arabic culture. It was argued that integrating certain cultural values of specific groups of users into the design of UI would increase their acceptance of the technology. Design/methodology/approach: A total of 135 users responded to an online survey about their acceptance of a culturally designed mHealth. Findings: The findings showed that culturally based language, colours, layout and images had a significant relationship with users' behavioural intention to use the culturally based mHealth UI. Research limitations/implications: First, the sample and the data collected of this study were restricted to Arab users and Arab culture; therefore, the results cannot be generalized to other cultures and users. Second, the adapted unified theory of acceptance and use of technology model was used in this study instead of

the new version, which may expose new perceptions. Third, the cultural aspects of UI design in this study were limited to the images, colours, language and layout. Practical implications: It encourages UI designers to implement the relevant cultural aspects while developing mobile applications. Originality/value: Embedding Arab cultural aspects in designing UI for mobile applications to satisfy Arab users and enhance their acceptance toward using mobile applications, which will reflect positively on their lives. © 2020, Emerald Publishing Limited.

ABSTRACT: Determining the competencies required for engineering programmes has become important due to the increasing challenges faced by engineers after graduation and the tremendous development in technology. This research aims to identify the general competencies that fresh graduate students of engineering schools in Jordan believe they need to become competent and effective in their profession as engineers. This study was the first of its kind with students as respondents, and it was the first study of this kind in Jordan. Competencies were collected from a previous study with 48 competencies split into 11 groups. A questionnaire was prepared with these competencies, then rated for the degree of importance by answering "What engineering competencies graduates will require for their future work in Jordan?" The study showed that all competencies were vital, including technical, personal, non-technical and attitudinal competencies. This study will help to link the outputs of university education provided by engineering departments with market needs as well as to harmonise study programmes offered by Jordanian universities. Also, the research outputs are expected to facilitate the transition process of students from one university to another. The empirically identified competencies could be used to help assess different engineering study programmes in Jordan. © 2020 Akram Suleiman, Jafar Abahre, published by Sciendo 2020.

Al-Quds University, East Jerusalem, Palestine;

Ankara University, Ankara, Turkey

ABSTRACT: Background It has been identified that ineffective nurse-patient communication in the emergency department (ED) can lead to frustration, mistrust and inadequate pain management. Therefore, it is important to recognise the potential barriers to effective communication, including nurse and patient-related factors. Aim To identify what emergency nurses perceive as barriers to nurse-patient communication, and if there is any difference in the perception of communication barriers between nurses' demographic subgroups. Method A total of 199 emergency nurses were recruited using convenience sampling, from nine hospitals in the West Bank, Palestine. These nurses completed a 27-item questionnaire that encompassed six domains of barriers that may affect nurse-patient communication: demographic, knowledge-related, environmental, social, economic and psychological factors. Results Of the six domains covered by the questionnaire, environmental factors scored the highest, meaning that emergency nurses perceived these to be the most significant barriers to effective nurse-patient communication. This was followed by knowledge-related and psychological factors. Knowledge-related factors were perceived to be a greater communication barrier by male nurses more than female nurses, and by younger nurses more than older nurses. Conclusion To enhance nurse-patient communication, it is important to establish a comfortable working environment and to provide ongoing training for nurses to develop their communication skills. © RCN Publishing Company Limited 2020

ABSTRACT: Carbopol® is a hydrophilic polymer commonly used in the preparation of oral controlled-release matrix tablets. These matrices are subjected to dissolution testing to investigate the rate and mechanism of drug release. The rate of drug release from these matrices is influenced by the viscoelastic properties of the gel layer formed upon hydration and surrounded tablet core. This study evaluates the gelation behavior and rheological characterization of Carbopol® in dispersion media, of varied chemical properties, commonly used in dissolution testing. The rheological properties of Carbopol® polymer underwent gelation were determined using a controlled-stress rheometer. Carbopol® gelation was not found in simulated gastric fluid of low pH (1.2-5.0) and simulated intestinal fluid of pH (5.0-6.5) during fasted (Fa) and fed (Fe) conditions. However, in water and at high pH (6.8-7.8), gelation occurred in phosphate buffers of high buffering capacity (β). Furthermore, no gelation was found in sodium chloride solutions of different ionic strengths (μ). These results highlight the importance of investigating the gelation behavior and rheological characterization of Carbopol® in dispersion media prior to dissolution testing. These preliminary studies can give an insight on the formation/absence of the gel layer around Carbopol® matrices which is responsible for controlling the release of drugs. © 2020 Pakistan Journal of Pharmaceutical Sciences. [85088930393&doi=10.14227%2fDT270220P22&partnerID=40&md5=9c29d4d5b2527aff56449d2581aeb1b](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088930393&doi=10.14227%2fDT270220P22&partnerID=40&md5=9c29d4d5b2527aff56449d2581aeb1b)

AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The purpose of this research was to evaluate the release pattern of the dual-release pellets of diclofenac sodium (DS), coated with enteric-and sustained-release layers, in dissolution media that resemble the physiological variables of the gastrointestinal (GI) fluid. Dissolution testing in three pH stages (acidic, intermediate, and basic) was conducted using USP apparatus I (basket) rotating at 100 rpm. The acidic pH stage resembles the gastric fluid during fasted and fed states, the intermediate pH stage resembles the fluid of the proximal small intestine (duodenal fluid), and the basic pH stage resembles the fluid of the small intestine during fasted and fed states and distal GI. DS pellets showed excellent gastric resistance in the acidic pH stage for 2 h. In the intermediate pH stage, DS pellets showed a gastric resistance for 2 h, followed by a low percent of DS release thereafter (15.2% after 10 h). DS release was accelerated in the basic pH stage, particularly in pH media 6.5-7.2. This is because the enteric-coated film starts to dissolve at pH > 5.5. In addition, DS release was influenced by the buffer capacity (β)/ionic strength (I) of the dissolution media, where DS release increased with increasing β /I of phosphate buffers (pH 6.8) up to a concentration of 50 mM and then decreased at 100 mM. These dissolution results corroborated with equilibrium solubility data and sink conditions (S values) of DS in the media of the three pH stages. This study provides an insight into the release pattern of the dual-release DS pellets throughout the GI tract to better correlate the in vitro release data of these pellets to those in vivo. © 2020, Dissolution Technologies Inc. ABSTRACT: Conjugating drugs with gold nanoparticles (GNP) is a key strategy in cancer therapy. Herein, the potential inhibition of the phosphatidylinositol 3-kinase (PI3K)/Akt pathway, and other pathways of the MCF-7 cell-line, was investigated upon treatment with gold nanorods (GNR) conjugated with a PI3K inhibitor drug. The results revealed that the coupling of GNR with the drug drastically modulated the expression of PI3K α at the gene and protein levels compared to the drug or GNR alone. The PI3K α pathway is involved in tumor progression and development through the mediation of different mechanisms such as apoptosis, proliferation, and DNA damage. Treatment with the nanocomplex significantly affected the gene expression of several transcription factors responsible for cell

growth and proliferation, apoptotic pathways, and cell cycle arrest. Furthermore, the gene expression of different regulatory proteins involved in cancer progression and immune responses were significantly modified upon treatment with the nanocomplex compared to the free drug or GNR alone. © 2020 by the authors. ABSTRACT: Aim: Glutamate has been considered as neurotransmitter that is critical in triggering relapse to drugs of abuse, including ethanol and cocaine. Extracellular glutamate concentrations are tightly regulated by several mechanisms, including reuptake through glutamate transporters. Glutamate transporter type 1 (GLT-1) is responsible for clearing the majority of extracellular glutamate. The astrocytic cystine/glutamate antiporter (xCT) regulates also glutamate homeostasis. In this study, we investigated the effects of cocaine exposure and ampicillin/sulbactam (AMP/SUL), a β -lactam antibiotic known to upregulate GLT-1 and xCT, on relapse-like ethanol intake and the expression of astrocytic glutamate transporters in mesocorticolimbic brain regions. Methods: Male alcohol-preferring (P) rats had free access to ethanol for 5 weeks. On Week 6, rats were exposed to either cocaine (20 mg/kg, i.p.) or saline for 12 consecutive days. Ethanol bottles were then removed for 7 days; during the last 5 days, either AMP/SUL (100 or 200 mg/kg, i.p.) or saline was administered to the P rats. Ethanol bottles were reintroduced, and ethanol intake was measured for 4 days. Results: Cocaine exposure induced an alcohol deprivation effect (ADE), which was associated in part by a decrease in the expression of GLT-1 and xCT in the nucleus accumbens (NAc) core. AMP/SUL (100 mg/kg, i.p.) attenuated the ADE, while AMP/SUL (200 mg/kg, i.p.) reduced ethanol intake during 4 days of ethanol re-exposure and upregulated GLT-1 and xCT expression in the NAc core, NAc shell and dorsomedial prefrontal cortex (dmPFC). Conclusion: This study suggests that these astrocytic glutamate transporters might be considered as potential targets for the treatment of polysubstance abuse. © 2020 The Author(s) 2020. ABSTRACT: Purpose: The purpose of this paper is to investigate the drivers of e-banking entrepreneurship. The impact of e-banking entrepreneurship on banks' performance in the banking industry is also investigated. Design/methodology/approach: A questionnaire was developed to collect

data from 16 banks with a sample of 214 respondents. Structural equation modeling using PLS was conducted to analyze the data. Findings: The results reveal a significant impact of top management support, organizational context, technological context and social capital on the degree of e-business entrepreneurship. The findings also reveal a direct impact of e-banking entrepreneurship on achieving a competitive advantage, financial performance and customer performance. Originality/value: The present empirical study contributes to a better understanding of the existing theories and practices of banking entrepreneurship and e-innovations in today's banking industry. This study also provides insights into the drivers and the role of e-entrepreneurship in this industry for improving the opportunities of competitiveness and growth. The findings of the present study are of importance to both academic and practitioner audiences. The present study provides empirical evidence to bolster e-banking technology as an enabler of banking entrepreneurship and improving performance. Additionally, these findings provide directives to managers regarding the untapped opportunities and potential that innovative e-banking technology can offer in a highly volatile and rapidly changing environment. © 2019, Emerald Publishing Limited.

Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: The current research aims at providing evidence concerning the influence of surplus free cash flow (SFCF) and stock market segmentations (SMS) on income-increasing earnings management practices in Jordan. The results, based on a sample of all non-financial companies that were listed on the Amman Stock Exchange (ASE) from 2013 to 2017, confirm the research hypotheses. The Huber-White's sandwich standard errors for random-effects regression was used as the primary statistical tool for this study. The findings revealed a significant and positive association between SFCF and income-boosting discretionary accruals (DAC). As well, the results found that SMS was significantly and positively associated with the positive DAC. This research adds value to scholarship by investigating the impact of SMS variable on earnings management. To the best available knowledge, this relationship has not been examined either in Jordan or elsewhere in the world. Further, this is the first empirical attempt to investigate the effect of SFCF on earnings management in Jordan, which provides meaningful information for companies seeking to understand and reduce agency problems within the Jordanian context. © 2020, Universiti Teknologi Mara. ABSTRACT: With the expansion of the network and increasing their users, as well as emerging new technologies, such as cloud computing and big data, managing traditional networks is difficult, where the VM load has increased as well as the required task processing time. Therefore, it is necessary to change the traditional network architecture. Lately, to address this issue, a notion named software-defined network (SDN) has been proposed, which makes network management more conformable. Network resources limitations and requirements fulfilment leads to the important need of load balancing that helps in distributing traffic via several resources to improve network resources efficiency and reliability. Many researchers have worked previously on this task, proposing several algorithms with advantages and disadvantages. This paper focuses on cloud computing load balancing concepts, and represents benefits and some weaknesses regarding to the selected load balancing algorithms and investigates the metrics of their algorithms. In addition, the important challenges of these algorithms have been reviewed to provide future researchers with better load balancing techniques. © 2020 IEEE.

ABSTRACT: Recommender Systems are used to provide suggestions to users based on their interests. One of the well-known problems in recommender systems is the cold start problem, which concentrates on providing recommendations when the user data is not sufficient. Although many solutions have been proposed in the literature, the majority did not concentrate on using both the hidden user motifs. We proposed previously a user-interest based cold start solution, however, finding similar users needed optimization. In this work, we propose the use of machine learning techniques to find patterns associating user profile information and user extracted interests. This would further improve the accuracy provided suggestions for new users. Experimental work showed that our solution is efficient in terms of training time, classification time, and accuracy. In details, using Bayesian Classifier Chain classifier proved to be the fastest training and classification time, while all classifiers proved to be efficient in term of accuracy. © 2020 IEEE.

ABSTRACT: Follow-up maintenance reports are important and tedious work. Bug repository is usually used to store maintenance reports which could be: fault repair, Functionality addition or modification, or environmental adaptation. Labeling these maintenance reports can reduce the time and effort of handling them. We proposed an approach that classifies maintenance reports into different categories. We applied a machine learning pipeline to achieve classification. We reached up to 78% precision, 83% recall, and 79%F1-score. Adopting such an approach can speedup handling maintenance reports and increase user satisfaction. © 2020 IEEE.

ABSTRACT: Data encryption techniques are important for answering the question: How secure is the Internet for sending sensitive data. Keeping data secure while they are sent through the global network is a difficult task. This is because many hackers are fishing these data in order to get some benefits. The researchers have developed various types of encryption algorithms to protect data from attackers. These algorithms are mainly classified into two categories namely symmetric and asymmetric encryption algorithms. This survey sheds light on the recent work carried out on encrypting a text into an image based on the RGB color value and held a comparison between them based on various factors evolved from the literature. © 2020 IEEE.

ABSTRACT: Many significant challenges related to transportation systems have been raised recently, these include the high accidents rate, road congestion, emission of gases, and environment pollution. Furthermore, transportation crashes caused injuries in accident. Researchers investigated virtual methodologies to automate the transportation process that known as Intelligent Transport System (ITS). In the last 20 years, ITS have been employed efficiently to enhance the performance of transportation systems, improve security of travel, and provide several choices for travelers. The idea of virtual technologies integration is a novel in transportation field. Collecting data from multi-sources played a significant improvement in ITS, this can help stakeholders for processing different forms of data. This huge amount of data can significantly help in the revolution of ITS. This paper focused on several Autonomous vehicles (AVs) related technologies that employed efficiently in ITS. This review integrates and synthesizes monitoring AVs using data fusion from different data sources. Furthermore, recent technologies and software toolboxes are presented in this paper to facilitate the researchers job in improving the data and sensor fusion in AVs. © 2020 IEEE.

ABSTRACT: Big data is term of dataset with characteristic volume, value and veracity that lead to challenges unable proceed using traditional techniques to extract value, project management perspective is dynamic processing that utilizes the appropriate resources of organization in many phases by measuring in four-factor scope, time, cost and quality. In this research aim improve data quality from big data via project management scope depends on high trust which is getting high accuracy from confidence level in volume of data, confidence get with context and value of data which lead to determine accuracy deeply in it and finally choose from data depending on veracity of it, the experiment using three main factors time, cost and scope, strongest relation arranging between them start by project scope as strongest one then cost, product and finally time is weakest between them, in the final when select best quality use two sides generally from quality degree and be middle-quality interval and especially from relative distance with the strongest factor. © 2020 IEEE.

ABSTRACT: Recently, various websites have become a popular means of deriving information. However, users still find it difficult to access the relevant data or use the websites. Hence, they require websites which offer accessible information and easy navigation. In this study, the researchers have investigated the accessibility of the different websites of the Jordanian universities. The researchers determined the accessibility of 30 websites and verified their compliance with the Guidelines 2.0 (WCAG 2.0) for accessing the web content, according to the World Wide Web Consortium (W3C). They tested the usability of the Al-Zaytoonah University website as a test study, by interviewing 6 students belonging to the University. They were asked to identify the pages directly, without any assistance or direction, and they were asked to describe the selection processes and assistive techniques that they used. The data was collected from these students for conducting the website usability test. 14 tasks were implemented in this study, like accessing their University webpages, e.g., homepages of the site and access to the e-learning sites from the university homepage. The time required for every task was assessed. Based on this study, the researchers could identify the websites that were error-free. The results indicated that most of the websites were not easily accessible and were difficult to use. Furthermore, when the researchers carried out the test study with the students, their results indicated that the user interface for every webpage needs improvement, rearrangement of the sequence of web links and addition of more tags and information. © 2020 IEEE.

ABSTRACT: E-commerce dominates a large part of the world's economy with many websites dedicated to selling products online. The vast majority of e-commerce websites provide their customers with the ability to express their opinions about the products/services they purchase. These reviews represent a rich source of information about the users' experiences, which is of great benefit to both the producer and the consumer. In This paper we present a set of machine/deep learning models, especially using Recurrent Convolutional Neural Network (RCNN) to predict the helpfulness of reviews. Mainly, two approaches are used: a supervised learning approach and a semi-supervised approach. The latter is a unique aspect of our work and it takes advantage of a large number of unlabeled reviews. The

results show that both approaches are better than existing approaches. Moreover, the results show that the second approach has a remarkably better performance compared with the first one, which is in accordance with recent trends in machine/deep learning that focus on benefiting from the huge amount of unlabeled data to enhance the performance of supervised models. © 2020 IEEE.

ABSTRACT: Finding trending research topics can be of great importance to many domains. However, despite its importance, the works that concentrated on this task are very limited. Furthermore, they did not consider important criteria to detect trending scientific topics. Furthermore, the extraction of trending topics need to be integrated with a recommender system, as it would be difficult for users to browse all the extracted trending scientific topics. In this work, we propose an efficient trending scientific topics extractor and an integrated recommender system. The contribution of this work lies in three points. First, improving the performance of the trending topic extractors by using two important criteria that were not used by the literature. Second, integrating a recommender system with the trending topic extractor to provide intelligent results based on the user profile. Third, insisting on the importance of this field as it deserves more works in this direction. Experimental results showed that the system is efficient in terms of updating time, trending topic extraction time, extraction recall and precision, and recommendation time. © 2020 IEEE.

ABSTRACT: Introduction: Overweight and obesity are on the rise worldwide, including Jordan.

Simultaneously the use of complementary and alternative medicine (CAM) is also increasing. The aim of this study is to investigate the patterns and efficacy of CAM used for the purpose of weight reduction and/or maintenance in a sample of Jordanians, with emphasis on herbal medicine. Methods: This was a cross-sectional survey that used a purposive convenience sample from Amman, Jordan between 2015 and 2017. A total of 462 individuals who reported using CAM and herbal medicine were recruited from nutrition and fitness centres, malls and universities. A self-administered questionnaire was completed by participants after obtaining their consent. Results: During the last 3 months, 379 (82 %) of participants had used herbs for weight management, while 279 (60.40 %) were still using them at the time of the study. Green tea leaves and lemon juice were most frequently used among participants (57.4 and 39.2 %; respectively). However, fennel users reported that it was the most effective for weight reduction and was used by (n = 24; 5.19 %) of participants of whom 87.50 % said it worked. Of those using cumin (n = 34; 7.4 %), 87.0 % believed it worked. Interestingly, all users of rosemary had reported dizziness as a side effect when used once daily and 1-2 years usage duration. Plants were used in the form of herbal teas, and were obtained from home (n = 161, 34.85 %), herbalists (n = 146; 31.60 %) and specialized centers (n = 120; 25.97 %). Conclusions: The study provides, for the first time, an insight about the diverse range of remedies used to manage weight in Jordanian society, and how these therapies are utilized in relation to allopathic care. Health care practitioners can use these findings to enhance their communication with patients regarding weight management. © 2020 Elsevier GmbH

ABSTRACT: Background: The Global Lung Function Initiative attempted to formulate global all-age lung function equations. The suitability of these equations to Middle Eastern children was never evaluated; this study will evaluate these equations in addition to other regional ones. Methods: Spirometry was conducted for 582 (311 boys) healthy 6- to 13-year-old Jordanian children. z scores, predicted values, percent predicted values, and frequency of records below lower limit than normal (LLN) were calculated for each child using the studied equations. Results: Although none of the studied equations produced a perfect representation of the study data, the GLI 2012 equations for Caucasians were the most suitable. Conclusion: GLI 2012 equations for Caucasians are a reasonable fit for Jordanian school-aged children. © 2020 Wiley Periodicals, Inc.

ABSTRACT: Cirsiol (CIR; 5,3',4'-trihydroxy-6,7-dimethoxyflavone) is an abundant bioactive plant flavonoid which has been shown to exhibit inhibitory activity against phosphatidylinositol-3-kinase (PI3K), an enzyme implicated in many cancer types. Despite its promising therapeutic benefits, CIR has not yet been formulated into any type of dosage form. The purpose of this study was to develop a novel polymeric nanoscale formulation for CIR isolated from Jordanian *Teucrium polium* L. to enhance its biopharmaceutical properties. CIR was entrapped into core-shell nanoparticles (nanocapsules; NC) composed of a castor oil-filled core and poly(ethylene glycol)-b-poly(ϵ -caprolactone) (PEG-PCL) polymeric shell by the nanoprecipitation technique. Highly monodisperse CIR-encapsulated NC (CIR-NC) were produced with a mean diameter of 158.1 nm and an almost neutral surface charge. CIR-NC contained on average 53.7 μ g CIR/mg polymer at an encapsulation efficiency of 53.5%. The NC formulation exhibited remarkable stability with no significant increase in particle size up to 6 months at 4 °C or in the presence of serum. Lyophilization of the formulation in the presence of mannitol as lyoprotectant maintained its colloidal stability. The formulation also demonstrated sustained drug release at pH 7.4, with 41% of CIR released after 4 days. An antioxidant assay showed that the free radical scavenging activity of CIR was maintained after encapsulation. Cytotoxicity assays in MCF-7 breast cancer cells showed dose-dependent cytotoxicity of CIR-NC, with an IC₅₀ of 53 μ M, which was comparable to free CIR. Our findings present a promising nanoformulation for a naturally occurring potent anticancer compound with the potential to improve its delivery challenges. © 2020 Elsevier B.V.

ABSTRACT: Modifications of the dithiolate linkers that connect the two iron atoms of the synthetic H-cluster mimics of [FeFe]-hydrogenase play a significant role on tuning its physical and electrochemical properties. In this report, we describe the redox properties and the catalytic behavior of the ortho-metalated complexes having the general formula [Fe₂(CO)₆{ κ , μ -S, η 2-(R)}] (R = C₁₃H₈O₅, 1 and C₁₇H₂₀N₂S, 2) in the presence and absence of acetic acid, AcOH as a proton source. Moreover, we explore the influence of substituting one CO in complex 1 by stronger electron donating, PPh₃ toward the electrochemical reduction mechanism of the resulting substituted model complex [Fe₂(CO)₅PPh₃{ κ , μ -S, η 2-(C₁₃H₈O₅)}], 3. Overall, the reduction of complexes 1-3 proceeds via simple EE mechanism (E = electron transfer) in the absence of AcOH. In Addition, all complexes show their ability to catalyze the reduction of protons and generate H₂ in the presence of AcOH. © 2019 Elsevier B.V.

ABSTRACT: Surface modification has a strong impact on mesoporous silica nanoparticles (MSNs) performance as drug carriers. Here, we described the chemical synthesis; in vitro drug release and cytotoxicity of MSNs decorated with poly ethylene glycol (PEG) or poly propylene glycol PPG as an outer shell wrap for nanoparticles (NPs). The lactose, glucosylgalactose, was used to provide a specific interaction with the asialoglycoprotein receptor which is expressed on the cell surface of hepatoma. Fourier transform infrared spectroscopy (FTIR) and transmission electron microscopy (TEM) confirmed successful chemical surface modification while Dynamic Light Scattering (DLS) confirmed the surface characteristic changes as size; polydispersity index (PI) and zeta potential. Our results showed that the PI was improved from 0.58 to 0.28 while size has been enlarged from 200 to 357 and 580 nm. A higher percentage of drug entrapment (doxorubicin) was observed with functionalized NPs (94%) compared to plain MSNs (63%). In this study, we effectively synthesized lactose-PPG-MSNs targeting HepG2 cells with IC50 of 0.07 mg/mL when loaded with doxorubicin. This study may provide a useful approach for designing and improving the applicability of MSNs as a promising drug delivery system in hepatocellular carcinoma. © 2020 Elsevier B.V.

ABSTRACT: Purpose: Explore the quality of sleep and investigate the relationship between sleep quality, using social media platforms, and academic performance among university students. Design and Methods: A cross-sectional correlation design was used, 412 students completed an electronic questionnaire. Findings: The majority of university students suffer from poor quality of sleep. The most frequently used social media platforms were WhatsApp, Snapchat, and YouTube. The strongest predictor of having very poor sleep quality was addiction on twitter. Practice Implications: An educational program about the importance of adequate sleep should be supported university students. © 2019 Wiley Periodicals, Inc.

ABSTRACT: Recent years have witnessed a global commitment to advancing financial inclusion as a key enabler for promoting equal opportunity and reducing poverty. In this paper, we use the IMF's Financial Access Survey data and two different approaches to construct a multidimensional financial inclusion index for a global sample of 95 countries over 2004-15. Results reveal an overall progress in financial inclusion over the period under study, most markedly in the use and access dimensions. Financial inclusion appears to be positively and significantly associated with GDP per capita, employment, bank competition, human development, government integrity, and internet usage. Our evidence also points to the importance of considering the level of national income when designing policies to boost financial inclusion. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: The blood brain barrier (BBB) is a very selective barrier that protects the brain and the central nervous system (CNS) from the entry of harmful substances and helps regulate the exchange of different molecules and nutrients from and into the brain and the CNS. This selectivity makes delivering therapeutic and diagnostic materials across the BBB very challenging. In this study, different shapes and sizes of gold nanoparticles (GNP) were synthesized and functionalized with five different thiolated ligands to obtain GNP with various surface chemistries. The potential of GNP of different properties to be accumulated into the brain through the BBB and into other organs was investigated in a mouse model using qualitative and quantitative approaches. Gold nanorods (GNR) functionalized with 4-mercaptophenol (Mph) showed the highest penetration ability across the BBB into the brain with no significant deposition in other organs. Interestingly, increasing the size of GNR retarded their delivery into the brain, while enhancing their accumulation in other organs. On the other hand, gold nanospheres (GNS) demonstrated high deposition percentages in the brain and other organs with possible toxic effects. The properties of GNP play a crucial role in their interaction with the BBB and accumulation in the brain and other organs. Thus, GNP can be considered a promising nano-platform for drug delivery into the brain and as a photothermal-inducing agent against brain cancer. © 2020 The Royal Society of Chemistry.

ABSTRACT: Background and Objective: X-ray repair cross-complementing group1 (XRCC1) is a key protein in base excision repair and closely associated with the coordination of the base excision repair pathway. Many studies have focused on XRCC1 SNPs and have shown an associated between these SNPs and the risk of several types of cancers, including head and neck cancer. There are many single nucleotide polymorphisms XRCC1 gene (SNPs) and the most common SNP that result in amino acid substitutions is exon 10 (Arg399Gln). This study aimed to investigate the association between Arg399Gln SNP and the risk of squamous cell carcinoma of the head and neck. Materials and Methods: Ninety nine patients with squamous cell carcinomas of the head and neck and 89 healthy adult controls were enrolled in this study. The Arg399Gln in XRCC1 allele was genotyped using polymerase chain reaction-restriction fragment length polymorphism method. Results: In the single-locus analyses, Arg399Gln SNP showed a significant association with head and neck cancer risk (p value = 0.016 and odd ratio of 1.8). On the genotype level, we applied three analysis models, namely co-dominant, dominant, and recessive genotypes. Arg/Arg homozygous major genotype was significantly (p value <0.05) associated with head and neck squamous cell carcinoma incidence with odd ratio of 2.23 and 2.24 for the co-dominant and recessive models, respectively. Conclusion: The findings indicated that Arg399Gln allele was associated with squamous cell carcinoma of the head and neck among Jordanian patients. This allele might be used as a genetic biomarker of squamous cell carcinoma of the head and neck. © 2020, Asian Pacific Organization for Cancer Prevention.

ABSTRACT: Polynomial functions F of degree m have a form in the Bernstein basis defined over 1-dimensional simplex W . The Bernstein coefficients exhibit a number of special properties. The function F can be optimised by the smallest and largest Bernstein coefficients (enclosure bounds) over W . By a proper choice of barycentric subdivision steps of W , we prove the inclusion property of Bernstein enclosure bounds. To this end, we provide an algorithm that computes the Bernstein coefficients over subsimplices. These coefficients are collected in an 1-dimensional array in the field of computer-aided geometric design. Such a construct is typically classified as a patch. We show that the Bernstein coefficients of F over the faces of a simplex coincide with the coefficients contained in the patch. © 2020 World Scientific Publishing Co.

ABSTRACT: Background: Despite management of acute pain, concerns regarding pain are still prevalent in the emergency department (ED). Purpose: This study aimed to explore the factors influencing patients' pain management in a Jordanian ED. Method: Fifteen semistructured interviews ($N = 15$) with purposively selected patients in the ED. Results: The thematic analysis uncovered two related themes. The first theme described the stage of "being on ED bed" which encapsulates two subthemes: "bad pain means, bad diagnosis" and "smiley faces versus grumpy faces." The second theme referred to as "being discharged" including two subthemes, namely, "praying for not paying" and "being grateful to God." The lack of money to pay for pain management was equally as stressful as pain itself. Patients' narratives suggest that nursing pain management is a critical time, extending beyond medical management to encompass communication and spirituality. Conclusions: The factors influencing the patients' experience of pain management extend beyond addressing the source of the pain. Consequently, effective communication coupled with respecting patients' spirituality and socioeconomic concerns is essential to pain management. To enhance patients' experience of pain management, the ED system should shift toward a patient-centric model. © The Author(s) 2019.

ABSTRACT: In this study, thermodynamic analysis and environmental impact of a lab-scale biomass-fired open cycle power plant have been performed. The performance of the plant including combustion and generated power efficiencies was studied based on first and second laws of thermodynamics. The combustion temperature and mass fraction of pollutants resulted from direct burning of biomass were also estimated theoretically using a mathematical model developed by the authors. It was found that the measured temperature of combustion of biomass mixture reached 818 °C, which agrees with theoretical result. The estimated energy and exergy efficiencies of the plant were 12 and 16.4%. The heat addition process in the boiler through the burner was the major source of irreversibility in the lab-scale plant; due to non-adiabatic heat transfer in the un-insulated burner where most exergy destruction and energy loss took place. The environmental impact of biomass combustion showed insignificant contents of sulfur and nitrogen oxides pollutants, which enhances the use of biomass as alternative fuel. © 2019 Elsevier Ltd

ABSTRACT: Background: Up to 35% of cancer patients have clinically significant levels of psychological distress during their treatment. Accordingly, better understanding of health-related quality of life and its predictors will help oncology nurses plan appropriate interventions to improve health-related quality of life. Aims: This study was conducted to investigate the relationship between hope, depression and anxiety and health-related quality of life among Jordanian cancer patients during their treatment period. Methods: Cross-sectional descriptive correlational design was conducted using the Hospital Anxiety and Depression Scale, Herth Hope Index and Functional Assessment of Cancer Therapy-Colorectal surveys. Results: 260 Jordanian patients with cancer from three Jordanian hospitals completed the study survey. The bivariate analysis indicated significant positive relationships between hope and quality of life ($r = .57, p < .0001$). A significant negative relationship was found between anxiety and depression and quality of life ($r = -.76, p < .0001$). A multiple regression analysis indicated that hope, Hospital Anxiety and Depression Scale and time since diagnosis were predictors of quality of life, and explained 66% of the variance in the quality of life for this sample. Conclusions: The assessment of psychosocial elements including hope, depression, anxiety, and quality of life should be a part of daily nurse-caring behaviours and practices. Implement education programmes to increase nurses' competencies in the psychosocial assessment are recommended. © The Author(s) 2019.

ABSTRACT: Proper assessment of patients' needs might enhance patients' outcomes, ability to cope with new challenges, identify required resources, prioritize service needs, determine patients with higher need levels, and improve patients' quality of life. A cross-sectional descriptive design was used. Total of 113 patients from different settings completed the study surveys including demographic sheet, Short-form cancer needs questionnaire (CNQ-SF), Functional Assessment of Cancer Therapy-General (FACT-G), and European Organization for Research and Treatment of Cancer Quality of Life Questionnaire (EORTC QLQ-INFO 25). Regression analysis indicated that care needs and information needs were predictors of QOL ($R^2 = 0.688, \text{adjusted } R^2 = 0.61, F(1.17, p < 0.001)$). A significant correlation exists between QOL, care needs and information needs. Daily nursing practices should include assessing patients; care needs, information needs, and QOL through using valid and reliable scales. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Purpose: The purpose of this paper is to investigate the main causes of delay in public construction projects. This is motivated by feedback from public construction experts concerning substantive delays during the last decade. The study thus seeks to help decision makers in Jordan and elsewhere identify problems and develop mitigating strategies. Design/methodology/approach: Causes of delay were identified from previous related studies and then augmented after consultation with experts. This resulted in 56 delay factors classified into eight groups. The sampling frame for the study was defined in terms of public construction projects (mostly related to roads) owned by the

Ministry of Public Works and Housing in Jordan. A survey was conducted with engineers working as representatives of the owner, contractors or consultants to elicit and evaluate the importance of the 56 delay factors. Findings: Overall, 113 completed questionnaire responses were returned and analyzed to rank the causes of delay using the relative importance index method. Owners and consultants showed more interest in factors related to themselves, while contractors showed highest interest in an external factor related to the owner of services. Four recommendations are put forward for decision makers to mitigate against delays. Originality/value: This research investigates a relatively large number of delay factors compared to other studies and these are categorized into groups to facilitate thematic understanding. Further, compared to previous related research, this research fills a gap by exploring the opinions of different contract parties. © 2019, Emerald Publishing Limited.

ABSTRACT: This paper is proposing a smart degree audit, scheduling and advising system using Matlab. The system would work in three phases; (i) Degree audit, i.e. extract data identify courses required by the students, (ii) class scheduling, i.e. tailored scheduling of required courses, (iii) advising student with required courses that is offered. The proposed approach has proved to be very efficient in all tasks. Efficient in terms of time consumption, advising where it can be done at no time, and accuracy of the developed plans, as the human error is eliminated. © 2020 IEEE.

ABSTRACT: IN THIS work a screening study in Jordan was conducted on identification of herbal smoking mixtures containing recently new marketed synthetic cannabinoids (aminoalkylindols) (XLR-11, AB-CHMINACA, AB-FUBINACA isomers) which were responsible for a few cases for suicide accidents, individual violent action and few homicides. The smoking items were seized by customs and by the Anti-Narcotics Department in the year 2016/17. Forensic evidences including herbal smoking mixtures, cigarettes, and cigarettes waste were screened for containing these banned drugs employing GC-EI/MS in scan mode with JWH-018 and 5F-ADB as surrogates and individual aminoalkylindols reference standards. The liquid-liquid extraction optimization results indicated that dichloromethane gave the highest recovery for aminoalkylindols in herbal smoking mixtures and methanol for cigarette waste filters. The Results indicated that the marketed herbs were in all sprayed with either XLR-11 (around 45%) or combination of either both XLR-11 and AB-CHMINACA or a combination of XLR-11 and AB-FUBINACA isomers (25%) and the rest was AB-CHMINACA or AB-FUBINACA isomers pure or mixtures. These results were further confirmed by cigarette waste analysis which gave approximate results to herbs or spices. To our knowledge this is the first study of its kind in the MENA region and to be conducted in Jordan with an optimization procedure that is not reported in literature. © 2020 National Information and Documentation Center (NIDOC).

ABSTRACT: the aim of this study is to identify the word of mouth and its effects on the buying behavior of stocks at the Amman financial exchange market. The Researcher relied on a questionnaire

as a means of data collocation method for the study. The study sample consisted of 125 clients who are clients at the Amman financial exchange market who were chosen at random, the researcher used the statistical package (SPSS) for data analysis. The researcher reached several conclusion, most important ones were that there was a medium level of evaluation for the word of mouth for the clients of the Amman stock exchange financial market reaching (3.55), The research has shown the word of mouth to have an effect of statistical significance (at $p=0.05$) on the buying behavior of the stocks at the stocks exchange including things like dealers, communication, reference group and the company status. Based on the results of this study the researcher made several recommendations including working on enhancing awareness of the stock exchange clients about the economic activity that is included in the word of mouth. © IJSTR 2020.

ABSTRACT: Many organization, programmers, and researchers need to debug, test and make maintenance for a segment of their source code to improve their system. Program slicing is one of the best techniques to do so. There are many slicing techniques available to solve such problems such as static slicing, dynamic slicing, and amorphous slicing. In our paper, we decided to develop a tool that supports many slicing techniques. Our proposed tool provides new flexible ways to process simple segments of Java code, and it generates needed slicing according to the user needs, our tool will provide the user with direct and indirect dependencies for each variable in the code segments. This tool can work under various operating systems and does not need particular environments. Thus, our tool is helpful in many aspects such as debugging, testing, education, and many other elements. © 2020 Universitas Ahmad Dahlan.

ABSTRACT: In this paper, we provide tight linear lower bounding functions for multivariate polynomials given over boxes. These functions are obtained by the expansion of polynomials into Bernstein basis and using the linear least squares function. Convergence properties for the absolute difference between the given polynomials and their lower bounds are shown with respect to raising the degree and the width of boxes and subdivision. Subsequently, we provide a new method for constructing an affine lower bounding function for a multivariate continuous rational function based on the Bernstein control points, the convex hull of a non-positive polynomial s , and degree elevation. Numerical comparisons with the well-known Bernstein constant lower bounding function are given. Finally, with these affine functions, the positivity of polynomials and rational functions can be certified by computing the Bernstein coefficients of their linear lower bounds. © 2020 by the authors.

ABSTRACT: Constant modulus algorithm (CMA) has been widely used in direction of arrival (DOA) estimation for constant modulus signals. However, CMA fails completely when dealing with array elements failure. In this paper we devise an algorithm to solve CMA fault-tolerance deficiency. The compensation of failed elements in 2D arrays is achieved by a Replace, Replicate, Reconstruct and Remove (4R) algorithm. The 4R-2D-CMA starts by replacing a failed-element signal by the nearest operating array element signal, then, after computing the covariance matrix, the corrupted rows and columns corresponding to failed elements in both elevation and azimuth are replicated from their Centro-symmetric counterparts to correct the covariance distortion. Replication step takes advantage

of a special structure of two perpendicular Centro-symmetric arrays producing a Centro-Hermitian matrix. Afterwards, a 2D-CMA algorithm is used for decomposition to produce azimuth and elevation directions matrices. After decomposition, a linear phase correction is used before the covariance matrix is reconstructed. Finally, a second decomposition is used to obtain final DOAs. The number of constant modulus (CM) sources is estimated from a robust spectrogram analysis. Results for an SNR of -3 dB with 11% of elements failure show almost full recovery and hence prove the effectiveness of the novel approach. © 2002-2012 IEEE.

ABSTRACT: This study aims to identify the impact of total quality management (TQM) dimensions on achieving competitive advantage at Five star hotels in Amman City the capital of Jordan from managerial perspective. In order to analyze the impact of total quality management (TQM) dimensions on achieving competitive advantage, the researchers selected certain independent variables (Adopting a customer-focused culture, Ongoing development, Focusing on the fulfillment of employees' needs, and focusing on meeting the administrative requirements), and one dependent variable which is achieving competitive advantage. The researchers designed a questionnaire and was given out to 45 directors and employees who work at the quality department of Jordanian five-star hotels. total distributed ones, were valid for the analytical descriptive study. Descriptive statistical analytical method was used for describing the phenomenon of the population using the SPSS to analyze the data collected from the questionnaire. The main result of this study showed that the examined total quality management dimensions jointly have a statistically significant impact - at the statistical significance level of $\alpha \leq 0.05$ - on the achievement of a competitive advantage from the perspective of the quality department staff at Jordanian five-star hotels. The research concludes focusing on the fulfillment of employees' needs shall encourage employees to ensure that development processes are carried out in ongoing manner. In addition, meeting the administrative requirements shall enable the management to focus on its customers. Meeting the administrative requirements shall also enable the management to utilize strategies and carry out effective communication to achieve quality. Thus, that shall participate in creating a competitive advantage. © 2020 IJSTR.

ABSTRACT: Jordan imports 94% of its oil and gas (fossil fuels) to meet its energy needs, leaving it vulnerable to variations in fuel price. Jordan's demand for energy is growing at a rate of 3% annually. In response, the government set a target of obtaining 10% of its energy needs from renewable energy resources by increasing electricity generation share from the present 1.13 GW-1.8 GW by 2020. The sources of generation include abundant solar, wind, and biomass resources, which also enhance economic growth and reduce pollution. This article analyzed the current energy situation in Jordan and assessed the available renewable energy resources potential for direct investments. The actual contribution of clean energy is still moderate at roughly 7% of total energy demand, despite the efforts placed on the development of alternative energy resources. The national electricity supply and demand are presented, and the government initiatives, financial incentives, and tax exemptions to encourage investments in clean energy are also discussed. The renewable energy policy generates future opportunities for investors with an ambitious \$20 billion energy plans as does its strategy to improve energy efficiency. This article will benefit interested clean energy investors and developers and plans for 2,000 MW investments in wind and solar energy are ready for bidders. Such an endeavor and model will also benefit neighboring countries in the region. ABSTRACT: 20-hydroxyeicosatetraenoic acid (20-HETE) is an arachidonic acid metabolite which is known to increase platelet aggregation and cardiovascular risk. In this study, nine non-steroidal anti-inflammatory drugs (NSAIDs) selected by chemical structures were screened to determine their effects on the glucuronidation of 20-HETE using human liver microsomes (HLMs). Then, the combined effects of the selected NSAID and genetic polymorphisms in UDP-glucuronosyltransferase (UGT) were investigated. Among the tested NSAIDs, diclofenac was the strongest inhibitor of 20-HETE glucuronidation with an IC₅₀ value of 3.5 μ M. Celecoxib, naproxen, mefenamic acid, ibuprofen, and indomethacin showed modest inhibition with IC₅₀ values of 77, 91, 190, 208, and 220 μ M, respectively, while acetylsalicylic acid, rofecoxib, and meloxicam did not inhibit 20-HETE glucuronidation. Glucuronidation of 20-HETE by UGT2B7 and UGT1A9 recombinant enzymes was significantly inhibited by indomethacin, mefenamic acid, diclofenac, ibuprofen, naproxen, and celecoxib ($P < 0.001$). In addition, diclofenac exhibited a competitive inhibition mechanism with the K_m value of 20-HETE glucuronidation increasing from 23.5 μ M to 62 μ M in the presence of 3.5 μ M diclofenac. Diclofenac further decreased 20-HETE glucuronidation in HLMs carrying UGT2B7*2 alleles compared with the wild-type HLMs. The results from this study would be useful in understanding the alteration of 20-HETE levels in relation to NSAID and UGT genetic polymorphisms. © 2020

ABSTRACT: In the current study, once-a-day dual-release pellets of the selective non-steroidal anti-inflammatory drug celecoxib (200 mg) was developed to treat arthritis. Pellets were prepared where a 100 mg celecoxib, located in the outer layer, was released in an immediate-release (IR) pattern, whereas the remaining 100 mg celecoxib, located in the inner layer, was released in a sustained-release (SR) pattern. Pellets were subjected to four coating- and loading-stages using solid-dispersion and spray-drying including seal-coating, drug-loading, SR-coating, and IR-loading. Release studies were carried out using dissolution media with a pH range 1.2–12.0. The IR-stage showed a fast release rate, where 47.0% of celecoxib (equivalent to 94 mg) was released within the first hour. Whereas the SR-stage showed a sustained-release pattern up to 16 h. Celecoxib converted from crystalline to amorphous form during the development of pellets. This in turn improves the aqueous solubility and hence the dissolution of celecoxib. The results of stability studies showed that pellets were stable at 30 °C/65 %RH and 40 °C/75 %RH for 6 months. The present study demonstrated that celecoxib pellets can be an effective strategy for delivering the poorly-soluble drug celecoxib in a dual-release pattern. © 2019 Elsevier B.V.

ABSTRACT: Purpose: This case report investigated the transactional model of stress and coping as guidance for nursing care of an adolescent patient with thalassemia. Sources Used: A case study of a 15-year-old female patient with β -thalassemia major. Data were collected using patient medical records, an interview with the patient and physical examination. Results: Four issues related to coping were isolated: Worsening physical symptoms; psychosocial consequences, coping process, and building supportive networks. These issues and the patient's adaption are explored via the transactional model. Conclusions: Having thalassemia was cognitively appraised by the patient as a stressful and taxing situation with detrimental consequences, such as changes in physical appearance,

stigmatization, and depression. Nurses should evaluate each patient's physical and psychosocial needs, utilizing appropriate theoretical models for designing a suitable care plan. As the case study demonstrates, the transactional model was an effective guide for nurses in planning care of an adolescent patient with thalassemia. © 2019 Wiley Periodicals, Inc.

ABSTRACT: In the past, 2D models were the main models for medical image processing applications, whereas the wide adoption of 3D models has appeared only in recent years. The 2D Fuzzy C-Means (FCM) algorithm has been extensively used for segmenting medical images due to its effectiveness. Various extensions of it were proposed throughout the years. In this work, we propose a modified version of FCM for segmenting 3D medical volumes, which has been rarely implemented for 3D medical image segmentation. We present a parallel implementation of the proposed algorithm using Graphics Processing Unit (GPU). Researchers state that efficiency is one of the main problems of using FCM for medical imaging when dealing with 3D models. Thus, a hybrid parallel implementation of FCM for extracting volume objects from medical files is proposed. The proposed algorithm has been validated using real medical data and simulated phantom data. Segmentation accuracy of predefined datasets and real patient datasets were the key factors for the system validation. The processing times of both the sequential and the parallel implementations are measured to illustrate the efficiency of each implementation. The acquired results conclude that the parallel implementation is 5X faster than the sequential version of the same operation. © 2018 Elsevier B.V.

ABSTRACT: A study was conducted to explore whether fatigue, workload, burnout and the work environment can predict the perceptions of patient safety among critical care nurses in Oman. A cross-sectional predictive design was used. A sample of 270 critical care nurses from the two main hospitals in the countryâ€™s capital participated, with a response rate of 90%. The negative correlation between fatigue and patient safety culture ($r=-0.240$) indicates that fatigue has a detrimental effect on nursesâ€™ perceptions of safety. There was also a significant relationship between work environment, emotional exhaustion, depersonalisation, personal accomplishment and organisational patient safety culture. Regression analysis showed that fatigue, work environment, emotional exhaustion, depersonalisation and personal accomplishment were predictors for overall patient safety among critical care nurses ($R^2=0.322$, $F=6.117$, $P<0.0001$). Working to correct these predictors and identifying other factors that affect the patient safety culture are important for improving and upgrading the patient safety culture in Omani hospitals. © 2020 MA Healthcare Ltd

ABSTRACT: Purpose The outbreak of the COVID-19 pandemic led to an almost complete cessation in the tourism sector worldwide. The sudden outbreak affected all economic sectors in Jordan and tourism was severely hit. The aim of this study is to adapt a "multi-step model for altering place image" to

uncover various media strategies that could possibly be used by Jordanian marketers to increase the flow of tourism and repair their destination image during the pandemic. Design/Methodology/Approach A qualitative research method was used to reach the objectives of the research. Findings The study provides a framework for tourism marketers to mitigate the effects of COVID-19 in the tourism sector. © 2020 World Sustainable Development Outlook. All rights reserved.

ABSTRACT: This paper attempts to analyze two plays, Elizabeth Cary's *The Tragedy of Mariam* (1613), and John Webster's *The Duchess of Malfi* (1612). It focuses on main characters in these works which compares and contrasts between them. These plays were selected to highlight issues related to Renaissance women such as marriage, feminism, misogynist, silence, and obedience. This analysis shows the tyranny of the husband against women, and their revolution against their social status. The outcome of this analysis endeavors to present new kind of heroines who want to change the traditional stereotype about women. Special attempt is given to propose feminist explanations for these characters. © 2020 ACADEMY PUBLICATION.

ABSTRACT: The present paper represents an attempt to focus upon analyzing and describing the major features of Arab American poetry written by prominent Arab poets who had arrived in America on behalf of millions of immigrants during the 19th century. Some of who wrote in English and Arabic like Ameen Rihani (1876-1940); Khalil Gibran (1883-1931) and Mikhail Naimy (1889-1988). Others wrote in Arabic like Elia Abumadi (1890-1957). Most of their poems in Mahjar (place of emigration) reveal nostalgia, their love to their countries and their ancestors and issues relating to Arab countries. The paper analyzes some of their poems based on linguistic, grammatical, lexical and rhetorical levels. © 2021 ACADEMY PUBLICATION.

ABSTRACT: Introduction: Sleep Quality disturbances are common among nurses especially those working in stressful situations such as emergency room. Additionally, sleep quality disturbances were found to interfere with nurses' quality of life and work performance. No studies have found the effect of fluctuated shifts on sleep quality among nurses. Objectives: To examine the impact of shift fluctuations on sleep quality among nurses working in the emergency room. Methods: A cross-sectional, descriptive design was employed. Five emergency rooms were selected from public and private hospitals located in Amman, Jordan. The selected hospitals were also referral sites with capacity of more than 200 beds. A convenient sample of nurses who had a minimum of six months experience in the emergency room and working on rotating shifts were eligible for participation. Nurses with known chronic respiratory problems and sleep apnea were excluded. A self-administered questionnaire including a demographic and work-related questions, and the Arabic version of the Pittsburgh Sleep Quality Index were provided. Shift fluctuations were clustered based on interchanging between morning, evening and night shifts. Results: A total of 179 emergency nurses working in rotating shifts participated in the study. The majority of the nurses were poor sleepers. The study found no significant differences between different shifts interchange and sleep quality. However, interchange between morning and evening shift reported the highest sleep disturbance. Sleep quality was positively correlated with the length of experience, while negatively correlated with the age and the number of monthly shifts.

Nurses who declared higher satisfaction and ability to work under pressure revealed better sleep quality. Conclusion: Emergency room nurses showed poor sleep quality. While there was no specific shift interchange cluster inducing poor sleep quality, some demographical and work-related characteristics indicated their influence on sleep quality. © International Journal of Occupational Safety and Health.

ABSTRACT: Central banks are producing traditional paper currencies within controls and under a corresponding inventory of metals or a basket of currencies, but digital currencies are not subject to any controls of any kind which may create a fertile environment of economic instability. The purpose of this paper is to explore the macroeconomics implications of digital currencies, in addition to examine the extent to which digital currencies are currently used as a form of money, and also to determine whether digital currencies pose a material risk to monetary or financial stability. In order to achieve the objectives of this paper, the study examined the digital currencies currently in use, and it analyzed its performance, and expectations, and finally, the study provides its point of view about possible risk associated with digital currencies in use and its effect to our economy. © 2020, Springer Nature Switzerland AG.

ABSTRACT: For the last year, one of the most critical topics in many countries was the exchange rate. Daily news affecting economy may have some explanation power. However, if we look from a broad view there should be bigger and more general factors for exchange rate movements. These general factors can be listed as a differential in inflation rates and changing in interest rate. In addition, this study aims to estimate the impact of exchange rate system on the inflation, the data of Kuwait Central Bank has been used for the period of 1990-2019. In addition, OLS has been applied on the data. The relationship between exchange rate and inflation rate in Kuwait was showed by (OLS) method. The estimated coefficient between inflation and real effective exchange rate was 0.01 and was not significant. The results of this study concluded that the rate of inflation rate not effected exchange rate in Kuwait during the period of this study. © 2020, Common Ground Research Networks. The effect of critical rhetoric in teaching english as a foreign language

(2020) Theory and Practice in Language Studies, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106968967&doi=10.17507%2ftpls.1007.04&partnerID=40&md5=15c7302c0993dd6764edfa2786ca70c7>

AFFILIATIONS: English Department, Faculty of Arts, Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: The present paper represents an attempt so as to examine and analyze texts in terms of the context and its relation to cultural, political and social issues. It also provides theoretical and practical information which are used in classroom to facilitate learning foreign language. Rhetorical analysis is essential to be used and incorporated into EFL classroom because it is an important field which is not isolated from other disciplines like critical thinking and learning process. Special emphasis is laid upon the role of contrastive rhetoric in facilitating the process of learning foreign languages. Some pedagogical implications for studying L2 correctly and effectively are also tackled. Furthermore, the major role of pragmatics in analyzing the Second and Foreign Language text is also highlighted. This is accomplished within a pedagogical point of view. It is hoped that the paper will be of value to EFL teachers, syllabus designers, applied linguists and specialists in ethnography of communication. © 2020 ACADEMY PUBLICATION.

ABSTRACT: We study the control problem for polynomial continuous-time dynamical systems. We consider polynomial Lyapunov functions and controllers, both parameterised in Bernstein form. Specifically, we present necessary and sufficient conditions for existence of polynomial controllers and Lyapunov functions of some maximum degree, providing at the same time explicit upper bounds on the degree of the involved Bernstein polynomials. The formulated conditions are a set of algebraic inequalities, in the space of Bernstein coefficients. Copyright © 2020 The Authors. This is an open access article under the CC BY-NC-ND license

ABSTRACT: This study aimed to identify the impact of national culture through its dimensions adopted in the Hofstede model (power distance, uncertainty avoidance, individuality, masculinity, long-term orientation and restraint) on the two dimensions of innovation (service innovation and process innovation) in Jordanian telecommunication companies. Also, the study aimed to identify the mediating role of organizational culture between national culture and innovation. The study population consisted of all the workers in those companies= and a proportional stratified sample of (302) employees was taken, where (296) questionnaires were retrieved, with a response rate of (98.2%). To achieve the aims of the study, the descriptive analytical method was used, based on a questionnaire developed for this purpose as a study tool, consisting of (39) items. Statistical methods appropriate for this type of studies were used and the study reached a set of results, the most prominent of which was that national culture has a statistically significant effect on innovation in Jordanian telecommunication companies. National culture, with its dimensions, has a statistically significant effect on organizational culture. Also, organizational culture has a statistically significant effect on innovation. It was also revealed, through path analysis using the Amos software, that organizational culture exercises a mediating role between national culture and innovation. In light of the results of the study, the most prominent recommendations were the necessity for the researched companies to encourage a culture of teamwork to reach new innovations, as well as the importance of adopting an innovative culture that does not avoid risks of being open to new ideas. © 2020 DAR Publishers/The University of Jordan. ABSTRACT: The aim of this paper is modelling and simulation of nonlinear impact system of viscoelastic bodies. Linear impact model was developed based on Kelvin-Voigt, and nonlinear modelling was based on Hunt-Crossley model. Two approaches were used in the nonlinear modelling; one is based on standard parameters of stiffness/damping coefficients, and the other approach is based on calibrated coefficients of stiffness/damping terms. A multi velocity values are considered to be 10.00m/s, 20.00m/s and 30.00m/s to evaluate the dynamic response of the viscoelastic impact model. This study concentrated on various high velocity impact to enhance a modeling process where coding solve type and Matlab Simulink environment is utilized. In addition, higher order ODE fitted data model has been used to improve the dynamic response of the viscoelastic body by optimizing fundamental impact model parameters, i.e. stiffness and damping terms based on deflection-time experimental data. The nonlinear body response and the contact force are analyzed and the results

showed the linear model has been corrected by 96.39% from experimental one, while the fitted data model corrected by 96.72%. © 2020 Elsevier Ltd. All rights reserved.

ABSTRACT: The Vortex tube (Ranque-Hilsch type/ RHVT) is a simple device used to obtain both cold and hot gas streams simultaneously from a compressed gas. The obtained cold gas is widely used in many low temperature commercial applications. In this work, the performance of the vortex tube was examined experimentally by studying the effects of inlet pressure variations, conical valve opening percentage, tube diameter and hot gas tube length on the thermal performance of the tube. Four tubes with diameters 14, 21, 25 and 32 mm with four hot exhaust gas lengths; 25, 50, 75 and 100 cm were tested experimentally and the obtained data were analyzed. It was observed that the 75 cm length of the hot side length, gives the maximum coefficient of performance for RHVT, as well as the maximum cold temperature reduction, either with or without insulation. Furthermore, the thermal performance of the RHVT was optimum for the two inner diameters; 14 and 21mm. This indicates that, when the ratio of hot side length to inner diameter (L_h/D) lies between 36 and 50, then the thermal performance of the RHVT is optimum and is highly recommended, which agrees with the results published in previous studies and investigations. © 2020. ABSTRACT: Background: Type 2 diabetes mellitus (T2DM) is a chronic condition with an impairing effect on multiple organs. Numerous respiratory disorders have been observed in patients with T2DM. However, the effect of T2DM on pulmonary function is inconclusive. Aims: In this study, we investigated the effect of T2DM on respiratory function and the correlation of glycemic control, diabetes duration and insulin intake. Methods: 1500 patients were recruited for this study; 560 having T2DM for at least a year were included in the final data, in addition to 540 healthy volunteers. Forced expiratory volume in one second (FEV1), forced vital capacity (FVC), forced expiratory flow at 25-75% (FEF 25-75%), as well as FEV1/FVC ratio values were measured. Results: A two-sample t-test showed that z-scores produced by Al-Qerem et al.'s equations for FEV1, FVC, and FEF 25-75% were significantly lower for the T2DM group than the control group ($p < 0.01$). FEV1/FVC ratio in the T2DM group was significantly higher ($p < 0.01$). Multiple linear regression analysis found that glycemic control represented by HbA1c as well as disease duration were negatively associated with the pulmonary function ($p < 0.01$). However, insulin intake was found to have no significant correlation with pulmonary function. Conclusion: T2DM was linked to reduced pulmonary function and was consistent with a restrictive ventilation pattern. HbA1c, as well as disease duration, were found to be independent risk factors for reduced pulmonary function. © 2020 Bentham Science Publishers.

ABSTRACT: Bernstein expansion of a polynomial function has linear and quadratic rates of convergence to the original function. In this paper, we extend a direct approximation method by the minimum and maximum Bernstein control points to multivariate polynomials and continuous rational functions over boxes. Furthermore, we explore the rate of convergence and properties of Bernstein basis and illustrate the advantages of this approach through its applications for positivity of nonlinear functions. To this end, sharpness, minimization, degree elevation and convergence properties of polynomials are extended to the multivariate rational polynomial Bernstein case. Subsequently, local

and global positive values of control Bernstein points are computed. Finally, several valid optimization bounds for the degree of Bernstein basis and the width of a box are given. © 2020. NSP Natural Sciences Publishing Cor.

ABSTRACT: Diabetes mellitus is a chronic disease characterized by hyperglycemia mainly because of the absolute or relative deficiency of insulin hormone. The dipeptidyl peptidase-IV inhibitors represent a class of glucose-lowering agents potentiating the action of the incretin hormones glucagon-like peptide-1 and glucose dependent insulinotropic polypeptide, which are secreted from the intestinal endocrine cells in response to food ingestion to stimulate insulin secretion from pancreatic beta cells. Natural products have been traditionally used for curing many diseases. In this study, in-vitro biological evaluation of the isolated compounds calotoxin, calotropin, pectolarigenin, apigenin 7-O-(3",6"-di-O-E-p-coumaroyl)- β -glycoside and extracts of *Calotropis procera*, *Ephedra foeminea*, *Artemisia herba-alba*, *Hylocereus undatus* and *Marrubium vulgare* showed potential inhibitory activity, where the butanol extract of *Calotropis procera* was found to have 85.3% inhibition of dipeptidyl peptidase-IV at 0.2 mg/100 μ L concentration. © 2020, Iranian Journal of Pharmaceutical Research. ABSTRACT: The main aim of this research paper is to examine the impact of fair value measurements on earnings predictability. This study focuses on analyzing the relationship between fair value measurements and predictability as a measure of earnings quality. The primary data needed to achieve the study objectives were collected through the annual reports of Jordanian commercial banks. Data from ten commercial banks representing the study sample were collected and analyzed using a time series method covering a period of eight years, from 2011 to 2018. The resolution data were analyzed using the statistical program SSPS. The study concluded that the unrealized gains or losses of fair value forecasted through comprehensive income have a high predictive power of earnings quality. The results also prove that the unrealized gains or losses of fair value forecasted through net income have a high predictive power of earnings quality in the Jordanian commercial banks. The regression and correlation coefficient analyses also refer to a strong magnitude between the two variables, the dependent variable (fair value accounting) and the independent variable (earnings predictability). © 2020 AESS Publications. ABSTRACT: Current study aimed at examining the influence of quality of AIS outputs in improving non-financial performance of Jordanian Islamic banks, AIS outputs characteristics included (Relevance, Credibility, Procedures and instructions, Timelines, IT infrastructure and Feedback Value). In order to achieve aim, researcher adopted a quantitative approach utilizing a questionnaire. After application; (150) individuals within financial departments in Jordanian Islamic banks responded o he questionnaire; and analysis showed that the quality of AIS outputs plays a role in improving and defining non-financial performance. The influence mainly was attributed to credibility which appeared to be the most influential among all, followed by relevance and procedures and instruction in the 2nd and 3rd ranks respectively. Study recommended the necessity for Jordanian Islamic banks to prepare a strategic plan and implement it to develop electronic accounting information systems to achieve the

continuity of the quality of that information and the principles of systems reliability in an integrated manner. © 2020. All Rights Reserved.

ABSTRACT: Despite the advantages of applying e learning, a few higher education organizations do not apply e-learning comprehensively and still there exist very few researches, which provide an integrated and effective structure for the acceptance of applying e-learning methods in the Jordanian universities. Hence, it is important to comprehend the factors, which affect the acceptance of e-learning in such universities based on the evaluation of the e-learning experience at Al-Zaytoonah University of Jordan from the viewpoint of student satisfaction during a full academic year by performing online survey. The study includes many contributions represented by identifying the strengths and weaknesses in the E-learning system after it was updated a year before the implementation of the study, as the new updates included adding more interactive content with students such as; voice and video chat, file and screen sharing, broadcasting lectures or classes, and interactive games. It was necessary to measure student satisfaction with the new changes as well as providing this experience to other educational institutions, it could be an inspirational start that opening new ways for them to develop the mechanisms of e-learning education, which has become one of the most important educational methods adopted in the present and the future, in addition, this study carried out at in the Middle East region, which considered relatively recent in the use of e-learning, and this is a clear guiding instrument for future studies based on different methods, which are related to an effective planning, implementation and development of e-learning. © 2020. ABSTRACT: Due to the increasing use of social media applications, it is essential to ensure that the connection is secure because sometimes it is required to fill secret information such as username and password. Many anonymous messages reach to the computer client, which may contain Trojan, virus (Malware). If the user is not an expert in the field of information security, then the user will open the incoming messages without ensuring its integrity, which allows hackers to enter the devices and planting malicious software in the client devices without their knowledge. In this paper, we will identify the concept of syntactic attack and its types, which leads to Cyber-Bullying attack—and also discussing the effect of penetration of devices on the Jordanian society. As shown in the result, the most common electronic crimes are crimes related to defamation, threats and extortion. The results also show the prevalence of Cyber-crime in densely populated places. Besides, Cyber-crime decreases in the regions where clans and tribes live. At the same time, the most age groups that have been exposed to electronic crimes are the groups 18-29 and 30-44. © 2020. THE ROLE OF COMPUTERIZED ACCOUNTING INFORMATION SYSTEMS (CAIS) IN PROVIDING A CREDIT RISK MANAGEMENT ENVIRONMENT: MODERATING ROLE OF IT

(2020) Academy of Accounting and Financial Studies Journal, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098687962&partnerID=40&md5=d258d87a8db200d21df073e97d46a615>

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: Study aimed at examining the influence of CAIS on building a healthy environment for credit risk management through the mediating role of IT infrastructure. Quantitative approach was used. A questionnaire distributed on (76) financial managers within banks, credit companies, and financial services in Jordan. Questionnaire consisted of statements that related to variables of CAIS (speed, compatibility with IFRS, low Error Margins, efficiency, classification, and precision) and variables of credit risk management principles (CRMP) (Establishing an appropriate credit risk environment, operating under a sound credit granting process, Credit administration, measurement and monitoring

process and Ensuring adequate controls). Results of study indicated that IT infrastructure mediates the relationship between CAIS and CRM, and the fact that CAIS can help in creating a healthy environment for CRM through paving the way for (appropriate credit risk environment) and (Credit administration, measurement and monitoring process) based on its characteristics of CAIS, the relationship was highlighted through the variance relationship which was scored through by variables through analysis. Study recommended that financial institution should be more aware of CAIS due to its ability to understand and examine circumstances around the client and their eligibility to be granted credit. Also, increasing awareness of banks and financial institutions to the importance of IT infrastructure and its role in the overall organizational approach in managing and dealing with credit related risks and failures. © 2020. ABSTRACT: In this paper, we study a new nonlinear sequential fractional differential problem of Duffing oscillator type. The considered problem involves two fractional order operators: Riemann and Liouville integral, and the derivative of Caputo, it is also with new nonlocal conditions. We prove an existence and uniqueness result. Also, we prove a new existence result using Schaefer theorem. We end our paper by presenting an illustrative example. © 2020, Research Publication. [85098528546&doi=10.22495%2fjgrv9i4art4&partnerID=40&md5=36849a2594f74789823518c80e198aca](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098528546&doi=10.22495%2fjgrv9i4art4&partnerID=40&md5=36849a2594f74789823518c80e198aca)

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: This study aims to find out the impact of the lending policies adopted by Jordanian commercial banks on their profitability. This study relied on the descriptive analytical approach to describe and review the theoretical framework of the study. The preliminary information was gathered through a questionnaire prepared for this purpose. The study population consisted of all the commercial banks operating in Jordan, numbering 13 banks during the period 2016-2020. The study concluded that the credit decisions in the Jordanian commercial banks are contributing to about 75.3% of their returns, and there is a statistically significant effect of lending policies (with their combined variables) on the profitability of commercial banks operating in Jordan. Also, the lending policies adopted by the Jordanian commercial banks have interpreted 53.9% of their profitability, and that is due to the strict lending policy adopted by these banks, and this result is adverse of Munyiri's (2010) results stating that a friendly lending policy will maximize demand and increases bank's profitability. Depending on the results, the study recommended that the Jordanian commercial banks should focus on a clearly allocated task, responsibilities, and powers within credit policies so that different administrative levels are granted the right to make high-quality credit decisions that enhance the speed of taking a decision, thereby increasing customer's base and profits. © 2020 The Authors.

ABSTRACT: In the history of the Abbasside state, Baghdad was Known as the most famous capital in the history of the state. Then Samarra`, which was considered as the second capital of the Abbasside during the reign of Al - Mu'tasem billah Bin Haroon Al- Rashid - who had brought too many Turkish soldiers to the Abbasside Army. Baghdad couldn't stand that number of soldiers, therefore, Al-Mu'tasem relocate his capital to Samerra`. Baghdad and Samarra`. Both of them were not the only capitals of the Abbasside Caliphas from Baghdad to Samerra was not the only one in their history. The Abbasside caliphs left Baghdad several times. For either political, economic social. In this study, the researcher studies those reasons and the effect of them on the Abbasside state. © 2020 University

ABSTRACT: Background: Nursing role is instrumental to effective patient care, but the level and standards of clinical practice can be affected by stress. Work-related stress among nurses working in mental health units in Jordan has not been investigated using an instrument in Arabic. Aim: To evaluate the psychometric properties of the Arabic version of the Devilliers, Carson, and Leary (DCL) Stress Scale when used on Jordanian mental health nurses. Methods: A descriptive, cross-sectional design was used on a convenience, non-probability sample of Jordanian 99 nurses working in three public hospitals. Results: The Arabic version of the DCL demonstrated acceptable levels of validity and reliability when it was used on mental health nurses working in units caring for psychiatric patients Jordan. Conclusions: A reliable and valid instrument that is useful in determining levels of stress in nursing staff. Another facet of findings in this study is to the empirical evidence on the presence of high stress among mental health nurses, which should be taken into consideration among health care planners in mental health in Jordan. Therefore, nurse managers can use these findings to implement actions necessary to alleviate work-related stress among nurses in order to improve retention and decrease the negative impact of stress on nurses' wellbeing. © 2020 DSR Publishers / The University of Jordan. Corporate social responsibility and competitive advantage: Relationships and mechanisms

(2020) International Journal of Economics and Business Administration, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097515651&doi=10.35808%2fijeba%2f494&partnerID=40&md5=c8632dee1458c1159a480f36c6d7f07d)

[85097515651&doi=10.35808%2fijeba%2f494&partnerID=40&md5=c8632dee1458c1159a480f36c6d7f07d](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097515651&doi=10.35808%2fijeba%2f494&partnerID=40&md5=c8632dee1458c1159a480f36c6d7f07d)

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: Purpose: This study is intended to gain insight into the association of Corporate Social Responsibility (CSR) implementations and the achievement of competitive advantage focusing on the mediation role of company reputation (CR) in this relationship. Design/Methodology/Approach: Semi-structured interview technique was used to confirm the validity of the research model. In addition, the purposive sampling method has been used targeting senior decision makers in different well-known 5-star hotels and resorts in Jordan. A total of three hundred (300) questionnaires were distributed. While two hundred and forty (240) questionnaires were retrieved from respondents, two hundred and eleven (211) questionnaires were valid and usable. Findings: The results elucidated the mechanism of CSR and competitive advantage relationship. Although the results confirmed the positive (direct and indirect) effect of the social, the legal, and the ethical dimensions of (CSR) on competitive advantage, data analysis did not support any significant impact for the environmental dimension on competitive advantage (CA) through the company reputation (CR) as a mediator variable. Practical Implications: This study raises awareness of (CSR) implementations in service-oriented developing economies through highlighting the mechanism and relationships of CSR and competitive advantage. It is hoped that, it will contribute to generate interest towards the concept of ``Environmental Corporate Social Responsibility`` (ECSR), as a strategic alternative at the aim of the achievement of competitive advantage. Originality/Value: The study goes beyond examining the causal relationship between (CSR) and competitive advantage. It focuses on achieving a deep understanding of this relationship by exploring the mechanisms of its work through illustrating the mediation role of reputation. © 2020 International Strategic Management Association. ABSTRACT: This study examines the impact of mergers on the financial performance of the Jordanian public shareholding companies. The study employs data collected for a sample of 10 Jordanian non-financial public firms that were engaged in legal horizontal merger deals between 2000 and 2013. The data was collected from the published annual financial reports of the merging companies and comparative companies for three years before the merger and three years after the merger. Event study methodology was applied to examine the data. Four measures of financial performance (FP) were used, which are return on assets (ROA), return on equity (ROE), earnings per share (EPS), and net profit margin (NPM). Two methods were used in the analysis - the change model and the intercept model using financial performance raw data and industry-adjusted data. The findings in general showed no significant impact of mergers on the financial performance of merging firms using the change model. However, by using the intercept model, significant impact of mergers on the financial performance was found on the sample of the study. The significant impact was found for mergers on the raw ROE of the merging firms, and on the ROA and NPM of the industry-adjusted firms. © 2020. All Rights Reserved.

ABSTRACT: In this paper, we introduce the concept of cyclic (α, β) -admissible Z-contraction mapping with respect to ζ . We also establish the existence and uniqueness of fixed points for this class of mappings in metric-like spaces. This work generalizes and extends some theorems in the literature. An example and some consequences are given to support the obtained results. © 2020, International Journal of Mathematics and Computer Science. All rights reserved

ABSTRACT: The social media has provided users with the chance to publish their written and multimedia content and express feelings and emotions about particular subjects via the internet. However, some users have abused these platforms by performing various acts such as Cyber-Bullying and Cyber-Harassment. These phenomena are dangerous and have negative psychological, health, and social effects. Although multiple works have focused on detecting these phenomena on English text, few works studied this phenomenon on Arabic. Moreover, these works used limited number of methods and datasets. Furthermore, there is a lack in Arabic datasets that are concerned with this topic. We propose the use of Machine Learning to detect such negative written acts. We apply various classification algorithms to the dataset, and we use various Arabic Natural Language Processing (NLP) tools. To evaluate the performance of the classifiers, we use Recall, Precision, and F1-Measure. The results show that the Random Forest algorithm yields the highest values of F1-Measure. The same results occurred when no stemming and no stop-word removal are applied. However, when separating datasets into Facebook Posts dataset and Twitter Tweets dataset, SVM gives the highest F1-Measure value. Significant tests were conducted to support our results. © 2020 Taiwan Academic Network Management Committee. All rights reserved.

ABSTRACT: Background: Cancer is a life-threatening group of diseases and universally, the second main cause of death. The design and development of new scaffolds targeting selective cancer cells are considered a promising goal for cancer treatment. Aims and Objective: Chalcone derivatives; 6-(3-aryl-2-propenoyl)-2(3H)-benzoxazolone, were previously pre-pared and evaluated against the oral cavity squamous cell carcinoma cell line, HSC-2, and were reported to have remarkably high tumor selectivity. The aim of this study was to further investigate the anticancer activities of the chalcone derivatives against human colon cancer cells with a possible elucidation of their mechanism of action. Methods: Computational studies were conducted to explore the potential interaction of the synthesized molecules with the phosphatidylinositol-4,5-bisphosphate 3-kinase α (PI3K α). Biological evaluation of the antiproliferative activities associated with compounds 1-23 was carried out against the colon cancer cell line, HCT116. Lactate Dehydrogenase (LDH) activity was measured to study necrosis, while the caspase-3 activation and DNA measurements were used to evaluate apoptosis in the treated cells. Results: Glide studies against PI3K α kinase domain demonstrated that the 6-(3-aryl-2-propenoyl)-2(3H)-benzoxazolone scaffold forms H-bond with K802, Y836, E849, V851, N853, Q859, and D933, and it fits the fingerprint of PI3K α active inhibitors. Biological evaluation of the reported compounds in HCT116 cell line confirmed that the series inhibited PI3K α activity and induced apoptosis via activation of caspase-3 and reduction of DNA content. Conclusion: The recently developed compounds might be employed as lead structures for the design of new antitumor drugs targeting PI3K α . © 2021 Bentham Science Publishers.

ABSTRACT: This study aims to examine the impact of financial inclusion on the financial performance of Jordanian banks listed in the Amman Stock Exchange. The study empirically tested the impact of five main indicators of financial inclusion on bank performance. Using a simple regression analysis, findings of the study showed statistically significant impact of two indicators of financial inclusion (i.e., financial access and enterprise financing) and bank financial performance (i.e., bank profitability) of Jordanian banks. The study recommends Jordanian financial institutions to move toward increasing innovative access to financial services as well as enhancing IT infrastructure and the development of financial services to raise the level of digital banking services which is currently considered relatively low when compared to other middle-income countries. ABSTRACT: This study aims to identify difficulties and challenges facing countries without a National Registration Law, with the Hashemite Kingdom of Jordan as model. Jordan, in compliance with the United Nations High Commissioner for Refugees (UNHCR), regulates the presence of refugees and asylum

seekers inside the Kingdom and at its borders in accordance with the UNHCR 1998 Memorandum of Understanding. Many such individuals have lost their identification documents when forced to leave their homelands due to armed conflict. Jordanian authorities try to solve such problems through the use of a magnetic-card system and iris scans. This study concludes that Jordan, in ratio to its population, is the second country worldwide to host the largest number of refugees. This study recommends that Jordan enact a National Asylum Law to regulate the presence of such refugees in the Kingdom. © Koninklijke Brill NV, Leiden, 2020

ABSTRACT: The purpose of this study is to explore perception of social discrimination among ordinary people and health-care workers toward individuals with COVID-19 in Jordan. A cross-sectional descriptive-comparative design was used to collect data from a convenience sample of 272 ordinary people and 109 HCWs utilizing an online survey format. HCWs reported low to medium social discrimination (SDS) level, while ordinary people reported a higher level with statistical difference ($t = 8.64$, $p < .001$). SDS had positive and significant correlation with years of experience, specialty of nursing, education and area of working among HCWs. The study signifies the social discrimination associated with COVID-19 among ordinary people and healthcare workers. Implications to health practices and public policies discussed. © 2020 Informa UK Limited, trading as Taylor & Francis Group.

Proposed simple low cost system for road traffic counting
(2020) International Journal of Systems, Control and Communications, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095735819&doi=10.1504%2fIJSCC.2020.110851&partnerID=40&md5=efe9a47c821bb4db96d05a16e23837ed>
AFFILIATIONS: Faculty of Science and Information Technology, Al-Zaytoonah University of Jordan, Amman, Jordan
ABSTRACT: Traffic congestion and the increasing number of vehicles is one of the major issues in most countries due to infrastructures with limited capacity. One of the finest solutions for road congestion is an intelligent transportation system (ITS) to be used for traffic optimisation. Most traffic management measurements are aimed at improving the safety and flow of traffic, reducing traffic emissions, and utilising traffic artery capacity more effectively. This paper proposes a simple low-cost system using cheap infrared sensors and timers for collecting the required data, such as number of vehicles and time and lane location information to be used in future traffic management systems. The proposed method can take the length and speed of the vehicle into account as part of traffic statistics. Copyright © 2020 Inderscience Enterprises Ltd.

ABSTRACT: Alogliptin, dipeptidyl peptidase-4 (DPP-4) inhibitor, Pioglitazone, thiazolidinediones (TZDs) and Metformin, biguanides are antidiabetic drugs that usually used in the management of type 2 diabetes that can be used solely or as combinations. In this article, a selective, simple, economical, precise, and stability-indicating RP-HPLC method has been developed and validated for assessing Alogliptin, Pioglitazone, and Metformin inside the bulk drug and tablet pharmaceutical dosage form. The mobile phase that used to separate the drug was consists of acetonitrile: buffer (potassium dihydrogen phosphate), (30: 70 v/v) on an ACE C18 \bar{n} (250 mm \times 4.6 mm), 5 μ m column at a flow rate of 1.0 mL/min at 250C and detection was at 230 nm. The linearity of the detector was established in concentrations ranging from 20-250 ppm; the regression coefficient was 0.9998. The ICH guidelines were followed to evaluate stability, where the API is stressed by acid, base, neutral, oxidation, and sunlight. Several parameters were used for validation, including linearity, precision, accuracy, the limit of detection, and limit of quantification. The results were fulfilling expectations based on ICH guidelines. Robustness of the method was verified in terms of changes in pH of the mobile phase, detector wavelength, mobile phase composition, and temperature. Also, the method results in low relative standard deviation and high recovery value, that ensure the convenience applicability of the method for routine analysis of tablet containing Alogliptin, Pioglitazone, and Metformin. © 2020 by Polish Pharmaceutical Society.

ABSTRACT: Depression and anxiety are prevalent mental illnesses among young people. Crisis like the Coronavirus Disease 2019 (COVID-19) pandemic may increase the current prevalence of these illnesses.

A cross-sectional, descriptive design was used to (1) explore the prevalence of depression, anxiety, and stress among youth and (2) identify to what extent certain variables related to COVID-19 could predict depression, anxiety, and stress (DAS) among young people in six different countries.

Participants were requested to complete an online survey including demographics and the DAS scale. A total of 1,057 participants from Oman (n=155), Saudi Arabia (n=121), Jordan (n=332), Iraq (n=117), United Arab Emirates (n=147), and Egypt (n=182) completed the study. The total prevalence of depression, anxiety, and stress was 57%, 40.5%, and 38.1%, respectively, with no significant differences between countries. Significant predictors of stress, anxiety, and depression were being female, being in contact with a friend and/or a family member with mental illness, being quarantined for 14 days, and using the internet. In conclusion, COVID-19 is an epidemiological crisis that is casting a shadow on youths' DAS. The restrictions and prolonged lockdowns imposed by COVID-19 are negatively impacting their level of DAS. Healthcare organisations, in collaboration with various sectors, are recommended to apply psychological first aid and design appropriate educational programmes to improve the mental health of youth. © 2020 Omar Al Omari et al.

ABSTRACT: Two comparative studies of the impact of different node deployment strategies on 2D and 3D heterogeneous wireless sensor network (WSN) are conducted. Uniform, normal, and exponential node deployment distributions are utilised. Three 3D network geometries are introduced, namely, cube, sphere, and cylinder networks. Stable election protocol (SEP) is used to evaluate the performance of different node distributions in terms of network energy, throughput, stability period and network

lifetime. Broadly speaking, it is noticed that normal distribution of nodes outperforms other distributions in the 2D and 3D comparative study, and in the study of different 3D network geometries with the exception of sphere network in which the uniform distribution performs almost the same as the normal distribution. It is also noticed that any node distribution performs better in a particular 3D network geometry than others. The paper also introduces the optimal cylinder network parameters for optimal network performance. Copyright © 2020 Inderscience Enterprises Ltd.

ABSTRACT: Several photovoltaic applications, especially of water pumping systems, have been introduced to contribute to the socioeconomic development in Jordan. This paper shows the achievability of utilizing photovoltaic (PV) modules to power water pumps in an assigned irrigation system in the Mafraq desert, Jordan. The irrigation system is built for an olive tree farm with an area of 50 km². The 91-kW photovoltaic system cost is around 63,000 USD, and the results of the analysis showed that the system generated energy savings of a little over 16,000 USD. The return on investment was calculated to be around 26% and the payback period was estimated to be 61 months. The system will start generating revenues after year 5. Further, an evaluation of carbon dioxide emission was conducted and it was found that the photovoltaic system will cut down the annual emissions of carbon dioxide by 2.12 tons/year. The utilization of this PV-irrigation system will almost certainly add to the socioeconomic development and it is considered one of the proposed solutions for the Jordanian farmers. © 2020 by Begell House, Inc.

ABSTRACT: The aim of this paper is to investigate the long and short run equilibrium relationship between conventional finance volume (CFV) and macroeconomic variables in one hand, and the long run and short run equilibrium relationships between Islamic finance volume (IFV) and macroeconomic variables in the other hand. Autoregressive Distributed Lag (ARDL) approach has been utilized for the sample of (1983-2015) period, to analyze the short and long run relationship between IFV and macroeconomic variables. The results show that there are existed evidences of long run and short run relationships among variables of this study. Also the results of error correction term (ECTt-1) showed that the IFV achieved high adjusted speed from the short run to the long run equilibrium by (17 months and 27 days) compared with CFV which needs to (20 months and 10 days). This study recommended that this is an opportune time to using Islamic finance system in order to reduce reliance on conventional system products and move into Islamic finance system which is closer to equity-based products and risk-sharing instruments. This paper uses empirical evidence to compare between Islamic finance and conventional finance. To the best of the authors' knowledge, the study on the role of Islamic finance industry towards reducing of economic obstacles, particularly in the context of Jordan economy. © 2020, Common Ground Research Networks. ABSTRACT: This study seeks to expand the five dimensions of the Hofstede's model of national culture with a sixth dimension that is religiosity. This study was conducted in an Arab country that is Jordan. The researchers developed the questionnaire items related to the religiosity. This study aims

to determine the impact of these six dimensions on two factors of change management: the change culture and outcomes (as two dependent variables). This study considered the change culture as a mediator variable affecting the relationship between the six dimensions of national culture and the outcomes of change. Results of the study revealed, through field primary data collected from the questionnaire, that all dimensions of national culture, with the exception of the collectivism, have a positive and significant impact on the change culture, while only three dimensions (uncertainty avoidance, long-term orientation, and religiosity) positively affect the change outcomes. ABSTRACT: Software program testing is the procedure of exercising a software component with a selected set of test cases as a way to discover defects and assess quality. Using software testing automation, especially the generating of testing data increases the effectiveness and efficiency of software testing as a whole. Instead of creating testing data from scratch, Big Data (BD) offers an important source of testing data. Although it is a good source, there is a need to select a proper set of testing data for the sake of selecting an optimal sub-domain input values from the BD. To refine the efficiency of software testing, this paper proposes a hybrid Genetic Algorithm and Binary Search (BSGA) technique that is used for detecting the error-prone path in a program. The BSGA combines the Genetic Algorithm (GA) with the Binary Search (BS) algorithm that uses the BD as input values for the program path coverage, and thus enhances the software testing. The BSGA represents a robust nonlinear search technique and a better quality solution, which therefore results in a cost reduction in the software testing industry. The experiments show that the results approved the impact of using the BS to enhance the performance of the GA, in terms of finding optimal test cases and test data for the input Big Data domain values. Whereas, these results minimize the cost of testing. © 2020, Tech Science Press. All rights reserved.

ABSTRACT: Cosmeceuticals are cosmetic products with biologically active ingredients purporting to have medical or drug-like benefits. Cosmeceuticals are commonly used in skincare regimens to maintain healthy skin and improve visible signs of aging. A review of the biomedical literature was conducted using a peer-reviewed journal articles to identify laboratory, animal, and clinical studies that evaluated the most recent breakthroughs in the biological properties and potential dermatologic uses of the different bioactive ingredients used in cosmeceuticals. Bioactive ingredients in cosmeceutical products are derived from various sources including food, herbs, tissue engineering and stem cell therapy. Their bioactive components and pharmacologic activities have been shown to provide dermatologic benefits with potential applications for skin rejuvenation, photo protection, wound healing, and more. The information provided by this article is valuable to get the picture of the latest trends and also helpful for clinicians and related manufacturing companies. Despite several developments in this field, extensive research is required for performing successful and precise clinical trials in the future. Further improvements would enable the researchers to develop new products in this field. © 2020, SILAE (Italo-Latin American Society of Ethnomedicine). All rights reserved.

ABSTRACT: One of the most important challenges in fluid mechanics, gas dynamics, and hydraulic machinery fields is measuring the flow velocity with high accuracy. It is more important in large systems; such as thermal power stations, large scale power generations, and combined cycle power plants. The exact estimation of the measurement uncertainty inflow velocity is extremely important in evaluating the accuracy of the measurement. This work describes the problem of estimating measurement uncertainty when there are two or more dominant components of the uncertainty budget. Two methods, analytical and numerical methods are used to study the comparative analysis for the results of determining the expanded uncertainty of measurement using two methods: analytical method and the numerical method. The analytical method uses the law of uncertainty propagation and is based on the estimation of uncertainty values of type A and B, while the numerical technique depends on the evaluation of measured samples by the Monte Carlo method using a random number generator. The aim of this article is to show the Monte Carlo method as an alternative way to determine the distribution of individual components of the measurement uncertainty budget. Also, the measurement of liquid flow velocity by an ultrasonic method has been analyzed, which is commonly used due to high measurement accuracy and non-invasiveness. Due to the complexity of the equation defining the measured flow velocity, determining the measurement uncertainty is not an easy task. © 2020, World Scientific and Engineering Academy and Society. ABSTRACT: New synthetic 36 fluoroquinolones (FQs) have been developed. Their anti-inflammatory and 2,2-diphenyl-1-picrylhydrazyl (DPPH)- and nitric oxide (NO)- radicals scavenging propensities were delineated in vitro. The anti-inflammation related NO radical scavenging bioactivities of new FQs compounds against lipopolysaccharide (LPS)-prompted NO production in RAW 264.7 macrophages were examined using the Griess assay. Selectively nitro FQ compound 2-AnisCEtA exerted an exceedingly superior anti-inflammatory effects ($p < 0.001$ vs. indomethacin IC50 value of $103.35 \pm 4.4 \mu\text{M}$) while 7 nitro FQs, 10 reduced FQs and 9 triazolo FQs were moderately more efficacious than indomethacin. The remaining 9 Compounds could display appreciable anti-inflammatory capacity. Unequivocally their DPPH radical scavenging effects were of substantially lesser efficacy than ascorbic acid. Using $400 \mu\text{M}$ methylglyoxal as the choice glucotoxicity concentration in RAW264.7 macrophages; it was shown that 18 out of 36 FQs could exhibit an exceedingly more superior than or significantly comparable cytoprotection against methylglyoxal-induced carbonyl toxicity to antiglycation aminoguanidine. Suggestively dual modulation of glycation-inflammation can be linked with FQs lipophilicity-chelating properties. FQs can serve as scaffolds for the development and designing of new druggable deglycation and antiglycation therapeutic candidates via duality of antiglycation-antiinflammatory capacities. © 2020 Har Krishan Bhalla & Sons.

ABSTRACT: Programmable Logic Controllers (PLCs) have dominated in the automation and in the controlling processes in industrial environments in the past decade. However, with the emergence of Internet of Things (IoT), the controlling and the automation processes have escalated to complex

levels. Data should be harvested from different locations to make one decision for different devices. Communication and networking over the Internet is an important feature of the new controlling process. Moreover, smart control requires the implementation of different heavy-computing machine learning in Clouds or in edge devices. These new issues require an upgrade of the ossified PLC design. In this paper, a new soft-PLC device has been designed. The new design tackles three main issues. First, designing a simple interface to read data from analog and serial sensors without any modifications of the PLC. Second, proposing an enhanced LADDER programmer (ELADDER) to allow networking between servers and PLCs without the complexity of learning other programming languages. Finally, enhancing the computational power of the PLC by introducing multi-threading to control different processes in a parallel method. The proposed soft-PLC has been designed utilizing a system on board for the computational process and a micro-controller for sensor interfacing. The proposed soft-PLC has been tested in a Lab with different controlling tasks, reporting and networking. © 2020 Praise Worthy Prize S.r.l.-All rights reserved.

A 2-dof skin stretch display on palm: Effect of stimulation shape, speed and intensity (2020) Lecture Notes in Computer Science (including subseries Lecture Notes in Artificial Intelligence and Lecture Notes in Bioinformatics), .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091302946&doi=10.1007%2f978-3-030-58147-3_2&partnerID=40&md5=33a944282b68b6be2d37ea349a154046

AFFILIATIONS: Al Zaytoonah University of Jordan, Amman, 11947, Jordan

ABSTRACT: Skin stretch has been widely utilized as a tactile display in different haptic applications. However, there has been little research focusing on skin stretch as a modality on the palm of the hand. In this study, a two dimensional tactor apparatus was designed and built to investigate the effects of stimulation speeds, shapes and intensities of skin stretch display on the palm. The tactor moved across the palm at different speeds to create stimulation shapes on the skin. Subjects reported the intensity of perceived stimuli and predicted speed rate of the tactor and stimulation shape and size. The results showed that there were statistically significant differences in the intensity of perceived tactile displays between different stimulation shapes and sizes. The results also showed the sizes and intensity of the stimulus grow larger with slower tactor speeds. © The Author(s) 2020.

ABSTRACT: This research examines the mobile-government services adoption, by combining both UTAUT and GAM models with adding new constructs for explaining the key factors that affect on adoption of mobile-government services. As a result, the study identified the critical factors that influence users' to adopt the system, and developed an integrated model as a powerful tool that assists in the adoption process of mobilegovernment applications. The novelty of this research will be an added value to the body of knowledge and its implications will be vital for researchers and decision/policy makers who are willing to make a change. © 2020, iJIM. The development of a new understanding of symptom cluster during pregnancy using the mediation model (2020) Open Public Health Journal, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091142301&doi=10.2174%2f1874944502013010388&partnerID=40&md5=50a3c9c50a57cd392dbb96779e9aa60d>

AFFILIATIONS: School of Nursing, Al-Zaytoonah University, Amman, Jordan

ABSTRACT: Background: Fatigue, depression and sleep disturbance are regarded as a symptom cluster associated with pregnancy. The mediation effect of sleep disturbance on the relationship between depression on fatigue is still unclear. Objective: To assess the mediation effect of sleep disturbance on the established relationship between depression and fatigue among pregnant women. Methods: This study used a cross-sectional design. Pregnant women (n = 130) at a private gynecology and obstetrics outpatient clinic in Amman, Jordan. Participants were recruited to complete the Brief Fatigue Inventory, the Insomnia Severity Index, and the Zung depression scale, in addition to the demographic questionnaire. The mediation effect was examined through a Hierarchical Multiple Regression model. Results: A total of 130 pregnant women participated (mean of ages= 27.3). Of those, 41.5% were

in the first trimester, while the rest were in their second and the third trimesters (27.7%, and 30.8%, respectively). Regression analysis indicated that about 23% of the variation of fatigue was explained by depression. Nonetheless, 47% of the variance of fatigue was explained by depression after identifying the mediation effect of sleep disturbance. Conclusion: The mediation role of sleep disturbance between depression and fatigue added a new approach to the assessment and prognosis of fatigue during pregnancy. © 2020 Suleiman et al.

ABSTRACT: In this paper, the effect of different node placement strategies on maximizing the lifetime of heterogeneous wireless sensor network is investigated. Normal, exponential, and uniform node placement distributions are utilized. Maximum likelihood estimation technique and the locations of nodes with uniform distribution are utilized to estimate the defining parameters of the normal and the exponential distributions. Stable Election Protocol (SEP) and LEACH protocols are used to evaluate the performance of different node location distributions in terms of stability and instability periods, network lifetime and throughput. It has been noticed that different node distributions have almost the same stable and unstable regions in SEP protocol with the same heterogeneity parameters. Moreover, an improvement of 25% in stability region is noticed in SEP protocol with uniform and normal distributions compared to LEACH protocol with the same heterogeneity parameters. Likewise, an improvement of 30% is noticed in stability region of the exponential distribution compared to LEACH protocol with the same heterogeneity parameters. It has been also shown that normal distribution has a slightly larger throughput compared to the uniform and exponential distributions. © 2020 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: This paper aims at introducing a reading in selected models of the Modern Arab Theatre, which tackled the city of Jerusalem in the past and present. The selected models are namely: "Martyrdom on the Al-Aqsa Gates" by the Iraqi author Qasem Mohammed, "The Way to Holy Jerusalem" by the Jordanian author Ibrahim Al Sa'afeen, and "without an Address" by the Jordanian author Mufleh Al Adwan. The focus comes to reiterate the value of the city and Al Aqsa Mosque historically and symbolically and its status for Arabs and Muslims. It also sheds light on how playwrights are affected by the suffering of Jerusalem and its people, and how keen they are to appropriate their plays to the painful reality and the harsh calamities that hit Jerusalem in implicature sometimes and explicitly at other times. The reason is that they seek the utilization of inspiring words aiming at the termination of the occupation of Jerusalem and liberating it. © 2020 University of Jordan, Deanship of Scientific Research. ABSTRACT: This paper aims to investigate the effect of credit risk, liquidity risk and bank capital on bank profitability over a nine-year period (2010–2018) by examining empirical evidence from an emerging market. This study is grounded on econometric panel data using GMM methods. The results indicate that credit risk, liquidity risk, and bank capital variables have an impact on bank profitability. Understanding the Basel requirements and their importance by local and foreign bank managers is significant as enforcing them can improve the efficiency of the bank and increases profitability while barricading it from risk. © 2020 The Author(s). ABSTRACT: The aim of this research is to critically review absorptive capacity conceptualization and operationalization. Although Cohen and Levinthal [1] emphasized multidimensionality of absorptive capacity, researchers have conceptualized it as a unidimensional construct, encompassing knowledge acquisition, assimilation, transformation and exploitation. From epistemological and ontological perspectives, knowledge acquisition and assimilation differ from other capacities, namely, knowledge transformation and exploitation. Knowledge acquisition and assimilation represent knowledge conversion from explicit-to- tacit and tacit-to-tacit processes that should be done at the individual level of analyses. Accumulated and assimilated knowledge with organization learning facilitate the transformative process to exploit knowledge for business purposes. Thus, absorptive capacity (ACAP) should be conceptualized and operationalized as a multilevel, multidimensional and latent construct involving distinctly dynamic capabilities. It involves a new way of thinking from epistemological and ontological perspectives. In addition, there is a paucity of research regarding ACAP measurement and specification. The current research provides a theoretical framework on how the measurement of ACAP should be taken in terms of its relation to indicators and order level. © 2020, The Editor(s) (if applicable) and The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: Background: The Human Leukocyte Antigen (HLA) class II genes, particularly the HLA-DR and-DQ loci, have been shown to play a crucial role in Type 1 Diabetes (T1D) development. Objective: This study is the first to examine the contribution of the HLA-DR/DQ alleles and haplo-types to T1D susceptibility in Jordanians. Methods: Polymerase chain reaction sequence-specific primers (PCR-SSP) were used to genotype 41 Jordanian healthy controls and 50 insulin-dependent diabetes mellitus (IDDM) patients. Results: The following alleles were found to be significant high risk alleles in T1D Jordanian patients: DRB1*04 (OR=3.95, $p<0.001$), DRB1*0301 (OR=5.27, $p<0.001$), DQA1*0301 (OR=5.67, $p<0.001$), DQA1*0501 (OR=3.18, $p=0.002$), DQB1*0201 (OR=2.18, $p=0.03$), DQB1*0302 (OR=5.67, $p<0.001$). However, Jordanians harboring the DRB1*0701 (OR=0.37, $p=0.01$), DRB1*1101 (OR=0.2, $p=0.01$), DQA1*0505 (OR=0.31, $p=0.02$), DQA1*0103 (OR=0.33, $p=0.04$), DQA1*0201 (OR=0.45, $p=0.04$), DQB1*0301 (OR=0.23, $p=0.001$), DQB1*0501 (OR=0.18, $p=0.009$) alleles had a significantly lower risk of developing T1D. Conclusion: A strong positive association of DRB1*04-DQA1*0301-DQB1*0302 (OR=5.67, $p<0.001$) and DRB1*0301-DQA1*0501-DQB1*0201 (OR=6.24, $p<0.001$) putative haplotypes with IDDM was evident in Jordanian IDDM patients whereas DRB1*1101-DQA1*0505-DQB1*0301 (OR=0.23, $p=0.03$) was shown to have a protective role against T1D in Jordanians. Our findings show that specific HLA class II alleles and haplotypes are significantly associated with susceptibility to T1D in Jordanians. © 2020 Bentham Science Publishers.

ABSTRACT: The paper introduces conformable fractional analogs of some basic concepts related to probability distributions of random variables, namely density, cumulative distribution, survival and hazard functions. Moreover, it introduces conformable fractional analogs to expected values, r th moments, r th central moments, mean, variance, skewness and kurtosis. In addition, it introduces conformable fractional analogs to some entropy measures, namely, Shannon, Renyi and Tsallis entropy measures together with Awad sup-entropy counter parts of these three measures. All these concepts had been applied to the conformable fractional chi-square probability distribution. © 2020 the author(s).

ABSTRACT: This research presents a methodology for user identification using ten English words handwritten on smartphone and mini-tablet. This research considers three features, namely Signature Precision (SP), Finger Pressure (FP), and Movement Time (MT) that were extracted from each of the ten English words using dynamic time warping. The features are then used individually and combined for the purpose of user identification based on the Euclidean distance and the k-nearest neighbor classifier. We concluded that the best identification accuracy results from the combinations of the SP and the FP features with average accuracies of 74.55% and 69% were achieved on small smartphone and Minitablet respectively using a dataset of 42 users. © 2020 International Association of Online Engineering.

ABSTRACT: The influence of electrolysis conditions at different electrolyte compositions on the phase formation and properties of coatings obtained by microarc oxidation (MAO) on an aluminum alloy AMg6 was studied. For electrolysis, three types of electrolytes were used: alkaline electrolyte ((KOH) solution in distilled water), silicate electrolyte (with different percentages of Na₂SiO₃ component) and complex alkaline silicate electrolyte with liquid glass (1/12 g/l Na₂SiO₃) and potassium hydroxide (1/6 g/l KOH). An analysis of the results showed that the choice of electrolyte type and conditions of the microarc oxidation process allows a wide variation in the phase-structural state, thickness and properties of the AMg6 aluminum alloy. The criterion for the expected phase-structural state of the coatings as a result of microarc oxidation is the completeness of the γ -Al₂O₃→ α -Al₂O₃ transformation process during coating formation. The use of an alkaline electrolyte does not allow achieving a high hardness of the coating due to the formation of the γ -Al₂O₃ phase and the absence of thermodynamic conditions for the γ -Al₂O₃→ α -Al₂O₃ transition. When using a silicate electrolyte, it is possible to significantly increase the growth rate of the coating, but at the same time, the presence of a large specific Si concentration stimulates the formation of mullite and an amorphous-like phase. The use of a combined alkaline silicate electrolyte (with different percentages of KOH+Na₂SiO₃) with a low content (6 g/l) of Na₂SiO₃ in solution stimulates the formation of mullite. This is manifested to the greatest extent with the lowest content (1 g/l) of the KOH component. At a higher content (2 g/l) of the KOH component, the processes characteristic of an alkaline electrolyte become dominant. This leads to an incomplete transformation reaction and the formation of only the γ -Al₂O₃ phase. The achievement of the thermodynamic conditions of the γ -Al₂O₃→ α -Al₂O₃ conversion became possible with an increase in the specific Na₂SiO₃ content in the electrolyte solution to 12 g/l. In this case, MAO coatings were formed on the AMg6 alloy with the highest hardness of 1500 kg/mm² and high electric strength of 12 V/μm. © 2020 V. Subbotin, O. Sobol, V. Belozarov, Ubeidulla F. ABSTRACT: Background: Excessive health anxiety can lead to significant disorders such as hypochondriasis. In children, assessment of the severity of health anxiety has been performed using the Childhood Illness Attitudes Scales (CIAS); however, no validated Arabic version of this tool exists. Aims: This study developed and validated an Arabic version of the CIAS questionnaire in Jordan in 2017 to provide a tool to measure the severity of health anxiety in the Arabic-speaking world. Methods: The CIAS was translated from English to Arabic then back-translated by a different translator and the 2 versions were compared before cognitive interviews were conducted. The final version of the questionnaire was circulated to 597 children. Of these, 200 were asked to retake the questionnaire after 10-15 days to evaluate test-retest reliability. Confirmatory factor analysis (CFA) on the 4-factor model suggested by the original questionnaire version was performed. Internal consistency and test-retest reliability were evaluated. Results: The CFA showed good fit (goodness of fit index = 0.92) with the 4-factor model of fears, help seeking, treatment experience, and symptom effects. Test-retest reliability was high and the model had good discriminant validity and internal consistency. Conclusions: The Arabic version of the CIAS provides a suitable tool to investigate the prevalence and severity of childhood anxiety in the Middle East. © World Health Organization (WHO) 2020.

ABSTRACT: There is an increasing demand of cosmetics for maintaining and enhancing human beauty, but cosmetics products, may include a number of harmful toxins which can be produce sever side effect. Global interest toward Herbal cosmetic is rising because of safety, as a products or homemade formula. The aim of the present study is to know the role of social media on consumers' health behavior toward Herbal cosmetic. depth interviews are used to collect the data by asking face-to-face to the respondent. Our results finds, that most of people in Jordan preferred Herbal cosmetic due to its safety, and 61.33% of sample agree that social media played an important role in switching them desire from Organic cosmetic to Herbal cosmetic, and Social Media Stars are the mean influencer in desire change. The innovative way to advert natural cosmetics in Jordan, throw inviting Social media influencers to drive people into Herbal cosmetic. © 2020 by Advance Scientific Research. ABSTRACT: In the Islamic religion, fasting is considered as one of the Islam's cornerstones. In Jordan, there is a belief that traffic accidents are higher in the month of Ramadan compared with other months of the year. The major objectives of this study were to investigate the impact of fasting on traffic accidents and model traffic accidents in Ramadan. To achieve these objectives, twelve major urban multilane segments in Amman, the capital of Jordan, were selected. Data on hourly, daily and monthly traffic volumes and accidents from 2013 to 2017 were obtained from related sources. Analysis results revealed that daily traffic volume values and hourly peak volume values in Ramadan as well as before and after Ramadan are approximately comparable. In contrast, results indicated that daily accident rate and number of accidents in Ramadan were found to be significantly larger than those before or after Ramadan. Using time-series analysis, ARIMA (9, 8) and ARIMA (7, 4) were found to be suitable to model daily accident rate and number of accidents in Ramadan, respectively. Finally, it was recommended to conduct behavioral and medical studies in order to clarify the issue of accident increase in Ramadan. © 2020 JUST. All Rights Reserved.

ABSTRACT: Guided by social-exchange-theory, present study examined transformational leadership (TL) as an antecedent for organisational commitment (OC) and its subsequent influence on job performance (JP). Through using a structured self-administered questionnaire, data were collected surveying (439) non-executive employees operating in (15) banks listed in Amman-Stock-Exchange through non-probability purposive sampling. Structural-equation-modelling using SMART-PLS was utilised and the result reported that TL components achieved 44%, 42.5% and 35.4% of the variance in affective, continuous and normative commitment respectively. Idealised influence did not have any significant effect on any level of OC, whereas intellectual stimulation influenced the three levels of OC. Individualised consideration influenced only affective and continuous commitment, and inspirational motivation influenced only normative and continuous commitment. Moreover, only affective commitment was significant in influencing JP and accounted for 82% of the variance. Following the results, discussion and implication were provided. Also, directions and suggestions for future researches were presented. © 2020 Inderscience Enterprises Ltd.. All rights reserved.

AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Background: Lately, diabetes has become the main health concern for millions of people around the world. Dipeptidyl peptidase-IV (DPP-IV) inhibitors have emerged as a new class of oral antidiabetic agents. Formerly, acridines, N4-sulfonamido-succinamic, phthalamic, acrylic and benzoyl acetic acid derivatives, and sulfamoyl-phenyl acid esters were designed and developed as new DPP-IV inhibitors. Objective: This study aims to develop a pharmacophore model of DPP-IV inhibitors and to evaluate phenanthridines as a novel scaffold for inhibiting DPP-IV enzyme. In addition, to assess their binding interactions with the enzyme through docking in the binding site of 4A5S (PDB). Methods: Herein, Quantum-Polarized Ligand Docking (QPLD) and ligand-based pharmacophore modeling investigations were performed. Three novel 3,8-disubstituted-6-phenyl phenanthridine derivatives 3-5 have been designed, synthesized and characterized. In vitro biological testing against DPP-IV was carried out using fluorometric assay kit. Results: QPLD study demonstrates that compounds 3-5 forms H-bond with Lys554, Trp629, and Tyr631, besides charge transfer interaction between their aromatic rings and the aromatic rings of Tyr547 and Tyr666. Moreover, they fit the three pharmacophoric point features of DPP-IV inhibitors and were proven to have in vitro DPP-IV inhibitory activity where compound 5 displayed a % inhibition of 45.4 at 100 μ M concentration. Conclusion: Phenanthridines may serve as a potential lead compound for developing new DPP-IV inhibitors as a promising antidiabetic agent. Computational results suggest future structural simplification. © 2020 Bentham Science Publishers.

ABSTRACT: Background: Recommender Systems use user interests to provide more accurate recommendations according to user actual interests and behavior. Methods: This work aims at improving recommender systems by discovering hidden user interests from the existing interests. User interest expansion would contribute in improving the accuracy of recommender systems by finding more user interests using the given ones. Two methods are proposed to perform the expansion: Expanding interests using correlated interests' extractor and Expanding interests using word embeddings. Results: Experimental work shows that such expanding is efficient in terms of accuracy and execution time. Conclusion: Therefore, expanding user interests proved to be a promising step in the improvement of the recommender systems performance. © 2020 Bentham Science Publishers.

Experimental investigation on the effect of fire-resistant coatings on combustion and flame spread characteristics by medium density fiber boards commonly used in Jordan

(2020) International Review of Mechanical Engineering, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85085680816&doi=10.15866%2fireme.v14i1.18498&partnerID=40&md5=cccf147cb4b6f9f66a887f6d0a2637df

Mechanical Engineering Department, Al-Zaytoonah University, Jordan

ABSTRACT: The rate of flame spread on surfaces indicates how quickly the hazardous stages will be reached in low ventilation compartments. Building codes and standards want building authorities to achieve the minimum flame spread requirements. Several types of wood have been used in the series of conducted tests for this research since most of the furniture products in Jordan depend on it. Jordan imports all of its needs from natural wood at a high cost. Medium density fiberboard has become very popular in Jordan as an alternative source of wood. For comparison, white pine and Medium density fiberboard have been tested according to the methodology of American Society for Testing and Materials standard using lateral ignition and flame transport apparatus. Ignition experiments of treated wood with fire resistant paint have been performed. The aim of this work is to investigate the effect of fire resistant paint on the performance of tested specimens by comparing ignitibility and flame spread parameters between unpainted and painted specimens. A comparison of six parameters that have been identified to demonstrate the capability of wood specimens to withstand a flame when fire resistant paint is applied will be presented. The sought parameters included are the minimum heat flux, the ignition time, the ignition parameter, the thermal inertia, the flame spread rate, and the peak heat release rate. The results have showed the propensity of specimens for flaming have been decreased with fire resistant paint. Flaming ignition temperature for pine specimen has been increased from 460 K to 530 K due to fire resistant painting. Furthermore, the flame of painted wood is weaker than the unpainted wood specimen while the flame spread parameter is lower for painted specimens. It has been 2.61 kW2/m3 for unpainted compared with 1.78 kW2/m3 for painted Medium density

fiberboard. © 2020 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: The objective of the study is to investigate the mediating role of the productivity of the banks sector in Jordan based on the relationship between human resources and strategic performance from the point of view of the senior management managers and functional unit managers (human resources, marketing, finance and accounting). Human resources were measured through human resource activities. The population of the current study represented all the commercial banks in Jordan, the total number of which is 26. A survey questionnaire is prepared based on the published literature, and the data are collected from 371 respondents from the targeted banks. The necessary tests to ensure reliability and validity are performed using SPSS. The results indicate that human resources positively affected strategic performance and productivity. The findings also revealed that productivity positively mediated the relationship between human resources and the commercial banks' strategic performance. © 2020 by the authors; licensee Growing Science.

ABSTRACT: Background. Delaying seeking health care for patients with acute coronary syndrome (ACS) causes high mortality and morbidity with variations among men and women regarding reasons for this delay. Objectives. This study explored factors associated with prehospital delay among men and women experiencing acute coronary syndrome for the first time in Jordan. Methods. 35 men and 33 women with ACS admitted and treated at the coronary and postcoronary care units. Results. Themes emerging from the data are knowledge about ACS, the resources related to health care, and concerns around family wellbeing. Owing to the traditional roles of men and women within the family, women felt responsible for maintaining the family, assisting in the financial conditions, and supporting family coherence by delaying hospitalization. Men were worried about the structural safety and maintenance of the family. Conclusion and Implications. Prehospital delay is common among first-timer ACS patients from both sexes, and thus, increasing awareness about ACS among the public from all age groups is necessary. Availability of specialized health care centers and equity in health care services are vital to improve public confidence in these health care settings and health outcomes. © 2020 Lourance A. ABSTRACT: The epidermal growth factor receptor (EGFR) belongs to the ERBB family of tyrosine kinase receptors. EGFR signaling cascade is a key regulator in cell proliferation, differentiation, division, survival, and cancer development. In this review, the EGFR structure and its mutations, signaling pathway, ligand binding and EGFR dimerization, EGF/EGFR interaction, and the progress in the development of EGFR inhibitors have been explored. © 2020 Bentham Science Publishers.

The effect of color use in designing instructional aids on learners' academic performance (2020) Journal of E-Learning and Knowledge Society, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085475051&doi=10.20368%2f1971-8829%2f1135246&partnerID=40&md5=971f80a5cfccf1189d25d6d4da974f4b>

AFFILIATIONS: Al-Zaytoonah University of Jordan, Faculty of Arts, Amman, Jordan

ABSTRACT: As a result of the rapid development in educational technology, the design of instructional aids has been gaining a lot of significance. To date, researchers have studied the effect of using instructional aids on the learners' academic performance, and a positive effect has often been proven. This study reviews and analyses existing literature and empirical evidence in relation to color use in designing instructional aids. Two major areas reviewed in the study are the Color Theory and the psychological and physiological impacts of color on learners. The results show that using colors in designing instructional aids plays an important role in enabling learners to concretize concepts and relations. Results also indicate that the effects of using color reflect on both the learners' and the teachers' emotional experiences. The results of the study may benefit educators, teachers, and pre-service teachers in designing the right and favourable learning environments for their teaching strategies. © Italian e-Learning Association.

ABSTRACT: Jamming attack is one of the most common threats on wireless networks through sending a high-power signal to the network in order to corrupt legitimate packets. To address Jamming attacks problem, the Particle Swarm Optimization (PSO) algorithm is used to describe and simulate the behavior of a large group of entities, with similar characteristics or attributes, as they progress to achieve an optimal group, or swarm. Therefore, in this study enhanced version of PSO is proposed called the Improved PSO algorithm aims to enhance the detection of jamming attack sources over randomized mobile networks. The simulation result shows that Improved PSO algorithm in this study is faster at obtaining the location of the given mobile network at which coverage area is minimal and hence central compared to other algorithms. The Improved PSO as well was applied to a mobile network. The Improved PSO algorithm was evaluated with two experiments. In the First experiment, The Improved PSO was compared with PSO, GWO and MFO, obtained results shown the Improved PSO is the best algorithm among others to fine obtain the location for jamming attack. In Second experiment, Improved PSO was compared with PSO in mobile network environment. The obtain results prove that Improved PSO is better than PSO for obtaining the location in mobile network where coverage area is minimal and hence central. © 2020 Science and Information Organization.

Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Purpose: the aim of this study is to evaluate patients' experience of adverse drug reactions (ADRs) associated with statins "HMG-CoA-reductase inhibitors" use and the patients' attitude toward these ADRs in Jordan, in terms of reporting ADRs, patient adherence and patients' beliefs, from the patients' point of view. Methods: A cross sectional study was used via a paper-based questionnaire that was distributed among community pharmacies in the capital Amman to be filled

by eligible adult patients. A total of 153 patients had completely answered the questionnaire. Results: A percentage of (72.5%) of the patients reported experiencing ADRs associated with statin drugs. Percentages of patients experienced symptoms related to myopathy, peripheral neuropathy, and some incidents of memory loss problems were (64.7%) (41.2%) (35.9%), respectively. The prevalence of ADRs was influenced by drug generics; simvastatin showed the highest rate of ADRs. Patient adherence to statin therapy was affected by the presence of ADRs, only 58.2% of participants were adherent to their statin drug. Conclusion: There were differences between different statin agents in the pattern of reporting ADRs. The variability between associated ADRs needs to be considered by physicians when prescribing this drug. Determining the best tolerated statin drug may enhance the patient's adherence. © 2020 DSR Publishers/The University of Jordan. All Rights Reserved.

The impact of financial policy on economic growth in Jordan (2000-2017): An ardl approach [Utjecaj finansijske politike na gospodarski rast u Jordanu (2000-2017): Ardl pristup] (2020) Ekonomski Pregled, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084058998&doi=10.32910%2fep.71.2.1&partnerID=40&md5=0482544674fcdabb6ce8aa70c73538e7>

AFFILIATIONS: Al Zaytoonah University of Jordan, Faculty of Business, Jordan

ABSTRACT: The aim of this paper is to examine the impact of financial policy on rate of economic growth in Jordan for the period of (2000-2017) taking into the considerations the fluctuations of taxation system. Autoregressive Distributed Lag (ARDL) approach has been utilized in order to analyze the long term relationship between study variable which are; money supply (M2), domestic credit provided by banks (DCBS) and real Gross Domestic Product GDP. The results shows that, money (M2) and domestic credit provided by banks (DCBS) can effects on GDP in Jordan for the study period. The taxation system in Jordan has been fluctuated many times during 2017 and 2018, which made the data partly not available. This led the research-ers to spend long time to find an accurate data in order to finalize this study. This study will add good practical evidence on the impact of changing the taxation system positively or negatively on the economic growth. © 2020, Hrvatsko Drustvo Ekonomista. All rights reserved.

ABSTRACT: Purpose: The purpose of this study is to investigate the role of top management support and organizational capabilities in achieving e-business entrepreneurship. Design/methodology/approach: Data were collected through a self-administered questionnaire from 26 manufacturing firms with a sample of 282 respondents. Data were analyzed using SmartPLS. Findings: The results show a significant impact of top management support on e-business entrepreneurship. The findings also show a direct impact of organizational capabilities, involving organizational agility and organizational learning on the e-business entrepreneurship. Moreover, the results of the study highlight the pivotal role of top management in preparing an organizational environment that fosters organizational learning and organizational agility capabilities to establish e-business entrepreneurship. Originality/value: This study contributes to the body of knowledge and understanding of e-business entrepreneurship and the pivotal role of top management support in today's very dynamic environment. Furthermore, the present study offers new insights into the impact of organizational capabilities on establishing e-business entrepreneurship. © 2020, Emerald Publishing Limited.

Computer Science Department, Al Zaytoonah University of Jordan, Jordan

ABSTRACT: This paper studies the problem of clinical MRI analysis in the field of lumbar intervertebral disk herniation diagnosis. It discusses the possibility of assisting radiologists in reading the patient's MRI images by constructing a 3D model for the region of interest using simple computer vision methods. We use axial MRI slices of the lumbar area. The proposed framework works

with a very small number of MRI slices and goes through three main stages. Namely, the region of interest extraction and enhancement, inter-slice interpolation, and 3D model construction. We use the Marching Cubes algorithm to construct the 3D model of the region of interest. The validation of our 3D models is based on a radiologist's analysis of the models. We tested the proposed 3D model construction on 83 cases and We have a 95% accuracy according to the radiologist evaluation. This study shows that 3D model construction can greatly ease the task of the radiologist which enhances the working experience. This leads eventually to a more accurate and easy diagnosis process. ABSTRACT: The process of identifying training needs is an important factor for training teachers in general and mathematics teachers in particular, which helps to achieve the desired goals of the educational process. This study pointed to distinguish the training needs of the Mathematics teachers in the light of integrating technology in teaching from their points of view. The descriptive approach, which branches into the methodology of studies of mutual relations, was used as a research methodology and a questionnaire was developed for the training needs of mathematics teachers as a study tool. The study population consisted of all teachers in private schools at Qwaisma district in Jordan country which is (80). The stratified random example of the study was (70) members with (40) females and (30) males. The study conclusion explains that the needs were medium emphasized on (35) training needs. The result also indicates that there was no statistically significant difference in assessing the training needs of Mathematics teachers belonging to the gender and experience since both of them need training and qualification to integrate technology in education. This study may contribute to enhancing learning among learners, developing their learning outcomes and encouraging teachers to use technology with education in mathematics in particular as a result of the rapid changes and developments that occur in the curricula. Syrian refugees in Jordan: Burden or Boon

(2020) Research in World Economy, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85082763259&doi=10.5430%2frwe.v11n1p180&partnerID=40&md5=10a6d8edb23e800df9f51e266f0365da

AFFILIATIONS: Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The growing number of Syrian refugees in Jordan broadens the importance of exploring Jordanians' attitudes toward increasingly protracted Syrian refugees. The purpose of this study is to examine the extent to which demographic and socio-psychological variables shape Jordanians' attitudes toward Syrian refugees. The study design is mainly quantitative with a qualitative technique to support and expand upon the study findings. Data were collected from 199 Jordanians over a sixteen-week period in 2015. Quantitative data were analyzed using a hierarchical regression method. The results reveal that attitudes toward Syrian refugees in Jordan are determined by issues such as unemployment and pressure on resources. Income, geographical location and patriotism were found to have statistically significant influence on Jordanians' attitude toward Syrian refugees. Jordanians who live in the North of the country (large number of Syrian refugees reside in this area), high income Jordanians, and Jordanian with high level of patriotism hold the least positive attitudes toward Syrian refugees. © 2020 Sciedu Press.

Al-Balqa Applied University, Jordan

ABSTRACT: Nowadays, various popular knowledge discovery tools are available to help companies extract of hidden predictive information from databases and data warehouses. A huge amount of data provide opportunity to predict future trends and assist businesses to enhance the effectiveness of digital

advertising campaigns in order to promote their products and services through various offered advertisements. The purpose of this study is to investigate knowledge discovery tools (data mining, web mining, OLAP, social media mining) which effect on digital advertising effectiveness (Exposure, Interactivity). data were collected using a developed questionnaire with a random sample 449 employees from the Jordanian telecommunications sector companies. Findings revealed that there is a significantly positive impact of knowledge discovery tools on the effectiveness of digital advertising. It concluded that researched companies should be maintaining the necessary requirements and advanced technical needs and provide financial, administrative support to keep up with knowledge discovery tools for enabling the effectiveness of digital advertising. © 2020 SERSC.

Department of Pharmacology, Faculty of Medicine, The University of Jordan, Amman, Jordan

ABSTRACT: Background: Hypoxic condition induces molecular alterations which affect the survival rate and chemo-resistant phenotype of cancer cells. Objective: The aim of this study is to investigate the influence of intermittent hypoxic conditions on the expression of glucose metabolism genes in breast cancer MCF7 cell line. Methods: The gene expression was analyzed using a polymerase chain reaction-array method. In addition, the cell resistance, survival and migration rates were examined to assure the hypoxic influence on the cells. Results: 30 hypoxic episodes induced the Warburg effect through significant (p -value < 0.05) upregulation of the expression of PCK2, PHKG1, ALDOC, G6PC, GYS2, ALDOB, HK3, PKLR, PGK2, PDK2, ACO1 and H6PD genes that are involved in glycolysis, were obtained. Furthermore, the expression of the major gluconeogenesis enzyme genes was significantly (ANOVA, p -value < 0.05) downregulated. These molecular alterations were associated with increased MCF7 cell division and migration rate. However, molecular and phenotypic changes induced after 30 episodes were normalized in MCF7 cells exposed to 60 hypoxic episodes. Conclusion: It is concluded, from this study, that 30 intermitted hypoxic episodes increased the survival rate of MCF7 breast cancer cells and induced the Warburg effect through upregulation of the expression of genes involved in the glycolysis pathway. These results may increase our understanding of the molecular alterations of breast cancer cells under hypoxic conditions. © 2020 Bentham Science Publishers.

ABSTRACT: Al-Zaytoonah University of Jordan (ZUJ) has recently carried out a large-scale sustainable energy project in an attempt to reduce its operational expenses. This comes as the university is seeking a sustainable campus in the areas of water, energy use and waste management. A number of sustainable development projects have been completed in the last four years and their benefits are just being realized. This paper will focus on these projects and cover their impact in terms of energy savings, sustainability advancement and environmental preservation. An economic analysis of energy savings that resulted from the installation of photovoltaic panel is also presented. In addition, the university had also adopted an irrigation system which utilizes reclaimed water from its wastewater treatment plant. The university also uses a network of dripping perforated pipes to water the vegetation on its campus. The education and awareness of sustainable development is also being disseminated among the students and faculty to create a partnership in sustainable development throughout the campus aimed at implementing a solid waste management plan. The university had also invested in energy efficient light fixtures, and smart appliances in the air conditioning and heating. This paper will detail the practices of the university in this sustainable development transformation. This research is intended to document sustainable development engineering projects which encompasses lean management and aimed at reducing cost and waste. © 2020, Springer Nature Singapore Pte Ltd.

ABSTRACT: Construction processes normally require large exchange of information among project parties on a daily basis. The wide development in Information and Communication Technology (ICT) in recent decades has helped to provide easy processing of data during the life-cycle of construction projects. However, traditional manual methods of filing are still common in the construction industry. The aim of this study is to investigate the use of different electronic documents in the construction projects. A quantitative survey was conducted with 91 respondents from the construction projects' engineers and practitioners. Also, the questionnaire survey investigates if there is an Electronic Document Management System (EDMS) applied in construction projects. Finally, the types of electronic files and the extent of using electronic-based documents were investigated. The results of this study help to understand the context of the documents in the construction projects that may be useful to seek opportunities for improvement, and provide effective solutions for EDMS application. © 2020, Springer Nature Singapore Pte Ltd.

Department of Civil and Infrastructure Engineering, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The construction sector in Jordan is an important economic area, contributing 3.1% to Jordan's GDP in 2016. The sector has changed over the past two decades since the end of gulf war; even changed rapidly in the last five years as a result of Arab spring, companies are encountered with more risks and uncertainties than before. One of major risks in the Jordanian construction industry is time delay, it is considered as inevitable. The goal of this study is to identify risk factors that cause time delay and then to explain the risk matrix for these factors in building projects in Jordan from the point of view of key construction project parties. The approach followed in the study is identifying main risk factors causing time delay. These factors are tabled in a questionnaire form and sent to construction professionals asking for their input in defining the risk framework of the 38 factors in terms of the effect and possibility of each hazard event. The framework was split into three categories (green, orange, and red) by the degree of severity over the time delay of the projects. Assessment of the 38 risk factors reveals that six elements of minor importance as they are in the green zone, 29 factors of medium importance in the yellow zone, and eight factors of critical importance in the red zone. This study's findings and suggestions will direct the project managers to improve their performance, which will have a significant impact on the sector. © International Research Publication House.

ABSTRACT: Data exists in large volume in the modern world, it becomes very useful when decoded correctly to inform decision making towards tackling real word issues. However, when the data is conflicting, it becomes a daunting task to get obtain information. Working on missing data has become a very important task in big data analysis. This paper considers the handling of the missing data using the Support Vector Machine (SVM) based on a technique called Correlation-Genetic Algorithm-SVM. This data is to be subjected to the SVM classification technique after identifying the attribute's correlation and application of the genetic algorithm. The application of the correlation enables a clear view of the attributes which are highly correlated within a particular dataset. The results indicate that apart from the SVM, the application of the proposed hybrid algorithm produces better outcomes identification rate and accuracy is considered. The proposed approach is also compared with depicts the Mean Identification rate of applying the neural network, the result indicate a consistent accuracy hence making it better. © Science and Information Organization.

ABSTRACT: Performance assessment of a two-bed silica gel-water adsorption refrigeration system driven by solar thermal energy is carried out under a climatic condition typical of Perth, Australia. A Fourier series is used to simulate solar radiation based on the actual data obtained from Meteororm software, version 7.0 for Perth, Australia. Two economic methodologies, Payback Period and Life-Cycle Saving are used to evaluate the system economics and optimize the need for solar collector areas. The analysis showed that the order of Fourier series did not have a significant impact on the simulation radiation data and a three-order Fourier series was good enough to approximate the actual solar radiation. For a typical summer day, the average cooling capacity of the chiller at peak hour (13:00) is around 11 kW while the cyclic chiller system coefficient of performance (COP) and solar system COP are around 0.5 and 0.3, respectively. The economic analysis showed that the payback period for the solar adsorption system studied was about 11 years and the optimal solar collector area was around 38 m² if a compound parabolic collector (CPC) panel was used. The study indicated that the utilization of the solar-driven adsorption cooling is economically and technically viable for weather conditions like those in Perth, Australia. © 2020 by the authors. ABSTRACT: Velocity and volume are two important factors that affect the accuracy of streaming data during the transfer process in Big data applications. This paper presents an Adaptive Fuzzy Map Approach that Relies on Fireflies Algorithm for Accruing Velocity of Big Data and Decentralized Decision Making. A key advantage of the Firefly algorithm is the providing of a small number of iterations comparing to the other methods, which minimize the execution time. Furthermore, the Firefly algorithm is significant to the fuzzy logic system to get its inputs. In addition to the Firefly algorithm, Kalman filter is used to scale the distances of Big data datasets, where it generates output by assigning the match and mismatch. This work used a real dataset to extract variables and values through fuzzification function and be able to coexist as categorical data. After 10 dependent runs that are dealing with certain parameters to be available on aspects of velocity and volume of Big data existing in two parameters Goal and Dimension, the meaningful aspect scale by minimizes the randomness parameter by approximately 1.6%. The other aspect is decision making that is gained through exploration and exploitation that is covered by attraction base and attraction_min parameters. The evaluation has been made by making a comparison between the proposed Adaptive Fuzzy Map Approach and ANOVA model based on the variables like travelled time, road, speed, and distance, which showed clear enhancement produced by the proposed Adaptive Fuzzy Map Approach in terms of the accruing velocity of Big Data. © 2020 IEEE.

ABSTRACT: Requirement gathering is a vital step in software engineering. Even though many recent researches concentrated on the improvement of the requirement gathering process, many of their works

lack completeness especially when the number of users is large. Data Mining techniques have been recently employed in various domains with promising results. In this work, we propose an intelligent recommender system for requirement engineering based on association rule analysis, which is a main category in Data Mining. Such recommender would contribute in enhancing the accuracy of the gathered requirements and provide more comprehensive results. Conducted experiments in this work prove that FP Growth outperformed Apriori in terms of execution and space consumption, while both methods were efficient in term of accuracy. © 2020, IICM. ABSTRACT: Purpose: To evaluate the bioactivity of hexane extract of *S. fruticosa* leaves against the cancer cell lines HepG2, MCF-7, and HCT-116, and to determine the chemical composition-function relationship. Methods: Using the liquid-liquid extraction method, the nonpolarL constituent compounds were isolated from the leaves. The cytotoxicity of the hexane extract was evaluated using an SRB assay. Mechanism of action was verified by observing the appearance of apoptotic bodies using fluorescence microscopy, while anti-proliferative activity was assayed via flow cytometry. Results: The results revealed that secondary metabolites in the hexane extract demonstrated the highest cytotoxicity, and thus anticancer activity, against HCT-116 cells, with an IC50 of 17.15 ± 0.78 mg/mL. The presence of apoptotic bodies indicate an ability to induce apoptosis. Flow cytometry results suggest that the secondary metabolites stalled the cell cycle at the G0/G1 phase. Conclusion: The results indicate that *S. fruticosa* hexane extract may be considered a potential new source of the anti-cancer compound, momilactone B. © 2020 The authors.

ABSTRACT: Objective To evaluate the resistance of clinical isolates from two main hospitals in Baghdad, Iraq, against commonly used antimicrobial drugs. Methods Five hundred clinical samples were collected from various sources at two hospitals in Baghdad and subjected to establish microbiological methods to determine their sensitivity to commonly used antimicrobial drugs. The antimicrobial sensitivity test used was the Kirby-Bauer disc diffusion method. Interpretations of the test outcomes were according to international values. Results Out of 500 clinical specimens, it was possible to obtain 239 bacterial isolates. The predominant isolates (74 specimens; 31%) were from throat swabs from which 40 isolates were of GABHS followed by 16 of *Klebsiella pneumoniae*. The second group of isolates were from blood (67 specimens; 28%) in which *Staphylococcus aureus* was represented by 20 specimens followed by *Proteus* species by 16 specimens. The third group of isolates was from the urine specimens (42 specimens; 17.6%). The urine isolates were distributed as *Proteus* spp (20 specimens) followed by bacterial isolates of *Pseudomonas aeruginosa* and *K. pneumoniae* (8 specimens each). The fourth group of isolates was from sputum (40 specimens; 16.7%) in which GABHS represented 18 isolates followed by 12 isolates of *K. pneumoniae*. No *Proteus* spp was isolated from either sputum or purulent wounds. Similarly, no GABHS and *K. pneumoniae* were isolated from purulent wounds. The results of the antimicrobial resistance tests among the bacterial isolates revealed that all isolates were highly resistant to most of the drugs used in this study. GABHS was resistant to all of the drugs except for Cefotaxime (76.7%). *Ps. aeruginosa* isolates were completely resistant to Cefotaxime, Cephalexin and Amoxicillin. Conclusion From this study it is concluded that multiple-resistant bacteria isolates are common and that antimicrobial resistance is widespread in Iraq. A policy to overcome this crisis will be urgently needed. © 2020 DSR Publishers/The University of Jordan.

ABSTRACT: Steganography is the art of concealing the existence of a secret data in a non-secret digital carrier called cover media. While the image of steganography methods is extensively researched, studies on other cover files remain limited. Videos are promising research items for steganography primitives. This study presents an improved approach to video steganography. The improvement is achieved by allowing senders and receivers exchanging secret data without embedding the hidden data in the cover file as in traditional steganography methods. The method is based mainly on searching for exact matches between the secret text and the video frames RGB channel pixel values. Accordingly, a random key-dependent data is generated, and Elliptic Curve Public Key Cryptography is used. The proposed method has an unlimited embedding capacity. The results show that the improved method is secure against traditional steganography attacks since the cover file has no embedded data. Compared to other existing Steganography video systems, the proposed system shows that the method proposed is unlimited in its embedding capacity, system invisibility, and robustness. The system achieves high precision for data recovery in the receiver. The performance of the proposed method is found to be acceptable across different sizes of video files. Copyright © 2020 KSII.

ABSTRACT: Introduction: : The health of the skeletal system is a vital issue in elderlies, hence, screening studies that investigate elders' bone health and identify associated factors affecting bone density are of prime importance. This study purposed to evaluate bone mineral density levels and examine its relationship with socio-demographic and clinical data, and body measurements among Jordanian elderlies aged 60 years and over. Methods: A cross-sectional, descriptive correlational study was used using a systematic random sampling technique to recruit 155 participants in Amman governorate. A questionnaire consists of socio-demographic and clinical data, and a form measures bone mineral density and body mass index were used. Bone mineral density was measured using a CM200 light device, where the T-score used to assess the bone mineral density. The T -scores equal $-1 < -2.5$ indicate osteopenia, while < -2.5 reflect osteoporosis. Results: Of the 151 subjects with completed data, 34.5% osteopenia, and 9.2% osteoporosis. The lowest bone mineral density was observed among older participants, divorced, illiterate, experiencing arthritis disease, and had a family history of osteoporosis and fractures. Sex, marital status, number of cola glasses, and number of cigarettes had a negative correlation with T-score, conversely, arthritis and family history of fracture had a positive correlation. The number of cola glasses was the main predictor. Conclusion: Jordanian elderlies experienced low bone mineral density. Developing appropriate health promotion programs for changing unhealthy behaviors and screening purposes are needed to enhance the knowledge of bones health and reduce the risks of developing osteopenia or osteoporosis. © 2020 UPM Press. ABSTRACT: Steganography is the art of hiding secret data inside digital multimedia such as image, audio, text and video. It plays a significant role in current trends for providing secure communication and guarantees accessibility of secret information by authorised parties only. The Least-Significant Bit (LSB) approach is one of the important schemes in steganography. The majority of LSB-based schemes suffer from several problems due to distortion in a limited payload capacity for stego-image. In this paper, we have presented an alternative steganographic scheme that does not rely on cover images as in existing schemes. Instead, the image which includes the secure hidden data is

generated as an image of a curve. This curve is resulted from a series of computation that is carried out over the mathematical chaotic fractal sets. The new scheme aims at improving the data concealing capacity, since it achieves limitless concealing capacity and disposes of the likelihood of the attackers to realise any secret information from the resulted stego-image. From the security side, the proposed scheme enhances the level of security as the scheme depends on the exact matching between secret information and the generated fractal (Mandelbrot-Julia) values. Accordingly, a key stream is created based on these matches. The proposed scheme is evaluated and tested successfully from different perspectives. © 2020, Zarka Private University. ABSTRACT: There is accumulating evidence in the biomedical literature suggesting the role of smoking in increasing the risk of oral diseases including some oral cancers. Smoking alters microbial attributes of the oral cavity by decreasing the commensal microbial population and increasing the pathogenic microbes. This study aims to investigate the shift in the salivary microbiota between smokers and non-smokers in Jordan. Our methods relied on high-throughput next-generation sequencing (NGS) experiments for V3-V4 hypervariable regions of the 16S rRNA gene, followed by comprehensive bioinformatics analysis including advanced multidimensional data visualization methods and statistical analysis approaches. Six genera—Streptococcus, Prevotella, Veillonella, Rothia, Neisseria, and Haemophilus—predominated the salivary microbiota of all samples with different percentages suggesting the possibility for the salivary microbiome to be restored after quitting smoking. Three genera—Streptococcus, Prevotella, and Veillonella—showed significantly elevated levels among smokers at the expense of Neisseria in non-smokers. In conclusion, smoking has a definite impact on shifting the salivary microbiota in smokers. We can suggest that there is a microbial signature at the genera level that can be used to classify smokers and non-smokers by Linear Discriminant Analysis Effect Size (LEfSe) based on the salivary abundance of genera. Proteomics and metabolomics studies are highly recommended to fully understand the effect of bacterial endotoxin release and xenobiotic metabolism on the bacterial interrelationships in the salivary microbiome and how they affect the growth of each other in the saliva of smokers. © 2019 by the authors. AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The highway capacity manual (HCM) of the United States of America provides techniques for evaluating the capacity and the quality of service of any facility. The present study is an attempt to determine the adequacy of the techniques in US HCM to predict the traffic performance of highways in Al-Anbar, Iraq. Capacity of the multi-lane rural highway that connects two cities in Al-Anbar Governorate, Iraq was estimated. Twenty sections of the multi-lane rural highway were selected and observed for this purpose. Data were collected using the video recording technique. Data were abstracted, processed and then analyzed using computer programs developed for this purpose. Three methods for estimating capacity were applied, which are, the enveloping curve technique, the best-fit technique, and the US HCM methodology. Results showed that the capacity estimation methodology using US HCM has limited application for the heterogeneous traffic situation prevailing in the studied sites. This finding is consistent with that obtained by previous studies in developing countries, such as India, Thailand, and Indonesia. The capacity estimate showed that the US HCM methodology tends to underestimate capacity unlike other techniques because the adjustment factor for the traffic composition is not applicable for all vehicle types in the traffic stream that has different equivalency units. Further, the underestimation is attributed partly by differences in driver behavior, vehicle characteristics, and roadside activities. © Springer Nature Switzerland AG 2020.

ABSTRACT: Objective: The objective was to identify and understand the coping strategies of colorectal cancer (CRC) patients. Methods: A mixed-methods approach including quantitative and qualitative methods was used to collect data from Jordanian patients. In the quantitative phase, we aimed to determine the coping strategies employed in a representative sample (n = 200) of Jordanian adult patients with CRC using the Jalowiec Coping Scale. In the qualitative phase, we aimed to understand these coping strategies through an in-depth and detailed exploration. A sample of ten participants was chosen purposefully based on their coping score in the quantitative phase, and interviews were conducted. Quantitative data were analyzed using SPSS software version 23. Qualitative data were analyzed using directed content analysis. Results: Results from the quantitative phase indicated that evasive coping strategies were used predominantly, followed by confrontive coping strategies and optimistic coping strategies. In contrast, fatalistic and emotive coping strategies had the lowest scores. In addition, the results indicated that the total scores for the effectiveness of coping strategies ranged from 42 to 143, with a mean of 93.45 (standard deviation 13.67); higher scores reflected greater effectiveness. Content analysis in the qualitative phase identified three themes, and subcategories emerged, including perceived collaborative support, increased awareness of treatment, and internal power. Conclusions: CRC patients used different coping strategies to face the new challenge. Oncology nurses can play a pivotal role in enhancing these coping strategies through implementing multidisciplinary programs. © 2020 Wolters Kluwer Medknow Publications. All rights reserved.

ABSTRACT: Many gas chromatography-flame ionization detection (GC/FID) studies are dealing with response behavior of analytes such as alcohols and alkanes. Studies in the field of liquid chromatography (LC)/FID mainly focused on volatile analytes. In contrast, studies on LC/FID by conveyor type interface covered high molecular weight non-volatile biopolymers, whereby no response factors were calculated. With this study, we fill the gap and present response factors of volatile and non-volatile analytes by LC/FID in terms of flow injection (FIA) measurements of the single compounds without an analytical separation by an LC column. In the present study, 56 different compounds such as carboxylic acids, N-heterocycles, halogenated acids, pharmaceuticals, and other compounds were investigated. In some cases, the obtained response factor data confirmed aspects known from GC/FID studies. But this study also disproves several assumptions done in previous response studies as well as the prediction models based upon the experimental data and literature. Especially the response factors and effective carbon number (ECN) values of structural isomers such as pyrazine, pyridazine, and pyrimidine are assumed to be equal in current response prediction models.

Contradictory to these assumptions, the experimental response factors and ECN values of, e.g., the structural isomers pyrazine (RFExp = 0.59; ECNExp = 3.66), pyridazine (RFExp = 0.66; ECNExp = 4.1), and pyrimidine (RFExp = 0.63; ECNExp = 3.93) reveal different experimental response factors and ECN than proposed by response factor prediction models (RFExp = 0.64; ECNExp = 4). Knowledge and Attitudes of Young People toward Mental Illness: A Cross Sectional Study

(2020) Comprehensive Child and Adolescent Nursing, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85074017798&doi=10.1080%2f24694193.2019.1670752&partnerID=40&md5=8ed49175c74a75536c24f5b52d4e4ab5

ABSTRACT: The aim of the study was to investigate young Jordanians' knowledge and attitudes toward people who have a mental illness. A cross sectional design was utilized. A convenient sample of 858 participants aged between 15-24 years old completed a survey. Participants under 19 years were accessed through their schools and those 19 years and above were accessed through universities. Results showed that although the majority of university and school students' responses were generally consistent, they disagreed on 11 items on the survey; for example, 186 (39.3%) of university students agreed that mental illness has a biological origin compared with only 119 (30%) of school students. The majority of young people 737 (85.9%) were willing to learn and 792 (92.3%) felt that they have to help people with mental illness, which make them willing to learn. In conclusion, the findings provide insights for decision makers and researchers in Jordan about young peoples' knowledge and attitudes toward mental illness. Increasing young adults' literacy through introducing educational programs such as mental health first aid courses will enrich their knowledge; help change attitudes and reduce stigma toward people living with mental illness. © 2019 Taylor & Francis.

ABSTRACT: Aim: To explore the prevalence of workplace violence among nurses who care for older people and its association with working stress, job satisfaction and quality of care in Jordan. Design: A cross-sectional design was used. Methods: A cluster random sampling was used to select three public hospitals, three private hospitals and 17 healthcare centres in Amman, Jordan. The researcher used a convenience sampling method to select 485 nurses. Data were collected between 2015-2016. Results: Almost 60% of the participants have been victims of violence at the workplace during the past year. Nurses who consider violence a problem at work have high levels of working stress ($p < .01$) as well as lower levels of quality of care ($p < .01$) and job satisfaction ($p < .001$). © 2019 The Authors. ABSTRACT: The aim of this research is to investigate the relationship between potential absorptive capacity, realized absorptive capacity, and innovation performance. Drawing on the knowledge-based theory, the current research conceptualizes absorptive capacity as two distinct and separated knowledge dynamic capabilities: potential absorptive capacity and realized absorptive capacity. The research addresses potential ACAP and realized ACAP separately and analyzed their influence on the firm's innovation performance. Using structural equation modeling (SEM) in a sample of 12 firms from Jordanian pharmaceutical industry, the research revealed that potential and realized absorptive capacities have significant and direct relations with firm's innovation performance. The results confirm that potential ACAP along with components (acquisition, assimilation), and realized ACAP (encompassing transformation, exploitation) are antecedents to the firm's innovation performance. The research advances the concept of absorptive capacity by exploring it as two different dynamic capabilities. © 2020, Springer Nature Switzerland AG.

ABSTRACT: Continuous Lake water quality monitoring is an important tool to a different aspect which includes catchment management authorities, providing real-time data for environmental protection and tracking pollution sources in lakes around ANNABA reagent. In order to assist catchment managers to maintain the health of aquatic ecosystems taking into consideration a cost-effective water quality data collection a low-cost low power system is proposed. The proposed system is constituted by spreading the sensor nodes and the base station. The nodes and base stations are linked using WSN technology (e.g. Zigbee). Base stations will be connected to the Internet using the Ethernet shield. The results indicate that a reliable monitoring system can be designed with appropriate calibration of sensors; this will allow us to continue monitoring the quality of the water at higher spatial resolution. © 2020, Springer Nature Switzerland AG.

ABSTRACT: Purpose: The study aimed to assess the correlation between fatigue and psychological factors, namely stress, social support, self-esteem, and depression among pregnant women in Jordan. Design and Methods: A cross-sectional design was suggested. Cluster stratified random sampling technique was adopted. Fatigue assessment scale, Rosenberg Self-Esteem Scale, Perceived Stress Scale, Multidimensional Social Support Scale, and Beck's Depression Inventory were used. Findings: A total of 580 pregnant women were included. Overall, 67.4% of the participants experienced fatigue, about 74.0% had moderate to high stress, 56.0% had moderate social support, around 89.0% had normal self-esteem, and 43.1% experienced moderate to extreme depression. Stress, self-esteem, and depression were correlated with fatigue. Practice Implications: This study can help develop proper psychosocial care and sustain mental health among women during pregnancy. © 2019 Wiley Periodicals, Inc.

ABSTRACT: This paper proposes an e-voting protocol to allow voting to be done from any location and still abide with the laws of security including identification, authentication, integrity, and anonymity. The proposed method relies on public key encryption that uses two pairs of certificates one for citizens containing private/public key pairs and the second for National Information Technology Center (NITC) that also contains private/public key pairs. NITC will be acting as a trusted certificate authority by to citizens and government. It is considered an objective and neutral unprejudiced party where no other governmental party has authority upon elections and is auditable by the independent election commission. © 2019 IEEE.

ABSTRACT: Despite the assured benefits of strategic primacy for HR administrators, performance effectiveness and cost reduction provided by Electronic-Human Resource Management (e-HRM), user

acceptance of these systems is a critical factor for the initiative's success. Accordingly, current research addresses factors that permit or hamper e-HRM adoption in private universities of Jordan. Conceptual theoretical model which extends the proposed UTAUT model was used, self-administered questionnaire was developed and data from 243 administrative employees who operate in four selected private universities in Jordan were collected through non-probabilistic self-selection sampling. Covariance-Based Structural Equation Modelling was employed to analyse relationships, performance expectancy and habits achieved (53%) of the varying behavioural intentions (BIs). Contrary to expectations, effort expectancy and social influence were not significant in achieving the variance, as facilitating conditions and BIs (43%) achieved the variance in e-HRM use. Accordingly, practical and theoretical implications were provided, with suggestions and directions for future studies. © 2019 World Scientific Publishing Co.

Marketing engineering and making marketing decisions
(2019) International Journal of Scientific and Technology Research, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077340876&partnerID=40&md5=a690a143be0381ffb00a4f2c3399b20d>

AFFILIATIONS: Department of marketing, The Faculty of Business, Al-Zaytoonah University, P.O box-130, Amman, Jordan

ABSTRACT: The concept of marketing engineering has become, today, an issue of great importance because it has helped in enabling marketing management to gain information and analyze it by using computer devices, communication networks, software and marketing decisions support systems, thus helping marketing management to take marketing decisions. The term marketing engineering can be traced back to Lilien et al. in "The Age of Marketing Engineering" published in 1998. In this article the authors defined marketing engineering as the use of computer decision models in making marketing decisions. The definition of marketing engineering was also developed by Lilien et al. 2002, who defined marketing engineering as "the systematic process of putting marketing data and knowledge to practical use through the planning, design, and construction of decision aids and marketing management support systems (MMSSs)". Among the driving factors toward the development of marketing engineering are the use of high-powered personal computers connected to LANs and WANs, the exponential growth in the volume of data, and the reengineering of marketing functions. Other researcher also called marketing engineering "the systematic process of putting marketing data and knowledge to practical use through the planning, design, and construction of decision aids and marketing management support systems." Marketing management works in a variable and unstable environment, where it is requested to be flexible and interactive with these changes in the internal and external environment of the organization. There is a tremendous flow of information, where marketing engineering has to collect and analyze, by adopting information systems, information technology management decision support systems. Marketing engineering played the major role in that and enabled marketing management to adapt to and accommodate external environmental factors and take the proper marketing decisions. The objective of this paper is to know the relation between marketing engineering and the process of making marketing decisions and to provide the knowledge frame for marketing engineering, the supporting phrases of it, the technology used, as well as the information technology, marketing technology, market technology and phrases used in support of marketing engineering. © IJSTR 2019.

ABSTRACT: Background: Fatigue affects nurses negatively and leads to physical, cognitive and emotional problems that may influence nurses' quality of life. However, there is a lack of studies about prolonged fatigue and its relationship with socio-demographic characteristics and job-related psychosocial factors among nurses, especially emergency nurses, worldwide and in Jordan. Aims: This study aims to assess the relationship between demographic factors, physical health, psychological distress and job-related psychosocial factors (psychological job demands, job control and social support) and prolonged fatigue among emergency department nurses in Jordan. Methods: A descriptive correlational study using a convenience sample was used to recruit 153 emergency nurses. Physical health Questionnaire, General Health Questionnaire, Job Content Questionnaire and Checklist Individual Strength were used. Results: The majority of emergency nurses experienced abnormally prolonged fatigue, moderate health, high psychological distress, high job demands and low job control and social support. Significant negative relationships were addressed between job control, social

support and prolonged fatigue, whereas income had a negative weak relationship. Psychological distress and job demands had a positive weak relationship with prolonged fatigue. There was a significant positive weak relationship between psychological distress, job demands and prolonged fatigue. Job-related psychosocial factors (with exception of social support) and mental health were the predictors of prolonged fatigue. Conclusions: Prolonged fatigue is a multidimensional phenomenon that can be affected by several factors such as job-related psychosocial factors and psychological health. These factors should be taken into consideration when testing and developing interventions to minimise prolonged fatigue among emergency nurses. © The Author(s) 2019.

ABSTRACT: Background As a third-world country experiencing a rise in the elderly population and changes to traditional family structures, improving psychological health is critical to improving quality of life (QoL) in the older adults living in residential care facilities in Jordan. Purpose This study aimed to (a) estimate the prevalence of depression among nursing home (NH) residents in Jordan; (b) measure perceived QoL in these NH residents in the dimensions of mobility, self-care, usual activity, pain and discomfort, and anxiety/depression; and (c) assess the influence of depression on each of these QoL dimensions. Methods This cross-sectional study recruited a convenience sample of 155 participants living in a residential care facility in Jordan. The instruments used included a sociodemographic and clinical questionnaire, the Mini-Mental State Examination, a Geriatric Depression Scale (GDS), and the EuroQoL, which is a five-dimension, five-level questionnaire. The data were presented as means, standard deviations, and percentages as well as adjusted odds ratios (AORs) with 95% confidence intervals (CIs). Results A high prevalence of depression was found in the study population, with 72.3% having a score between 6 and 9 on the GDS, which is suggestive of depression. Moreover, 18.1% scored ≥ 10 on the GDS, which is indicative of a nearly continual state of depression. With regard to the QoL dimensions, 84.5% of the participants reported experiencing pain, 81.9% reported anxiety/depression, 80.6% reported problems performing usual activities, 75.5% reported problems with self-care, and 63.2% reported mobility difficulties. Pain, anxiety, and depression were found to be significantly associated with level of depression (AOR = 2.78 and 95% CI [1.18, 6.57], AOR = 5.81 and 95% CI [2.14, 15.78], and AOR = 4.75 and 95% CI [1.87, 12.07], respectively). Conclusions Depression is common among NH residents in Jordan and is associated significantly with poor QoL. This study yielded empirical data that may be used to develop strategies to enhance or promote the mental health status and QoL of NH residents in Jordan. © 2019 The Authors. ABSTRACT: Aims: To investigate the efficiency of triclosan, ethylenediaminetetraacetic acid (EDTA) and cranberry alone or in combinations against *Escherichia coli* strains as urinary catheter lock solutions to reduce catheter-associated urinary tract infections. Methods and Results: Viable counting was used to assess antibiofilm activities for triclosan, EDTA and cranberry alone or in combinations against *E. coli* strains embedded in biofilm onto all-silicon Foley catheter surface. The results revealed that combination of triclosan (10 mg ml⁻¹/EDTA 30 mg ml⁻¹) when filling the catheter balloon was able to eradicate and prevent biofilm formation among all tested *E. coli* including the resistant strains, whereas triclosan (8.5 mg ml⁻¹)/ cranberry (103 mg ml⁻¹) combination was a successful catheter lock solution by preventing all tested strains from adhering onto catheter surface when filled via the eye hole. Conclusions: The combinations of triclosan/EDTA and

triclosan/cranberry were significantly effective in eradicating and preventing biofilm formation of the tested *E. coli* strains on Foley catheters. Significance and Impact of the Study: Combinations of triclosan/EDTA and triclosan/cranberry have a promising application as nonantibiotic catheter lock solution. © 2019 The Society for Applied Microbiology

ABSTRACT: In this report two diiron hexacarbonyl complexes containing sulphur-rich heterocycles have been prepared as [FeFe]-hydrogenase mimics. These two complexes are obtained from the reaction of Fe₃(CO)₁₂ with 3,11-dibenzyl-7,14,15-trithia-3,11-diazadispiro[5.1.58.26]pentadecane. They have been characterized by different spectroscopic techniques (¹H and ¹³C{¹H} NMR, IR and MS) as well as X-ray diffraction analysis. Moreover, we have investigated the influence of the sulphur-rich heterocycles linker on the redox potentials of the complexes and their catalytic ability in the presence of acetic acid (AcOH) by applying cyclic voltammetry. © 2019 Elsevier Ltd

ABSTRACT: Herein, a library of gold nanorods (GNR) decorated with polyethylene glycol-thiol (PEG-SH) containing different functionalities were synthesized and characterized by optical absorption spectroscopy, zeta potential, dynamic light scattering (DLS), transmission electron microscope (TEM) and proton nuclear magnetic resonance (¹H-NMR). The colloidal stability of GNR when exposed to skin, and their preferential accumulation into excised human skin layers were investigated. Confocal laser scanning microscopy, transmission electron microscope (TEM) and inductively coupled plasma-optical emission spectroscopy (ICP-OES) were utilized to track the penetration of GNR into different skin layers. The results demonstrated that cholesterol-PEG coated GNR were preferentially loaded up in the upper layers of skin (stratum corneum), while phospholipid-PEG coated counterparts were drastically deposited in skin dermis. Neutral methoxy-PEG-coated GNR were distributed in both SC and dermis skin layers, while charged GNR (anionic-carboxylic acid-PEG-GNR and cationic-amine-PEG-GNR) revealed a minimal accumulation into skin. DSPE-PEG-GNR and Chol-PEG-GNR demonstrated antibacterial activities against *Staphylococcus aureus* (*S. aureus*) at MIC values of 0.011 nM and 0.75 nM, respectively. Photothermal treatment for *S. aureus* at sub-MIC concentrations resulted in a significant bactericidal effect when using Chol-PEG-GNR but not DSPE-PEG-GNR. Gold-based nanoscale systems have great value as a promising platform for skin diseases therapy. © 2019, The Author(s).

ABSTRACT: Nanomedicine has had a profound impact on the treatment of many diseases, especially cancer. However, synthesis of multifunctional nanoscale drug carriers often requires multistep coupling and purification reactions, which can pose major scale-up challenges. Here, we leveraged bioinspired oxidation-triggered polymerization of catechols to synthesize nanoparticles (NPs) from the plant polyphenol quercetin (QCT) loaded with a hydrophobic anticancer drug, curcumin, and functionalized with poly(ethylene glycol) (PEG) for steric stabilization in one reaction step. NPs were formed by base-catalyzed oxidative self-polymerization of QCT in the presence of curcumin and thiol-terminated PEG upon mixing in a universal solvent (dimethyl sulfoxide), followed by self-assembly with the gradual addition of water. Dynamic light scattering and X-ray photoelectron spectroscopy were used to confirm NP PEGylation. Drug loading was verified by UV-vis spectroscopy. Curcumin-loaded NPs were efficiently internalized by CT26 murine colon cancer cells as determined by flow cytometry and confocal microscopy. NPs also demonstrated sustained release and potent cytotoxicity in vitro. Moreover, in vivo imaging of CT26 tumor-bearing Balb/c mice following tail vein injection of DiR-labeled QCT NPs showed steady tumor accumulation of the NPs up to 24 h. This was further supported by significant tumor uptake of curcumin-loaded QCT NPs as measured by flow cytometry analysis of tumor homogenates. Our findings present a greener synthetic route for the fabrication of drug-loaded surface-functionalized NPs from poorly water-soluble plant polyphenols such as QCT as promising anticancer delivery systems. ABSTRACT: Today, the amount and complexity of data that is globally produced increases continuously, surpassing the abilities of traditional approaches. Therefore, to capture and analyze those data, new concepts and techniques are utilized to engineer powerful big data systems. However, despite the existence of sophisticated approaches for the engineering of those systems, the testing is not sufficiently researched. Hence, in this contribution, a comparison of traditional software testing, as a common procedure, and the requirements of big data testing is drawn. The determined specificities in the big data domain are mapped to their implications on the implementation and the consequent challenges. Furthermore, those findings are transferred into six guidelines for the testing of big data systems. In the end, limitations and future prospects are highlighted. © 2019 IEEE.

ABSTRACT: Recently, water desalination has been developing increasingly worldwide. Many new plants are contracted constantly. Strategic planning and many other technical decisions are significant to these strategic systems. The proposed Artificial Intelligent (AI) methods provide decision makers with different choices for investment, where each is comprised of different desalination combinations regarding to locations, capacities, and energy sources in terms of several performance metrics. The

intelligent decisions determine the optimal stations location and the water desalination system capacity for future expectations. Other smart decisions select the optimal desalination technologies for available existing and suggested desalination planting. In addition, AI methods provide decision makers to configure the pipeline network and transport water among the planting locations. The proposed work is a method to upkeep strategic decision making for the best water desalination facility. Our methodology offers a set of AI alternatives for several desalination plans. Decision support systems and tools are imperfect to deliver a set of alternatives. Therefore, the proposed work provides a systematic decision process to validate several water desalination alternatives, considering intelligent water pumping to the locations through the pumping network and water storage at every location. The proposed approach is validated for a case study in Jordan, which is a beginner country in desalination. The results show where economic and environmental benefits occurs. It shows how the AI methods can introduce an optimal settings of the desalination process to the people who makes decisions. © 2019 IEEE.

ABSTRACT: We investigate distributed combining techniques for distributed detection in wireless sensor networks (WSNs) over Rayleigh fading multiple access channel (MAC). The MAC also suffers from path loss and additive noise. The WSN is modelled as a Poisson point process (PPP). Two distributed transmit combining techniques are proposed to mitigate fading; distributed equal gain transmit combining (ddEGTC) and distributed maximum ratio transmit combining (dMRTC). The performance of the previous methods is analysed using stochastic geometry tools, where the mean and variance of the detector's test statistic are found thus enabling the fitting of the received signal distribution by a log-normal distribution. Surprisingly, simulation results show that ddEGTC outperforms dMRTC. © 2019 IEEE.

ABSTRACT: This article presents two novel algorithms for the estimation and diagnosis of the current unbalance factor (CUF) for three-phase power systems from single period of three-phase acquired data samples. The CUF is evaluated by an algorithm named circular phase shift (CPS), and the three-phase parameters are estimated by a circular cross-correlation (CCC) algorithm for unbalance diagnosis. The estimated CUF along with multisensory data is transmitted and monitored through a remote web server for diagnosis and detection of incipient three-phase power systems faults including three-phase machines. The CPS algorithm estimation has an accuracy that exceeds 95% for CUF values exceeding 5%. The CCC time-complexity and the Cramer-Rao Lower Bound analysis are presented for performance evaluation. The CCC algorithm outperforms the IEEE-Standard-1057 estimation method in both phase accuracy and processing memory requirements compatible with low-cost microcontrollers. Experimental results on condition monitoring of industrial induction machines (1.5 to 7.5 KW) are also presented with custom designed 2.4-GHz wireless sensor network and an IEEE 802.11 Internet of Things gateway with multisensory data which carries out the effectiveness of the system. © 2005-2012 IEEE.

ABSTRACT: Background: Fatigue is the most reported and most distressing symptom among patients with cancer. However, no questionnaire that measures fatigue and fatigue interference with life has been translated into Arabic. Aims: This study aimed to translate and validate the Arabic version of the Brief Fatigue Inventory (BFI-A). Methods: The BFI was translated into Arabic using the forward-backward translation technique. This cross-sectional study collected data from cancer patients through a self-administered questionnaire that included the BFI-A, Insomnia Severity Index (ISI), Zung Depression Scale (ZDS), MD Anderson Symptom Inventory total score (MDASI), and Medical Outcome Study Short Form 36 (SF-36) Vitality Subscale. Descriptive and inferential statistics were used including mean, standard deviation, internal consistency, and correlation coefficient using Pearson's correlation. Results: A total of 79 patients were recruited in Amman, Jordan, in 2015. Mean of the total BFI-A was 4.01 (2.4), showing that 83.5% had nonsevere fatigue. Cronbach's α coefficient of the BFI-A was 0.93. The correlations between total BFI-A scores and BFI-A items were significant ($P < 0.05$) and ranged from 0.75 to 0.86. BFI-A showed a significant correlation ($P < 0.05$) with the following tools: ISI = 0.70, ZDS = 0.69, MDASI = 0.75, and SF-36 Vitality Subscale = -0.57. Conclusions: This study suggests that the BFI-A is a reliable and valid tool to assess fatigue among Arab cancer patients. © World Health Organization (WHO) 2019.

The Performance of Emergency Department Nurses Across Sectors in Jordan: An Application of the Work Functioning Model

(2019) Research and theory for nursing practice, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074352912&doi=10.1891%2f1541-6577.33.4.344&partnerID=40&md5=318529686d3ed7974ad0f8132b877336>

AFFILIATIONS: Faculty of Nursing, Al-Zaytoonah University of Jordan Amman, Jordan

ABSTRACT: Work functioning is a relatively new conceptual model developed to embrace various aspects surrounding work performance, work participation, and individual capacity. The assessment of work performance (AWP) in nursing has gained inconsistent evidence due to examining it from multidimensional aspects. This study aimed to perform the AWP in nurses working in the emergency departments (EDs) at different healthcare sectors in Jordan. A descriptive, cross-sectional design was used in which ED nurses completed a questionnaire. ED nurses were recruited conveniently from four referral hospitals located in Amman (two government and two private hospitals). The Nursing Work Functioning Questionnaire (NWFQ), in addition to the demographic questionnaire were completed. A total of 179 ED nurses participated in the study (100 government and 79 private nurses). A few differences were found between government and private sector nurses in respect to work functioning domains. Overall, nurses from both sectors reported minimal impairments in their performance represented in seven domains. However, ED nurses from the private sector claimed more frequent work incidences compared to ED nurses from the government sector ($p = .043$). In addition, associate nurses showed higher avoidance behavior than registered nurses in both sectors ($p = .031$). Contrary to former studies, this study found minimal discrepancies in work performance between government and private sectors, and employing the work functioning model is useful to gain a thorough understanding of the AWP. © Copyright 2019 Springer Publishing Company, LLC.

ABSTRACT: Purpose: We aimed to examine the prevalence of obesity among adolescents living in a refugee camp in Jordan and analyze the factors influencing their weight perceptions. Design: Cross-sectional survey. Methods: We examined the body weight perception, and the influence of psychological, cultural, and social factors, among Palestinian refugee adolescents living in Jordan using a cross-sectional survey. Univariate, bivariate, and multiple logistic regression analyses were used to investigate the relationships between body weight status, weight perception, satisfaction with weight, screen time, and depression status of these adolescents. Results: A total of 620 adolescents participated in the study, of which 24% were either overweight or obese. Overweight or obese adolescents were more likely to underestimate their weight ($p < .001$), while those with depressive symptoms (Patient Health Questionnaire for Adolescents score > 14), were more likely to overestimate their body weight ($p = .021$). Having symptoms indicative of depression (adjusted odds ratio [AOR] = 1.70; 95% confidence interval [CI] = 1.16–2.50) and having a body mass index in the overweight/obese range (AOR = 4.16; 95% CI = 2.73–6.35) were predictors of discordant weight perception. Conclusions: This study showed that excess body weight is a significant issue among Palestinian refugee adolescents living in a refugee camp in Jordan. Underlying depression is an important factor in excess weight and distorted weight perceptions especially among this vulnerable group. Clinical Relevance: The study highlights the importance of addressing discordant body weight perception and depression in weight management in nursing interventions for vulnerable adolescent groups. © 2019 Sigma Theta Tau International

ABSTRACT: Localization is an important primitive that is utilized in a number of important applications such as location-based mobile services, augmented reality, and autonomous mobile robotics. While the GPS technology is considered the de facto standard for outdoor localization, it is known to suffer from significant accuracy limitation in urban areas. In this work, we present a particle filter-based data fusion technique for localization in urban areas. The proposed localization technique provides more accurate location estimation results due to its ability to efficiently fuse together information collected from diverse sensor technologies. The novelty of our proposed approach stems from its ability to fuse data from diverse sources, namely, phase shift fingerprints collected from Low Power AM Radio (LPAM) towers and inertial measurement sensors. Our simulation results indicate that the proposed approach can achieve an accuracy of 0.5 m using a limited number of LPAM towers as low as 5. Also, the proposed approach requires the collection of a low number of LPAM phase shift fingerprints. Our simulations indicate that 30 fingerprints are enough to provide 0.5 m accuracy in a 100×100 m² deployment. © 2019, Springer-Verlag London Ltd., part of Springer Nature.

ABSTRACT: The aim of this study was to develop an ibuprofen microemulsion (IBU-ME) incorporated into in situ gels (microgels) for local delivery into periodontal pockets. The IBU-ME was prepared at a concentration of 1% w/v IBU. Various concentrations of the thermosensitive Pluronic® F127 (P127) solution and a series of combinations of the P127 solution and IBU-ME at a 1:1 ratio were initially developed and tested to determine their sol-gel transition temperatures ($T_{sol \rightarrow gel}$). Based on these studies, a constant concentration of P127 (11.1% w/v) and variable concentrations of IBU-ME were used to prepare the microgels. The mechanical properties ($T_{sol \rightarrow gel}$, gelling time (T_{gel}), viscosity, and viscoelastic properties) of the microgels were evaluated. The release of IBU from the microgels was determined in vitro. Rheological stability studies were performed to investigate the mechanical properties of the microgels after one month. The transition behavior studies demonstrated that the microgels are thermosensitive systems with pseudoplastic flow and their viscoelastic properties indicated that the elastic property was greater than the viscous property ($G' > G''$). The results showed that the mechanical properties of the microgels depend on the concentration of IBU-ME. In addition, rheological stability studies demonstrated that T_{gel} and $T_{sol \rightarrow gel}$ are increased after one month, whereas the viscosity and viscoelastic properties are decreased after one month. Owing to the rigid structure of the microgels, the release of IBU from the microgels followed a controlled-release pattern. © 2019 Elsevier B.V.

ABSTRACT: Plant polyphenols have received considerable attention in recent years due to their ability to undergo oxidation-triggered self-polymerization, forming biocompatible versatile coatings and templated nanoparticles (NPs) that can be leveraged for a variety of biomedical applications. Here we show for the first time that untemplated NPs can be conveniently synthesized from the abundant plant polyphenol quercetin (QCT) simply by incubation with an oxidizing agent in a universal organic solvent, followed by self-assembly upon gradual addition of water. The process yielded NPs of around 180-200 nm in size with a range of colors that resembled light to medium-brown skin tones. The NPs were characterized by UV-Vis, FT-IR, and ¹H-NMR spectroscopy and by dynamic light scattering and transmission electron microscopy to understand their physicochemical properties. Antioxidant and cell viability assays were also conducted to demonstrate the NPs' free-radical scavenging activity and biocompatibility, altogether providing valuable insights into the structure and function of this emerging class of nanomaterials to guide future biomedical applications. © 2019 by the authors.

ABSTRACT: Shifting from traditional marketing into online marketing has allowed people to share their experiences about various aspects of those products using textual comments known as Product Reviews. As a result of this shifting, people are able to access various websites where they can find reviews for all kind of products, even the rare ones. Thus, these reviews act as a supplementary information and help people to make the right decision before buying products. Reviews that influence one's decision are considered influential reviews, as they provide truthful experiences. Given the list of reviews for a certain product, each user can vote for any given review as helpful or unhelpful. As a result, each review would be given a number that represents how many users found this review helpful. This would indicate how influential each review is. As a result, buyers rely on these reviews and those who wrote these reviews. This study emphasizes on the importance of using user votes as an important source of information for new users. The contribution of this work lies in two aspects. First, it provides a comprehensive statistical analysis of a previously-published dataset containing Amazon reviews. Second, this study insists on the importance of using user votes. This study is the first phase for many future interesting directions. It was shown that the relationship between the number of reviews and the percentage of votes is an inverse relationship. © 2019 IEEE.

ABSTRACT: Arabic is a derived language that has a deep structure and words meaning, one of the Arabic challenges is its morphology dependency. Arabic Natural Language Processing (ANLP) tools are required to achieve many tasks, such as Machine learning. For the text classification task, the ANLP is considered as preprocessing steps. These preprocessing steps include but not limited to Stemming, Normalization, and Stop-words Removal. In this work, we collected 2, 000 news articles from Arabic online newspapers, the data were classified using Support Vector Machine (SVM) and Nave Base (NB) classifiers. The classification task was conducted for the purpose of comparing three different Arabic light stemmers; P-Stemmer, Khoja Stemmer, and Light10 Stemmer. The P-Stemmer results was dominating the other two stemmers in both SVM and NB classifiers with accuracy of 0.92 for F1-measure in SVM classifier and 0.90 for F1-Measure in NB classifier. © 2019 IEEE.

ABSTRACT: Emotion Analysis (EA) is a process of determining if the text has any emotion. EA spread significantly in the recent years, especially for social media applications as applied to tweets and

Facebook posts. An assumption has been presented recently that each social media post has no intensity or has one emotion. Different cases for public posts have been considered in this work, it focuses on several emotions (multi-label) included in a single post. Tweeter posts (Tweets) have been employed to validate the proposed work, it is possible to have different intensities related to each tweet (multi-target). The proposed work focused on Arabic language tweets unlike previously implemented work, which focused on other languages such as English or Chinese. A multi-label multi-target data set of Arabic tweets annotated for emotion analysis has been built, and different experts participated in the annotation process and Cohens Kappa measure was employed to determine their concordance. © 2019 IEEE.

ABSTRACT: The large size and the dynamic nature of the Web highlight the need for continuous support and updating of Web based information retrieval systems. Crawlers facilitate the process by following the hyperlinks in Web pages to automatically download a partial snapshot of the Web. While some systems rely on crawlers that exhaustively crawl the Web, others incorporate focus within their crawlers to harvest application or topic specific collections. This project studied web crawling and scraping at many different levels. It will aggregate information from multiple sources into one central location. It Specifics a program for downloading web pages. Given an initial set of seed URLs, it recursively downloads every page that is linked from pages in the set, that have content satisfies specific criterion. Social media, web applications, and mobile applications have been employed together in the proposed system to manage the search in the rapidly growing worldwide web. Applying the proposed system is resulting in a fast and comfortable search engine that fulfill the users requests based on specific geolocations. © 2019 IEEE.

ABSTRACT: Natural Language Processing (NLP) is a branch of computer science that focuses on developing systems that allow computers to communicate with people using everyday language. NLP tools are Devoted to making computers understand statements written in human language. Indexing, text retrieval and word processing are considered as challenges in the classification process. Hence, Arabic Natural Language Processing ANLP tools are needed to achieve the aforementioned tasks. ANLP includes preprocessing such as Stemming, Normalization, Stop-word Removal, Part of speech POS and other processes. In this work, we collected 1, 000 news articles from Alghad.com newspaper, then we classified our dataset using SVM and NB algorithms using NLTK tool. We compared the results of two stemmers; P-Stemmer and NLTK stemmer using the mentioned classification process. The results of the classification for the P-Stemmer was better than the NLTK stemmer and for the two classifiers. © 2019 IEEE.

ABSTRACT: Social networks in real life is growing quickly, Social media have become a day base use for most of Internet users, because of the huge amount of provided services. Social media shares users' thoughts and data through a virtual networks. The proposed work focuses on implementing a smart job seeking system based on client's geo-location. This work proposes a smart system that mines social media networks, such as Twitter and Facebook to match the best vacancy for the exact job seeker. The matches have been presented based on client's geo-locations, which are located by mining

their social media posts history. This system overcomes recent such systems as it employs modern recommender methods, Geolocation concepts, and Natural Language Processing (NLP) together in social media for real life problem solution. © 2019 IEEE.

ABSTRACT: Social media applications such as WhatsApp, Facebook, Instagram, Twitter, etc., are widely used among society; each application has its own uses, differences and market share. According to official Jordanian statistics, WhatsApp is considered to be the most commonly used social media application by Jordanian people for creating, sharing and exchanging information. In this paper, we present a comprehensive preliminary study for the implementation of a national platform that contains information about Obsessive-Compulsive Disorder (OCD) in Jordan using the WhatsApp to collect the information. This project will be a pilot study using a cross-sectional design to determine the potential of the proposed platform in usability and effectiveness as a prototype system. Moreover, it will be the first mental health application that addresses the needs of the Arabic culture and region. The project will be implemented in two phases: the first phase, which includes the design of the OCD-questionnaire and the collection of data using the WhatsApp application, the collected data will be stored to a database which is going to be the first OCD database of its kind. The second phase of the project involves the design of a mobile application that can help to diagnose cases and provide medical advice to help alleviate the symptoms of the OCD. The publicity of using WhatsApp application will help in covering different geographical areas and reaching a variety of people with maintaining their confidentiality. © 2019 IEEE.

ABSTRACT: Abstract: The dithiocarbonato metal complexes $M(\kappa^2S,S-S_2CO)(\kappa^2P,P-dppf)$ $\{M= Ni, Pd, Pt; dppf= bis(diphenylphosphino)ferrocene\}$ are obtained from the reaction of the metal(II) complexes $[M(\kappa^2S,S-S_2COEt)_2]$ with the dppf ligand or from the chloride substitution of $M(\kappa^2P,P-dppf)Cl_2$ by the O-ethylthiocarbonato anion. These complexes are produced by C-O bond cleavage by the O-ethylthiocarbonato anion present in solution. These new complexes have been characterized by UV-Vis, NMR, IR spectroscopy and elemental analysis. The structures of the three complexes were further confirmed by single-crystal X-ray diffraction analysis. Graphical Abstract: The dithiocarbonato metal complexes $M(\kappa^2S,S-S_2CO)(\kappa^2P,P-dppf)$ $\{M= Ni, Pd, Pt, dppf= bis(diphenylphosphino)ferrocene\}$ are obtained from the reaction of the metal(II) complexes $[M(\kappa^2S,S-S_2COEt)_2]$ with the dppf ligand or from the chloride substitution of $M(\kappa^2P,P-dppf)Cl_2$ by the O-ethylthiocarbonato anion. These new complexes have been characterized by UV-Vis, NMR, IR spectroscopy and elemental analysis. The structures of complexes 1-3 were further confirmed by single-crystal X-ray diffraction analysis. [Figure not available: see fulltext.]. © 2019, Indian Academy of Sciences.

ABSTRACT: The invention of electric vehicles (EVs) is a leap in the fields of automobile industry,

rationalization of energy and conservation of the environment. This study focuses on adapting the model of acceptance of technology to identify consumer's behavior on the use of EV. The technology acceptance model was developed by Fred Davis (1989). The study community consists of 550 consumers from Amman city, the results show there is strong relation between independent variables (Perceived usefulness, Attitude toward using EV, Perceived ease of Use EV, Perceived the challenges of use) and the dependent variable (EV Use), where the value of the coefficient indicator is positive (0.415) and the value of the calculated F is (21.767), which is greater than the tabular value (2.89), and the moral value is (0.0), which is less than (0.05). This is an indicator that there is statistical impact for independent factors on consumer behavior. © TJPRC Pvt. Ltd.

ABSTRACT: This research aims to test the antecedents that influence behavior intention of animation usage among marketing students in universities depending on the extended unified theory of acceptance and use of technology (UTAUT2) introduced by Venkatesh et al. (2012). Partial least square structural equation modeling approach was used to analyze information gathered from undergraduate marketing students in Jordanian universities. The results revealed that hedonic motivation, performance expectancy, students' innovativeness, learning value and effort expectancy were significant constructs influencing the behavior intention of animation usage. The research extended UTAUT2 in the field of animation usage by integrating the constructs of learning value and students' innovativeness to the model. The research provides practitioners and teachers in the marketing field with advantageous methods in their learning process. © 2019

ABSTRACT: Battery energy storage is becoming a viable economic option for standalone solar power systems in the Levant region. The lead battery is one of the most important current options in solar energy storage systems. Batteries are subject to many factors, during its operation that causes batteries' de-gradation and impacting its shelf life. This paper presents features of the cycle recovery charging (CRC) method in refreshing and settling utilized lead batteries that have been utilized as a part of home solar energy storage systems. Experimental tests were performed on the utilized gel - lead battery (12 V 97 Ah C/5 h solar battery). The findings of these experiments show that this new recovery charging method that established important improvements in terms of charging realization. The foregoing improvements contributed to increasing the shelf life of the battery, capacity recovery, maintaining the cell stability and refreshing the batteries. © 2019 Elsevier Ltd

ABSTRACT: Efficiently managing the irrigation process has become necessary to utilize water stocks due to the lack of water resources worldwide. Parched plant leads into hard breathing process, which would result in yellowing leaves and sprinkles in the soil. In this work, yellowing leaves and sprinkles in the soil have been observed using multimedia sensors to detect the level of plant thirstiness in smart farming. We modified the IoT concepts to draw an inspiration towards the perspective vision of 'Internet of Multimedia Things' (IoMT). This research focuses on the smart employment of internet of Multimedia sensors in smart farming to optimize the irrigation process. The

concepts of image processing work with IOT sensors and machine learning methods to make the irrigation decision. sensors reading have been used as training data set indicating the thirstiness of the plants, and machine learning techniques including the state-of-the-art deep learning were used in the next phase to find the optimal decision. The conducted experiments in this research are promising and could be considered in any smart irrigation system. The experimental results showed that the use of deep learning proves to be superior in the Internet of Multimedia Things environment. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Medical images have a very significant impact in the diagnosing and treating process of patient ailments and radiology applications. For many reasons, processing medical images can greatly improve the quality of radiologists' job. While 2D models have been in use for medical applications for decades, wide-spread utilization of 3D models appeared only in recent years. The proposed work in this paper aims to segment medical volumes under various conditions and in different axel representations. In this paper, we propose an algorithm for segmenting Medical Volumes based on Multiresolution Analysis. Different 3D volume reconstructed versions have been considered to come up with a robust and accurate segmentation results. The proposed algorithm is validated using real medical and Phantom Data. Processing time, segmentation accuracy of predefined data sets and radiologist's opinions were the key factors for methods validations. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Cyclopentadienyl ruthenium complexes bearing mixed heterocyclic thiol and bis(diphenylphosphino)ferrocene (dppf)ligands are presented. The complex-salts [CpRu(dppf)(κ 1S-HS-het)]PF₆ {Cp = η -5-C₅H₅; HS-het = 2-mercaptobenzothiazole (1), 2-mercaptobenzimidazole (2)} were synthesized from the reaction of CpRu(dppf)Cl with the thiol in the presence of KPF₆ salt under reflux. Complexes 1 and 2 have been characterized by spectroscopic methods (1H-NMR, 31P{1H}-NMR, MS)and elemental analysis. The solid-state structures of [CpRu(dppf)(κ 1S[*s*bdn]S2C7H5N)]PF₆ (1)and [CpRu(dppf)(κ 1S-SC7H6N2)]PF₆ (2)have been determined by X-ray crystallography. The cyclic voltammetry of these two complexes are measured. © 2019 Elsevier B.V.

ABSTRACT: Image processing has gained an increased usage and impact in modern pavement networks automatic distress severity classification (DSC). DSC defines priorities and maintenance resources optimum allocation in order to achieve a cost-effective rehabilitation process. This paper presents a novel computer vision algorithm having the ability to process, isolate and evaluate the distress severity level of a pavement. A pavement color image is converted to grayscale and then processed for

image denoising of the granularity and complex texture that represent and artifact in cracks edge detection. The processing is achieved by a 2D dual-tree double density wavelet transform filter banks that significantly reduces the granularity noise while preserving the pavement cracks for edge detection. The 2D wavelet FIR filters perform analysis, soft thresholding then a synthesis of the image. The second step is then an edge detection process followed by morphological filtering and labeled components size-histogram filter to isolate false edges as residuals of denoising. A final step is performed by two Savitzky-Golay filters for the detection of longitudinal and transverse alligator cracks projections. A weighted score function with multiple parameters is used for DSC. © 2019 IEEE.

ABSTRACT: Big data is facing many challenges in different aspects, which appear in characteristics such as: Velocity, Volume, Value and Veracity. Processing and analysis of big data are challenging issues to acquire quality information in order to support accurate medical drug practice. The quality of data taxonomy is indicated by three basic elements: are meaningful, predication and decision-making. These elements have been encouraged in previous work that focused on the same challenges of big data. Consequently, the proposed approach preserves the quality of medical drug data toward meaningful data lake by clustering. It consists of four components. Data collection and pre-processing represent the first component in the data lake. Profile data is treated with semi-structured data to clean it up. The second component is extracting data through enforcing rules on whole data to produce different groups and generate weight based on constraints within groups. In component three, data is organized and clustering. This component complies with schema profiling referring to component two in the data lake. Weight outputs of component three are inputs for component four, where K-Mean clustering is applied to obtain different clusters. Each cluster presents an alternative drug to achieve meaningful drug data that is consistent with component three in the data lake. This paper addressed two main challenges; the first challenge is extracting meaningful data from big data; whereas the second challenge is using big data technique with K-Mean clustering algorithm. An experimental approach was followed through using Food and Drug Administration (FDA) data and symptoms in R framework. ANOVA statistical test was carried out to calculate sum of square error, P-Value and F-Value for the evaluation of variances between clusters and variances within clusters. The results showed the efficiency of the proposed approach. © BEIESP.

ABSTRACT: With the developments in virtual reality technologies, significant researches have been conducted for human response on indoor luminous environment using head-mounted display to replace those in real environment. However, the limited resolution and luminance values offered by the devices might affect the perceived appearance and high-order impressions in the simulated virtual environment. In this study, a simulated 3-dimensional virtual office was compared against a real one. Both settings presented similar physical and luminous conditions to twenty participants (N = 20). The study investigated subjective and objective visual responses and participants' interaction with the virtual environment based on measurements of perceived presence. Subjective assessments included questions on luminous environment appearance (brightness, colour-temperature, distribution) and high-order perceptions (pleasantness, interest, spaciousness, excitement and complexity). Objective assessments measured contrast-sensitivity and colour-discrimination tasks to assess visual performance across the two representation environments. Results showed no significant differences between the two environments based on the studied parameters, indicating a high level of perceptual accuracy of appearance and high-order perceptions. Minor physical symptoms related to the headset use and high level of perceived presence were found, indicating the proposed methodology's capability to

provide realistic immersive environments. Although attributes regarding scene quality: colours, details, and contrast were perceived significantly different to the real environment, objective tasks showed that similar contrast and colour appearance can be produced in the virtual environment with minor impact on fine-details due to limited resolution. Virtual reality maybe a promising alternative representation medium to investigate visual perceptions as the overall appearance of the scene can still be correctly acquired. © 2019 Elsevier Ltd

ABSTRACT: Enzymes in the cytochrome P450 4 (CYP4) family are involved in the metabolism of fatty acids, xenobiotics, therapeutic drugs, and signaling molecules, including eicosanoids, leukotrienes, and prostanoids. As CYP4 enzymes play a role in the maintenance of fatty acids and fatty-acid-derived bioactive molecules within a normal range, they have been implicated in various biological functions, including inflammation, skin barrier, eye function, cardiovascular health, and cancer. Numerous studies have indicated that genetic variants of CYP4 genes cause inter-individual variations in metabolism and disease susceptibility. Genetic variants of CYP4A11, 4F2 genes are associated with cardiovascular diseases. Mutations of CYP4B1, CYP4Z1, and other CYP4 genes that generate 20-HETE are a potential risk for cancer. CYP4V2 gene variants are associated with ocular disease, while those of CYP4F22 are linked to skin disease and CYP4F3B is associated with the inflammatory response. The present study comprehensively collected research to provide an updated view of the molecular functionality of CYP4 genes and their associations with human diseases. Functional analysis of CYP4 genes with clinical implications is necessary to understand inter-individual variations in disease susceptibility and for the development of alternative treatment strategies. © 2019 by the authors. ABSTRACT: Software requirements with its functional and non-functional methods are the first important phase in producing a software system with free errors. The functional requirements are the visual actions that may easily evaluated from the developer and from the user, but non-functional requirements are not visual and need a lot of efforts to be evaluated. One of the main important non-functional requirements is security, which focuses on generating secure systems from strangers. Evaluating the security of the system in earlier steps will help to reduce the efforts of reveals critical system threats. Security threats found because of leaking of security scenarios in requirement phase. In this paper, we purpose an intelligent model to extract and evaluate security features from scenarios based on set of security system goals and a set of security requirements saved on rich story scenarios dataset (RSSD). This model will used a support vector machine (SVM) classifier to classify the security requirement based on RSS dataset. The using of SVM will enhance the overall process of evaluating the security requirements. The results show a significant enhancement in security improvements. © 2019 Institute of Advanced Engineering and Science. All rights reserved.

ABSTRACT: Objectives: The objective of this study is to assess quality of nursing work life (QNWL) and related factors among nurses working in emergency room (ER). Methods: A cross-sectional descriptive design was employed. Data were collected from a convenient sample of nurses working in ER. Eligible participants were required to complete a demographic and work related variables sheet, the

Brooks Quality of Nursing Work Survey (BQNWLS). Results: A total of (186) nurses participated in the study. Study participants reported a BQNWL mean score of ($M = 140.15$, $SD = 28.34$) indicating a moderate BQNWL. Additionally, the participants scored moderate levels on all BQNWL subscales. The mean score of BQNWL was statistically better for nurses who had training courses on emergency department ($t = -2.663$, $P = 0.008$). However, no other statistically significant differences were found in BQNWL scores in regarding to demographic and work related variables. Conclusion: The results of this study reported a noticeable alteration in QNWL among nurses working in ER. The nurses had a moderate QNWL levels. Also, the results emphasized on the importance of conducting further interventional research studies in the future to establish effective measures to enhance nurse QNWL. Consequently, this may improve the provided nursing care for the patients and their families. © 2019 The Authors. ABSTRACT: Traffic congestions in urban cities occur due to the massively increasing number of automobiles, the inadequate mass transit and road systems, and other reasons that are all the results of overdevelopment. Accordingly, the necessity to solve such an issue arises. One of the suggested solutions to solve such a problem is to use traffic management systems in order to control the congestions and improve the road traffic flow. Therefore, this paper proposes the state-of-the-art of a centralized traffic agent-model control system with an algorithm that aims to improve the traffic flow. The proposed model is a multi-agent model which consists of the Controller Agent, Global Positioning System (GPS) Agent, Sensors Agent, and Traffic Light Agent. The agents will work together as one system to assist the Controller Agent to adjust the time period of the traffic lights to reduce the traffic congestion as much as possible. © ICIC International 2019.

ABSTRACT: In this paper, we present the architecture and operation of a dynamic agent-based intrusion detection technique in Mobile Ad Hoc Network (MANET). The proposed technique has cooperative agents' architecture. Traditional intrusion detection techniques have trouble dealing with dynamic environments such as collecting real-time attack related audit data and cooperative global detection. The proposed detection technique comprises a set of static and mobile agents. Autonomous agents can perform specific intrusion detection tasks which are used to collect data, detect intrusions, distribute aggregated intrusion information to all other mobile nodes in MANET in an intelligent way, and collaborate with other agents. © 2019, ICIC International. ABSTRACT: This study examines the factors that influence the voluntary adoption of the digital reporting of the statutory accounts and returns to the company registry (Companies House) by small private companies in the UK. We analyse survey data from 343 members of the Association of Chartered Certified Accountants working in small companies or in practices with small company clients in the UK. The data is examined using statistical methods, mainly PLS-SEM. Our results show the following

factors positively influence the voluntary adoption of digital reporting by small private companies: the relative advantage from standardisation benefits, the company's technology competence and support from top management. We also provide evidence that the complexity of the company's accounting system and technology costs inversely influence this voluntary adoption. The study contributes to the emerging literature by expanding our understanding of how the standardisation of financial information flows benefits small private companies. The results should be of interest to small companies and their accountants, regulators in the UK and other jurisdictions planning digital reporting initiatives or seeking to reduce administrative burdens on smaller entities. © 2019 Elsevier Inc.

ABSTRACT: Background: Patients diagnosed with breast cancer were reported to have high levels of psychosocial distress and poor quality of life (QOL). Mindfulness is believed to improve QOL and reduce psychological distress in various populations, but its unique association with QOL and psychological distress in women with breast cancer has yet to be established. Objectives: This study was conducted to examine the relationship of mindfulness with depression, anxiety and QOL of women diagnosed with breast cancer. Methods: A descriptive, correlation design was used. Results: A sample of 234 Jordanian women completed the study. 24% of the participants scored above the cut-off for clinical depression, 36.3% scored above the cut-off for clinical anxiety, and 35.5% scored above the cut-off for poor QOL. Mindfulness accounted for significant unique variance in depression, anxiety and QOL above and beyond the variance accounted for by the demographic variables, clinical variables and social support. Conclusion: The current study provided preliminary evidence for the relationship of social support and mindfulness with the psychological well-being and QOL among Jordanian women with breast cancer. Future research may want to tailor an intervention that combines social support and mindfulness-based interventions and identify their benefits to support Jordanian women with breast cancer. © 2019 John Wiley & Sons Ltd

ABSTRACT: In this paper, we investigate fusion rules for distributed detection in large random clustered wireless sensor networks with a three-Tier hierarchy; the sensor nodes (SNs), the cluster heads (CHs), and the fusion center (FC). The CHs collect the SNs' local decisions and relay them to the FC, which then fuses them to reach the ultimate decision. The SN-CH and the CH-FC channels suffer from additive white Gaussian noise. In this context, we derive the optimal log-likelihood ratio (LLR) fusion rule, which turns out to be intractable. So, we develop a sub-optimal linear fusion rule (LFR) that weighs the cluster's data according to both its local detection performance and the quality of the communication channels. In order to implement it, we propose an approximate maximum likelihood based LFR (LFR-AML), which estimates the required parameters for the LFR. We also derive Gaussian-Tail upper bounds for the detection and false alarms probabilities for the LFR. Furthermore, an optimal CH transmission power allocation strategy is developed by solving the Karush-Kuhn-Tucker conditions for the related optimization problem. Extensive simulations show that the LFR attains a detection performance near to that of the optimal LLR and confirms the validity of the proposed upper bounds. Moreover, when compared to equal power allocation, simulations show that our proposed power allocation strategy achieves a significant power saving at the expense of a small reduction in the detection performance. © 2015 IEEE.

ABSTRACT: The development of new antihyperlipidemic agents with higher potency and lower side effects is of high priority. In this study, 1,3,4 thiadiazole Schiff base derivatives were synthesized as potential peroxisome proliferation-activated receptor- α (PPAR α) agonists and characterized using elemental analysis, FTIR, ¹H-NMR, ¹³C-NMR and mass spectroscopy and then tested for their hypolipidemic activity in Triton WR-1339-induced acute hyperlipidemic rat model in comparison with bezafibrate. The compounds showed significant hypolipidemic activity. Induced fit docking showed that the compounds are potential activators of PPAR α with binding scores - 8.00 Kcal/mol for 2,5-bis(4-hydroxybenzylidenamino)-1,3,4-thiadiazole. PCR array analysis showed an increase in the expression of several genes involved in lipid metabolism through mitochondrial fatty acid β oxidation and are part of PPAR α signaling pathway including Acsm3, Fabp4 and Hmgcs1. Gene expression of Lrp12 and Lrp1b involved in LDL uptake by liver cells and Cyp7a1 involved in cholesterol catabolism were also found to be upregulated. © 2019, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Olive mill wastewaters (OMWWs) are a significant source of environmental pollution, especially in important olive oil producing countries such as Spain, Greece, Syria, Jordan and other countries in the Mediterranean. Due to cost issue no treatments plants are currently available at the mills; therefore, OMWW is normally discharged into the environment causing serious environmental problems such as: coloring and pollution of surface and ground waters, soil surface, and foul odors problems. Approximately 209,000 tons of olives have been processed in Jordan in 2017, which generated 175,000 m³ of OMWWs. They generated roughly 3,069 tons of BOD₅, 7,956 tons of COD, 149 tons of residual olive oil, 2.07 tons of phenols, 3,753 ton total suspended solids and 4.2 ton of phosphorous. The OMWW is rich in organic matter expressed as BOD₅ and COD with COD/BOD₅ of 2.6 indicated that OMWWs is not suitable for biological treatment and therefore must be treated before discharge to the environment or sewer system. Cleaner production options and proper environmental waste management systems at the mills are needed to reduce their environmental impact. This may include the adoption of the two-phase mills to reduce water use to less than half the quantities used in traditional and three phases mills. © 2019 The Author(s)

ABSTRACT: Herein, the cytotoxicity, cellular uptake and wound healing of human dermal fibroblasts were investigated upon treatment with gold nanorods (GNR) decorated with different ligands. Neutral and cationic poly ethylene glycol (PEG)-decorated GNR demonstrated the least cytotoxicity and cellular internalization, while anionic-and bovine serum albumin (BSA)-coated GNR revealed significant cytotoxicity and cellular uptake into human dermal fibroblasts. The cell scratch test demonstrated that neutral, cationic PEGylated GNR and anionic-decorated GNR have accelerated the wound healing rate in vitro after 24 h of incubation with scratched human dermal fibroblasts compared to control, while there was a drastic retardation of wound healing rate of scratched fibroblasts upon exposure to BSA-GNR accompanied with a significant release of the inflammatory cytokine; interleukin-1 β (IL-1 β). The cytotoxicity of GNR against the dermal cells and their ability to enhance the wound healing in vitro are greatly linked to their surface modifications. © 2019 by the authors. ABSTRACT: The cloud service platforms number has increased and this resulted in an increased number of its providers. This emphasizes the investigation of the factors which influence its services and overall performance. Therefore, this study explores the performance evaluation of the cloud services which are critical provisioning quality services and distribution of the workload. A performance evaluation method has been designed to assess the cloud computing services used for the computer network. The performance of 1.76 GFLOPS was achieved through the cluster with one node to advertise the peak performance as depicted by Amazon (66%). A total of 52.4 GFLOPS or 39.87% has been obtained for 16 instances from the 85% efficiency and the theoretical peak. The experiment performed in this study showed that the reliability and performance of the investigated clouds are beneath the expectations. Therefore, this cloud is inadequate and inefficient for scientific computation comprehensively, although it shows a dire adaptation based on temporarily and immediate resources. © 2019, ICIC International. ABSTRACT: Abstract: The S-alkyl selenothiocarbonato iron complexes of the general formula CpFe(CO)₂SeC(O)SR (R = Et, n-Pr, i-Pr) are made by the reactions of (μ -Se)[FeCp(CO)₂]₂ and S-alkyl chlorothioformates RSC(O)Cl. The CO-substitution reactions of CpFe(CO)₂SeC(O)SEt with triphenylphosphine, triphenylarsine, or triphenylantimony (EPH₃) gave the monosubstituted complexes CpFe(CO)(EPH₃)SeC(O)SEt (E = P, As, Sb) in high yields. All the S-alkyl selenothiocarbonato iron complexes have been characterized by IR, MS, ¹H, ⁷⁷Se, ³¹P, ¹³C NMR spectroscopy, and elemental analysis. The solid-state structures of CpFe(CO)₂SeC(O)SiPr and CpFe(CO)(PPh₃)SeC(O)SEt, were determined by X-ray crystal structure analysis. The cyclic voltammetry of the same two complexes was also investigated. Graphic abstract: [Figure not available: see fulltext.]. © 2019, Springer-Verlag GmbH Austria, part of Springer Nature.

ABSTRACT: With the continued evolution of three dimensional (3D) object presentation and usage, the security of such objects has become an increasingly desirable research area. Previous efforts mostly concentrated on the encryption of point clouds, solid models, meshes, and 3D textured models. The (texture map) part of meshed 3D objects was overlooked by previous encryption techniques of 3D meshed objects in spite of its importance because they require preprocessing to be extracted. Therefore, this paper provides a system for the full encryption of 3D textured objects with their texture maps. It provides an improved system based on an existing flexible cryptosystem named Flexible cryptosystem based on Cellular Automata (FcCA). The FcCA system has two drawbacks. One drawback is shuffling plain data without changing their values, which yields the same histogram and nonstandard encryption ratios. The other drawback is the need for many generations to make the keyspace very large, which is unsuitable for the large size of textured object data. This work overcomes these drawbacks of FcCA and fully encrypts 3D textured objects with their texture maps. The improvements to FcCA include making intersect start points change with every generation and encrypting the values of plain data while shuffling them using cellular automata. At first, the plain 3D object is extracted to vertices, faces, and texture, in addition to its texture map. After that, extracted data are encrypted using the proposed improved FcCA (iFcCA) cryptosystem. Implementation and analysis of this new system showed its preponderance as it can encrypt and decrypt 3D textured objects better than FcCA and other existing methods. Moreover, it reduces the need for many generations of cellular automata, and consequently, reduces execution time. In addition, iFcCA has a very robust key, and it can resist different types of attacks. © 2019 Elsevier Ltd

ABSTRACT: Quercetin (QCT) is an abundant plant polyphenol with demonstrated efficacy in several diseases including colon cancer. Herein we have developed polymeric nanoparticles (NPs) of QCT based on the pH-sensitive polymer Eudragit® S100 to achieve colon pH-specific drug release following oral administration. NPs were prepared by the nanoprecipitation technique and showed a mean diameter of 66.8 nm and a partially negative surface charge of -5.2 mV. NPs contained on average 2.2% w/w QCT at an encapsulation efficiency of 41.8%. IR spectroscopy and differential scanning calorimetry (DSC) both revealed the presence of intermolecular interactions, most likely H-bonding, between QCT and Eudragit® S100, which likely contributed to drug loading. DSC also indicated that the drug was present in the NPs in an amorphous state, which was further confirmed by X-ray diffraction. In vitro release testing showed a delay in drug release in acidic pH, but complete release within 24 h at pH 7.2. A cytotoxicity assay was performed on CT26 murine colon carcinoma cells, where QCT-loaded NPs displayed significantly higher potency (IC50 = 0.8 µM) than free QCT (IC50 = 65.1 µM). Our findings present a promising nanomedicine for colon-targeted delivery of QCT in diseases such as colon cancer. © 2019 Elsevier B.V.

ABSTRACT: Artificial bee colony (ABC) algorithm is one of the most recent swarm intelligence-based algorithms simulate the foraging behavior of honey bees in their hive. ABC starts with a colony of artificial bees with sole aim of discovering the place of food sources with high nectar amount using the solution search equation in the employed bee and onlooker bee operators. However, the solution search equation is good in exploration and poor in exploitation. In this paper, the solution search equation of the onlooker bee is modified by using a value of the fittest food sources selected by a set of selection schemes inspired from the evolutionary algorithms. This is to guide the search process of onlooker bee toward the fittest food sources from the population in order to empower the

exploitation capability and convergence. Four selection schemes are incorporated with the ABC algorithm to choose the fittest food sources in four versions as follows: global-best, tournament, linear rank, and exponential rank. For evaluation purposes, 10 classical benchmark optimization functions are used to study the sensitivity analysis of each ABC algorithm to its parameters. The performance of the proposed ABC versions is compared with the original ABC version in order to study the effectiveness of the modifications. In addition, a comparative evaluation of ABC algorithms is carried out against the state-of-the-art methods that worked on CEC2005 benchmark functions, CEC2015 benchmark functions, and two real-world cases of economic load dispatch problem. The experimental results show that the selection schemes incorporated within the search equation of the onlooker bee directly affects the performance of ABC algorithm. © 2018, Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: The convergence of social networks and mobile computing has generated new horizons to explore and use the capabilities of mobile social networking in humanitarian crises. Whereas there is extensive and evolving interest in mobile social networking in cohesive societies that have stable normal living conditions, comparatively little research exists on harnessing mobile social networking to foster participation in crisis management. Far less attention has been focused on investigating the motivations and determinants to continue the use of mobile social networking in humanitarian crises that have arisen out of civil wars. Therefore, using the Syrian crisis as a case study, the purpose of this study is to investigate the motivations and determinants to continue the use of mobile social networking to participate in crisis management in civil war-torn societies. An online questionnaire was used to collect data from Syrians who have remained in Syria. Smart PLS was used to analyze the data. The results indicated that mobile social networking plays a significant role in the fulfillment of basic humanitarian needs, including survival, safety, a sense of community, freedom of speech and expression, pressures for peace, cognitive motivations and self-actualization. In addition, the results indicated that users of mobile social networking encounter a wide range of risks on the individual and societal levels, including direct personal threats, the penetration of terrorism ideology, the incitement of violence, and the advocacy of hatred. The present study sheds light on the critical role of mobile social networking in providing an opportunity for the participation of society's members in the crisis management. It also investigates the impact of trust and perceived risks on the continued usage of mobile social networking in war-torn societies. © 2017 Elsevier Ltd

ABSTRACT: The purpose of this paper is to investigate whether the factors causing internal conflict affect the effectiveness of the methods used in handling these conflicts. The main instruments of research used in this study were the survey questionnaire. Data gathered from the (192) respondents were statistically treated and analyzed using arithmetic weighted mean, it was interpreted based on the Likert scale, in testing the hypotheses multiple regression was used. The results showed that the following causes of conflict, task interdependencies, different goals of subunits, bureaucratic factors, communication problems, competition for scarce resources, differences in the performance standards, and differentiation were noted to be linked to the effectiveness of the conflict handling methods. Management, departments, units, division's heads, and team leaders of the Jordanian commercial banks favor resolving conflicts. It was found that, regardless of what causes conflicts, they were able to contain and resolve conflicts, using all different styles and modes of conflict handling methods. The result of the multiple regression test revealed that there was a significant positive effect of the factors causing conflict on all different styles and techniques, used in handling conflicts. It was concluded that avoidance style, would not resolve the conflict, and it might negatively affect the behavior of individuals, so it should be averted. Using the collaborating mode would encourage positive interactions among members of the organization, resulting in a more cooperative working environment. The compromising method should be used in a way that will satisfy

all conflicting parties, to ensure that, the focus would be on achieving goals of the entire organization. © 2019, Pro Global Science Association. All rights reserved.

ABSTRACT: This study is to explore the relationship between technological innovation and managerial innovation. The great emphasis has been on technological innovation, with neglect of managerial innovation, which has had major contributions to improving technology management and increasing the availability of companies through the three main forms of managerial innovation: general managerial Innovation, the innovation of managerial concepts and Re-innovation of the company. In the post-industrial age, innovation has reached its peak in the creation of the Internet and its integrated technologies and applications. Management innovation has reached its peak in the innovation of knowledge management and the productivity of knowledge work. © 2019, Pro Global Science Association. All rights reserved.

ABSTRACT: This study is aiming at exploring and analyzing the relationship between the three dimensions of Business Re-engineering Processes (Organization's Structural, Procedural and Technological) (BPR) and the three aspects of employees' performance (knowledge, skill, and attitude). The main results of this study have revealed that there is a positive, strong, and significant relationship between the BPR dimensions and employee performance. It also indicates that there is a statistically significant effect of the BPR dimensions on the employee's performance. © 2019, Pro Global Science Association. All rights reserved.

ABSTRACT: In this study, the photothermal-induced bactericidal activity of phospholipid-decorated gold nanorods (DSPE-AuNR) suspension against Pseudomonas aeruginosa planktonic and biofilm cultures was investigated. We found that the treatment of planktonic culture of Pseudomonas aeruginosa with DSPE-AuNR suspension (0.25-0.03 nM) followed by a continuous laser beam exposure resulted in ~6 log cycle reduction of the bacterial viable count in comparison to the control. The percentage reduction of Pseudomonas aeruginosa biofilm viable count was ~2.5-6.0 log cycle upon laser excitation with different concentrations of DSPE-AuNR as compared to the control. The photothermal ablation activity of DSPE-AuNR (0.125 nM) loaded into poloxamer 407 hydrogel against Pseudomonas aeruginosa biofilm resulted in ~4.5-5 log cycle reduction in the biofilm viable count compared to the control. Moreover, transmission electron microscope (TEM) images of the photothermally-treated bacteria revealed a significant change in the bacterial shape and lysis of the bacterial cell membrane in comparison to the untreated bacteria. Furthermore, the results revealed that continuous and pulse laser beam modes effected a comparable photothermal-induced bactericidal activity. Therefore, it can be concluded that phospholipid-coated gold nanorods present a promising nanoplatfrom to eradicate Pseudomonas aeruginosa biofilm responsible for common skin diseases. © 2019 by the authors.

Abu Sharour, L.

A cross-sectional study on oncology nurses' knowledge and practice of oral mucositis among cancer patients in Jordan

(2019) International Journal of Nursing Sciences, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85067692850&doi=10.1016%2fj.ijnss.2019.05.005&partnerID=40&md5=2b8dc81ca9a64afe2febe2d322a1013c

AFFILIATIONS: Faculty of Nursing, AL-Zaytoonah University of Jordan, Jordan

ABSTRACT: Objectives: This study was conducted to evaluate oncology nurses' knowledge and compliance with oral mucositis (OM) management guidelines. Methods: A cross-sectional design with a nonparticipant observation approach was utilized. In phase I, a cross-sectional convenience sample (n = 140) of oncology nurses completed the knowledge test. In phase II, a random sample (n = 20) of oncology nurses from participants in phase I was observed during their practice. Results: Fifty-seven (40.7%) of the participants had an unsatisfactory level of knowledge. Most of them had knowledge deficits regarding pathology, OM definition, assessment, scoring, treatment, and patient education and advice. A significant difference existed among nurses with diploma, bachelor, and postgraduate degrees as determined by one-way ANOVA (P = 0.001). There were no significant difference between average scores of male and female nurses were higher than those of nurses (P = 0.45). No significant difference was observed among knowledge scores of nurses with different job titles (P = 0.51). The average score of male nurses in terms of skill performance was higher than that of female nurses (29.20 ± 2.10 vs 27.10 ± 1.80) without statistical significance. Conclusion: The knowledge and compliance with OM management guidelines among Jordanian oncology nurses need to be improved. National OM prevention and management guidelines are adopted in Jordan. Continuing education and training are also recommended. © 2019 Chinese Nursing Association

ABSTRACT: The consumption of dietary supplements has nowadays become popular, especially in Jordanian sports clubs and gyms. In fact, there is a widespread idea, among consumers, that these proteins contain hormones in order to increase their efficiency. The objective of this study is to develop a better understanding of customer opinion in an era that increased growth in Jordan and improves a chromatographic method to detect the testosterone in protein supplements. The method of this study, six popular types of proteins in the Jordan market have been chosen after conducting a primary study of the pro-teins' users by questionnaires to identify their opinions about these proteins. These proteins have been analyzed by reverse-phase high-performance liquid chromatography by developing an easy and fast method to detect testosterone signal between 8-9 minutes of the chromatogram. The results of the study showed that 61% of the users believe that sport proteins contain hormones and other substances that are not mentioned in the list of ingredients. While 39% believe otherwise. On the other side, HPLC results of six proteins showed no signs for testosterone hormone. The main reason that drives them to take sport proteins is for building muscles in spite of they believe it could be harmful due to containing hormones and other substances. So in future investigations, it might be possible to use different brands and investigate them by using the same method. © International Journal of Research in Pharmaceutical Sciences.

ABSTRACT: S. M. Ulam once addressed the problem 'when is it true that a mathematical object satisfying a certain property approximately must be close to an object satisfying the property exactly?'. This problem was solved by D. H. Hyers in 1941 using the functional equation and thereafter numerous research papers and monographs have been published for various types of functional equations in different spaces. The solution proposed by D. H. Hyers (1941) later developed into the famous generalized Hyers-Ulam-Rassias stability of functional equations. In this paper, we intend to attain the general solution to a new mixed type functional equation and interrogate the generalized Hyers-Ulam-Rassias stability in fuzzy normed spaces. Also, we seek to provide its application for generating secret keys in client-server environment. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.

Workplace bullying and its preventive measures and productivity among emergency department nurses (2019) BMC Health Services Research, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85068573727&doi=10.1186%2fs12913-019-4268-x&partnerID=40&md5=7a8b5f648f856bc0553d8c28c20e0117>

AFFILIATIONS: Faculty of Nursing, Clinical Nursing Department, Al-Zaytoonah University of Jordan, Airport Street, Amman, Jordan

ABSTRACT: Background: Workplace bullying has adverse effects on nurses' productivity and emotional well-being and increases nurses' desire to leave their jobs. Bullying is a common phenomenon that has been reported worldwide. Emergency Department (ED) nurses are particularly exposed to bullying as a result of their job stressors and demands. Purposes: To examine the prevalence of bullying and the impact of preventive measures on productivity among Jordanian ED nurses; and to examine bullying in relation to personal and organizational factors. Methods: We surveyed ED nurses in five hospitals in Amman, Jordan - two government hospitals and three private hospitals. The eligibility criteria for the study, met by 134 persons, were having at least an associate degree and having worked in the ED for at least six months. We used a four-part questionnaire that included demographic data, the Negative Acts Questionnaire, questions on prevention of bullying, and a health and productivity survey. Data analysis included descriptive and inferential statistics. Results: A total of 120 ED nurses joined the study, an 89.6% response rate. The majority of participants were male (65%) and their mean age was 29.4 years. Ninety percent of the participants reported being bullied. Nurses with less experience in the ED were exposed to more bullying compared to other nurses. Of nurses who reported being bullied, 61.7% reported associated decreased productivity, including the ability to respond to cognitive demands, provide support, appropriate communication, safe care, and competent care. The overall mean score for the prevention of bullying questionnaire was 94.51 out of 168 (SD = 23.43). Drilling down, the highest mean score was for the "Individual sub-scale", and the highest item mean score was for "I know the process of how to report bullying". Conclusion: Bullying is prevalent among ED nurses in Jordan; it has significantly influenced the nurses' perception of their productivity and the quality of care they provide. Although nurses reported adopting measures to prevent bullying, they were insufficient to address this widespread problem. Implications for nursing and health policy: Bullying is a common occurrence in nursing practice in Jordan, as in other places. It has a detrimental effect on the quality of health care. Accordingly, interventions, which we describe, should be undertaken to minimize the incidence and impact of bullying. © 2019 The Author(s).

ABSTRACT: Enterprise resource planning (ERP) systems play very significant role in automated business processes. However, Private Jordanian universities should think more about implementing ERP systems to manage their processes and produce high quality output. Certainly, many research on ERP adoption have revealed that the organizations often faced many barriers and the failure rate is very high. In addition, different research projects conclude that, oftentimes, universities do not gain the expected benefits from adoption the ERP system. The universities in Jordan should understand the factors that affect the acceptance of ERP in order to gain the expect benefits of ERP. Hence, it is significant to determine the factors affect the acceptance of ERP in Jordanian Universities. The main

objective of this research is to determine the factors that affect the acceptance of using ERP by Jordanian universities. © 2019 International Journal of Information and Education Technology. All rights reserved.

ABSTRACT: Disaster recovery of information technology is a hot area of security for protecting data against unsatisfactory events, which involves a set of procedures for system continuation. Disaster recovery is a subset of business continuity, while the disaster recovery planning is a subset of business continuity planning. There are many policies for disaster recovery. This paper begins with an illustrative study of some models for disaster recovery. Then, it gives a discussion of some cloud-based disaster recovery strategies and compares them with the traditional disaster recovery. The results show that the cloud-based disaster recovery achieved better results than traditional disaster recovery. Also, the paper highlights importance of disaster recovery planning. © 2019, ICIC International. All rights reserved.

ABSTRACT: Purpose: To investigate the protective effect of vitamin E (Vit E) and selenium (Se) combination against gentamycin (GM)-induced renal and hepatic toxicity in rats. Methods: Forty-eight male Wistar albino rats were administrated GM at a dose of 80 mg/kg/day, with or without Se (1.5 mg/kg/day), and/or Vit E (250 mg/kg/day) for a period of 4 weeks. Serum samples from each rat were subjected to biochemical analysis for kidney and liver functions, while kidney and liver biopsies were also investigated by histological examination. Results: GM significantly increased serum creatinine, urea, alanine aminotransferase (ALT), aspartate aminotransferase (AST) and free radicals ($p < 0.05$). Moreover, GM induced significant histological and ultrastructural alterations in the renal and hepatic tissues of the rats. Exposure to a combination of Vit E and Se did not attenuate the GM-induced toxicity in renal and hepatic tissues. Conclusion: These results suggest that Vit E and Se combination have no significant protective role against GM-induced hepatic and renal toxicity. © 2019 The authors.

ABSTRACT: This paper presents a novel algorithm called the recursive intelligent optimizer (RIO) applied to a digital phase control in dynamically reconfigurable phased arrays with applications mainly in radar systems and communication antennas. The RIO belongs to the class of iterative learning control algorithms and operates in deterministic, stochastic, and population initialization modes which are valuable in fast dynamic array reconfiguration. The array factor of a centrosymmetric array is modeled by a linear transformation and mainly optimized for the sidelobe level (SLL), beam steering, and interference suppression. The RIO dynamic reconfiguration is achieved in less than 1.2 s for an array of 100 elements where initial phases are optimized with recursive learning adding up to 5.7 and 8.5 dB to the SLL of 100 and 200 elements arrays, respectively. Failed phase shifters are turned off and the array synthesis is reoptimized for new digital phases with a minimal performance loss. Indeed, the failure of 10% of elements producing a heavy loss of 5.9 dB is fully compensated to a minor loss of 0.3 dB in 441 ms. © 1963-2012 IEEE.

ABSTRACT: A computer scientist aims to develop an algorithm that if followed will solve the related problem. Algorithms are finite processes that contain a step by step list of instructions in solving a problem. In the same context, discrete mathematics is the background behind many computer operations, and it is concerned with structures which take on a discrete value often infinite. Besides, it analyzes data whose values are separated (such as integers) and provide the needed understanding of important topics such as logical inferences and mathematical proof. Moreover, it shows that algorithms always produce the correct results. This paper proposes a new approach to prove the validity of implications involving quantifiers and logical operators. The new approach is based on simplification and logical inference methods which are used for the first time in solving such problems. Therefore, the proposed methods were used to verify the validity of different implications. The results for all previously known to be valid formulas using the simplification method were valid. And when using the logical inference method, the conclusions were true in all cases; accordingly, the arguments were valid. © 2019, ICIC International. All rights reserved.

ABSTRACT: Introduction: The global lung function initiative (GLI) 2012 introduced new multi-ethnic spirometry reference values for numerous ethnicities. Objectives: The aim of this study was to investigate the suitability of the GLI reference values for the adult Jordanian population. Methods: About 1875 (1029 females and 846 males) healthy non-smoking adults were enrolled from several locations in Jordan. Spirometry tests were performed. z-scores and predicted normal values were calculated for each participant using GLI 2012 equations in addition to other local equations from the Middle East. Results: Our results indicated that none of the GLI 2012 or other regional equations studied produced an acceptable fit to our data. Conclusion: A need to formulate a specific equation for the Jordanian population is urgently required to better evaluate their respiratory conditions. © 2019 John Wiley & Sons Ltd

The impact of introducing the Modified Early Warning Score 'MEWS' on emergency nurses' perceived role and self-efficacy: A quasi-experimental study

(2019) International Emergency Nursing, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85064273887&doi=10.1016%2fj.ienj.2019.03.005&partnerID=40&md5=5bfa6e32bd543f747a55c513156e2754)

85064273887&doi=10.1016%2fj.ienj.2019.03.005&partnerID=40&md5=5bfa6e32bd543f747a55c513156e2754

AFFILIATIONS: Faculty of Nursing, Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: Background: Early warning Score is a bedside track and trigger system used to facilitate early detection and management of deteriorating patients. Although emergency department nurses are the key to implement this task, their interaction and contribution to provide an estimate of patients' severities is still suboptimal and neglected. Aim: This study aimed to introduce an educational programme using the Modified Early Warning Score (MEWS) to nurses working in the emergency departments and to assess the programme impact on nurses' self-efficacy and perceived role. Methods: This non-equivalent, multi-centre, quasi-experimental study, assigned two groups of emergency nurses into intervention and control. The intervention group received three interactive educational sessions totalling 12 h relevant to the application of MEWS in emergency situations using a validated programme called 'COMPASS'. The other group received no intervention. Both groups were assessed for self-efficacy and perceived role in the pre-test, immediate post-test, and three months later follow-up phase. Results: A total of 232 participants were divided into intervention and control groups (118 and 114, respectively), having no variations in age, gender, or experience as registered nurses. The intervention group showed a significant improvement in the self-efficacy scores for the nurses (F: 152.21, df: 2, p < 0.001). Similarly, the intervention nurses exhibited a significant improvement in the perceived role scores after the intervention (F: 121.20, df: 2, p < 0.001). The control group showed no changes in either variable across the three phases. While older nurses with longer experience showed higher self-efficacy after the programme, the perceived role

explained an additional 57.0% of the variance in self-efficacy after controlling these two demographics (Beta: 0.743, $p < 0.001$, CI: 1.18-1.66). Conclusion: The existence of an early warning system in the emergency department is able to enhance nurses' self-efficacy and perceived role coinciding with nursing interactions with the multidisciplinary team. © 2019

ABSTRACT: Purpose: This study purposed to assess the psychosocial correlates of work-related fatigue among Jordanian emergency department nurses. Design and Methods: A cross-sectional study was conducted among Jordanian emergency nurses ($n = 220$). Measures included Occupational Fatigue Exhaustion/Recovery Scale (OFER15) and Copenhagen Psychosocial Questionnaire version Two (COPSOQ II). Findings: The psychosocial factors correlated with all types of work-related fatigue (acute, chronic, and inter-shift [recovery]) were quantitative demands, work-family conflict, sexual harassment, threats of violence, physical violence, and bullying. Importantly, quantitative demands and sexual harassment were the main predictors of all types of work-related fatigue. Practice Implications: The psychosocial correlated factors should be considered when developing interventions to minimize work-related fatigue phenomenon. This would lead to a more positive working environment which will promote safe nursing care. © 2019 Wiley Periodicals, Inc.

ABSTRACT: Nanotechnology-based platforms have gained a growing interest in skin wound healing. Herein, gold nanoparticles (AuNPs) of different shapes (rods and spheres) and surface modifications (neutral, cationic and anionic charged polymers) were synthesized, characterized and loaded into a thermosensitive hydrogel (poloxamer 407). AuNPs-hydrogels exhibited excellent colloidal stability and demonstrated slow and prolonged release behavior over a 48-h of exposure using in vitro model. Hydrogels of poly ethylene glycol (PEG)-gold nanorods (AuNRs) and cationic poly allyl amine hydrochloride (PAH)-AuNRs demonstrated remarkable wound healing properties upon topical application on wounds using an animal model. PEGylated and cationic charged-AuNRs hydrogels have enhanced skin re-epithelization and collagen deposition after 14 days of daily wound treatment compared to controls, and they affected the gene expression of several inflammatory and anti-inflammatory mediators. Hydrogels of PEG-AuNRs and PAH-AuNRs exhibited potent in vitro antibacterial activity against staphylococcus aureus (*S. aureus*) and Pseudomonas aeruginosa (*P. aeruginosa*). Furthermore, AuNPs of different shapes and surface modifications demonstrated low percentages of deposition into the main body organs after 21 days of daily wound treatment. Hydrogels of AuNRs could be a promising nano-platform for wound healing. © 2019 Elsevier B.V.

ABSTRACT: Purpose: The study aims to investigate the transfer behavior of the weakly basic BCS class II model drug carvedilol from the stomach to the small intestine and compare the concentration profiles of carvedilol that were determined during the in vitro transfer model and dissolution testing. Methods: An in vitro transfer model, previously introduced by Kostewicz et al., was used in this study. A donor phase of simulated gastric fluid was used to predissolve Dilatrend® tablet (25 mg

carvedilol). Media that simulate and cover the physiological pH and buffer capacity ranges of the intestinal fluid were used as acceptor phases. pH measurements were reported to investigate the effect of addition of donor phase containing predissolved carvedilol on lowering the pH of the acceptor media. The f2 similarity factor was used to compare the concentration profiles of carvedilol determined during the in vitro transfer model. Results: Carvedilol was completely dissolved in all tested acceptor phases, resulted in no precipitation. The buffering capacity of the acceptor phase plays an important role in determining its pH. A discrepancy was found between the concentrations of carvedilol in all tested acceptor phases obtained using the transfer model and those reported using dissolution apparatus II in corresponding media. Conclusions: Results showed that dissolution testing using apparatus II might not be sufficient to predict its transfer from the stomach into the small intestine and that the in vitro transfer model may be more effective at mimicking the conditions in the gastrointestinal tract. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

An efficient semantic recommender method for Arabic text

(2019) Electronic Library, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85066991359&doi=10.1108%2fEL-12-2018-0245&partnerID=40&md5=c8c46db4872be9aedf1d87cbe295b04b>

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan;

Tafila Technical University, Tafila, Jordan

ABSTRACT: Purpose: This paper aims to propose a new efficient semantic recommender method for Arabic content. Design/methodology/approach: Three semantic similarities were proposed to be integrated with the recommender system to improve its ability to recommend based on the semantic aspect. The proposed similarities are CHI-based semantic similarity, singular value decomposition (SVD)-based semantic similarity and Arabic WordNet-based semantic similarity. These similarities were compared with the existing similarities used by recommender systems from the literature. Findings: Experiments show that the proposed semantic method using CHI-based similarity and using SVD-based similarity are more efficient than the existing methods on Arabic text in term of accuracy and execution time. Originality/value: Although many previous works proposed recommender system methods for English text, very few works concentrated on Arabic Text. The field of Arabic Recommender Systems is largely understudied in the literature. Aside from this, there is a vital need to consider the semantic relationships behind user preferences to improve the accuracy of the recommendations. The contributions of this work are the following. First, as many recommender methods were proposed for English text and have never been tested on Arabic text, this work compares the performance of these widely used methods on Arabic text. Second, it proposes a novel semantic recommender method for Arabic text. As this method uses semantic similarity, three novel base semantic similarities were proposed and evaluated. Third, this work would direct the attention to more studies in this understudied topic in the literature. © 2019, Emerald Publishing Limited.

Novel weighted interest similarity measurement for recommender systems using rating timestamp

(2019) 2019 6th International Conference on Software Defined Systems, SDS 2019, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85073892072&doi=10.1109%2fSDS.2019.8768548&partnerID=40&md5=8b33726b49ff2c38dacddb380c53548>

AFFILIATIONS: Alzaytoonah University of Jordan, Amman, Jordan;

Jordan University of Science and Technology, Irbid, Jordan

ABSTRACT: This paper proposes a novel similarity measurement for recommender systems that uses weighted user interests and rate timestamps. Although some works were proposed previously to include the time factor in the recommendation process, these works were based on the use of the time factor with user rates. In this work, we show that using user rates could be misleading in some cases, and we propose the use of the time factor with the hidden user interest(s) instead of user rates. The user interests are weighted according to the time factor so that recent interests are given more weight than the older ones as they are more important. Experimental results proved that our proposed similarity measurement is efficient in terms of accuracy and recommendation time. © 2019 IEEE.

Comparative study for recent technologies in arabic language parsing

(2019) 2019 6th International Conference on Software Defined Systems, SDS 2019, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85073888783&doi=10.1109%2fSDS.2019.8768587&partnerID=40&md5=35107ba0dab0d2d00973fcd73f2fb6aa>

AFFILIATIONS: Alzaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Parsing the natural language is an interesting issue for many of natural language processing (NLP) applications. Parsing a complex language such as Arabic represents a challenging task for many researchers. Arabic is a complex language due to the rich morphology and the complicated structure of its sentences, since it contains difficult linguistic features. This

comparative study discusses the existing and the developed Arabic parsing systems, we describe here current technologies which are employed for parsing Arabic text. A comparison between several parsing systems is proposed in this paper as well, by stating the key features and limitations for each of them. Finally, solutions to address the main limitations of these Arabic parsing systems have been suggested. © 2019 IEEE.

The trauma of condemnation and the embellishment of an illegitimate child as a source of regeneration in Lizzie Leigh and Ruth

(2019) *Ars Aeterna*, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85068938454&doi=10.2478%2faa-2019-0005&partnerID=40&md5=84e6947d724071f0d20755349f640161>

AFFILIATIONS: Dept. of English Faculty of Arts, Al-Zaytoonah University, PO. Box 1089, Amman, Jordan
ABSTRACT: This paper focuses on Mrs Gaskell's treatment of the erring girl in Lizzie Leigh (1850) and Ruth (1853) and the new elements that she introduces which brand the treatment as different. Contrary to her Victorian contemporaries, Mrs Gaskell stresses the role of religion, the use of biblical quotations on the treatment of the sinner, and the role of motherhood. The paper also shows how Mrs Gaskell makes the illegitimate child an incentive towards repentance and hope of reclamation. Through her motherly love and devotion to her child, a mother rises and grows in character and faith. Moreover, the paper demonstrates Mrs Gaskell's condemnation of the falsity of the traditional taxonomy of "illegitimate" or "fallen", and her assertion that social value lies in the inherent properties within the individual. It also highlights how she makes forgiveness for the sinner a duty which society has to fulfil, and maintains that if the charitable and the kind are forced "to lie" because of the existing social and moral attitudes, then it is imperative that they should be changed so that "lies" are unnecessary. It concludes by investigating the stormy reception and the controversy it created among readers. © 2019 Taher Badinjki, published by Sciendo 2019 Allott, Miriam. I960.

A hybrid clustering routing protocol based on machine learning and graph theory for energy conservation and hole detection in wireless sensor network

(2019) *International Journal of Distributed Sensor Networks*, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85067645908&doi=10.1177%2f1550147719858231&partnerID=40&md5=79145bad5cf59a9ac9886d782c4a012c>

AFFILIATIONS: Department of Electrical Engineering/Communications and Computer, Al-Zaytoonah University of Jordan (ZUJ), Amman, Jordan;
Computer Science Department, Huazhong University of Science and Technology (HUST), Wuhan, China
ABSTRACT: In this work, a new hybrid clustering routing protocol is proposed to prolong network life time through detecting holes and edges nodes. The detection process attempts to generate a connected graph without any isolated nodes or clusters that have no connection with the sink node. To this end, soft clustering/estimation maximization with graph metrics, PageRank, node degree, and local cluster coefficient, has been utilized. Holes and edges detection process is performed by the sink node to reduce energy consumption of wireless sensor network nodes. The clustering process is dynamic among sensor nodes. Hybrid clustering routing protocol-hole detection converts the network into a number of rings to overcome transmission distances. We compared hybrid clustering routing protocol-hole detection with four different protocols. The accuracy of detection reached 98%. Moreover, network life time has prolonged 10%. Finally, hybrid clustering routing protocol-hole detection has eliminated the disconnectivity in the network for more than 80% of network life time. © The Author(s) 2019.

ABSTRACT: Soil amendment with olive cake produced from olive mills waste (olive pomace/cake) is an ordinary practice in olive producing countries in the Middle East. It is used to improve soil physical and chemical properties as well as cheap waste management approach. But, the olive cake contains small percentage of residual oil which may affect water holding capacity of soil and penetration rate in agricultural lands. The data provided in this article shows the influence of

adding olive pomace to clay and sand clay soils in terms of water holding capacity (WHC), penetration depth and accumulate intake. © 2019 The Authors

ABSTRACT: Objective: Our objective was to assess the effectiveness of a structured educational program on improving oncology nurses' knowledge, self-confidence, and self-efficacy in nutritional assessment and counseling for patients with cancer. Methods: A pretest-posttest quasi-experimental design was used. A sample of 60 nurses from oncology units participated as an experimental group (n = 30) and a control group (n = 30). The participants completed a knowledge test before completing the educational program. Self-confidence and self-efficacy also were assessed pre- and postintervention. Results: There was a significant difference between the experimental (mean [M] = 26.00, SD = 8.00) and control (M = 10.00, SD = 3.75) groups regarding knowledge after the interventional sessions (t = -16.00, P = 0.001). Furthermore, the results indicated a significant difference (t = -24.00, P = 0.001) between the experimental group (M = 60.50, SD = 13.10) and the control group (M = 36.50, SD = 7.60) regarding self-confidence in managing cancer patients. Finally, there was a significant difference between the experimental group (M = 33.50, SD = 3.10) and control group (M = 23.25, SD = 2.75) regarding self-efficacy (t = -10.25, P = 0.001). Conclusions: The educational program improved the oncology nurses' knowledge, self-confidence, and self-efficacy in relation to nutritional assessment and counseling. Improving nurses' competencies will improve the quality of care provided to the patients and patient health outcomes. © 2018 Elsevier Inc.

ABSTRACT: Swarm intelligence is a kind of artificial intelligence that is based on the collective behavior of the decentralized and self-organized systems. This work focuses on reviewing a heuristic global optimization method called particle swarm optimization (PSO). This includes the mathematical representation of PSO in contentious and binary spaces, the evolution and modifications of PSO over the last two decades. We also present a comprehensive taxonomy of heuristic-based optimization algorithms such as genetic algorithms, tabu search, simulated annealing, cross entropy and illustrate the advantages and disadvantages of these algorithms. Furthermore, we present the application of PSO on graphics processing unit and show various applications of PSO in networks. © 2019, Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: Aim: To identify the predictors of nurses' work stressors who care for older people (i.e., over age 65 years) in Jordan. Background: Nurses sometimes experience stress which could occur as results of caring for older people, for example, with multiple physical and psychological needs. This stress could affect the job satisfaction and reduce the quality of care provided to older people. Thus, identifying sources of stress and predictors that cause stress for nurses is required to enhance quality of care for older people. Design: A cross-sectional design. Methods: Cluster random sampling was used to select study settings (i.e., 3 public hospitals, 3 private hospitals and 17 healthcare centres) in Amman, Jordan. A convenience sampling method was used to select 485 nurses. The Quality-Work-Competence questionnaire and Nurses' Working Life Questionnaire were used. Multiple linear regressions were used to identify predictors of job stress for nurses providing care for older people. The data were collected between June 2016 and January 2017. Results: Job satisfaction, competence, development skills, gender, organisational climate and employee development, all have demonstrated significant correlations with stress. The regression analysis showed that the model

significantly predicted a sizable portion of variance ($R^2 = 0.27$, $p < 0.001$) in the physical and psychological stress among nurses working in the older people care settings. Conclusion: The nursing profession and the employing agencies should support nurses who care for older people in practice by conducting special training programmes to cope with stress. Interventional studies should be conducted to confirm the association between the nurses' work stress who care for older people and job satisfaction, competence, development skills, gender, organisational climate and employee development. Implications for practice: It is recommended that rotating appropriate competent nurses who care for older people, in particular dementia patients who are usually very ill may have greater needs due to their cognitive status, through other wards would temporarily reduce the nurses' stress. The nursing profession and the employing agencies should support nurses who care for older people in practice by conducting special training programmes focusing on the teaching skills and knowledge of how to deal with stress. © 2019 John Wiley & Sons Ltd

ABSTRACT: Objective: The study aim was to evaluate health-related quality of life (HRQoL) and to explore factors associated with poor HRQoL in patients with type 2 diabetes in Jordan. Methods: The EQ-5D questionnaire was used to assess HRQoL in outpatients ($n = 196$) with type 2 diabetic during their clinic appointment at three major Hospitals in Jordan. Sociodemographic and medical data were collected from patient interviews and medical files. Multiple linear regression was performed to build a model with variables associated with poor HRQoL. Key findings: The mean score of the total EQ-5D index of the 196 participants was 0.724. Most of the patients reported 'some problems' through the five dimensions, with the highest percentage (46.1%) related to mobility domain. Regression analysis identified women gender ($\beta = -0.252$; $P < 0.01$), duration of diabetes ($\beta = -0.344$; $P < 0.01$) number of medications ($\beta = -0.423$; $P < 0.01$), and insulin therapy ($\beta = -0.205$; $P < 0.05$) as being significantly associated with poor HRQoL. Conclusions: The quality of life for patients with type 2 diabetes in Jordan has considerable scope for improvement. Future diabetes management programs should focus on improving HRQoL, with specific attention to be given for women patients, those who have long duration of diabetes, and patients receiving multiple medications or insulin therapy. © 2018 Royal Pharmaceutical Society

ABSTRACT: Background: Workplace bullying has adverse effects on nurses' productivity and emotional well-being and increases nurses' desire to leave their jobs. Bullying is a common phenomenon that has been reported worldwide. Emergency Department (ED) nurses are particularly exposed to bullying as a result of their job stressors and demands. Purposes: To examine the prevalence of bullying and the impact of preventive measures on productivity among Jordanian ED nurses; and to examine bullying in relation to personal and organizational factors. Methods: We surveyed ED nurses in five hospitals in Amman, Jordan-two government hospitals and three private hospitals. The eligibility criteria for the study, met by 134 persons, were having at least an associate degree and having worked in the ED for at least six months. We used a four-part questionnaire that included demographic data, the Negative Acts Questionnaire, questions on prevention of bullying, and a health and productivity survey. Data analysis included descriptive and inferential statistics. Results: A total of 120 ED nurses joined the study, an 89.6% response rate. The majority of participants were male (65%) and their mean age was 29.4 years. Ninety percent of the participants reported being bullied. Nurses with less experience in the ED were exposed to more bullying compared to other nurses. Of nurses who reported being bullied, 61.7% reported associated decreased productivity, including the ability to respond to

cognitive demands, provide support, appropriate communication, safe care, and competent care. The overall mean score for the prevention of bullying questionnaire was 94.51 out of 168 (SD = 23.43). Drilling down, the highest mean score was for the "Individual sub-scale", and the highest item mean score was for "I know the process of how to report bullying". Conclusion: Bullying is prevalent among ED nurses in Jordan; it has significantly influenced the nurses' perception of their productivity and the quality of care they provide. Although nurses reported adopting measures to prevent bullying, they were insufficient to address this widespread problem. Implications for nursing and health policy: Bullying is a common occurrence in nursing practice in Jordan, as in other places. It has a detrimental effect on the quality of health care. Accordingly, interventions, which we describe, should be undertaken to minimize the incidence and impact of bullying. © 2019 The Author(s).

ABSTRACT: Enhanced Weighted Exact Matching Algorithm (EWEMA) is an exact string matching algorithm that finds the pattern 'P' in the text 'T.' EWEMA contains two phases, the preparing phase, and the matching phase. This paper aims to enhance EWEMA and reduce its time complexity using the proposed algorithm called Advanced Weighted Exact Matching Algorithm (AWEMA). The simulation results presented the improvement in the algorithm AWEMA over EWEMA. © 2019 IEEE.

ABSTRACT: This paper surveys the various multicast routing protocols proposed for mobile ad-hoc networks. Some of the protocols use tree based approaches for creating multicast routes, some use graphs to construct multicast trees for routing, some protocol use the flooding approach to send multicast packets. This paper makes a detailed analysis and talks about the merits and demerits of various multicast protocols for mobile ad-hoc networks. The paper focuses on the number of control messages used in every protocol, the data structures used to maintain information, the merits of the protocol, the demerits and overhead involved during routing, the bandwidth utilized due to these message overheads. Also this paper studies the advantages and disadvantages of using trees, graphs and flooding for routing. © 2019 IEEE.

ABSTRACT: Mobile Ad hoc Network (MANET for short) is a new art of wireless technology that connect a group of mobile nodes in a dynamically decentralized fashion without the need of a base station, or a centralized administration, whereas each mobile node can work as a router. MANET topology changes frequently, because of the MANET dynamically formation nature, and freely to move randomly. MANET can function as standalone or can be connected to external networks. Mobile nodes are characterized with minimal human interaction, weight, less memory, and power. Despite all the pros of MANET and the widely spreading in many and critical industries, MANET has some cons and suffers from severe security issues. In this survey we emphasize on the different types of attacks at MANET protocol stack, and show how MANET is vulnerable to those attacks. © 2019 IEEE.

ABSTRACT: Arabic Language is spoken widely in the world. It has very special characteristics that made it hard to be handled by computers. Recently, Social Media is considered as one of the richest source for knowledge sharing and information gathering in the internet. Arabic Natural Language Processing (ANLP) tools play major role when trying to understand the content of any Arabic textual data (e.g. social media), it helps clean noisy data, stem words, etc. Also, it assists with understanding of the semantic or sentiment contents. We use Arabic Machine Learning (Classification and Clustering) with social media to discover the polarity or opinion in the contents. Many kinds of classifiers and clusters used with Social Media content detection, like SVM and K-Mean. In this paper we review the literature of the popular ANLP tools with AML software on social media contents toward identifying the best tools in these domains. © 2019 IEEE.

ABSTRACT: Electronic data has been created today in large quantities requiring data recovery services organization's work may experience the various type of disasters whether it was natural or man-made, which may result in huge loss of data. The purpose of recovery technology is the possibility of retrieving information from the backup server when the main data server is lost in the event of disasters. There are some difficulties such as time and cost complexity that make it difficult to implement such techniques. When you use disaster conditions as a service, these disasters can be remedied and data recovery speeds at low cost. In this paper, we compared and discuss the various techniques to create a unique backup and recovery system. In general, all these techniques focus on three different aspects: cost control, data replication, and security issues. © 2019 IEEE.

ABSTRACT: The program slicing technique is an abstracting technique that focuses on the program code. Clause Slicing is the type of program slicing that focuses only on the code clauses, which allows the quality assurance to measure program robustness by measuring every code clause against the programming language standards. The proposed model gives a new way for measuring the robustness quality factor using program clause slicing. © 2019 IEEE.

ABSTRACT: In this paper, an efficient numeric-analytic algorithm has been applied based on the residual power series approach to solve fuzzy fractional initial value problems of order 2β , $0 < \beta \leq 1$, under the strongly generalized differentiability. The present method relies basically upon the concept of the residual functions and generalized Taylor formula that constructs analytical and approximate solutions in the form of rapidly convergent series according to their parametric form. To validate the efficiency, reliability, and applicability of the proposed approach, the experimental data has been presented. © 2019 IEEE.

ABSTRACT: Disaster is an unexpected event in a system lifetime, which can be made by nature or even human errors. Disaster recovery of information technology is an area of information security for protecting data against unsatisfactory events. It involves a set of procedures and tools for returning an organization to a state of normality after an occurrence of a disastrous event. So the organizations need to have a good plan in place for disaster recovery. There are many strategies for traditional disaster recovery and also for cloud-based disaster recovery. This paper focuses on using cloud-based disaster recovery strategies instead of the traditional techniques, since the cloud-based disaster recovery has proved its efficiency in providing the continuity of services faster and in less cost than the traditional ones. The paper introduces a proposed model for virtual private disaster recovery on cloud by using two metrics, which comprise a recovery time objective and a recovery point objective. The proposed model has been evaluated by experts in the field of information technology and the results show that the model has ensured the security and business continuity issues, as well as the faster recovery of a disaster that could face an organization. The paper also highlights the cloud computing services and illustrates the most benefits of cloud-based disaster recovery. © 2019 IEEE.

ABSTRACT: An effective numerical method depends on the fractional power series is applied to solving a class of boundary value problems associated with obstacle, unilateral, and contact problems of fractional order 2α , $0 \leq \alpha \leq 1$. The fractional derivative is considered in the Caputo sense. This method constructs a convergent sequence of approximate solutions for the obstacle problem. A numerical example is given to illustrate the higher accuracy of this technique. © 2019 IEEE.

ABSTRACT: Recently it has become important to focus on the requirements of the system and how to take them and analyze them to determine the system infrastructure through which they will be relied upon in the rest of the system building. Some difficulties have been encountered in the process of understanding and analyzing the data taken from the user to convert it to UML diagrams. In this paper, we create a new approach that focuses mainly on increasing accuracy for this technique, reducing time in the systems of generating the use case of text written in natural language and finding solutions to some problems in current technologies because people need a smart and accurate system to meet their needs and save their time and increase the reliability of the reliance on software. © 2019 IEEE.

ABSTRACT: Designing and Developing of Sensors to assess and evaluate the presents of different physical phenomena in the environments has heavily introduced in the past decade. Different methods and techniques have been studied to develop a direct micro-sensors. With the introduction of microcontrollers and machine learning, sensors data may be used to predict other indirect phenomena in the environment. In this work, the electrical conductivity is utilized to predict the type of a solution or liquid in a cup. A simple sensor electric circuit based on ATmega328 micrcontroller has been designed to detect the electrical conductivity values in different liquids. Subsequently, these values have been utilized to train an artificial neural network model (ANN) to predict the liquids commercial names. The designed circuit and the ANN model have been tested with different 15 liquids diluted with water. eleven liquids are drinkable, the other 4 are chemical cleaning liquids. Our simple ANN model with this tiny dataset and two features only can detect the liquid type with an accuracy of more than 80% and a MSE value of less than 1%. © 2019 IEEE.

ABSTRACT: nowadays, the success of many online applications relays on keeping the data sent through the global network secure and far away from hackers. To carry out this task, the two communicating parties must exchange keys during their session. Some of the key exchange protocols are called key agreement protocols. The Elliptic Curve-Diffie Hellman (ECDH) is one of the most efficient algoiithms for securing data. The ECDH is more efficient than other traditional techniques such as Rivest-Shamir-Adleman (RSA) in terms of key size, computation and network bandwidth. The Authenticated Key Agreement (AKA) protocol is used for establishing a common session key between the two communicating parties. The common session key is used for subsequent cryptography goals. Most of the key agreement protocols (e.g. Menezes-Qu-Vanstone(MQV) family) generate one key per session therefore increasing the opportunities for guessing the session key. In this paper, we focus on developing an enhanced multiple sessions key which is based on ECDH. We propose an efficient and secure AKA protocol which is based on the ideas of the hashed MQV (HMQV), the YAK protocol as a robust key agreement based on public key authentication and multiple session keys. The proposed protocol generates multiple common keys per a session, where the generated common key depends on the static and ephemeral keys. Furthermore, the proposed protocol overcomes the attacks on the HMQV and YAK protocols and provides desirable security properties as compared with the relatedworks in this paper. © 2019 IEEE.

ABSTRACT: Extracting a structured text data from a published webpages has drawn attention in the last decade, the process of web data extraction has many challenges, due to variety of web data and the unstructured from of HTML files. The aim of this survey is to provide a comprehensive overview of current web data extraction techniques, in term of extracted data quality, where the redundant and the noise data should be eliminated. Merits and demerits for each web information extraction technique will be stated, and finally a classification framework for the discussed techniques will be provided. © 2019 IEEE.

ABSTRACT: In this research paper, a simulation model is proposed which can be used to evaluate the performance of LEACH protocol in realistic noise-prone WSN environment. In this model, the noise-

level is represented by the probability of reception ($p\{-r\}$) of packets. When $p\{-r\}$ is one the network environment is considered noise-free and all packets sent are received and when $p\{-r\}$ is less than one the environment is considered noise-prone. The noise effect is specified by generating a uniform random number U ; if U is less than $p\{-r\}$ the packet is delivered successfully to the receiving node, otherwise, packets are dropped. The proposed simulation model was implemented utilizing Python programming language. The effect of various noise levels on the performance of homogeneous LEACH algorithm was investigated for different network metrics. An energy model incorporating noise was derived analytically. © 2019 IEEE.

ABSTRACT: In This paper we study certain fractional forms of Abel's equation: $y'=P(x)+Q\{-1\}(x)y+Q\{-2\}(x)y^2+Q\{-3\}(x)y^3$. We solve the fractional form of the equation for the cases: $Q\{-2\} = 0$ or $Q\{-3\}= 0$. Such cases reduce the equation to Bernoulli fractional differential equation. © 2019 IEEE.

ABSTRACT: The genetic algorithm is used in many applications and one of these applications is the traffic signal system. The traditional traffic light suffers from several problems such as long waiting period and thus increasing the number of vehicles. Genetic algorithms a type of optimization algorithm, meaning they are used to find the optimal solution based on the theory of natural selection and evolutionary biology so they have several steps starts from the initial population, calculate the fitness function for each solution (Chromosome) and ends with selections, crossover, and mutation. The result of the genetic algorithm is increasing the total number of vehicles passing through the traffic signal system. © 2019 IEEE.

ABSTRACT: Internet of things have many applications, one of them is smart homes. The main drawback of IoT that depends on a centralized cloud. The Blockchain approach with a decentralized technique will solve the centralized cloud approach. Smart homes have many security issues, threats, attacks, user privacy, integrity, etc. Blockchain is playing role in many IoT applications also the solution of these security problems. This paper explains the Blockchain in smart home with the main three tiers, how Blockchain can help to secure the data, transaction, also describe the security analysis in IoT smart homes. © 2019 IEEE.

ABSTRACT: Nowadays, digital circuits are widely applied in different equipment such as computers, cell phones, digital watches, etc. As a result, new approaches to implement digital circuits are needed. Applying predicate logic is one way for achieving that. In particular, quantification (which is a commonly studied topic in predicate logic) can be used in the translation of a given logical statement which would assist in designing digital circuits. As a result, this paper proposes a new

approach to implement the unique existential quantifier in digital circuits. © 2019 IEEE.

ABSTRACT: In the last few years, CAD systems has been optimized significantly medical applications. Digital systems have been employed recently in diagnosing procedures and facilitate the process in determining illness in patients. Different scanner system have been used to acquire medical images, which are different the quality output. The main problem associated to image acquisition is the amount of information in the acquired images, and what are the exact time and bed displacement in each scan. This work tests different factors in PET scanners leading to standards for optimizing the scanner variables in medical diagnosis area. Simulated body phantom is experimented here due to the closure properties regarding to real patient data. The phantom out put images were acquired under different circumstances with different scanning time at each bed scan. The segmentation process is then applied on the best slice evaluating the actual spheres size. We propose an efficient way to set the best scanner variables during the scanning process, which lead to the most accurate segmentation result. © 2019 IEEE.

ABSTRACT: We propose an active set method to solve the dual of the convex quadratic programming problem which is the core of the support vector machine (SVM) training. The method stems from the more general method developed by the first author. By using the special handling of certain quadratic programming problems where the Hessian matrix in the objective function is given as a product of a matrix and its transpose, and by simplifying the solution of the linear system arising at each iteration of the method, we were able to produce an implementation for certain SVMs. The results of an experiment using MATLAB are reported. © 2019 IEEE.

ABSTRACT: The growth of developing mobile application increases the need for mobile application testing to create free of errors application. Random testing such as monkey tool is frequently used to test mobile application. However, monkey tool suffers from shortcomings such as long time and low accuracy. In this paper, we propose an approach to improve the monkey tool. The proposed approach solves the monkey tool shortcoming and it decreases the time needed to run the test and increases the ability of the tool to catch errors to become more accurate and effective. © 2019 IEEE.

ABSTRACT: The Internet of things systems (IoT) has a significant impact on different aspects of our lives. For that reason, IoT systems should be in high quality and clean of defects. The quality measurements for IoT systems vary according to the type of the IoT system and its applications. Therefore, IoT systems should be quality measured differently considering the presence of

heterogeneous objects bound together to build the IoT system. This diversity leads to a variety of quality measurement model, which makes the process of measuring quality more challengeable, less accurate, and less applicable. In this research, different quality models for IoT systems have been studied and compared regarding the quality factors. Besides, a new quality model for IoT has been proposed. The new model focused on all the characteristics related to IoT systems, by introducing quality factors that measure them. © 2019 IEEE.

ABSTRACT: Cuckoo Search Algorithm (CSA) has been successfully applied to a range of various fields such as engineering, medical, and image processing. However, it typically suffers from a lack of effective exploration, loose diversity, and premature convergence. This paper aspires to develop a new version of CSA that is based on the features of Reinforcement Learning (RL) to enhance the research technique of CSA, which will be called CSARL. The performance of CSARL is evaluated by applying set of unimodal and multimodal benchmark functions. The results demonstrate that the CSARL outperforms the basic CSA, genetic, harmony search and krill herd algorithms, in terms of convergence speed, the diversity, and exploration search. © 2019 IEEE.

ABSTRACT: The Code Complexity and Object Oriented Programming (OOP) is an import topic due to the role of OOP playing in most of the software design and architectures nowadays. In OOP there are key design concepts like Encapsulation, Polymorphisms and Inheritance that affect the coding design, structure and style. The challenge is how to minimize the Complexity in OOP and complying with the key concepts of OOP design. This paper reviews the literature on current solutions for code complexity and proposes a new model for OOP code complexity. The new model has added into OOP complexity metrics the following characteristics: abstraction and class details complexity. The proposed model is based on the following attributes selection criteria: Readability, Understandability, Maintainability, Reusability, Extensibility and Consistency of the programming code. © 2019 IEEE.

ABSTRACT: Clustering protocols in wireless sensors networks (WSN) have dominated as a tailored routing protocols to harvest and route data from sensors's nodes to the sink station. A lot of clustering protocols have been proposed in the literature. However, does clustering algorithms work correctly in all cases? In other words, is it necessary for the nodes to be clustered during the network lifetime? In this work, a new Hybrid Clustering Routing Protocol (HCP) is proposed. The new protocol consists of two main phases; cluster formation and data forwarding. In the first phase, sensors's nodes decide to forward the traffic to the cluster head or directly to the sink node according to a threshold value. In this case, if the number of nodes in the network becomes small and scattered, no clustering will be performed. We simulated HCP and compared its performance with LEACH and LEACH-T. The results show reduction in network power consumption and an increase of the network lifetime by 30%. © 2019 IEEE.

ABSTRACT: Software evolution is an inevitable need in most of the modern businesses, software that doesn't accommodate changes is hard to survive the market needs. Also, software changes can affect the overall design of the software and sometimes in a corrupting way, affecting the maintainability and evolvability of the software, which introduces technical debt that needs to be solved by continuous refactoring and restructuring of software. Code smells are useful indicators to identify the parts of the code to be refactored to improve the overall maintainability of the software. We present an overview of software code smells, detection and analysis mechanisms and difficulties. Also, we address the effect of refactoring on software maintainability and error-proneness of software. © 2019 IEEE.

The acceptance of using enterprise resource planning (ERP) system in higher education: A case study of jordanian universities
(2019) 2019 IEEE Jordan International Joint Conference on Electrical Engineering and Information Technology, JEEIT 2019 - Proceedings, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85067105803&doi=10.1109%2fJEEIT.2019.8717451&partnerID=40&md5=570c438237442233b179af2a6d4db550>
AFFILIATIONS: Department of Software Engineering, Al-Zaytoonah University of Jordan, Amman, Jordan; Department of Computer Science, Mu'Tah University, Amman, Jordan
ABSTRACT: Enterprise resource planning (ERP) systems become very significant in managing business processes. However, higher education institution (HEI) should think more about implementing ERP systems to manage their processes and produce high quality output. Certainly, many research on ERP adoption have revealed that the organizations often faced many barriers and the failure rate is very high. In addition, different research projects conclude that, oftentimes, universities do not gain the expected benefits from adoption the ERP system. The HEI in Jordan should understand the factors that affect the acceptance of ERP in order to gain the expect benefits of ERP. Hence, it is significant to determine the factors affect the adoption of ERP in HEI in Jordan, that is, whether the universities is ready for implementing it. Therefore, the main purpose of this study is to determine the factors that affect the acceptance of using ERP by Jordanian universities, by evaluating through the questionnaire survey, in order find the most appropriate and prepared universities that willing to adopt ERP system in Jordan. © 2019 IEEE.

ABSTRACT: Artificial Intelligence (AI) plays an important role in our life and touch base most of our surrounding applications and systems. A huge amounts of data are created every day from many different sources that need to be monitored and analyzed properly and report results and take actions. A more complex software applications have been built, time is becoming a critical factor to release applications that must be fully tested and comply with Business Requirements. AI plays a key role in Software Testing and can get more accurate results and saves time. This paper discuss the Artificial Intelligence key pillars that can be used in Software Testing. It also open a window on how the future will look like in terms of Artificial Intelligence and the Software Testing. The results show that AI can achieve better results in Software Testing and AI-driven testing will lead the new era of the quality assurance (QA) work in the near future. AI Software Testing will reduce time to market and will increase the efficiency of the organization to produce more sophisticated software and will create smarter automated testing. © 2019 IEEE.

ABSTRACT: In the recent years, the healthcare Commercial Off-The-Shelf (COTS) products are being increasingly integrated in the healthcare industry in order to decrease the development cost and increase the overall system productivity. Consequence, the selecting process of healthcare COTS software becomes problematic and more difficult, thus the well-defined method for evaluating and selecting the appropriate products that will be accepted in the real life becomes a necessity. Thus, this study was carried out to investigate the current practices, problems, activities and techniques of the evaluation and selection healthcare COTS software in healthcare industry. The survey and data collection was carried out in Jordanian healthcare sector. The descriptive statistics analysis was applied to categorize the identification techniques based to their importance. This paper presents the data, the analysis and finding based on pilot survey. These actual findings of this survey will facilitate constructing new framework for healthcare COTS software evaluation and selection, and also will provide useful information to those who are interesting in the same field. © 2019 IEEE.

ABSTRACT: Blockchain Technology has been proposed to tackle author, centrality and storage issues. It converts centralized applications into dynamic distributed ones. Many researchers have proposed protocols and applications for mapping the old central applications into blockchain based distributed application. In this work, new system framework for Public World Wide Used Motor Vehicle History Reporting System, named CarChain, is proposed and designed. The new framework has not been constructed based on any of the popular well-known public blockchain networks. The framework constructs a peer-to-peer (P2P) overlay network that broadcasts transactions as any end system multicasting system in P2P live streaming applications. The framework allows car owners, repairing companies and insurance agencies to register and add new histories for cars in a simple method. Four different smart contracts control block updates in CarChain. In addition, database technology has been leveraged to cache intermediate data. We show in this paper the challenges and research opportunities that encounter blockchain based applications, such as CarChain. © 2019 IEEE.

ABSTRACT: Technology is one of the most essential factors that affect the business environment of modern banking organizations, allowing new capabilities to support the decision making process at all levels of the organizations to influence the immediate working environment. The use of data mining is one of the important recommendations of the study that will affect the efficiency and effectiveness efficiency of banking operations. The use of data mining technology strengthen the knowledge base and provide all the necessary data that will assist the Jordanian commercial banking industry in its decision-making process. The purpose of this study is to examine the role of applying data mining tools in the industry and decision making in Jordanian commercial banks. To achieve this objective, the researchers will use descriptive analytical methodology based on the questionnaire distributed to the members of the study community. © 2019 IEEE.

ABSTRACT: Internet of Things (IoT) is defined as an inanimate object which is designed with built-in wireless connectivity, and monitored, controlled and linked over the internet. As any new technology, IoT is confusing for the normal consumer especially as debates swirl around standardization, security and privacy. This paper presents the IoT applications such as home automation, healthcare, smart grid, smart city and smart car and focuses on how to secure the generated data by IoT devices from an unauthorized access. The IoT consists of devices which are constrained in their computational capability, network bandwidth, packet size and memory such as sensor nodes. This paper demonstrates that a lightweight and mutual authentication protocols are a fundamental building block for providing the mutual authentication between user and devices in the IoT applications. Furthermore, this paper surveys some of authenticated key agreement protocols for securing IoT and presents a comparison between them in terms of security and performance. © 2019 IEEE.

ABSTRACT: The electronic authentication system authenticates the documents electronically using the blockchain technology, which enables us to implement an integrated system of official documents of all kinds for Al-Zaytoonah University of Jordan. This technology allows us to build a robust database system that cannot be tampered with, modified, destroyed or altered. It further ensures the safety of documents issued within the University departments and those exported or deported outside the University system; such as, financial documents, official documents and academic certificates. Moreover, this system guarantees us a very high level of data and information security and confidentiality. Our system will be built using a database that provides 100% true information about the exports of that system. This technology will help users prevent the forgery of the data and official documents issued by the University of Al-Zaytoonah, both internally and externally, and also enables the departments within the University to issue documents to third parties while ensuring confirmed, undeniable delivery and sound content. © 2019 IEEE.

ABSTRACT: Internet of Things (IoT) is a contemporary concept for connecting the existing things in our environment with the Internet for a sake of making the objects information are accessible from anywhere and anytime to support a modern life style based on the Internet. With the rapid development of the IoT technologies and widely spreading in most of the fields such as buildings, health,

education, transportation and agriculture. Thus, the IoT applications require increasing data collection from the IoT devices to send these data to the applications or servers which collect or analyze the data, so it is a very important to secure the data and ensure that do not reach a malicious adversary. This paper reviews some attacks in the IoT applications and the security weaknesses in the IoT environment. In addition, this study presents the challenges of IoT in terms of hardware, network and software. Moreover, this paper summarizes and points to some attacks on the smart car, smart home, smart campus, smart farm and healthcare. © 2019 IEEE.

ABSTRACT: Polynomials and rational functions of total degree l defined on n dimensional box have a representation in the Bernstein form. The range of these functions is bounded by the smallest and the largest Bernstein coefficients. In this paper, bounding properties of the range of monomials are extended to the multivariate rational Bernstein case. First, algebraic identities certifying the positivity of a given rational function over a box are addressed. Subsequently, we investigate certificates of positivity by minimization, and bounding functions which are independent of the given dimension. © 2019 IEEE.

ABSTRACT: Start-ups are fast growing entrepreneurship. They have emerged for fast propagating of new technology, products or services. In this work, a measurement study of mobile phone applications will be conducted. This study aims to reveal the popular applications' fields in smartphones world. This popularity is utilized to recommend a field for a new startup. To this end, a new model based on supervised machine learning back propagation neural network (BPNN) model is proposed. The new model is trained and utilized to predict the popularity of new applications in any application field. To facilitate our process, a web-crawler has been written to harvest smartphones' applications information from a popular Android platform's market. The crawled data consists of download count, applications categories and users' reviews. These data has been fed to train the proposed model. Our results show that the model has been trained with a mean square error root approximately 0.002, which show the relation between download count and application category. This relation reflects the popularity of some categories in smartphone applications' market. © 2019 IEEE.

ABSTRACT: Texture classification is the assignment of texture to one or more texture classes. It has been largely used in various fields. This paper proposes a system for Texture Classification using Independent Component Analysis (ICA) using set of classifiers. Independent Component Analysis proved its efficiency in many domains. Our objective is to improve texture classification by adopting the use of ICA with a classifier in this domain. After extracting the main features of the image,

classification using set of classifiers is performed. Experimental results have shown that ICA has a promising performance in texture classification. When combined with neural networks, Texture classification accuracy reached the accuracy of 91%. Furthermore, Naïve Bayes showed both exceptional training and testing times, and therefore, it proved to be efficient for big datasets. © 2019 IEEE.

ABSTRACT: Traffic congestions recognized as a significant problem in modern urban cities. Jordan considered as one of the top countries worldwide in terms of frequency of traffic accidents where the increase in the number of vehicles had led to the rise in the number of traffic incidents, involving the increase in fatalities and injuries, but the fixed timers still control the current traffic signals system in Jordan. In this paper, an Intelligent Road Traffic Management System based on Human Community Genetic Algorithm (IRTMS) proposed. The IRTMS compared with the current traffic system in the Hashmet Kingdom of Jordan, which concludes that it has the minimum total time and waiting time compared with the current traffic lights system. © 2019 IEEE.

ABSTRACT: Steganography is defined as the art of hiding secret data in a non-secret digital carrier called cover media. Trading delicate data without assurance against intruders that may intrude on this data is a lethal. In this manner, transmitting delicate information and privileged insights must not rely on upon just the current communications channels insurance advancements. Likewise should make more strides towards information insurance. This article proposes an improved approach for video steganography. The improvement made by searching for exact matching between the secret text and the video frames RGB channels and Random Key -Dependent Data, achieving steganography performance criteria, invisibility, payload/ capacity and robustness. © 2019 IEEE.

ABSTRACT: The rapid increase in the demand of location based services (LBS) for indoor environments has attracted scholars to indoor localization based on fingerprinting due its high accuracy. In this paper, we propose our novel indoor localization approach based on fingerprints of Received Signal Strength Indicator (RSSI) measurements. We present our approach of fingerprint preparation and setup and how we utilized machine learning techniques using Long Short-Term Memory (LSTM) Neural Networks for location estimation. Our experimental results shows that our localization approach outperforms well-known existing approaches like the KNN and localization techniques. © 2019 IEEE.

ABSTRACT: In this paper, a study of the effect of different node distributions on energy consumption in wireless sensor network is conducted. Three different node placement distributions are utilized namely, uniform, normal, and exponential distributions. LEACH clustering algorithm is utilized to evaluate the performance of the three node placement strategies in terms of energy expenditure, network throughput and network lifetime. In general, it was noticed that normal distribution of network nodes outperforms the other distributions regarding energy consumption, throughput and network lifetime especially when the sink node is distant. © 2019 IEEE.

ABSTRACT: Background: Spirometric reference values are crucial in screening, diagnosis and monitoring the therapeutic course of respiratory diseases. These values from a representative population are key to making a precise interpretation of respiratory diseases. The objective of this study is to determine the spirometric reference values of a healthy Jordanian population. Method: Participants were recruited from Al-Zaytoonah University of Jordan and from several pharmacies, polyclinics and hospitals in different cities in Jordan. To formulate Jordanian-specific spirometric reference values, generalised additive models for location scale and shape (GAMLSS) were used. Results: Spirometric reference values were derived from 1,949 healthy nonsmoking adults (1,061 females) and validated in 300 healthy nonsmoking subjects (150 females). Conclusion: Spirometric reference values were developed for a Middle Eastern adult population. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: This study seeks to provide a broad and thorough review of the literature on the big five traits (BFT) through a long history of conceptual and applied studies in many areas depending on large samples of individuals, groups and countries. The BFT is the most widely accepted model to describe the structure of personality traits, so this study sought to identify them in order to achieve a better understanding as well as for consideration by researchers in their future studies. This review focused on the eight key observations related to the BFT. These observations are: meaning of the traits; the history of the BFT model; unity or hierarchy of traits; number of the traits; three perspectives on BFT; BFT questionnaires; BFT and performance; and the need for a sixth trait. The results of the study clearly confirmed that there are problems with universal models that tend to generalize a limited number of dimensions in order to interpret personality across borders and cultures. © 2019, Gadjah Mada University. ABSTRACT: The increased demands on the COTS software in the last decades have flooded the software market with a huge number of COTS software. Therefore, selecting the most suitable COTS software has become the main challenge to the organizations that intend to use such software. In other words, the wrong decisions will reflect negatively on the organization entirely by increasing the cost, time, and effort. In this paper, an empirical study is oriented towards discovering, describing, validating, and holistic understanding of processes, activities, characteristics of current

practices, and problems of the COTS software evaluation and selection in Jordanian organizations. The findings of this survey that comprise the important processes, activities, techniques, problems, and approaches were delivered based on the developers' preferences. These also form the basis of knowledge from the practitioners' perspectives for researchers to develop and improve the existing theories, models, and techniques so that they would become more acceptable in real life. At the same time, these findings could also be used as feedbacks for organizations to not only improve the COTS software selection process but also encourage the use of a well-defined and systematic method. © 2019, ICIC International. ABSTRACT: Endophthalmitis, an intraocular infection, may lead to irreversible loss of vision. Antimicrobial chemotherapy is prescribed prior to ocular surgical procedures to avoid endophthalmitis. Fluoroquinolones are the most commonly prescribed and used antibiotics during such procedures. However, the selection of a single entity and proper regimen is not specified in medical guidelines. The objective of this study is to develop a rapid and selective simultaneous high-performance liquid chromatography-tandem mass spectroscopic method to explore the bioavailability of 4 fluoroquinolones, including 0.5% moxifloxacin hydrochloride, 0.3% gatifloxacin, 0.3% ciprofloxacin hydrochloride, and 0.3% ofloxacin, in human aqueous humor after antibiotic topical administration using gemifloxacin as Internal Standard according to the European Medicines Agency (EMA) and US Food and Drug Administration (FDA) guidelines. The newly validated method was capable of accurately and precisely quantifying each antibiotic at the lowest reported lower limit of quantification of 10 ng/mL and operating on a very low pipetting volume of 15 µL, indicating a reliable quantitation of all analytes simultaneously using a very small quantity of aqueous humor with total chromatographic run time of 2.5 min. Sixty-seven patients were divided into 4 groups for each antibiotic. Before the cataract surgery, each group received 4 drops of one of the antibiotics over 1 h, separated by 15 min time interval. After 15-20 min from the last drop, approximately 50-100 µL of aqueous humor was collected during surgery for analysis. The average concentrations of moxifloxacin, gatifloxacin, ofloxacin and ciprofloxacin in aqueous humor samples were 891.8, 271.7, 191.4 and 69.5 ng/mL, respectively. Only moxifloxacin average concentration was higher than the minimum inhibitory concentration for the common endophthalmitis pathogens. © 2019 Elsevier Inc.

ABSTRACT: Ponicidin, an ent-kaurane diterpenoid derived from *Rabdosia rubescens*, exhibits antitumor activities against several types of cancers. This review summarizes the botanical sources, biological activities, and biopharmaceutical profile of ponidicin. Additionally, a molecular docking study has been undertaken to correlate the interaction of this diterpenoid with biomacromolecules found in the literature. For this purpose, an up-to-date (till December 2018) literature survey was conducted using a number of databases such as PubMed, Science Direct, Web of Science, Scopus, the American Chemical Society, Clinicaltrials.gov, and Google Scholar. Findings suggest that ponidicin exerts antioxidant and anticancer activity in various test systems, including experimental animals and cultured cancer cells. Research findings revealed that anticancer mechanisms of ponidicin include antioxidant/oxidative stress induction, cytotoxic, apoptotic inductive, chemosensitizer,

antiangiogenic, and antiproliferative effects. In silico study suggests that 5ITD (PI3K) was the best protein with which ponocidin interacts to exert its anticancer effect. In conclusion, ponocidin might be a promising plant-derived cancer chemotherapeutic agent. © 2019 International Union of Biochemistry and Molecular Biology, Inc.

ABSTRACT: This paper presents a novel smart-grid power-conditioning system with intelligent control for solving a critical issue affecting the performance and life of three-phase asynchronous machines that are highly sensitive to voltage and phase drifts power disturbances of the electric grid. The present work of controlling the power supply of an electric-grid is based on an original power conditioning control algorithm; named recursive stochastic optimization (RSO) algorithm. An asynchronous machine steady-state model is derived based on symmetrical components analysis, permitting the evaluation of the effect of both voltage and phase unbalance using voltage and current unbalance factors. The three-phase power supply is conveyed through a power conditioning and intelligent control system, driven by a digital signal processor (DSP) controller, which measures the input currents, estimates the unbalance factors, and searches for voltage levels that minimize the electric-grid unbalance using the RSO, in order to act on a feedback power-electronics stage. The RSO algorithm shows excellent results along with very fast response time of the order of 20 ms allowing real-time control. Results obtained are validated with a Simulink dynamic model. The intelligent control system architecture based on TMS320C6748 DSP board with signal acquisition and control microcontroller is proposed. © 1982-2012 IEEE.

ABSTRACT: Gold nanorods (GNRs) have gained pronounced recognition in the diagnosis and treatment of cancers driven by their distinctive properties. Herein, a gold-based nanosystem was prepared by utilizing a phospholipid moiety linked to thiolated polyethylene glycol, 1,2-distearoyl-sn-glycero-3-phosphoethanolamine-N-PEG-SH, as a surface decorating agent. The synthesized phospholipid-PEG-GNRs displayed good colloidal stability upon exposure to the tissue culture medium. Cytotoxicity of phospholipid-PEG-GNRs was investigated toward MCF-7 and T47D breast cancer cells using sulforhodamine B test. The results revealed that phospholipid-PEG-GNRs demonstrated high cytotoxicity to MCF-7 cells compared to T47D cells, and minimal cytotoxicity to human dermal fibroblasts. The cellular uptake studies performed by imaging and quantitative analysis demonstrated massive internalization of phospholipid-coated GNRs into MCF-7 cells in comparison to T47D cells. The cellular death modality of cancer cells after treatment with phospholipid-PEG-GNRs was evaluated using mitochondrial membrane potential assay (JC-1 dye), gene expression analysis, and flow cytometry study. The overall results suggest that phospholipid-modified GNRs enhanced mainly the cellular apoptotic events in MCF-7 cells in addition to necrosis, whereas cellular necrosis and suppression of cellular invasion contributed to the cellular death modality in the T47D cell line upon treatment with phospholipid-PEG-GNRs. The phospholipid-coated GNRs interact in a different manner with breast cancer cell lines and could be considered for breast cancer treatment. © 2019 American Chemical Society.

ABSTRACT: Big Data, is a growing technique these days. There are many uses of Big Data; Artificial Intelligence, Health Care, Business, and many more. For that reason, it becomes necessary to deal with this massive volume of data with caution and care in a term to make sure that the data used and produced is in high quality. Therefore, the Big Data quality is must, and its rules have to be satisfied. In this paper, the main Big Data Quality Factors, which need to be measured, is presented in the perspective of the data itself, the data management, data processing, and data users. This research highlights the quality factors that may be used later to create different Big Data quality models. © 2019 IEEE.

ABSTRACT: The electrochemical reduction of the complex $[\text{Fe}_2(\text{CO})_6[\text{m}-(\text{SCH}_2)_2\text{GeMe}_2]]$ (1) under N_2 and CO is reported applying cyclic voltammetry. Reduction of complex 1 in CO saturated solutions prevents the possible release of CO from the dianion 1²⁻, while the latter reacts with additional CO forming a spectroscopically uncharacterized product P1. This product undergoes a reversible redox process at $E_{1/2} = -0.70 \text{ V}$ (0.2 V⁻¹). In this report, the structure of the neutral complex 1, isomers of dianionic form of 1, and P1 are described applying DFT computations. Furthermore, we propose reaction pathways for H₂ production on the basis of the cyclic voltammetry of complex 1 in presence of the strong acid CF₃SO₃H. © 2019 by the authors.

ABSTRACT: This work aims to investigate the quality effects of integrating creative technology as an instructional tool in higher education. In 2015, Al-Zaytoonah University of Jordan established a pilot project entitled "Interactive Learning Using Smartboards". In this project, each faculty received a number of smartboards, desktops, Internet connection, and lecturers training. 450 participants completed a 28-item survey. The questionnaire included questions about demographic information and Likert scale questions related to 4 hypotheses which predicted that lecturers and students would offer favourable opinions about various aspects of smartboards use and benefits, as well as written comments and concerns. The findings indicated a high degree of user's satisfaction with most aspects of the smartboard and its use. Thus, accessibility to such technology should be extended to more lecturers and students by adding smartboards to more classrooms and laboratories in the university. © 2019, ICIC International. ABSTRACT: In NRSC28, Elkamchouchi and Abu Elkair proposed an efficient protocol for authenticated key agreement, and the authors claimed that the proposed protocol is secure against known attacks. However, this letter shows that Elkamchouchi and Abu Elkair protocol cannot withstand the two types of key compromise impersonation (KCI) attacks namely, general-KCI, and static-KCI. In addition, we show the man-in-the-middle attack and known key security attack on Elkamchouchi and Abu Elkair protocol, and also the protocol cannot provide perfect forward secrecy property. Furthermore, we use the Scyther tool as an automated verification method to demonstrate the security flaws in Elkamchouchi and Abu Elkair protocol. © 2019 ICIC International.

ABSTRACT: Purpose: This study measured levels of compassion fatigue, burnout and satisfaction among critical care and emergency nurses. It investigated coping strategies as moderating factors and as predictors to levels of compassion fatigue. Methods: Using a cross-sectional design, this study was conducted on 228 (84.4%) out of 270 from four Jordanian hospitals. Nurses worked in different types of critical care units and emergency departments. Nurses completed a demographic questionnaire on the professional quality of life and coping strategies indicator scales. Results: Nurses had low to average compassion satisfaction, burnout and secondary stress syndrome. Problem-solving and avoidance ranged between very low and average levels. Nurses reported having very low to average levels on seeking social support scale. Female nurses had better compassion satisfaction compared with their male colleagues, and the type of unit had a significant impact on the secondary stress syndrome, problem-solving, and seeking social support. Nurses from the surgical cardiovascular ICU scored the highest mean scores on the secondary stress syndrome. Better coping strategies were associated with higher compassion satisfaction and lower levels of secondary stress syndrome. Problem-solving significantly predicted compassion satisfaction, avoidance significantly predicted secondary traumatic syndrome. Conclusions: Coping strategies are moderating factors that could improve compassion satisfaction among critical care nurses. Managers could use findings to create healthier and supportive work environments. We recommend focusing on activities that promote better coping strategies, including improving the social support system. We also recommend replicating this study using a qualitative approach to identify further causes of compassion fatigue. © 2019 The Authors. *Brain and Behavior* published by Wiley Periodicals, Inc.

ABSTRACT: Background: End-of-life care (EOLC) is a pivotal element of work in ICUs and for critical care nurses, thus, it is considered one of the top research priorities recently as number of admission ICUs increasing and high percentage of deaths also. Objective: This study was conducted to explore the obstacles of EOLC and strategies for improvement from nurses' perception. Methods: The questionnaire, that was developed by Beckstrand and Kirchhoff (2005), was used to collect data from 163 critical care nurses from different hospitals. Results: Two hundred questionnaires were distributed. One hundred and sixty-three questionnaires were completed and returned with response rate 81.5%. The majority of the participants were male nurse 104 (63.8%), with bachelor degree 153 (93.9%), working in adult. ICU 105 (64.4%), as bedside nurse 141 (86.5%). The highest obstacles from the nurses' perception were family and friends who continually call the nurse wanting an update on the patient's condition rather than calling the designated family member for information (mean=4.07). Furthermore, the highest three supportive behaviors from the nurses' perception were physicians agreeing about direction of patient care (mean=3.96), family members accept that patient is dying (mean=3.94), and family designating one family member as contact person for the rest of the family (mean=3.89). Conclusion: As the number of deaths is increasing in critical care units, the needs to understand how the EOLC is provided in these units. Identifying obstacles and supportive behaviours will assist the stakeholders and policymakers to set the action plans for improving the quality of EOLC. © 2019, The Indonesian Foundation of Critical Care Medicine. ABSTRACT: Dalfampridine is a medication that is approved by the US Food and Drug Administration to improve walking impairments in patients with multiple sclerosis (MS). The branded dalfampridine is enormously expensive; hence, the availability of generic dalfampridine will provide better access to the medication, especially for uninsured patients with MS. Bioequivalence studies are demanded by the regulatory authorities to allow the marketing of new generics of dalfampridine. The aim of this study was to assess the bioavailability of the generic (test) and branded (reference) formulations of 10 mg dalfampridine of extended-release tablets after oral administration to healthy adults under fed conditions. The current report methodology was based on a comparative, randomized, single-dose, 2-way crossover open-label study design. Twenty-seven subjects were given a single dose of the test dalfampridine tablet and completed the clinical study. The pharmacokinetic parameters C_{max} and $AUC_{0 \rightarrow \infty}$, $t_{1/2}$, K_{el} , $AUC_{0 \rightarrow t}$, t_{max} , and $t_{1/2el}$ were estimated to prove bioequivalence. The confidence intervals for the log-transformed test/reference ratios for dalfampridine 100.96% (97.09%–104.97%) and 99.77% (95.81%–103.87%) for C_{max} and $AUC_{0 \rightarrow \infty}$, respectively, were within the allowed limit specified by the regulatory authorities (80%–125%). Hence, clinically, the test tablet can be prescribed as an alternative to the reference for the indication of improving walking impairments in patients with MS. © 2018, The American College of Clinical Pharmacology

ABSTRACT: Background: Medication administration errors (MAEs) have short-and long-Term implications on patients' health as well as on hospitals' accreditation and financial status. Purpose: The purpose was to explore Jordanian nurses' perceptions about MAEs. Methods: A cross-sectional design was used with a convenience sample of 470 nurses. Results: The most common types of MAEs were wrong time (32.6%) and wrong patient (30.5%). In addition, night shifts accounted for 42.9% of MAEs; the factor that contributed the most to MAEs was workload. Conclusion: Developing effective quality assurance programs in relation to medications and medication administration in all Jordanian health care settings is vital to ensure patient safety. Nursing educators in clinical and academic settings need to reinforce the importance of medication rights as well as medication calculation. A distraction-free zone should be created and reinforced in all medication rooms. © 2019 Lippincott Williams and Wilkins. All Rights Reserved.

ABSTRACT: Arachidonic acid (ARA) metabolites are involved in cardiovascular diseases and drug-induced cardiotoxicity. The present study aimed to investigate the effects of nonsteroidal anti-inflammatory drugs (NSAIDs) on the gene expression of ARA-metabolizing cyp450 genes in the hearts, kidneys and livers of experimental mice. Thirty five Balb/c mice were divided into 5 groups, and each group contained 7 mice. Then, the groups were administered different NSAIDs, diclofenac mefenamic acid, ibuprofen, or meloxicam, for 14 days in doses equivalent to those used in human treatment.

Subsequently, liver, kidney and heart samples were isolated for analysis of the expression of ARA-metabolizing cyp450 genes using real-time polymerase chain reaction. In addition, the histological alterations induced by mefenamic acid were examined. It was found that 20-HETE synthesizing gene cyp4a12 was upregulated (> 2.2 fold) in the hearts of NSAID-treated mice, which was associated with the 2-fold downregulation of the cardio-protective biomarker GATA4 gene and the induction of cox2 expression (p value < 0.05). In the kidneys, the expression of cyp4a12 was significantly reduced (p value < 0.05) while cyp2c29 expression was upregulated by more than 2 fold. In the liver, all NSAIDs except diclofenac significantly decreased the expression of all genes tested (p value < 0.05) and were

associated with abnormal accumulation of fat in the liver. Furthermore, these molecular findings were in parallel to histological alterations induced in the liver, kidney, and heart after mefenamic acid administration. This study concluded that NSAIDs altered the expression of ARA-metabolizing cyp450 genes and induced histological alterations that may influence the function of the vital organs. © 2019 Elsevier Inc.

ABSTRACT: As software systems change and evolve over time regression tests have to be run to validate these changes. Regression testing is an expensive but essential activity in software maintenance. The purpose of this paper is to compare a new regression test selection model called ReTSE with Pythia. The ReTSE model uses decomposition slicing in order to identify the relevant regression tests. Decomposition slicing provides a technique that is capable of identifying the unchanged parts of a system. Pythia is a regression test selection technique based on textual differencing. Both techniques are compare using a Power program taken from Vokolos and Frankl's paper. The analysis of this comparison has shown promising results in reducing the number of tests to be run after changes are introduced. © 2019 Universitas Ahmad Dahlan.

ABSTRACT: In this paper an analytical model of the optimal number of clusters and the corresponding optimal probability are derived for different types of 3D WSN settings utilizing single-hop homogeneous LEACH protocol. Three types of 3D network configurations are analyzed. These include cube, cylinder and sphere network configurations. Energy analysis of these network configurations is done in noise-prone communication environment. The noise is modelled utilizing the probability of reception p_r . A small value of p_r indicates more packets are dropped, which is a sign of large noise. It was shown through analysis and simulation that optimal number of clusters, optimal probability and energy consumption are affected by the geometry of the 3D WSN, noise, and transmission amplification model used. © 2001-2012 IEEE.

ABSTRACT: Concrete with high levels of Pozzolan suffers from poor early age strength development and

an extended setting time and may therefore lead to construction delays thus limiting its use in the concrete industry. The main objective of this study has been to evaluate the effectiveness of calcium carbonate nano-particles (CCNPs) on improving the fresh and mechanical properties of high volume natural Pozzolan (HVNP) cement mortars. At the beginning, CCNPs have been synthesized in a simple and inexpensive way, and then the optimum content of nano-CaCO₃ has been determined based on the highest compressive strength achieved by ordinary Portland cement mortar with different proportions of CaCO₃ nanoparticles. In the end, the determined optimum content has been used in order to evaluate the effect of nano-CaCO₃ on the properties of HVNP mortars containing 40% and 60% natural Pozzolan as partial replacement of cement. Scanning electron microscopy (SEM) and X-ray diffractometry (XRD) techniques have been used in order to investigate the microstructure, the properties, and the compositions of the synthesized nano-particles and the cement-Pozzolan mortars. CCNPs have been synthesized efficiently via the simple precipitation method and suitable sonication process has been used to disperse CaCO₃ nanoparticles. The results have indicated that nano-CaCO₃ has increased the compressive strength of the Pozzolan-cement mortars, and the best result has been obtained at an optimum content of 1% nano-CaCO₃. The addition of nano-CaCO₃ to the HVNP mortar improved its setting behavior; on the other hand, it has decreased its workability. However, this reduction in the workability has been offset by an increase due to partial replacement of cement by HVNP. Blending nano-CaCO₃ with HVNP (40 and 60% replacement levels) has compensated for the low compressive and flexural strength at early ages of HVNP mortars. Thus, it has proved to be an effective way for improving the mechanical properties of high volume natural Pozzolan-cement mortars. The XRD and SEM results have confirmed that nano-CaCO₃ has improved the early strength development and the microstructure of HVNP mortars by making it denser with less pores. © 2019 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: *Echinococcus multilocularis* is an endemic parasite of red foxes in several European countries. This parasite has been present for decades in central Europe i.e. Switzerland, Eastern France, Southern Germany and Austria, which constitute the core endemic area of Europe. In the Scandinavian countries Sweden and Denmark, several recent findings were made in foxes. To better understand the dynamics and geographic spread of *E. multilocularis* in Europe, genetic studies have been undertaken using the DNA microsatellite marker EmsB. In Europe, the parasite spread in hitherto non-endemic areas was suspected to take place after founder events, in which the core endemic area presents a wider genetic diversity in comparison to newly endemic areas. However, identical parasite profiles can be shared between them, highlighting the parasite spreading in a mainland-island system. In this study, Swedish (27 adult worms from seven red foxes) and Danish (38 adult worms from nine red foxes) isolates were examined using fragment size analyses of the tandemly repeated microsatellite EmsB in order to compare the genetic profiles of the Scandinavian worms with a reference collection of European worm isolates from seven countries. Six EmsB profiles were detected in the Scandinavian panel. Three profiles were described in Denmark and four in Sweden. Only one of these profiles was detected in both countries. All profiles identified in the present study have previously been found in other European countries, suggesting an epidemiological link. Due to the relatively low number of Scandinavian *E. multilocularis* isolates analysed so far, firm conclusions cannot be made regarding the true genetic diversity. Nevertheless, the low genetic variation detected in Sweden and Denmark in this study is similar to the values obtained from peripheral areas of the main European endemic focus, which were more recently colonized by *E. multilocularis*; and continuous surveillance of this parasite is warranted to provide further insight into its epidemiology in Scandinavia. © 2019

ABSTRACT: Two efflux transporters, ATP-binding cassettes B1 (ABCB1) and G2 (ABCG2), are highly expressed in the endothelial cells of the brain, where they regulate the bioavailability and distribution of several endogenous and xenobiotic compounds. However, whether ABCB1 or ABCG2 has any link with drug dependence, drug withdrawal effects, or the incidence of adverse effects in drug abuser is not known. In this study, we determined the effects of voluntary ethanol consumption following repeated exposure to cocaine or vehicle on the relative mRNA and protein expression of Abcg2/ABCG2 and Abcb1/ABCB1 in the nucleus accumbens (NAc) and medial prefrontal cortex (mPFC) of male alcohol-preferring (P) rats. Male P rats were allowed free choice access to ethanol (15 and 30% v/v) and water for 5 weeks to establish baseline drinking behavior. The following week, rats were either injected with 20 mg/kg i.p. of cocaine or saline, once a day, for 7 days. The relative mRNA and protein expression of Abcb1/ABCB1 and Abcg2/ABCG2 in the NAc and mPFC were significantly decreased in ethanol-saline- and ethanol-cocaine-exposed rats compared to control rats that received neither ethanol nor cocaine. Thus, prolonged exposure to commonly abused drugs, ethanol and cocaine, alters the expression of Abcb1/ABCB1 and Abcg2/ABCG2 mRNA and protein levels in brain areas that play a role in drug dependence. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Purpose: this paper aims to discuss the relationship between electronic bank services and the profit and to measure the impact of this relation on the profit size. Design: Statistical Package for the Social Sciences (SPSS) version 18 has been used to apply on the study variables which are; ROA, ROE and Profit Margin for the period of 2010-2015. Findings: The outcomes of this paper show that, there is a relationship between study variables and E-Banking services. Moreover, according to the testing the relationship between E-Banking and ROE the result approved that there is no impact, in other hand ROE and Margin has a significant effect one banking which means these two variables are affecting the profit. © 2019 Association for Computing Machinery.

ABSTRACT: New iron complexes containing selenocarbonato, selenothiocarbonato and selenodithiocarbonato ligands in addition to CO/EPh3 mixed ligands are synthesized and characterized. CpFe(CO)(EPh3)SeC(Y)Y'Ar [(Y)Y' = (O)O; Ar = C6H5 (1). (Y)Y' = (S)O; Ar = 4-C6H4Cl (2). (Y)Y' = (S)S; Ar = C6H5 (3). E = P (a), As (b), Sb (c)] are accessible from the reactions of CpFe(CO)2SeC(Y)Y'Ar with EPh3 under photolytic conditions. The new complexes have been characterized by various spectroscopic methods (UV-Vis, IR, 1H-, 31P-, 13C-, 77Se-NMR) and elemental analysis. The determined structure of CpFe(CO)(AsPh3)SeC(O)OC6H5 (1b) has been farther supported by single-crystal X-ray crystal structure analysis. © 2018 Elsevier B.V.

Trinity College Dublin, School of Pharmacy and Pharmaceutical Sciences, Dublin, Ireland
ABSTRACT: Paracetamol (acetaminophen) is one of the most commonly used antipyretic and analgesic drugs worldwide. It is the drug of choice for patients with bronchial asthma, hemophilia, salicylate hypersensitivity, peptic ulcer, and pregnant or breastfeeding women who cannot be treated with nonsteroidal anti-inflammatory drugs. It is marketed and manufactured by many pharmaceutical companies, which necessitates the requirement of quality control investigation. A post-market evaluation was conducted on five commercial paracetamol products (500 mg) available in Jordan, which involved quality control testing in terms of dissolution, disintegration, weight variation, and glass transition temperature (T_g) determination using dynamic mechanical thermal analysis (DMTA). Dissolution and disintegration of the five products were compared under two different conditions, compendial United States Pharmacopeial Convention (USP) and non-compendial. Compendial experiments were conducted under pH 5.8, and non-compendial testing was carried out under pH 1.2. Results revealed variations in the dissolution patterns at the different pH conditions for the same formulation. Generally, faster dissolution was observed when testing the dissolution in compendial USP conditions; pH 5.8 compared to pH 1.2. Disintegration was also affected by pH in the tested formulations. T_g detected via DMTA of the tested formulation was ranged from 18.82 ± 0.77 °C to 23.13 ± 2.46 °C. No correlation was found between T_g variation and drug dissolution. In general, all products met the compendial requirements despite their differences in the early stages of dissolution profiles. Our work highlights the importance of post-market quality control testing of generic equivalents of immediate release dosage forms, which is essential for improving upon existing formulations. It also introduces DMTA as an informative tool for detecting thermal transitions of active pharmaceutical ingredients (APIs) in solid oral dosage forms. © 2019, Dissolution Technologies Inc. ABSTRACT: The main objective of this study is to identify the impact of social media tools on improving patients' mental image of the healthcare provided by private hospitals (an applied study in Amman city). An analytical descriptive style was used to achieve this goal because this method was appropriate for the nature of the study. A questionnaire was designed as a tool to collect data. The questionnaire was first presented to a number of experts in the marketing field. The study population consisted patients treated by private hospitals in Amman, Jordan. The study sample was a proper sample of this population: (550) patients received copy of the questionnaire, and (513) copies were returned and deemed suitable analysis. The study shown that social media had a statistical significant impact on patients' mental image of private hospital, and Facebook shown the greatest effect cognitive and behavioural dimension, whereas Twitter showed the greatest effect on the influence dimension. © 2019, Indian Journal of Public Health Research and Development. ABSTRACT: Women, nowadays, become more interested or more oriented to plastic surgery including smile improvement. Although smile improvement popularity is increasing among Iraqi women, but published researches are rare in this field. Consequently, the objective of this study is to determine the factors that affect woman behaviour and direct her to improve the smile. The theory of planned behavior, developed by Ajzen in 1985(1), and the variables were adopted and formed according to study objectives, i.e. attitude, social, perceive, cost and dentist. The study approach and methodology depended on collecting data from 367 women in Baghdad city, data was analyzed by using the proper statistical methods (SPSS) and AMOS analysis. There are positive correlations between attitude, social, perceived, cost, dentist and intention; and the results show that the dentist has most significant effect on intention with correlation 0.215** and Sig 0.000. There is positive relationship

between Intention and behavior with correlation 0.298** and Sig 0.000 This paper provides information about factors that impact behaviour of Iraqi woman to improve the smile, and as far as we know, it is considered to be the first study, in this field, in Iraq. © 2019, Indian Journal of Public Health Research and Development. ABSTRACT: In the university, course scheduling and preparation for each semester can be defined as the process of determining what courses to offer, the number of sections needed for each course, assigning of a faculty member to teach each section, and allocating a timeslot and a classroom for each section to avoid clashes. The output of this activity (which is a timetable) affects every faculty member and student in various departments. This process is essentially broken down into three main stages: determining the courses to be offered as well as their section numbers, assigning faculty members to different sections, and scheduling of the sections into timeslots and classrooms. This paper investigates each of these steps and congregates them in a scheduling and Decision Support System (DSS). The DSS is used to make easy the process of course offerings by taking into consideration the students' suggestions because the department resources are limited. The faculty member preferences are also considered in the assignment of sections for the sake of lessening disappointments in the department. Also, the couples (faculty, section) are planned into university timeslots based on faculty member preferences. Our proposed system considers student suggestions and preferences and the time availability of a faculty member since it minimizes disappointments and avoids conflicts between faculty members and classrooms and courses. © 2019 Zina Houhamdi et al.

ABSTRACT: The aim of this diagnostic analysis is to identify the weaknesses in the process of reforming policy in Jordan. This study will first present a diagnostic analysis of the characteristics of administrative reform in Jordan. Following this, weaknesses will be identified with a focus on policy roles in the policy-making process. Administrative reform has long been an area of interest and development in Jordan since the early 1980s. Conferences were held, political and technical committees formed, and expertise and resources invested. The outcomes of these programs have been below expectations, with inadequate impact. This investigation paid attention on how Jordan can best invest its resources to maximize efficiency in the public sector, specifically the process of reforming policy. This study concludes that the primary factor impacting efficiency, accountability, and responsiveness is the degree of authority at both national and organizational level. Recent efforts in Jordan to tackle these issues could create more conflicts that threaten the Jordanian government's stability. Other resources have been dedicated to reviewing the rules and values that govern the relationship between state and society. © 2018 John Wiley & Sons, Ltd.

ABSTRACT: Background: Multiple Sclerosis (MS) is associated with poor quality of life (QOL).

Individuals suffering from MS must make multiple adjustments as their condition changes. To date, little is known about the role of psychosocial adjustment in improving QOL of patients with MS.

Purpose: The purpose of this study is to identify the relationship between psychosocial adjustment and HRQOL controlling for demographic variables among patients with MS. Methods: This study used a descriptive-correlational design. A sample of 160 patients from two hospitals participated in the study. Self-reported data were collected using the demographic survey, Multiple Sclerosis Quality of Life (MSQoL-54) tool and Psychosocial Adjustment to Illness Scale-Self Report (PAIS-SR). Results: Participants reported poor QOL and difficulty with psychosocial adjustment. The QOL and psychosocial adjustment were correlated with various demographic variables. After controlling for demographic variables, psychosocial adjustment explained a large variance in the mental health composite of QOL (r^2 change = 44%) and the physical health composite of QOL (r^2 change = 38%).

Conclusion: Psychosocial care could play a vital role in improving quality of life among MS patients. © 2018 Elsevier Inc.

ABSTRACT: This paper presents a novel image processing technique for recognizing finger signs language alphabet. A human-computer interaction system is built based on the recognition of sign language which constitutes an interface between the computer and hearing-impaired persons, or as an assistive technology in industrial robotics. The sign language recognition is articulated on the extraction of the contours of the sign language alphabets, therefore, converting image recognition into one dimensional signal processing, which improves the recognition efficiency and significantly reduces the processing time. The pre-processing of images is performed by a novel skin-color region segmentation defined inside the standard RGB (sRGB) color space, then a morphological filtering is used for non-skin residuals removal. Afterwards, a circular correlation achieves the identification of the sign language after extracting the sign closed contour vector and performing matching between extracted vector and target alphabets vectors. The closed contour vector is generated around the hand palm centroid with position optimized by a particle swarm optimization algorithm search. Finally, a multi-objective function is used for computing the recognition score. The results presented in this paper for skin color segmentation, centroid search and pattern recognition show high effectiveness of the novel artificial vision engine. © 2018 IEEE.

ABSTRACT: The low recyclable recovery (RR) rate of municipal solid waste (MSW) (7.0%) in Jordan compared to the average recovery rate of the members of the EU (42%) indicates the necessity of changing the current practices of RR being implemented in Jordan where the latest national strategy of MSW management, launched by the Ministry of Municipal Affairs in May 2015, aims to achieve an RR rate of 50% by the year 2034. This research aims to identify the attributes of an efficient and successful RR programme and recommend an implementable plan for RR that can achieve the target of 50% earlier than the year 2034. Practices of RR currently being implemented in Jordan are analysed and compared with successful practices implemented in developed countries. A public-private partnership is suggested to establish and operate semi-mechanical RR facilities that use the resources currently owned and operated by Joint Service Councils and local municipalities. Utilising the current resources enables the country to achieve the 50% RR rate goal. The rough financial analysis conducted clearly indicates that the 20% RR rate of plastic alone can offset the deficit in the municipality budget resulting from MSW management in Jordan. © 2019 ICE Publishing: All rights reserved.

ABSTRACT: This paper attempts to explore and investigate the role of discourse markers (DMs) in the annexes of the International Civil Aviation Organization (ICAO). Discourse markers are cohesive markers that play an important role in connecting paragraphs, sentences, clauses and phrases to both previous and following items and therefore reflect the speaker's/writer's intended attitude about a certain issue. Several studies were made concerning the realisation of discourse markers in different genres, but as far as the researcher knows no study was considered in terms of the International Civil Aviation legal documents such as the ICAO annexes. Thus, the focus of this study is on examining discourse markers in the selected data in terms of function and usage by adopting Hyland and Tse's classification of discourse markers. The results reveal that the textual function of discourse markers dominates the ICAO annexes, whereas the interpersonal functions were not found. Such results proved the significance of the choice and usage of discourse markers in such a specific register as the legal documents of ICAO which designated the impact they have on the structure and organisation of the texts. © 2019, © 2019 NISC (Pty) Ltd.

ABSTRACT: Nowadays, the rapid growth of Internet applications open the doors for people to communicate and do business around the world and thus saving time, efforts and money. However, the success of these applications is based on protecting the data from hackers. It is well known that preventing sensitive data from hackers while they are sent through the global network is a big challenge. There are many techniques used for securing data. Some of these techniques are based on encrypting a readable text into an unreadable text using mathematical operations, while other techniques are based on encrypting a readable text into an image (e.g., the Text-to-Image Encryption algorithm-TTIE) or into musical notes using an encryption key. The encryption key must be secure and should not be sent through the Internet. This paper proposes adding a new security level to the TTIE algorithm, and demonstrates how the encryption key produced by the TTIE algorithm is exchanged with the other party using the Diffie Hellman technique. Thus, this paper proposes a modified TTIE algorithm called the Diffie Hellman Text-to-Image Encryption algorithm (DHTTIE), and tests and analyses the proposed algorithm. © 2019, © 2019 Taru Publications.

ABSTRACT: The paper deals with the element of the narrative space in "The Silent House", written by Nobel Prize winner, the Turkish author, Orhan Pamuk. The study consists, in addition to the introduction, of two parts: the first part focuses on the terminology of the research; the notion of the space and its esthetic; and finally the representation of the author and his works. The second part analyses the relation between the narrative space and the other narrative elements in "The Silent House" such as: the events, the personages and the time. The study ends with certain conclusions concerning this novel in which the space takes a very remarkable place starting from its title. The conclusion shows that the space in this novel isn't just a simple decor but it's a capital element of the novel. © 2019 DAR Publishers/University of Jordan. All Rights Reserved.

ABSTRACT: This study aims to identify the extent of strategic effectiveness of the accounting information systems in achieving security in the shadow of the electronic commerce. The study followed the descriptive method, To achieve this purpose, a questionnaire was developed by the researcher. The researcher has developed a (300) item. A survey was performed which included a sample of (309), randomly selected from the total number of the study population. (300) subjects responded to the questionnaire Giving a response rate of (97 %the results showed that The presence of a relation with statistically significance at significance level ($\alpha=0.05$) for the strategic effectiveness of the accounting information systems in achieving security in shadow of the electronic commerce. results showed There's significant difference at significance level ($\alpha=0.05$) of strategic effectiveness of the accounting information systems in achieving security in the shadow of the electronic commerce due to (gender, scientific qualification, occupational experience and occupational level). © 2019. ABSTRACT: Cosmetic accounting is a process used by accountants who have a vast knowledge of accounting rules to address the figures reported in the financial reports. This study focuses on the crucial role of the concentration of ownership and the political influence on the quality of earnings among Jordanian industrial firms listed on the ASE during the period 2014-2017. The results of regression indicate that there is a negative impact of both of ownership concentration and political connection on the quality of earnings reported in financial reports. This means that the most significant shareholders use their power, and the political role of board members to manipulate earnings to be consistent with their interests. The study found that other important factors may affect the quality of earnings such as foreign ownership, especially with the migration of some capital to Jordan as a safe environment for investment, particularly under the political and economic tension in neighboring countries. © 2019, Pro Global Science Association. ABSTRACT: The purpose of this paper is to investigate the Consumer Price Index (CPI) as a competitiveness inflation measure and to determine whether an empirical relationship exists between the rates of inflation represented in CPI and the level of the real exchange rate. In order to achieve the objectives of this paper, the study calculated the consumer price index (CPI) as an inflation rate for the period 2010-2018, and also adopted the real exchange rates for the same period. In order to achieve the objectives of the study, a Pearson correlation analysis between the average CPI rates, and the average exchange rate were conducted. The outcomes of the correlation analysis conducted reflect a negative correlation of 62% between the exchange rates and the CPI's inflation rates, which means that when CPI rates cause direct opposite effect of the determination level of exchange rates on the Jordanian economy. © 2019 The Authors.

ABSTRACT: Document Management System (DMS) is always known to be vital for management of the complexity of construction projects. This study aims at investigating the opinions of DMS practitioners regarding the use of Electronic Document Management System (EDMS) in construction projects. A questionnaire survey was conducted with 91 respondents involved in the construction projects. The respondents were asked to evaluate the extent, motivations and challenges of applying EDMS in the construction projects in Jordan. According to the survey results only 8.8 % of the respondents described the document system in their construction projects as mostly electronic, while 38.5% described their document system as using almost similar percentage of electronic and paper-based documents. The results also showed that the top motivation to the application of EDMS in the construction projects is the improvement of search and retrieval of information, while the top challenge is the high expected financial cost of EDMS. This study helps to evaluate the existing DMS, and investigate the motivations, challenges and opportunities to improve EDMS implementation and application in the construction projects. © 2019 International Conference on Construction in the 21st Century. ABSTRACT: In a cross-cultural context, the speakers' cultural disposition, linguistic codes, and social identity may influence their pragmatic behaviour; thus, lead to communication breakdowns. This paper studies the cross-cultural pragmatic failure in polite requests among Arab participants from different cultural backgrounds, and reattempts to test[validate] the universality of Speech Act Theory, and Theory of Politeness. To that end, 96 situations have been collected from 16 Arab participants divided into two groups to examine the polite strategies they use in request and invitation situations. The results of the qualitative data analysis have shown that almost all participants favour conventionally direct strategies in requests and invitations to express politeness and hospitality. As for the Arab students who are UK citizens, the results indicated that they have a tendency to use more indirect strategies in different situations. However, this indirectness was perceived as lack of hospitality in invitations, and lack of pragmatic clarity in requests by the first group. The results of the data analysis show that there is no one formula of how politeness can be perceived by different cultures, and that the differences stem out from different socio-cultural norms. The findings also provide worthwhile insights into theoretical issues concerning Arabic communicative acts, as well as the relation between the universal pragmatic features, and culture-specific theoretical differences. © 2019 ACADEMY PUBLICATION.

ABSTRACT: Purpose This study examined nurses' role in their practice, nursing education and the impact of culture in Jordan on helping men suffering from sexual problems. Design and Methods A cross-sectional study design was used: 265 nurses completed and returned the questionnaire, a 57.4% response rate. Findings Overall, sexual health problems appeared hidden and unresolved. This may be a result of culture and society issues, including masculinity, men's health beliefs, religious issues and men's lack of trust in nurses and their keeping things confidential. Practice Implications Creating a comprehensive strategy for sexual health care is necessary. This will require education, increased awareness and development of appropriate gender sensitive health services to suit the culture of Jordan. © 2019 Al-Ghabeesh et al.

ABSTRACT: Administrative decision is a final legal action that emerges based on the sole will of the administration and aims at achieving legal effects for achieving the public interest. The legal status of the electronic administrative decision is a substrate for forcing the legal effects resulting from the administrative decision. Jurists of law have been divided into two parties about the procedure by which the legal status of the electronic administrative decision is achieved, the first party confirms that the legal status is related to the act of announcing the electronic administrative decision while the second party sees that the status of the electronic administrative decision is based on electronic signature by the authorised person. Through research, both legal opinions and evidence were offered to prove the validity of the legal status of the electronic administrative decision with the overwhelming perspective represented by the opinion regarding the electronic signature of the decision. © 2019 Primrose Hall Publishing Group.

ABSTRACT: This paper presents a novel technique for Face Recognition from a Partial Face View (FRPV), which consists of three phases. The first phase uses an existing algorithm to detect faces in input images. The second phase includes splitting the input images undetected by the first phase into two, four, six, or eight parts. Then, every part is rotated by a new split and rotate face detection (SRFD) algorithm until it detects a face in one of these partial images. The third phase uses the Eigenfaces method with train and test databases to perform recognition. This phase compares the selected test image with images in the train database until it recognizes the person and updates the train database. The FRPV system was implemented using a head-pose image database where every person has multiple images with several poses having different Pitch and Yaw Angles ranging from -90° to +90°. The results showed that the FRPV system outperformed previous methods. Its accuracy rate was equal to 96% for faces that had different poses. In addition, the SRFD method achieved a detection success rate of 67%, which is better than other similar methods. © 2019, National Institute of Science Communication and Information Resources (NISCAIR).

ABSTRACT: The dynamic education environment has compelled educational institutions to discover alternatives to optimize their data technology platform's costs and operational effectiveness. Cloud computing has developed as an important technology that could add more value by offering software and infrastructure alternatives for the university's whole IT needs on the web. In this article, the effect of cloud computing on academic organizations will be discussed and the main variables that make cloud computing excellent in educational institutions. The significance of using private cloud computing in education is demonstrated in a case study conducted at Al-Zaytoonah University (Jordan). The case study results indicate that cloud computing can save the cost and resources of university systems. It also shows that cloud resources offer learners and employees easy access and make cooperation more effective and efficient. © 2019, National Institute of Science Communication and Information Resources (NISCAIR).

AFFILIATIONS: AlZaytoonah Univesity of Jordan, Jordan

ABSTRACT: This study examines the effect of deficit financing on economic stability in Jordan during the period 2005-2017, using quarterly data by employing the Vector Error Correction Model (VECM) after seasonally adjusting the variables. This paper is unique as it is the first of its kind that tackles the issue of stability in Jordan. It provides empirical evidence that external borrowing

(EBDT) and domestic bank financing (BANK) negatively affect economic stability in Jordan. The bank effect is due to crowding out the private sector. External borrowing negative impact is driven by the current high level of outstanding public debt, 98 percent of GDP. Public debt is mainly channeled to finance current expenditures at the expense of capital expenditures, which has a minimal impact on growth. Interest rate (REPO) effect is in line with the finance theory as higher rates lead to lower growth. Nonbank financing (NonBank), although not statistically significant, exhibits the right sign as it has a positive effect. Future research may extend this work by including other macroeconomic variables such as current account deficit, money supply and direct foreign investment. © 2019, Hrvatsko Drustvo Ekonomista. ABSTRACT: Background: Mouse Udp-glucuronosyl Transferase (UGT) 2b1 is equivalent to the human UGT2B7 enzyme, which is a phase II drug-metabolising enzyme and plays a major role in the metabolism of xenobiotic and endogenous compounds. This study aimed to find the relative expression of the mouse ugt2b1 gene in the liver, kidney, and heart organs and the influence of Nonsteroidal Anti-inflammatory Drug (NSAID) administration. Methods: Thirty-five Blab/c mice were divided into 5 groups and treated with different commonly-used NSAIDs; diclofenac, ibuprofen, meloxicam, and mefenamic acid for 14 days. The livers, kidneys, and hearts were isolated, while the expression of ugt2b1 gene was analysed with a quantitative real-time polymerase chain reaction technique. Results: It was found that the ugt2b1 gene is highly expressed in the liver, and then in the heart and the kidneys. NSAIDs significantly upregulated (ANOVA, $p < 0.05$) the expression of ugt2b1 in the heart, while they downregulated its expression (ANOVA, $p < 0.05$) in the liver and kidneys. The level of NSAIDs' effect on ugt2b1 gene expression was strongly correlated (Spearman's Rho correlation, $p < 0.05$) with NSAID's lipophilicity in the liver and its elimination half-life in the heart. Conclusion: This study concluded that the mouse ugt2b1 gene was mainly expressed in the liver, as 14-day administration of different NSAIDs caused alterations in the expression of this gene, which may influence the metabolism of xenobiotic and endogenous compounds. © 2019 Bentham Science Publishers.

Stylistic narrative of "otherness": A study of power relations in John Steinbeck's "The Murder" and Gabriel García Márquez's "A very old man with enormous wings"

(2019) Dirasat: Human and Social Sciences, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077358973&partnerID=40&md5=6b9462ce1ec09b224bf2f1c0d7dcfd74>

AFFILIATIONS: University of Jordan, Jordan;

Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: This study investigates the stylistic features marking powerlessness/"otherness" in fiction. To this end, this study stresses two fictional characters: Jelkain John Steinbeck's "The Murder" (1934) and the old man in Gabriel García Márquez's "A Very Old Man with Enormous Wings" (1955). Most clauses associated with these characters exhibit a fixed set of verbs that make such characters influenced by, rather than influencing, the story's events. Also, in other clauses they are passive participants, affected by other actors. These characters are juxtaposed with superior characters, like Jim, Elisenda, and Pelayo, whose power is foregrounded by other types of verbs. ©

ABSTRACT: By the method of microarc oxidation of technically pure aluminum and aluminum doped with copper, vanadium and zinc (in an alkali silicate electrolyte at a current density of ~ 20 A/dm²), the resulting coating is about 100 μ m thick. The nonmonotonic dependence of the phase composition and hardness on the doping level of aluminum (Al + Cu, Al + Zn, and Al + V systems) is revealed. It was established that the degree of influence of alloying elements on the transformation process of γ -Al₂O₃ \rightarrow α -Al₂O₃ is determined by their crystal-chemical characteristics (charge, ionic radius). Therefore, the mechanism of formation of the phase composition should be associated with the stabilization and destabilization of the γ -Al₂O₃ phase. The results indicate that Cu²⁺ cations contribute to destabilization of the γ -Al₂O₃ phase, while Zn²⁺ and V⁵⁺ cations stabilize the γ -Al₂O₃ phase (with a Zn and V content of more than 3 wt.%). A model is proposed for explaining the results obtained, which is based on the formation of the γ -Al₂O₃ phase in the initial period of time and the appearance of the α -Al₂O₃ phase in subsequent periods (as a result of an increase in the power of microdischarges). It is shown that the highest hardness of coatings on aluminum alloys (about 16 GPa) is achieved with a copper content in the range of 3-4 wt.%. © 2019 - STC "Institute for Single Crystals".

Mechanical Engineering Department, Al-Balqa' Applied University, Amman, Jordan

ABSTRACT: The main objective of this experimental work is to study oil shale pyrolysis by direct heating of solar energy, using a simple concentrated solar system, and a thermogravimetric analyzer (TGA). The tested sample was obtained from a local oil shale deposit, Ellujjun, in Jordan. The TGA test results confirmed that the involved reactions depended on final reactor temperature: the higher the temperature, the greater the weight loss in the sample. A series of experiments using a new design of fixed bed retort powered by solar energy were carried out to study the influence of various operating parameters such as environment inside the reactor and final temperature on the pyrolysis process. The magnitude of the total yield was mainly dependent on temperature and the medium inside the retort. The highest oil yield was witnessed when air was used as gas in the retort, while in subsequent experiments using kerosene the oil yield was much lower. However, this was almost nil in case of using water in the retort. This is the first research of its kind in the Middle East and North Africa (MENA) region, utilizing a solar parabolic dish reflector to heat up the reactor and is deemed to open the way in the future for more detailed research in the field of solar oil shale retorting and/or gasification. © 2019 Estonian Academy Publishers.

ABSTRACT: The preliminary idea of statistical weighted B-summability was introduced by Kadak et al. [27]. Subsequently, deferred weighted statistical B-summability has recently been studied by Pradhan et al. [38]. In this paper, we study statistical versions of deferred weighted B-summability as well as deferred weighted B-convergence with respect to the difference sequence of order r (≥ 0) involving (p, q)-integers and accordingly established an inclusion between them. Moreover, based upon

our proposed methods, we prove an approximation theorem (Korovkin-type) for functions of two variables defined on a Banach space $CB(D)$ and demonstrated that, our theorem effectively improves and generalizes most (if not all) of the existing results depending on the choice of (p, q) -integers. Finally, with the help of the modulus of continuity we estimate the rate of convergence for our proposed methods. Also, an illustrative example is provided here by generalized (p, q) -analogue of Bernstein operators of two variables to demonstrate that our theorem is stronger than its traditional and statistical versions. © 2019, University of Nis. AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, 11733, Jordan

ABSTRACT: Purpose: To prepare emulsion-based Intrapocket polymeric films for the treatment of periodontitis. Method: Films were fabricated by dehydration of an emulsion containing k-carrageenan (KC) in aqueous phase and Compritol® 888 ATO (Compritol®) or Dimodan® UJ (DU®) or different ratios of both. The resulting films were characterized by mechanical texture analyser to determine Young's modulus and tensile strength. Glass transition temperature (T_g) of the films was evaluated by dynamic mechanical and thermal analyser while surface morphology was evaluated using scanning electron microscope. In-vitro drug release was conducted in pre-warmed phosphate buffer. Bacterial adherence was assessed after 24 h. Results: Young's modulus was highest for KC films to which no lipid was added (5.33 ± 0.38 GPa) and decreased following lipid incorporation. T_g was highest in KC films (106.25 ± 4.53 °C) but decreased upon addition of lipids. The surface of KC was smooth but roughness increased with increasing Compritol® load. Drug release from KC films was complete (99.80 ± 8.43 %) after 2 h; however, upon adding lipid, the release was extended 8 h and was affected by lipid type and ratio. Microbiologic assay demonstrated noticeable reduction in viable count compared to control and was affected by lipid type and ratio. The film formulated from a combination of DU® and Compritol® in a ratio of 80:20 was strong, flexible and reduced microbial adherence. Moreover, it showed a smooth surface and extended release for over 8 h. Conclusion: Intra-pocket films were prepared by drying emulsion-based films. Resulted films were strong, flexible, prolonged drug release over 8 h and could lower bacterial growth. The prepared film may offer efficient treatment in periodontitis patients. © 2019 The authors.

ABSTRACT: BACKGROUND: Breast cancer-related lymphedema (BCRL) is one of the most common complications among women with breast cancer. OBJECTIVE: This study was conducted to evaluate the oncology nurses' knowledge about lymphedema assessment, prevention, and management among women with breast cancer, and identify the relationships between oncology nurses' academic qualification, years of experience, and level of knowledge. METHODS: A cross-sectional descriptive design was used. A sample of 150 participants from three institutions completed the study surveys. RESULTS: 60% ($N = 90$) of the participants did not pass the knowledge test. 70% ($N = 105$) of the participants showed lack of knowledge regarding BCRL assessment and examination. The results showed that the participants had knowledge deficit regarding BCRL anatomy, pathophysiology, assessment and examination, risk factors, prevention interventions and precautions, patient education and consultation, and follow-up appointment. Importantly, 96% ($N = 144$) of the participants reported that they did not receive any continue education regarding BCRL. The results showed that was no significant relationship between years of experience, and level of knowledge ($r = 0.25$; $n = 150$; $p < 0.51$). A significant relationship was found between the nurses' knowledge according to their academic qualifications ($2 = 6.21$; $p < 0.0001$). CONCLUSIONS: The results indicated that there is a need for a structured educational program to improve oncology nurses knowledge regarding BCRL. © 2019 IOS Press and the authors. Isolation and structure elucidation of bioactive polyphenols

(2019) Studies in Natural Products Chemistry, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074777624&doi=10.1016%2fb978-0-12-817901-7.00010-1&partnerID=40&md5=68d3294062ef3962fdcbc71da49ad578>

AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Recent development in analytical methods provides significant information necessary for bioactive natural products isolation and structure elucidation. Chromatographic separation, mass and NMR spectroscopic identification tools represent a highly dynamic field with massive recent advances. Bioactive polyphenols are attractive phytochemical group with wide range of diverse effects as well as various biological activities. In this review, the use of recent analytical methods for chemical characterization, isolation and structure elucidation are discussed, organized by analytical techniques and phytochemical class, including simple polyphenolic acids, flavonoids, tannins, xanthenes, lignans, coumarins and other related compounds published between 2012 and 2017. A table is structured to summarize all techniques used in publications devoted for bioactive polyphenols separation, isolation and structure elucidation. The recent separation and isolation techniques including column chromatography, HPLC, GC, and TLC are discussed. Additionally, the advances in spectroscopic techniques such as 1D and 2D NMR, UV, MS, LC-MS, GC-MS are reviewed. Moreover, the role LC-MS plays throughout the discovery of new phenolic compounds, where applications range from simple characterization to full structure identification is deliberated. © 2019 Elsevier B.V.

ABSTRACT: The diffusion-weighted magnetic resonance imaging (DW-MRI) is a promising method for non-invasive investigation of anatomical connectivity in the human brain. Q-ball imaging (QBI) is a diffusion MRI reconstruction technique which has been proven very successful in resolving multiple intravoxel fibre orientations in MRI (i.e., fibre crossing) based on the standard computation of the orientation distribution function (ODF), which is a 3-dimension spherical function founded to detect the dominant fibre orientations in the underlying volume of a pixel (voxel). However, ODF still has a limitation in determining fibre directions which may be corrupted by neighbour directions. In this paper, we proposed a new method to solve the ODF problem by adapting the hybridisation of the cuckoo search algorithm (i.e., global search) and bat algorithm (i.e., local search), namely, CSBA. The performance of the method is demonstrated by experiments in both synthetic and real data. Copyright © 2019 Inderscience Enterprises Ltd.

ABSTRACT: Critical gap and follow-up times are two important fundamental traffic parameters used in the design and operational analysis of roundabouts and un-signalized intersections. Moreover, they are used to assess capacity and level of service at minor roads. In Jordan, roundabouts are used extensively, and therefore, there is a need to conduct studies on follow-up and critical gap time. The driver behaviour in Jordan can be described as aggressive in terms of their choice of follow-up headway at roundabouts. In this study, the roundabouts were located in mountainous terrain which allowed the collection of critical gap observations for approach slopes ranging from 6% up to 8%. The critical gap and follow-up times were recorded and analyzed. This research also identified other factors affecting critical gap, lag and follow-up times such as geometry of roundabout, slope of the approach, culture and behaviour of drivers. This research also proposes a significant relationship between approach slope at roundabouts and the observed gap. This relationship may be incorporated in the estimation of capacity and level of service determination at roundabouts. The results of this

study should assist highway and traffic designers in the design and the performance evaluation of roundabouts. © 2019, Instytut Badawczy Drog i Mostow. All rights reserved.

ABSTRACT: Smart device industry allows developers and designers to embed different sensors, processors, and memories in small-size electronic devices. Sensors are added to enhance the usability of these devices and improve the quality of experience through data collection and analysis. However, with the era of big data and machine learning, sensors' data may be processed by different techniques to infer various hidden information. The extracted information may be beneficial to device users, developers, and designers to enhance the management, operation, and development of these devices. However, the extracted information may be used to compromise the security and the privacy of humans in the era of Internet of Everything (IoE). In this work, we attempt to review the process of inferring meaningful data from smart devices' sensors, especially, smartphones. In addition, different useful machine learning applications based on smartphones' sensors data are shown. Moreover, different side channel attacks utilizing the same sensors and the same machine learning algorithms are overviewed. © 2019 Mohammad Masoud et al. ABSTRACT: Purpose: To investigate the knowledge, attitude, practice (KAP) and satisfaction of Jordanian patients using analgesic patches. Methods: This cross-sectional descriptive study was conducted in four urban centers in Jordan (Amman (capital), Irbid (northern Jordan), Zarqa (central Jordan), and Karak (southern of Jordan)) using a validated closed and open-ended questionnaire. The questionnaire was delivered by hand to a target sample of 250 patients. Results: A total of 178 patients were recruited with a response rate of 71.2 %. Only 40 % of patients had previously been prescribed or recommended to take analgesic patches by a physician or pharmacist. The overall proportion of patients who were aware of the correct use of patch was only of 31 %. Conclusion: The use of patches in Jordan is limited due to lack of patients' knowledge about the proper use of patches. Further studies should be carried out to evaluate healthcare providers' perceptions and knowledge towards the use of patches. © Pharmacotherapy Group, Faculty of Pharmacy, University of Benin, Benin City, 300001 Nigeria.

ABSTRACT: Background: Testing by pharmacogenomics (PGx) aims to reduce the side-effects of medicines and to optimize therapy. Aim: To ascertain the knowledge and attitudes towards PGx among pharmacy students in Jordan and West Bank of Palestine (WBP). Methods: This cross-sectional study focused on pharmacy students from five universities in Jordan and WBP. Students were asked to answer an online

survey comprising 30-closed ended questions measuring the knowledge and attitudes towards PGx. Results: The total number of respondents to the questionnaire was 466. Most (96.1%) respondents knew that genetic variations can affect the drug response. Most students stated that the total number of lectures mentioning PGx was fewer than three. Most (>80%) respondents answered that they knew that human genetics can affect the response, inter-individual variation, and ethnic variations in the drug response. However, their knowledge about US Food and Drug Administration recommendations regarding PGx testing of commonly used drugs was weak. Also, 60.3% of respondents stated that the information they received about PGx was insufficient. Most (>92.7%) students wished to know more about PGx and believed that PGx is helpful in choosing the appropriate drug. Conclusion: Pharmacy students had fair knowledge and good attitudes towards PGx. These factors could aid application of PGx in clinical practice in Jordan and WBP. © 2019 Jarrar et al.

ABSTRACT: This study focuses on the impact of traffic variables; vehicular speed, traffic volume and road gradient, that have a significant impact on vehicle emissions and the corresponding quantity of air pollutants. These factors are normally addressed when devising general and detailed urban plans. Such factors are normally used to assess the adverse effects resulting from motor vehicles dominating roads and highways, including environmental hazards, such as air and noise pollution. Moreover, they identify environmental impacts of road and traffic planning. The study focuses on environmental issues that can be considered and modeled in order to be included in all generalized plans. In this study, concentrations of CO, NO, TVOCs and SO were monitored periodically at various sampling sites. The study revealed that the concentration of air pollutants showed a high correlation with traffic flow and prevailing road gradients. The concentrations of SO₂, NO₂, CO and TVOCs were highly correlated to key traffic flow parameters, such as road gradient, vehicular speed and traffic volume. © 2019 JUST. All Rights Reserved.

ABSTRACT: The current study addressed the effect of electronic-human resource management (e-HRM) as a moderating variable on training practices and employee-level performance relationship, as guided by the contingency theory and social exchange theory in the context of a developing country. Through the application of a self-administrated questionnaire, data were collected from respondents (n = 592) operating in the private sector of Jordan. Notably, structural equation modelling (SEM) with smart partial least square (PLS) was applied; the results confirmed the hypothesised model, as training practices and e-HRM use significantly affect employee performance. Further, e-HRM was seen to significantly moderate the relationship. In addition, discussion for the implications, direction and suggestions for the future body of literature were introduced. ABSTRACT: Cloud computing helps organizations to move fast and adopts different services that accelerate building and hosting their services and reach more customers and third parties quickly. Cloud computing is gaining a considerable attention nowadays due to its accelerated adopting,

deployment models and the variety of services it provides to customers. The quality model for cloud computing is becoming a critical area that needs to be secured to preserve the expected Quality of Service (QoS). The characteristics of the chosen quality model indicate the likelihood of a cloud computing service performing as expected and promised in the agreed Service Level Agreement (SLA) between the services providers and customers. This paper highlights the cloud computing famous quality models and introduces a quality model called S3MQual (Service Measurement Metrics Model) quality model that can add a great value to the customers and meet or exceed customer's expectation. Customers start giving more and more attention on the quality of services of cloud computing as it affects their business growth and continuity. ICIC International © 2019.

ABSTRACT: There are many vital issues that the software implementation faces during all projects phases journey and throughout the Software Development Lifecycle (SDLC). Many software change implementations fail due to lack of engagement of the stakeholders, employees and management resistance, poor leadership, organization environment, cultural issues and others. The importance of this study is to propose a new Change Management (CM) model and framework that are integrated with the SDLC. The new CM framework supports the different aspects of the change and introduces a new process that helps integrate organization, technology, and stakeholders, which will result in increasing employees' acceptance of the change (Software) and to have a smooth deployment and successful change implementation. ABSTRACT: Agent-based modeling stresses on a system's dynamic entities. Active objects, known as agents, must be recognized with agent-based modeling and their actions defined. Agents may be business-process, business-functional-unit, employees, tools, products, or business partners; anything is appropriate to the system. Connections are being established between them, environmental business parameters are set, and simulations are running. The entire dynamics of the system arise from the interactions or behaviors of many entities. In our paper, we simulate an agent-based Business Information System (BIS) and study the efficiency of the BIS system using smart software agents. The proposed agent possesses rational knowledge and reactive capabilities and interacts, including other agents, with the external business environment. We investigate whether smart software agents in certain circumstances can improve the performance of the Business Information System (BIS). The main contribution of this work is to simulate and evaluate business information system's performance using smart software agents. Furthermore, there may be a systematic view of the intelligent agents, assuming that a decision is a process involving evaluation, cognitive-signal generation, and cognition-response. Sales and Operations Planning (SOP) is chosen to demonstrate the impact of using smart software agent. NetLogo is used to design, implement and test the proposed agent on the SOP system as a multi-agent simulation and programming language. ICIC International © 2019.

Sustainable development of urban conserved heritage: An analytical study of Kursunlu mosque in Ulus, Ankara

(2019) International Journal of Sustainable Development and Planning, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85072675619&doi=10.2495%2fSDP-V14-N3-273->

AFFILIATIONS: Al-Zaytoonah University of Jordan, Department of Architecture, Amman, Jordan; Necmettin Erbakan University, Faculty of Engineering and Architecture, Department of Architecture, Konya, Turkey

ABSTRACT: Sustainable design movement in Turkey and across the world mostly focuses on new buildings, with little attention on existing built heritage. Nonetheless, historical building heritage constitutes a majority of the built environment in Turkey. According to the statistics of Turkish Ministry of Culture and Tourism, there were 106.359 registered immovable cultural heritage in all

around Turkey at the end of the year 2017. It is thus important to investigate sustainable development potentials and make suggestions for conserved built heritage. The aim of this research stems from the importance of finding a clear visualization for urban design for cities in the present and future by means of sustainable development, which satisfies the needs of the present and protects the rights of the future. Hence, this manuscript first examines the sustainability potentials of a case study in the 16th century Kursunlu Mosque with its neighbourhood, located in the historic Ulus district in Ankara, Turkey. This research investigates the importance of studying the term 'urban conservation' within the context of historic Ulus area. Although the mosque is nearly walking distance to historic touristic destinations of Ankara such as the Castle, Ahi Elvan and Ahi Serafettin Mosques, Cengel Khan (Museum), Cukur Khan, Safran Khan and Hamamonu area, it does not attract much of the visitors, because of its lack of integrity with the nearby built environment and its restoration necessity. Research methods include literature and archival survey, in-situ observations, and interview with the local community. The analysis reveals urban conservation potentials of the area and sustainable development suggestions for the mosque with its neighbourhood. The major conclusion of the research is that sustainable development suggestions as well as conservation measures of the case study mosque and urban conservation analysis may provide the user and visitor increase and contribute to the revitalization of the building and the neighbourhood area in the long term. © 2019 WIT Press

ABSTRACT: In this paper, we study quadric surfaces in the 3-dimensional Euclidean space which are of finite I I I-type, that is, they are of finite type, in the sense of B.-Y. Chen, corresponding to the third fundamental form. We show that helicoids and spheres are the only quadric surfaces of finite I I I-type. © 2019 Belgian Mathematical Society. All rights reserved.

ABSTRACT: Context: Jordan is looking for a cheap and locally affordable source for its cosmetics, fuel and medical applications. Jojoba offers one solution to such problems. It is considered as a good medicinal plant that can be used for several applications. Aims: To evaluate the effect of parameters as mixing speed, temperature, feedstock grain size, mixture ratio and mixing time on the jojoba yield. Methods: The mathematical model combining the effect of all the above variables was then used to find the optimum combination for maximum yield. Response Surface Methodology (RSM) technique was used for modeling and optimization. Based on the Pareto chart of parameters effect, the seed size was the most significant followed with temperature effect. Results: It was found that the optimum values obtained for best yield were seed size of about 0.48 mm, the temperature of about 65°C and mixing time of 2.8 hours maximum yield of about 56% wt can be obtained. Conclusions: A mathematical model was successfully built and tested for the Jojoba oil yield under different conditions. The optimum parameters that produced the highest yield were also found. © 2019 Journal of Pharmacy & Pharmacognosy Research.

ABSTRACT: Introduction: Pharmacists can have a valuable role in educating patients on correct inhaler technique leading to improved asthma management. Rural areas can benefit from the role of the pharmacist considering the barriers found in attending primary health-care facilities. Objectives: This study aimed to assess the impact of inhaler technique education delivered by pharmacists on patients' inhaler technique, Asthma Control Test (ACT) score, forced expiratory volume in the first 1 second (FEV1%), and reliever use (puffs/day). Methods: A pre-post interventional study was conducted over 6 months from February 2017 to July 2017 in rural areas in Jordan. Asthma patients visiting respiratory clinics and using metered dose inhaler (MDI) or turbuhaler (TH) controlled medication were randomly recruited. Inhaler technique was assessed via published checklists. The ACT, FEV1%, and reliever use (puffs/day) were assessed. Patients were educated on inhaler technique via demonstration with return demonstration education. All assessments were repeated 3 months post education. Results: A total of 103 (TH, n=44; MDI, n=59) patients were recruited (mean age=46.5 ±13.5), 74% females. Patients reported an overuse of their reliever (5.1±4.2 puffs/day). Only 2 patients (1.9%) had well-controlled asthma, while the rest had either moderately (19.4%) or poorly (78.6%) controlled asthma. Patients using the MDI achieved 3.03±4.30 ACT score improvement (p<0.001), which is a clinically significant improvement in control. Patients using the TH achieved a statistically significant improvement of 2.07±4.72 (p=0.031). FEV1 % improved significantly for MDI users (p=0.005) but not for TH users (p=0.097). Reliever use decreased significantly for MDI and TH users. Conclusion: Asthmatic patients living in rural areas in Jordan reported poor inhaler technique, ACT scores, and FEV1 % scores and high use of reliever medications. Pharmacist-led educational intervention resulted in improved inhaler technique scores, ACT scores, and FEV1 % scores and lowered reliever use over time. © 2019 Bsheti et al.

ABSTRACT: This paper investigates both long-run and short-run elasticities between gross domestic product and foreign direct investment (FDI) in Jordan. Annual data have been used in order to explore the relationship between foreign direct investments (FDI) with economic growth for the period 1992-2013. Data were collected for both variables (FDI and GDP) from the World Bank and World Development Indicators, and the Autoregressive Distributed Lag Model (ARDL) approach was used. The results show long-run and short-run elasticities in foreign direct investment (FDI) and GDP. The results indicate that Jordanian policy makers focus their efforts to attract more FDI to Jordanian economy. This is because more FDI is expected to lead to a decrease in economic obstacles in Jordan (e.g., increased level of investment, decreased unemployment rate). © 2019 Catholic University of Colombia. ABSTRACT: In this work an experimental work was conducted to improve the performance of photovoltaic panels (PV) by cooling them using phase change materials (PCM). A photovoltaic system made up of two identical PV panels were installed side by side, PCM was integrated on the back side of one of these photovoltaic panels, while the other one was kept as a standard one for comparison purposes. A micro converter with all necessary accessories to conduct the work were also used. The generated currents and voltages, temperatures of the ambient and the PV panels and the incident solar irradiance were recorded on hourly basis for twenty-eight days using a data acquisition system. The stored data was analyzed and it was found that the cooled PV panel using PCM had performed 2.6% better than the standard panel. © 2018 Jordan Journal of Mechanical and Industrial Engineering.

ABSTRACT: It is well acknowledged that thin films of zinc sulfide (ZnS) can be successfully synthesised via spray pyrolysis of an aqueous solution of zinc acetate and thiourea onto a glass substrate at a temperature of 200°C. However, the effect of spray rate on the structural and optical properties of ZnS thin films has not been considered deeply. Therefore, this study synthesized ZnS thin films on glass substrates under different spray rate (1, 2, 3 and 4 mlmin⁻¹). The films were characterized using X-ray diffraction (XRD), field emission scanning electron microscopy (FESEM), UV-Vis-NIR spectrometry, and photoluminescence (PL) spectroscopy. The X-ray diffraction of all the samples confirmed the characteristic cubic structure of ZnS thin films. On the other hand, the morphology and crystallinity seemed to be depended on the spray rate. It was found that the value of bandgap of ZnS films slightly increased when the spray rate was increased. Furthermore, the variations observed in the 3.35-3.80 eV range are most likely related to the Zn (S, O) formation within the solid solution. PL analysis specified the presence three peaks (2.38, 2.98 and 3.5 eV) at spray rate of 3 ml min⁻¹, which are attributable to Zn vacancies, S vacancies, interstitial sulfur and interstitial zinc. © 2019 Elsevier Ltd. ABSTRACT: Electronic (E)-cigarettes are the latest form of nicotine delivery device and are highly popular in the general population. It is currently unknown whether vaping E-cigarettes (E-CIGs) leads to nicotine addiction. Alterations in the levels of the neurotransmitters in the mesocorticolimbic areas have been reported to mediate the initiation and development of nicotine addiction. Therefore, to determine whether E-CIGs activate the same addiction pathways as conventional cigarettes, we investigated for the effects of daily inhalation of nicotine (24 mg/ml)-containing E-CIG vapor for 6 months on the concentrations of these neurotransmitters in the frontal cortex (FC) and striatum (STR) of male C57BL/6 mice as compared to control group that was exposed to air only. We reported here that 6-month E-CIG vapor containing nicotine inhalation decreased dopamine concentration only in the STR. There were no changes in serotonin concentrations in the FC or STR. Chronic E-CIG exposure also increased glutamate concentration in the STR alone, while glutamine concentrations were increased in both the FC and STR. We found that E-CIG exposure also decreased GABA concentration only in the FC. These data suggest that chronic E-CIG use alters homeostasis of several neurotransmitters in the mesocorticolimbic areas, which may result in the development of nicotine dependence in E-CIG users. © 2019 Frontiers Media S.A.. ABSTRACT: Three diiron hexacarbonyl complexes containing dithiolato (5), diselenolato (6), and

selenolato-thiolato ligands (7), respectively, have been prepared as [FeFe]-hydrogenase mimics. Treatment of Fe₃(CO)₁₂ with one equivalent of the corresponding 5-membered heterocycles 1, 3 and 4 in toluene at reflux afforded the corresponding complexes 5-7. The reaction of 5,5-bis(bromomethyl)-2,2-dimethyl-1,3-dioxane with in situ generated Na₂Se₂ results in the formation of 8,8-dimethyl-7,9-dioxa-2,3-diselenaspiro[4.5]decane (1) and traces of 7,7-dimethyl-6,8-dioxa-2-selenaspiro[3.4]nonane (2). Alternatively, 5,5-bis(bromomethyl)-2,2-dimethyl-1,3-dioxane reacts with in situ generated Na₂Se₂ yielding compound 2 in 26% yield. When Fe₃(CO)₁₂ reacts under reflux with the selenaspiro compound 2 in toluene, the unique diiron complex, [Fe₂(CO)₆{μ₂,κ₃-Se,C,O-SeCH₂C₇H₁₂O₂}] (8), is obtained as a result of an initial selenium-carbon bond activation. Compounds 5, 6, 7, and 8 were characterized by IR, ¹H, ¹³C{¹H}, and ⁷⁷Se{¹H} NMR spectroscopy, mass spectrometry, elemental analysis, and X-ray single-crystal structure analysis. The chiral complex 8 shows a coordination of the O atom at the dioxane ring to one Fe atom and the O-CH- carbanionic group to the other Fe atom. Furthermore, we investigated the redox properties and the catalytic behaviour of complexes 5-8 in the presence of AcOH as a source of protons. The reduction of complexes 5-7 is accompanied by a chemical process resulting in an overall two-electron transfer at their primary reduction wave. This observation is consistent with an ECE reduction (E = electrochemical process, C = chemical process), while each reduction event in the case of complex 8 involves simple transfer of one electron. Moreover, high level DFT calculations were performed on neutral 8 and its reduction products 8⁻ and 8²⁻. © 2019 The Royal Society of Chemistry and the Centre National de la Recherche Scientifique.

Handling semantic repetition when translating Arabic short stories: The case of excerpt from the book of the dead

(2019) 3L: Language, Linguistics, Literature, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85070718083&doi=10.17576%2f3L-2019-2502-04&partnerID=40&md5=350ede8324f54294d9bfa1bd49ea9ca1>

ABSTRACT: The translation of literary texts into another language is undoubtedly a challenging task, especially when dealing with a combination of languages that are linguistically, stylistically and culturally different. The main purpose of this paper is to examine the translation of one of the devices of creative writing used in the construction of Arabic short stories, namely semantic repetition. The analysis is based on comparing the occurrences of semantic repetition in the Arabic short story " " Excerpt from The Book of The Dead with their translations in the target text. This literary work, by Ahmad Faqih, has been selected for analysis mainly because it contains a significant number of repetition instances that serve various pragmatic functions. The main concepts and aspects of Toury's theory of norms and other taxonomies of translation strategies will be used to identify translation shifts and strategies adopted by the translators. The analysis reveals that the translators resorted to four main strategies when translating semantic repetition into English: retention, compression, grammatical shift and deletion. The analysis also reveals that instances of semantic repetition are often omitted or modified in the English translation, and consequently their functions are sacrificed. This will certainly affect the representation of the original literary work and offer the target readers a slightly different version of the text. © 2019 Penerbit Universiti Kebangsaan Malaysia. ABSTRACT: This paper examines the effectiveness of the audit committee in limiting the adverse effects of the provision of non-audit services (NAS) on earnings management. In addition, the current study examines the effect of surplus free cash flow and NAS on earnings management. Earnings management occurs less frequently when the audit committee is effective. In this study, audit committee effectiveness refers to the overall effectiveness of the committee that was measured using a composite measurement of effectiveness. The sample comprised 336 industrial firms listed on the Amman Stock Exchange from 2014 to 2016. The results documented that the positive relationship between surpluses free cash flow and earnings management. This study contributes to the literature by providing evidence that investors realise that NAS harms the independence of the auditor by creating an economic bond between the auditor and client that could negatively affect audit quality and hence earnings credibility. As does all research, this study suffers from limitations, including the fact that this study sheds the light only on the industrial sector in Jordan, Thus, the need exists for more research to be conducted using other sectors in Jordan and other countries as well to determine the effects of other variables on earnings management from other perspectives. ABSTRACT: Background: Glucuronidation is one of the most important phase II metabolic pathways. It is catalyzed by a family of UDP-glucuronosyltransferase enzymes (UGTs). UGT1A1 and UGT1A7 catalyze the glucuronidation of a diverse range of medications, environmental chemicals and endogenous compounds. Polymorphisms in the UGT1A gene could potentially be significant for the pharmacological, toxicological and physiological effects of the enzymes. Objective: The UGT1A gene is polymorphic among ethnic groups and the aim of this study was to investigate the different UGT1A1 and UGT1A7 polymorphisms in Circassians, Chechens and Jordanian-Arabs. Methods: A total of 168 healthy Jordanian-Arabs, 56 Circassians and 54 Chechens were included in this study. Genotyping of 20 different Single-nucleotide polymorphism (SNPs) was done by using polymerase chain reaction- DNA sequencing. Results: We found that Circassians and Chechens have significantly higher allele frequencies of UGT1A7*2, UGT1A7*3 and UGT1A7*4 than the Jordanian-Arab population, but all three populations have similar frequencies of UGT1A1*28. Therefore, Circassians and Chechens are expected to have significantly lower levels of the UGT1A7 enzyme with almost 90% of these populations having genes that encode low or intermediate enzyme activity. Conclusion: This inter-ethnic variation in the UGT1A alleles frequencies may affect drug response and susceptibility to cancers among different subethnic groups in Jordan. Our results can also provide useful information for the Jordanian population and for future genotyping of Circassian and Chechen populations in general. © 2019 Bentham Science Publishers.

AFFILIATIONS: Faculty of Nursing, Al-Zaytoonah University of Jordan, P.O. Box: 130, Amman, 11733, Jordan

ABSTRACT: Introduction: Self-medication has become an important issue among university students. There is a trend in prevalence of self-medication. This study was aimed to 1) assess the prevalence of self-medication, 2) identify the patterns and attitudes towards self-medication practices, and 3) examine socio-demographic characteristics factors correlate of self-medication among university students in Jordan. Methods: A descriptive-correlational design and a stratification random sampling method were used. A self-administered questionnaire was used, which consists of socio-demographic characteristics, information about the patterns of self-medication, and attitudes towards self-

medication practices. Results: The prevalence of self-medication was 98.4%. Painkillers (paracetamol and non-steroidal anti-inflammatory), antibiotics, and herbals were the most commonly used medicines. Pain (e.g., a headache, toothache, muscle, joint, and abdomen) was the most common symptoms of practicing self-medication. Previous experience, emergency situation, and minor diseases were the main reasons for self-medication use. Pharmacists, family, and physicians were the major sources of drug information for self-medication. Students had high positive attitudes towards self-medication and had awareness of adverse effects of medicines. There was a relationship between gender, health status, and self-medication. Conclusions: The results of the study could help to develop strategies and strong policies to promote the logical use of medicine among university students. The university should develop education and prevention measures and implement a self-medication program based on students' attitudes towards self-medication. Drug regulatory and health authorities should enforce restrict application of rules regarding selling and purchasing of self-medication, and design messages targeting to raise awareness regarding the hazards of self-medication. © 2019 UPM Press. Puritanism in Edmund Spenser's Amoretti and epithalamion: Refashioning the Petrarchan sonnet (2019) *Pertanika Journal of Social Sciences and Humanities*, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85069180342&partnerID=40&md5=dc916905dc4964ea7dcdf45bb48e1340>

World Islamic Science and Education University, Amman, 11947, Jordan

ABSTRACT: This paper analyses Edmund Spenser's sonnet sequence Amoretti and its concluding sequel Epithalamion within the context of Puritanism. By highlighting the Puritanical concepts in Spenser's two poetic works, the two researchers demonstrate the aspects in which Spenser parts ways with the Petrarchan sonnet tradition. Spenser offers a pure, Christian love that ends in holy matrimony as an alternative to the unsanctified, unrequited love in Petrarchan sonnets. Moreover, this research identifies the segments of Spenser's poems wherein Platonism is exceedingly manifested. Through the textual examination of the two aforementioned works, it becomes evident that nuances of the Puritan faith come to light in Spenser's depiction of a holy, Christian courtship and marriage, in his portrayal of the lady as an embodiment of heavenly light in contrast to the inferiority of earthly existence and in his parallel presentation of the lover's suffering for his angelic lady as an allegorical reflection of the agony endured by the Puritan to gain Heavenly Grace. © Universiti Putra Malaysia Press

Perception of primary care physicians' toward pharmacogenetics in Jordan (2019) *Jordan Medical Journal*, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85068848564&partnerID=40&md5=276cc369ceb8f3b9cf1b8dc110118d17>

AFFILIATIONS: School of Pharmacy, Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: Objective: Pharmacogenetics plays a major role in personalizing pharmacotherapy. However, it is not widely practiced in the clinical healthcare centers in many countries, including Jordan. The present study aims at assessing pharmacogenetic knowledge among primary care internist physicians from different public and private Jordanian hospitals. Methods: A structural questionnaire, covering the basic background information and attitude toward pharmacogenetic practice, has been distributed among 300 primary care internist physicians in six hospitals in Amman, Zarqa and Karak cities and some private clinical centers in Amman between January to March 2017. Results: The response rate has been 63.3%. The majority of internist physicians have responded that pharmacogenetics is important in reducing the unwanted drugs side effects (64.21%) and enhancing the efficacy of the treatment (62.11%). The majority of the participants (61.05%) have responded that physicians should know about pharmacogenetics and 64.73% of the participants want to know more about it. Furthermore, the majority of the respondents (80%) believe that pharmacogenetics will be relevant to the clinical practice if it is applied in Jordan. In addition, 40.52% of the participants have answered that patients should be analyzed genetically before describing the drugs. Most of the internist physicians have responded that laboratory pharmacogenetic tests are not available (48.94%), in the currently working hospitals, and not covered by medical insurances (69.47%). Conclusion: It is concluded from the results of this study that most of the primary care internist physicians in Jordan know the clinical importance of pharmacogenetic testing but it is still not widely practiced. Further intensive studies are needed to find the possible ways of implementation of pharmacogenetic testing in Jordan. © 2019 DAR Publishers / The University of Jordan.

ABSTRACT: The aim of the study was to develop and characterize mucoadhesive buccal patches of valsartan (VAL) in nanoemulsion (NE) form and to evaluate the impact of nano-formulation in improving its solubility, mucoadhesive strength and in-vitro permeation in comparison to the traditional mucoadhesive VAL patches. A thermodynamic stable VAL-loaded NE was developed with a mean droplet size of 22.5 nm. It was composed of 40% w/w water, 10% w/w oleic acid: Labrasol[®] at a ratio of 2: 1 v/v, and 50% w/w polysorbate 20: Transcutol[®]-P at a ratio of 1: 3 v/v. Bi-layered patches were prepared using 3% w/v ethylene vinyl acetate in dichloromethane as the backing layer and 1.5% w/v Carbopol[®] 971P aqueous solution mixed with VAL-loaded NE as the mucoadhesive layer. Patches showed acceptable weight variation, thickness, folding endurance, mucoadhesive strength, and in-vitro permeation. NE-based patches were more effective in enhancing the penetration of VAL than traditional patches, without significant difference in the mucoadhesive strength. They showed a higher steady-state flux and permeability coefficient than the traditional patches with a flux enhancement ratio of 2.36. The study concluded that NE-based patch is a promising approach that can be tailored to optimize drug release profile in-vivo. © 2019 Polish Pharmaceutical Society. All rights reserved.

ABSTRACT: Recently, iris recognition had been gained growing interest from researchers because of its high accuracy against other person identification techniques. This work presents an iris recognition system based on particle swarm optimization (PSO) and Independent Component Analysis (ICA) as feature extraction algorithm. Many experiments were conducted using different: swarm size (20, 40 and 80), PSO iterations (100 and 200) and ICA feature vector length (64, 128, 256 and 512). The results showed that: the best performance of the iris recognition system (high PSNR, high recognition rate and lower MSE) will be increased when increasing the ICA feature vector length to 512, increasing the swarm size to 80 and decreasing the number of iterations to 100. Best obtained value of recognition rate is 98%, best PSNR value is 38 and lower MSE value is 0.0011. The suggested iris recognition system has the ability to recognize un trained iris images but with lower performance. © 2019 ICAI 2015 - WORLDCOMP 2015. All rights reserved.

ABSTRACT: The drive of the work study is essentialised at first to investigate corporate social responsibility (CSR) awareness impacts on apparent customer satisfaction (CSatf) and banking performance (BPerf) in the Jordanian banking division. Meanwhile, the second focus of this work is to propose a mediating role of customer trust (CTrust) and spiritual leadership (SprLead) with a measurement of relationship effect between exogenous and endogenous variables. A hypothesised model test was performed through field survey, total of 417 customers input gathered in 24 banks. Results and presumptions reveal that customers in Jordanian banks ascertain that CSR is a dimensional paradigm that obliges as a direct component of CSatf and BPerf through a positive relationship. While, CTrust has a partial positive mediating effect on relationship between CSR - CSatf, and between CSR - Bperf, SprLead had a partial mediating effect between CSR - CSatf and did not influence the relationship between CSR - BPerf. Negative stereotypes of Arabs: The Western case

(2019) Indian Journal of Social Work, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85067967891&doi=10.32444%2fIJSW.2018.80.1.87-114&partnerID=40&md5=23e6ba9e0353971d790834f25e73dd7e>

AFFILIATIONS: Department of Business Administration, Faculty of Business, Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: The article explains negative stereotypes of Arabs as conceptualised by the West. The findings suggest that negative stereotypes about Arabs are increasing, provoking further misunderstanding and distortion of the Arab image. Stereotypes reinforcing the majority-minority bias are rooted in the long history of conflicts and unfriendly relations with Arab nations. © 2019 Tata Institute of Social Sciences. ABSTRACT: Background: Phosphoinositide 3-kinase α (PI3K α) has emerged as a promising target for anticancer drug design. Objectives: Target compounds were designed to investigate the effect of the p-OCH₃ motifs on ligand/PI3K α complex interaction and antiproliferative activity. Methods: Synthesis of the proposed compounds, biological examination tests against human colon adenocarcinoma (HCT-116), breast adenocarcinoma (MCF-7), and breast carcinoma (T47D) cell lines, along with Glide docking studies. Results: A series of 1,2-bis(4-methoxyphenyl)-2-oxoethyl benzoates was synthesized and characterized by means of FT-IR, ¹H and ¹³C NMR, and by elemental analysis. Biological investigation demonstrated that the newly synthesized compounds exhibit antiproliferative activity in human colon adenocarcinoma (HCT-116), breast adenocarcinoma (MCF-7), and breast carcinoma (T47D) cell lines possibly via inhibition of PI3K α and estrogen receptor α (ER α). Additionally, results revealed that these compounds exert selective inhibitory activity, induce apoptosis, and suppress VEGF production. Compound 3c exhibited promising antiproliferative activity in HCT-116 interrogating that hydrogen bond-acceptor mediates ligand/PI3K α complex formation on m- position. Compounds 3e and 3i displayed high inhibitory activity in MCF-7 and T47D implying a wide cleft discloses the o- attachment. Furthermore, compound 3g exerted selective inhibitory activity against T47D. Glide docking studies against PI3K α and ER α demonstrated that the series accommodate binding to PI3K α and/or ER α . Conclusion: The series exhibited a potential antitumor activity in human carcinoma cell lines encoding PI3K α and/or ER α . © 2019 Bentham Science Publishers.

ABSTRACT: Aim: The aim of this study was to investigate differences in the barriers to good cancer pain management between physicians, nurses, and pharmacists in Jordan. Design: A descriptive correlational design was used to answer the research questions of this study. Methods: A group of 473 participants completed the study questionnaires (Barriers Questionnaire - II and Nurses' Knowledge and Attitudes Survey). Results: Fears related to analgesic use, fears related to opioid side effects, communication, cultural beliefs, and lack of knowledge were the most clearly identified barriers to cancer pain management. Cancer pain management has not previously been an area of interest for the Jordanian health authorities. Conclusion: The information that emerged from this study helps to identify the current barriers and misconceptions among health professionals that prevent effective pain management for cancer patients. To maximize the role of health professionals in this area, health administrators need to provide them with more specialized training and empowerment. © 2019 Central European Journal of Nursing and Midwifery

ABSTRACT: Ten compounds of 2, 5-disubstituted-amido-1, 3, 4-thiadiazole, 3, 5-disubstituted-amido-1, 2, 4-thiadiazole and a Schiff base of 1, 3, 4-thiadiazole derivatives were synthesized. The structures were characterized by elemental analysis and different spectroscopic techniques and their biological activities were evaluated. All the synthesized compounds were screened for their antimicrobial activity against Staphylococcus aureus and Escheriochia coli, and antifungal activity against Candida albicans and a clinical isolate of Candida albicans. Most of the compounds have shown significant antibacterial and antifungal activity. When compared with the standard antimicrobial agents. The induced fit study of Schiff base derivative showed that the compound has potential inhibitory effect on bacterial β carbonic anhydrase with binding score of (-33.681 kJ/mol). © 2009-2019, JGPT.

ABSTRACT: Test complexity and test adequacy are frequently raised by software developers and testing agents. However, there is little research works at this aspect on specification-based testing at the use case description level. Thus, this research proposes an automatic test cases generator approach to reduce the test complexity and to enhance the percentage of test coverage. First, to support the infrastructure for performing automatic, this proposed approach refines the use cases using use case describing template and save it in the text file. Then, the saved file is input to the Algorithm of Control Flow Diagram (ACFD) to convert use case details to a control flow diagram. After that, the Proposed Tool of Generating Test Paths (PTGTP) is used to generate test cases from the control flow diagram. Finally, the genetic algorithm associated with transition coverage is adapted to optimize and evaluate the adequacy of such test cases. A money withdrawal use case in the ATM system is used as an ongoing case study. Preliminary results show that the generated test cases achieve high coverage with an optimal test case. This automatic test case generation approach is effective and efficient. Therefore, it could promote to use other test case coverage criteria. Copyright © 2019 Tech Science Press

ABSTRACT: This paper empirically looks at the effect of ownership structure on audit fees in developing economies using all the national twelve banks in Jordan as a case ; the study uses published annual data ranging from 2008 to 2015. Those banks include (10) conventional and the (2) Islamic banks. The Jordan banking sector is dominated by a high institutional ownership concentration; this is followed by family and government ownership. We find a significantly positive (insignificantly negative) effect of both family and institutional (Government) ownership on audit fees regarding of conventional banks; which means, it is possible that owners ask the auditors to provide high quality service which in turn results on high audit fees. We further document that our results show insignificantly negative effect of controlled family and institutional ownership of Islamic banks on audit fees. Finally, we do not, however, find evidence of any effect of government ownership for both banking systems on audit fees. This shows that in Jordan, conventional banks truly pay higher audit fees when these are controlled by family or institutional shareholders and pay lower fees if dominated by government ownership, these results explain the mixed effects of the nature of family and institutional ownership on audit fees. Based on these results; we suggest that ownership variable constitutes a key determinant of audit fees. © 2019, Allied Academies.

ABSTRACT: A series of biologically active 3-quinoline carboxylic acid hydrazide-hydrazones has been synthesized from 3-quinoline carboxylic acid hydrazide and a variety of aldehydes, with moderate to good yields. The chemical structures of the new products were confirmed by elemental analysis, IR, and ¹H NMR, ¹³C NMR spectral data. The structural and Frontier Molecular Orbital (FMO) properties and the Density Functional Theory (DFT) calculations were conducted for the new compounds. The new hydrazide-hydrazones exhibited low to moderate antibacterial activity against Staphylococcus aureus and Esherichia coli in comparison with gentamycin. Among the tested compounds, compounds 9 and 13 were found to be the most active. Phthalimide derivative 2 of 3-quioline carboxylic acid hydrazide showed remarkable antibacterial activity. © 2019 Bentham Science Publishers.

ABSTRACT: Repeated administration of hepatotoxicants is usually accompanied by liver fibrosis. However, the difference in response as a result of repeated exposures of acetaminophen (APAP) compared to a single dose is not well-studied. Therefore, in the current study, the liver response after a second dose of APAP was investigated. Adult fasted Balb/C mice were exposed to two toxic doses of 300 mg/kg APAP, which were administered 72 h apart from each other. Subsequently, blood and liver from the treated mice were collected 24 h and 72 h after both APAP administrations. Liver transaminase, i.e. alanine amino transferase (ALT) and aspartate amino transferase (AST) levels revealed that the fulminant liver damage was reduced after the second APAP administration compared to that observed at the same time point after the first treatment. These results correlated with the necrotic areas as indicated by histological analyses. Surprisingly, Picro Sirius Red (PSR) staining showed that the accumulation of extracellular matrix after the second dose coincides with the upregulation of some fibrogenic signatures, e.g., alpha smooth muscle actin. Non-targeted liver tissue metabolic profiling indicates that most alterations occur 24 h after the first dose of APAP. However, the levels of most metabolites recover to basal values over time. This organ adaptation process is also confirmed by the upregulation of antioxidative systems like e.g. superoxide dismutase and catalase. From the results, it can be concluded that there is a different response of the liver to APAP toxic doses, if the liver has already been exposed to APAP. A necroinflammatory process followed by a liver regeneration was observed after the first APAP exposure. However, fibrogenesis through the accumulation of extracellular matrix is observed after a second challenge. Therefore, further studies are required to mechanistically understand the so called "liver memory". © 2019, Leibniz Research Centre for Working Environment and Human Factors. All rights reserved.

ABSTRACT: Biomechanics refers to study of movement within dynamic biological systems. Advancement of computer software technologies such as JAVA language leads to combine stimuli and signals by biological systems and utilize them for research purposes. The main aim of this research is to analyse various biomechanical software and advancements that have been made in the field of mechanical software. Secondary research analysis has been utilized within this research paper. A Number of computational software such as OpenSim and ABAQUS have been proven to be very beneficial in this aspect. Advancement in biomechanical software has led to better research in cancer and cytoskeletal studies. Thus, Biomechanical software enables us to study kinetics of body without invasive procedures and does not cause any hindrance to ethical issues. © 2019 Eastern Macedonia and Thrace Institute of Technology.

Cholesterol-coated gold nanorods as an efficient nano-carrier for chemotherapeutic delivery and potential treatment of breast cancer:: In vitro studies using the MCF-7 cell line

(2019) RSC Advances, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85064972880&doi=10.1039%2fc9ra01041f&partnerID=40&md5=96b9da99533de3bf6d41f7eddd4775d1>

ABSTRACT: Gold nanorods (GNRs) have a recognized role in treatment of cancers as efficient nanocarriers for chemotherapeutic drug delivery. In this study, GNRs modified with cholesterol-PEG were employed as a nanocarrier for a hydrophobic compound having a promising phosphatidylinositol 3-kinase (PI3K α) inhibitory activity. The acquired nanocomplex was characterized by optical and infrared (IR) absorption spectroscopies, in addition to hydrodynamic size and zeta potential. Glide docking and superposing of docked poses of the hydrophobic ligand and cholesterol moiety demonstrated that hydrophobic interactions drive the conjugation and attachment of the ligand to the cholesterol moiety of the nanocarrier. In vitro release study under a cellular environment indicates that the presence of cells has enhanced the release and the cellular uptake of the conjugated ligand. Furthermore, the anti-proliferative assay of the nanocomplex revealed potent cytotoxicity over a low concentration range of the nanocomplex against MCF-7 breast cancer cells compared to the free compound or the nanocarrier alone. Analysis of cellular death modality by flow cytometry showed that the nanocomplex has a rapid effect on cell death, as cells went toward the late apoptotic/necrotic stage rapidly and proportionally to the increase of the nanocomplex concentration. The overall results propose that cholesterol-decorated GNRs could be considered as a promising nanocarrier for hydrophobic drugs to achieve efficient delivery and potential therapy against breast cancer cells. © 2019 The Royal Society of Chemistry.

ABSTRACT: Background: Nudix Hydrolase 15 gene (NUDT15) encodes nucleotide triphosphate diphosphatase which metabolizes the purine analog drugs, such as anticancer thiopurine and anti-gout allopurinol. Genetic variants on Nudix Hydrolase 15 gene (NUDT15) gene effects the drug's hydrolyses and hence increases the susceptibility to drug-induced toxicity. The NUDT15 gene has been genotyped in various ethnic groups, however, it has not been genotyped among the Middle Eastern Arab Jordanian population. Aim: The current study aimed to identify NUDT15 genetic variants among Jordanian Arab population. Method: The DNA samples were isolated from leukocytes of 85 unrelated Jordanian Arab volunteers. The coding regions of NUDT15 gene; Exon 1,2 and 3, in addition to some regions of intron 1,2 and 3'UTR, were amplified using polymerase chain reaction (PCR). the PCR products were then subjected to purification and sequenced using Applied Biosystems Model (ABI3730x1). Results: Six NUDT15 genetic variants were found among the volunteers. The results were as followed: A novel synonymous variant 36A > G on exon 1 (6%, 95%CI= 3- 9%), the intronic IVS1 +116C > T variant on intron 1 (0.6%, 95%CI= 0-2%), the non-synonymous variant on exon 3; 415C > T (0.6%, 95%CI= 0-2%), A novel non-synonymous variant on exon 3; 404C > A (0.6%, 95%CI= 0-2%), and two novel variants on 3'UTR ;502G > A (2%, 95%CI= 0.5-4%) and 588T > C (0.6%, 95%CI= 0-2%). NUDT15 36A > G was found to be the most common allele among Jordanians was. In silico softwares predicted that the novel NUDT15 404C > A was harmful and affected NUDT15 enzyme's stability and function. Furthermore, the frequency of NUDT15 IVS1 +116C > T, among Jordanians, showed to be significantly lower from what was reported in other ethnicities with a p value > 0.05 on the other hand, the frequency of 415C > T variant showed to be similar to Europeans in contrast to Asians and Indians that showed to be significantly lower (p value > 0.05). Conclusions: The frequency of NUDT15 genetic variants is low among the Jordanian volunteers and significantly lower than other ethnic groups. The findings of this study may increase our understanding of the inter-individual variation in the response to purine analog drugs. Further clinical studies are needed to investigate the influence of novel NUDT15 404C > A on drug metabolism and response. © 2019, NUDT15 Genetic Variants in Jordanians.

ABSTRACT: The aim of this paper is to analyze the relationship between foreign direct investments and financial development in Bahrain. The estimation of financial development effects was performed for the period 1978 to 2015, which covers the political conflicts that recently happened in Middle East area (Arab Spring). On the other hand, the paper sought to examine the causality relationship between

foreign direct investments and financial development. The study empirically investigates the short and long run equilibrium relationship between the variables by applied co-integration and Autoregressive Distributed Lags Approach (ARDL). The Granger causality test was employed to capture causality relationship. The obtained results show that there is a significant positive relationship between FDI and financial development in short and long run, while, a significant negative relationship between Arab Spring and financial development. However, the results also revealed bidirectional causality relationship between FDI and financial development. © 2019, Hrvatsko Drustvo Ekonomista. All rights reserved.

ABSTRACT: BACKGROUND: High-fidelity simulation (HFS) as a teaching-learning method has increased, especially in medical programs. OBJECTIVE: This study was conducted to assess the effectiveness of using HFS on the satisfaction, self-confidence, self-efficacy, and knowledge of undergraduate students in oncology care. METHODS: A pre-test post-test quasi-experimental design was utilized. Random sampling technique was used to recruit the participants. The scenarios including septic shock and infusion reaction were implemented. The training program including lectures and the simulation was run in a high fidelity simulation lab. RESULTS: There was a significant difference ($t=-5.95$, $p=0.001$) between the experimental group ($M=13.95$, $SD=3.35$) and the control group ($M=6.25$, $SD=2.65$) regarding knowledge, confidence ($t=-22.75$, $p=0.001$) between the experimental group ($M=61.25$, $SD=12.10$) and the control group ($M=38.50$, $SD=6.20$), satisfaction level $t=-18.25$, $p=0.001$; experimental group- $M=42.25$, $SD=4.25$; and control group- $M=28.50$, $SD=3.15$), and there was a significant difference between the experimental group ($M=35.50$, $SD=3.25$) and control group ($M=24.25$, $SD=2.85$) regarding self-efficacy ($t=-13.25$, $p=0.001$). CONCLUSIONS: High-fidelity simulation in nursing increased student knowledge, self-confidence, satisfaction, and self-efficacy in managing septic shock and infusion reaction as common oncology emergencies. © 2019-IOS Press and the authors. Lived experience of Jordanian colorectal cancer patients with recurrence: an interpretative phenomenological analysis

(2019) Psychology, Health and Medicine, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85062452579&doi=10.1080%2f13548506.2019.1587481&partnerID=40&md5=29bea57f3c2d850b29e79e772fb497d4>

AFFILIATIONS: Faculty of nursing, AL-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Despite improvement in the cancer treatment modalities, recurrence is still common. This study was conducted to explore Jordanian colorectal cancer patients' experience during the recurrence phase. Phenomenology-Qualitative design with semi-structured individual interviews with open questions was used. Three main themes and several subthemes were emerged: (1) adequate information and support from professionals (helpful relationship with professionals and disease orientation), (2) disease and treatment impact (being shocked, uncertainty, losing autonomy, isolation, and discomfort), and (3) seeking complementary treatment (spiritual activities and complementary therapy). The results can be helpful in increasing our understanding of the CRC experience during recurrence phase. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.

Cultural identity in Monica Ali's Brick Lane: A Bhabhian perspective

(2019) International Journal of Arabic-English Studies, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85060202819&doi=10.33806%2fijaes2000.19.1.4&partnerID=40&md5=d6da05e6fff2f9fc9adbb7f1c8312872>

AFFILIATIONS: Al-Zaytoonah University, Amman, Jordan

ABSTRACT: This paper explores the question of cultural identity in Monica Ali's Brick Lane (2003) through making specific reference to Homi Bhabha's views of hybridity, third space, mimicry and ambivalence. Though Ali's novel has been discussed in light of traditional postcolonialism, it has not been duly scrutinized through a dominantly Bhabhian perspective. Besides making use of Bhabha's theories, this article draws upon the works of some other theorists of cultural identity such as Stuart Hall and Edward Said to highlight its emphasis on a Bhabhian approach. Grounding its discussion in Bhabha's theory of cultural identity, it explores the way/s the major characters in Ali's novel struggle to realize their sense of cultural identity in their own different ways. Specific emphasis is laid on the novel's protagonist Nazneen and the development of her cultural

identity. © 2019 Librairie du Liban Publishers. All rights reserved.

ABSTRACT: One of the most cited limitations of capillary and microchip electrophoresis is the poor sensitivity. This review continues to update this series of biannual reviews, first published in

Electrophoresis in 2007, on developments in the field of online/in-line concentration methods in capillaries and microchips, covering the period July 2016-June 2018. It includes developments in the field of stacking, covering all methods from field-amplified sample stacking and large-volume sample stacking, through to isotachopheresis, dynamic pH junction, and sweeping. Attention is also given to online or in-line extraction methods that have been used for electrophoresis. © 2018 WILEY-VCH Verlag GmbH & Co. KGaA, Weinheim

ABSTRACT: The Clause slicing technique is static slicing techniques which also have forward and backward slicing methods. The Clause slice criteria are the clause and the clause number. In this paper, we have discussed the Clouser tool the forward clause slicing tool introduce some improvements to it. The Clouser mechanism divides the program code statement into clauses, depending on clause slicing rules, identifies the variables and built-in functions, then slices the clauses regarding the slice criterion that was entered by the user. Comparing to other static slicing techniques the clause slicing is more accurate and precise because it considers all the code in micro-level, where it focuses on every syntax in the code. The Clouser still needs to be enhanced to slice more code features. © 2019 Institute of Advanced Engineering and Science. All rights reserved.

ABSTRACT: This research puts forth a new conceptualisation of espoused Islam and Islam-in-use, the discrepancy between the ideal and the real. Espoused Islam is what Arab managers believe in their stated value. Islam-in-use is their operationalised beliefs that they actually use. Although, there is ample evidence that Arab managers can and do switch mindsets between espoused Islam and Islam-in-use depending on which is cued in context, little is known about these contradicting orientations. The antecedents of these variations are deeply rooted in history, Arab culture ethos and Islam. The interpretive analysis of concepts has been used to understand the missing paradigm between espoused Islam and Islam-in-use, as well as to shed light on some contradicting orientations among them. An examination of this divergence involves rigorous research and further empirical operationalisation. Consequently, this conceptualisation is very valuable to western partners regarding how they should cultivate and express their own values and execute business in the Arab world. ABSTRACT: In this paper, a set of conditions under which the absolute Nörlund summability method include in the absolute weighted mean method have been established. Three non-trivial examples to show that this inclusion holds have been given, and other three examples to show that even if both (N, r) and (N, q) are regular, the inclusion fails to holds have been constructed. The paper give two non-trivial examples to show that the equivalence of these two methods May holds. Finally, we give two examples to show that inclusion May holds in only one way without the other. © Soc. Paran. de Mat.

ABSTRACT: The present study aims to develop and empirically validate a framework for exploring the role of business intelligent tools in shaping the dimensions of collective intelligence. A questionnaire survey was developed to collect data from 9 firms across all industries with a sample of 89 respondents. Structural Equation Modeling, using smart PLS was conducted to analyze the data. The results indicated that business intelligent tools play a significant role in harvesting the dimensions of collective intelligence, including collective cognition, shared memory, knowledge sharing, and collective learning. © 2019, Springer Nature Switzerland AG.

ABSTRACT: The objective of this study was to assess the levels of contamination by toxic metals (Pb, Al, Ni, Cd and As) that may be present in 25 infant pharmaceutical herbal products and 15 traditional herbs in Jordan. Both products and medicinal herbs are currently prescribed by paediatricians. They are available as over-the-counter medicines and are sold the in herbal market, ensuring easy accessibility for parents. Inductively coupled plasma-optical emission spectroscopy (ICP-OES), with limit of detections (LODs) of 0.10, 1.00, 0.20, 0.15 and 2.00 mg.kg⁻¹ for Pb, Al, Ni, Cd and As respectively, was employed to measure the levels of toxic metals in the samples. Pb, Al and Ni were detected in 88, 76 and 4% of the analysed samples of pharmaceutical herbal products and in 93, 87 and 13% of the analysed samples of traditional herbs, respectively. Neither Cd or As were detected in all analysed samples. The data obtained were subsequently compared by referral to the acceptable limits of toxic heavy metals according to World Health Organisation (WHO) standards. Largely, the results showed acceptable toxic metal levels in the finished pharmaceutical products and the traditional medicinal herbs for infants. One exception to this was Persian Thyme (Satureja thymbra) with Pb

content of 41.18 mg.kg⁻¹. Also, the daily intake of detected metals through pharmaceutical herbal products was found to be lower than the daily tolerable intake limit set by the regulatory bodies, except of 8% of products that exceeded the tolerable daily intake of Pb set by US FDA, as compared to traditional medicinal herbs, where the tolerable daily intake for Pb, Al and Ni were exceeded in 40, 60 and 8% of the analysed herbs, respectively. The results obtained revealed that the excessive use of medicinal plants as alternative medicine should be used with caution keeping in mind the safety factor in infants. © 2018, Springer Science+Business Media, LLC, part of Springer Nature.
