ABSTRACT: This study aimed at identifying the impact of using some active learning (AL) strategies in a Curricula and Teaching Methods Course on the learning motivation level and the development of Critical Thinking Skills among the Faculty of Arts at Al-Zaytoonah University (ZUJ) students. The study subjects were (61) male and female students selected from the Curricula and Teaching Methods Course of the Faculty of Arts at ZUJ. The study adopted the quasi-experimental approach. To answer the two questions of the study, the Learning Motivation Scale consisting of (35) paragraphs, and the Critical Thinking Skills Test consisting of (34) paragraphs were constructed. The study results revealed that there are significant differences between the means of the scores of the students of the Curricula and Teaching Methods course between the experimental group and the control group on the Learning Motivation Scale and the Critical Thinking Skills Test that can be attributed to using AL strategies. Therefore, the researcher recommended the use of learning outcomes related to learning motivation and critical thinking skills. © 2023, North American Business Press. All rights reserved.

ABSTRACT: Dentists and their patients are highly exposed to COVID-19 due to the close contact nature of dental procedures. The primary aim of this study was to investigate the impact of COVID-19 on dental care practices and services in Jordan. A mixed-method design was used; data from dentists (N = 400) were collected using an online survey, and 15 semi-structured telephone interviews were conducted with dentists from public and private sectors. The findings revealed that the COVID-19 pandemic significantly impacted dental care practices and services. The majority of the participants reported a decline in their income and a decline in dental services demand, with a significant increase in costs for this profession. Additionally, this study showed that most participants were in a state of anxiety and fear about contracting the virus and transmitting it to their families while practising their profession that caused a change in their behaviours and attitudes. In conclusion, dental healthcare workers are at greater risk of being infected with COVID-19. There is a need to implement recommended protocols in dental clinics, it is also essential that decision makers develop appropriate interventions and measures to ensure continuity in the provision of dental services during the pandemic. © 2023 Indian Institute of Health Management Research.

ABSTRACT: There is increasing evidence regarding the importance of vitamin D in the prognosis of coronavirus disease 2019 (COVID-19). Genetic variants in the vitamin D receptor (VDR) gene affect the response to vitamin D and have been linked to various diseases. This study investigated the associations of the major VDR genetic variants ApaI, FokI, and TaqI with the severity and long post-infection symptoms of COVID-19. In total, 100 Jordanian patients with confirmed COVID-19 were genotyped for the VDR ApaI, FokI, and TaqI variants using the polymerase chain reaction-restriction fragment length polymorphism (PCR-RFLP) method. COVID-19 severity, the most commonly reported long-COVID-19 symptoms that lasted for >4 weeks from the onset of infection, and other variables were analyzed according to VDR genetic variants. In this study, ApaI and FokI polymorphisms showed no significant associations with COVID-19 severity ($p > 0.05$). However, a significant association was detected between the TaqI polymorphism and the severity of symptoms after infection with the SARS-CoV-2 virus ($p = 0.04$). The wild-type TaqI genotype was typically present in patients with mild illness, whereas the heterozygous TaqI genotype was present in asymptomatic patients. With regard to long-COVID-19 symptoms, the VDR heterozygous ApaI and wild-type TaqI genotypes were significantly associated with persistent fatigue and muscle pain after COVID-19 ($p < 0.05$). Most carriers of the heterozygous ApaI genotype and carriers of the wild-type TaqI genotype reported experiencing fatigue and muscle pain that lasted for more than 1 month after the onset of COVID-19. Furthermore, the TaqI genotype was associated with persistent shortness of breath after COVID-19 ($p = 0.003$). Shortness of breath was more common among individuals with homozygous TaqI genotype than among individuals with the wild-type or heterozygous TaqI genotype. VDR TaqI is a possible genetic variant related to both COVID-19 severity and long-COVID-19 symptoms among Jordanian individuals. The associations between VDR TaqI polymorphisms and long-COVID-19 symptoms should be investigated in larger and more diverse ethnic populations. © 2023 by the authors.

ABSTRACT: In this paper, a new bio-inspired metaheuristic algorithm called Giant Armadillo Optimization (GAO) is introduced, which imitates the natural behavior of giant armadillo in the wild. The fundamental inspiration in the design of GAO is derived from the hunting strategy of giant armadillos in moving towards prey positions and digging termite mounds. The theory of GAO is expressed and mathematically modeled in two phases: (i) exploration based on simulating the movement of giant armadillos towards termite mounds, and (ii) exploitation based on simulating giant armadillos' digging skills in order to prey on and rip open termite mounds. The performance of GAO in handling optimization tasks is evaluated in order to solve the CEC 2017 test suite for problem dimensions equal to 10, 30, 50, and 100. The optimization results show that GAO is able to achieve effective solutions for optimization problems by benefiting from its high abilities in exploration, exploitation, and balancing them during the search process. The quality of the results obtained from GAO is compared with the performance of twelve well-known metaheuristic algorithms. The simulation results show that GAO presents superior performance compared to competitor algorithms by providing better results for most of the benchmark functions. The statistical analysis of the Wilcoxon rank sum test confirms that GAO has a significant statistical superiority over competitor algorithms. The implementation of GAO on the CEC 2011 test suite and four engineering design problems show that the proposed approach has effective performance in dealing with real-world applications. © 2023 by the authors.

ABSTRACT: Background and objective: Asthma is a common disease that has a significant influence on patients' quality of life. Although Arabic tools for assessing symptom control and quality of life in individuals with asthma are available, no sufficient studies have evaluated the validity of these tools. Therefore, the aim of the current study was to validate the Arabic version of these tools. Methods: Exploratory Factor Analysis (EFA) and Confirmatory Factor Analysis (CFA) were conducted on the Arabic versions of the Asthma Control Test (ACT) and Mini Asthma Quality of Life Questionnaire (Mini AQLQ). Results: A total of 314 participants (70.1 % females) were enrolled in the current study. The mean age of the participants was 51.47 (± 16.37). EFA suggested a three-factor model for Mini AQLQ and a one-factor model for ACT, which was confirmed by CFA analyses. High correlations were found between spirometric values and ACT and Mini AQLQ scores, indicating good concurrent validity. The area under the curve produced by the Roc curve was 0.861 ($p < 0.001$), and the most suitable cut-off point was 4.741. Conclusion: All analyses conducted showed that the Arabic versions of both Mini AQLQ and ACT are reliable and valid and can be administered to adults with asthma. The application of these validated instruments will improve the management and diagnosis of asthma in Arab countries. © 2023 The Author(s)

On the semantics of (negated) approximative kaada in Classical Arabic: A case for embedded exhaustification

(2023) Linguistics Vanguard, .

ABSTRACT: The purpose of this paper is twofold. First, it proposes a compositional semantic analysis for approximative kaada in Classical Arabic which has the property of being a clause-level rather than predicate-level operator: [KAADA α] is paraphrased as [α is false but there exists β close to α such that β is true]. The analysis is based on the integrated semantics of Penka (Penka, Doris. 2006. Almost there: The meaning of almost. Proceedings of Sinn und Bedeutung 10. 275-286) in which the negativity component of kaada is interpreted as part of its lexical meaning within a situation semantics framework. It also makes a novel use of the concept of semantic closeness among situations in terms of the intuitively appealing dimension of the relative completion of an event. Second, the paper presents and analyzes an instance of a puzzle noted by most descriptive Classical Arabic grammarians (see, for example, al-Ahmad, Ayman. 2021. Dalalit KAADA l-manfiah fi l-Qur'aan l-kareem. Journal of the Association of Arab Universities for Literature 9(2). 838-859) in which negated kaada has an interpretation where the negativity implication disappears altogether. The paper offers a solution to the puzzle based on a previous suggestion made by Kilbourn-Ceron (Kilbourn-Ceron, Oriana. 2016. Embedded exhaustification: Evidence from almost. Journal of Semantics 34(1). 43-60) in which an instance of embedded exhaustification appears to apply in approximatives in certain contexts in such a way that the negativity inference is obscured. © 2023 Walter de Gruyter GmbH, Berlin/Boston.

ABSTRACT: Introduction: The integration of Artificial Intelligence (AI) in medical education and practice is a significant development. This study examined the Knowledge, Attitudes, and Practices (KAP) of health professions' students in Jordan concerning AI, providing insights into their preparedness and perceptions. Methods: An online questionnaire was distributed to 483 Jordanian health professions' students via social media. Demographic data, AI-related KAP, and barriers were collected. Quantile regression models analyzed associations between variables and KAP scores. Results: Moderate AI knowledge was observed among participants, with specific understanding of data requirements and barriers. Attitudes varied, combining skepticism about AI replacing human teachers with recognition of its value. While AI tools were used for specific tasks, broader integration in medical education and practice was limited. Barriers included lack of knowledge, access, time constraints, and curriculum gaps. Conclusions: This study highlights the need to enhance medical education with AI topics and address barriers. Students need to be better prepared for AI integration, in order to enable medical education to harness AI's potential for improved patient care and training. © 2023, The Author(s).

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This research investigates how the characteristics of a risk management committee (RMC), as a recently emerging sub-committee within the board of directors, impact firm performance indicators. The investigation employs a dataset encompassing service and manufacturing firms that are listed on the Amman Stock Exchange (ASE) over the period 2019–2022, comprising a total of 236 firm-year observations. The primary statistical technique utilised in the study is fixed-effect regression with Huber–White standard errors. The findings demonstrate that RMC attributes such as size, independence and meeting frequency exert a significant and positive effect on return on assets, return on equity and Tobin's Q. These insights hold practical implications for stakeholders, regulators and policymakers in assessing the influence of RMC characteristics on firm performance within the context of the ASE. Understanding these dynamics can inform decision-making and regulatory frameworks, promoting effective risk management practices in publicly traded corporations. The current study represents the initial empirical exploration within the corporate governance literature concerning the nexus between RMC qualities and firm performance in Jordan. © 2023 Institute of Public Enterprise.

ABSTRACT: The present study aimed to evaluate disease activity and explore the factors associated

with poor disease control among patients with rheumatoid arthritis (RA). This cross-sectional study was conducted at outpatient rheumatology clinics in two teaching hospitals in Jordan. Medication adherence was assessed using the validated five-item compliance questionnaire for rheumatology, and disease activity was assessed using the clinical disease activity Index score. Ordinal regression was performed to explore the factors associated with uncontrolled RA. Most of the participants (n=261) demonstrated moderate to high disease activity (71.2%). Seronegative RA (B=-0.882, CI [-1.584/-0.180], $p < 0.05$) was significantly associated with lower disease activity, while medication non-adherence was significantly associated with poor RA control (B=1.023, CI [0.289-1.756], $p < 0.01$). Future research should explore the factors associated with medication non-adherence. These factors should be targeted in future interventions to improve RA control, particularly in patients who suffer from high disease severity. © 2023 by Author/s and Licensed by Modestum.

Bank performance, capital and size: a comparative analysis in MENA and EU

(2023) Eurasian Economic Review, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178280312&doi=10.1007%2fs40822-023-00248-6&partnerID=40&md5=e62198cccca429c182f894d573543efb>

AFFILIATIONS: Faculty of Business, Al Zaytoonah University of Jordan, Queen Alia Airport St 594, Amman, Jordan

ABSTRACT: The debate on optimal bank capital and size and their association with bank performance is still ongoing and high on policy makers' agenda. This study analyzes the impact of capital and size on bank performance for 1053 banks operating in the EU and MENA regions over the period 2009–2020. The results show that capital is an important determinant of bank performance as it is highly significant in both regions; however, banks' performance in MENA seems to be more responsive to changes in the capital ratios. Further, while bank size has a positive non-linear relationship with profitability in the EU region, it does not seem to have a significant impact in the MENA region. This study contributes to the literature by providing a strong empirical evidence that more capital is associated with higher profitability in regions characterized by different levels of development, contrary to the bankers' belief that capital is costly. Regulators may find this conclusion to be useful and in line with their objective of boosting bank resilience and performance. © 2023, The Author(s) under exclusive licence to Eurasia Business and Economics Society.

ABSTRACT: Background: The stress level among nurses is significantly high, which negatively affects the nurses' well-being and the quality of care provided to patients. The goal of this study was to measure the impact of implementing a resiliency training program on nurses. Method: A pretest-posttest quasi-experimental design was used to measure the impact of nurses' participation in a resiliency training program. The sample was recruited with the convenience sampling technique. Participants were allocated to groups according to their ability to attend all intervention sessions. A total of 137 participants completed all phases of the study. The study was conducted at a private hospital in Amman, Jordan. Data were collected at two time points, before the intervention and 1 week after the intervention. Results: Analysis of covariance was used to measure differences between groups after the intervention. The results indicated that there were statistically significant differences ($p < .001$) in resilience and stress levels between the groups after the intervention. Conclusion: Nurses in the intervention group showed a significant improvement in resilience scores and a significant reduction in stress scores. © 2023, Slack Incorporated. All rights reserved.

ABSTRACT: Ribociclib is a cyclin-dependent kinase (CDK4/6) inhibitor and is a standard of care for

treating metastatic breast cancer. The drug has moderate oral bioavailability and exhibits permeability-controlled absorption. Novel formulations to enhance ribociclib pharmacokinetics are being developed and tested in rats. This requires developing analytical assays for quantifying ribociclib monitoring in rat plasma. We present a fully validated, sensitive, and simple LC-MS/MS method for measuring ribociclib in rat plasma. Ribociclib-D6 was utilized as an internal standard, and a simple protein precipitation procedure with acetonitrile was used in sample preparation. Excellent assay linearity was observed over a standard curve concentration of 1.008–1027.624 ng/mL. Acceptable intra- and inter-day accuracy and reproductivity were demonstrated for ribociclib quality controls (bias and CV% within $\pm 15\%$). Complete extraction recovery of ribociclib was achieved, and a negligible matrix effect of analyte to internal standard ratio was observed. Ribociclib was stable at various conditions, including bench-top, freeze-thaw, and short-term stability. Overall, the presented method is simple, sensitive, accurate, and precise and was successfully applied to quantify ribociclib in plasma samples from a pharmacokinetic study of ribociclib suspension and nanoparticle formulation in rats. © 2023 John Wiley & Sons, Ltd.

ABSTRACT: Automatic person identification (API) using human biometrics is essential and highly demanded compared to traditional API methods, where a person is automatically identified using his/her distinct characteristics including speech, fingerprint, iris, handwritten signatures, and others. The fusion of more than one human biometric produces bimodal and multimodal API systems that normally outperform single modality systems. This paper presents our work towards fusing speech and handwritten signatures for developing a bimodal API system, where fusion was conducted at the decision level due to the differences in the type and format of the features extracted. A data set is created that contains recordings of usernames and handwritten signatures of 100 persons (50 males and 50 females), where each person recorded his/her username 30 times and provided his/her handwritten signature 30 times. Consequently, a total of 3000 utterances and 3000 handwritten signatures were collected. The speech API used Mel-Frequency Cepstral Coefficients (MFCC) technique for features extraction and Vector Quantization (VQ) for features training and classification. On the other hand, the handwritten signatures API used global features for reflecting the structure of the hand signature image such as image area, pure height, pure width and signature height and the Multi-Layer Perceptron (MLP) architecture of Artificial Neural Network for features training and classification. Once the best matches for both the speech and the handwritten signatures API are produced, the fusion process takes place at decision level. It computes the difference between the two best matches for each modality and selects the modality of the maximum difference. Based on our experimental results, the bimodal API obtained an average recognition rate of 96.40%, whereas the speech API and the handwritten signatures API obtained average recognition rates of 92.60% and 75.20%, respectively. Therefore, the bimodal API system is able to outperform other single modality API systems. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Maternal embryonic leucine zipper kinase (MELK) is a serine-threonine kinase. Several studies have revealed its role as a regulator in the tumorigenesis of various cancers. Consequently, MELK has been considered as an attractive therapeutic target for cancer management. Herein, we report pharmacophore models extracted from crystallographic complexes of potent ligands bound to MELK protein. The resulting models were evaluated by Receiver Operating Characteristic (ROC) analysis, and the best models were employed as search queries to screen the national cancer institute for potent inhibitors. The anti-MELK bioactivities of acquired hits were evaluated in vitro. Moreover, best anti-MELK hits were further evaluated against lung and cervical cancer cells (A549 and HeLa, respectively) using cell viability MTT assay. The enzymatic assay identified six potent hits with IC50 values ranging from nanomolar to low micromolar values. The most active hit showed anti-MELK IC50 of 134.6 nM. Likewise, these hits significantly inhibited the growth of tested cancer cell lines. Interestingly, four of the identified inhibitors have chemical scaffolds that are notably different from those of reported MELK inhibitors. This study highlights the use of X-ray crystallographic structures to boost the drug discovery process. ABSTRACT: The purpose of this study is to examine the relationship between sustainability performance (SP) and financial performance (FP), based on performance disclosures (reporting) of the Jordanian financial sector for the period of 2017–2020. The study employs green innovation (GI) indicators as moderating and mediating variables; by using hierarchical regression; as means of unlocking and examining the relationship between SP and FP; through the lens of the stakeholder theory. The hierarchical regression findings suggest that GI indicators partially mediate the relationship between SP and FP, but do not demonstrate a moderating effect. As a main result, it is indicated that Jordanian financial institutions may use SP transparency indicators as an incentive variable, which could influence their overall FP. The research also contributes to the existing literature by adding insight into the use of GI indicators in a developing country and the potential impact on financial institutions markets. These findings lend empirical credence to the generally held belief that increase disclosure benefits for both internal and external users. © 2023 The Authors. ABSTRACT: Due to high surface area, loading capacity, and selectivity, Metal-Organic Frameworks (MOFs) have shown much promise recently for potential applications in extraction and delivery of agrochemicals for environmental remediation and sustainable release, respectively. However,

application of MOFs for pesticide delivery in wider agricultural context can be restricted by their granular form. Herein, an alternative approach is studied using biodegradable polymer-MOF composites to address this limitation. The loading and release of a widely used pesticide, 2,4-dichlorophenoxyacetic acid (2,4-D), is studied using two MOFs, UiO-66 and UiO-66-NH₂, and the 2,4-D-loaded MOFs are incorporated into biodegradable polycaprolactone composites for convenient handling and minimizing runoff. The MOFs are loaded by in-situ, and post-synthetic methods, and characterised thoroughly to ensure successful synthesis and loading of 2,4-D. The pesticide release studies are performed on the MOFs and composites in distilled water, and analysed using UV-Vis spectroscopy, demonstrating sustained-release of 2,4-D over 16 days. The loaded MOF samples show high loading capacity, with up to 45 wt% for the in-situ loaded UiO-66. Release kinetics show more sustained release of 2,4-D from UiO-66-NH₂ compared to UiO-66, which can be due to supramolecular interactions between the NH₂ group of UiO-66-NH₂ and 2,4-D. This is further supported by computational studies. © 2023 The Authors. Advanced Sustainable Systems published by Wiley-VCH GmbH.

ABSTRACT: COVID-19 vaccines have been instrumental tools in the fight against SARS-CoV-2 helping to reduce disease severity and mortality. At the same time, just like any other therapeutic, COVID-19 vaccines were associated with adverse events. Women have reported menstrual cycle irregularity after receiving COVID-19 vaccines, and this led to renewed fears concerning COVID-19 vaccines and their effects on fertility. Herein we devised an informatics workflow to explore the causal drivers of menstrual cycle irregularity in response to vaccination with mRNA COVID-19 vaccine BNT162b2. Our methods relied on gene expression analysis in response to vaccination, followed by network biology analysis to derive testable hypotheses regarding the causal links between BNT162b2 and menstrual cycle irregularity. Five high-confidence transcription factors were identified as causal drivers of BNT162b2-induced menstrual irregularity, namely: IRF1, STAT1, RelA (p65 NF-κB subunit), STAT2 and IRF3. Furthermore, some biomarkers of menstrual irregularity, including TNF, IL6R, IL6ST, LIF, BIRC3, FGF2, ARHGDI, RPS3, RHOU, MIF, were identified as topological genes and predicted as causal drivers of menstrual irregularity. Our network-based mechanism reconstruction results indicated that BNT162b2 exerted biological effects similar to those resulting from prolactin signaling. However, these effects were short-lived and didn't raise concerns about long-term infertility issues. This approach can be applied to interrogate the functional links between drugs/vaccines and other side effects. © 2023, Springer Nature Limited.

ABSTRACT: Having a child with a congenital anomaly is a very stressful event that affects the whole family due to the critical and permanent needs it might impose. This study aimed to assess stress levels among Jordanian parents of children with congenital anomalies and their relationship to three factors: depression, anxiety, and somatization. A cross sectional survey was conducted at three hospitals in Jordan among 360 parents of children with congenital anomalies by using the Perceived Stress Scale and the Portuguese version of the Brief Symptom Inventory. The study found that both

parents experienced high levels of stress, anxiety, and depression, although there was a significant difference in stress level between mothers and fathers, with the mothers experiencing higher stress than the fathers. The correlation between stress levels with anxiety ($r = 0.763$) and depression ($r = 0.829$) were strong and positive, while somatization was moderate ($r = 0.425$). In a conclusion, parents of children with congenital anomalies experience high levels of stress. Parental stress leads to many psychological problems such as somatization, depression, and anxiety. © 2023 Neonatal Nurses Association

ABSTRACT: Background: Heart Failure (HF) is a chronic disease associated with life-limiting symptoms that could negatively impact patients' health-related quality of life (HRQOL). This study aimed to evaluate HRQOL and explore the factors associated with poor HRQOL among patients with HF in Jordan. Methods: This cross-sectional study used the validated Arabic version of the Minnesota Living with Heart Failure Questionnaire to assess HRQOL in outpatients with HF visiting cardiology clinics at two public hospitals in Jordan. Variables were collected from medical records and custom-designed questionnaires, including socio-demographics, biomedical variables, and disease and medication characteristics. Ordinal regression analysis was used to explore variables associated with poor HRQOL among HF patients. Results: Ordinal regression analysis showed that the number of HF medications ($P < 0.05$) and not taking a loop diuretic ($P < 0.05$) significantly increased HRQOL, while the number of other chronic diseases ($P < 0.05$), stage III/IV of HF ($P < 0.01$), low monthly income ($P < 0.05$), and being unsatisfied with the prescribed medications ($P < 0.05$) significantly decreased HRQOL of HF patients. Conclusions: Although the current study demonstrated low HRQOL among patients with HF in Jordan, HRQOL has a considerable opportunity for improvement in those patients. Variables identified in the present study, including low monthly income, higher New York Heart Association (NYHA) classes, a higher number of comorbidities, and/or taking a loop diuretic, should be considered in future intervention programs, aiming to improve HRQOL in patients with HF. © 2023, The Author(s).

ABSTRACT: Background: Adequate incident reporting practices for clinical incident among nurses and even all healthcare providers in clinical practice settings is crucial to enhance patient safety and improve the quality of care delivery. This study aimed to investigate the level of awareness of incident reporting practices and identify the barriers that impact incident reporting among Jordanian nurses. Methods: A descriptive design using a cross-sectional survey was employed among 308 nurses in 15 different hospitals in Jordan. Data collection was conducted between November 2019 and July 2020 using an Incident Reporting Scale. Results: The participants showed a high level of awareness of the incident reporting with a mean score of 7.3 (SD = 2.5), representing 94.8% of the highest score. Nurses perceived their reporting practices at the medium level, with a mean score of 2.23 out of 4. The main reporting barriers included worrying about disciplinary actions, fearing being blamed, and

forgetting to make a report. In regard to awareness of incident reporting, there were statistically significant differences in the mean for total awareness of the incident reporting system scores according to the type of hospital ($p < .005^*$). In regard to self-perceived reporting practices, nurses working in accredited hospitals demonstrated statistically significant differences in self-perceived reporting practices ($t = 0.62, p < .005$). Conclusions: The current results provide empirical results about perceived incident reporting practices and perceived barriers to reporting frequently. Recommendations are made to urge nursing policymakers and legislators to provide solutions for those barriers, such as managing staffing issues, nursing shortage, nurses' empowerment, and fear of disciplinary actions by front-line nurse managers. © 2023, The Author(s).

ABSTRACT: In this paper, we aim to propose a novel analytical method for obtaining atomic solutions to partial differential equations. A theory of tensor products in Banach spaces is utilized and some properties of atom operators are studied to achieve our goals. The proposed scheme is demonstrated through illustrative examples of inhomogeneous partial differential equations. The approach is indeed quite direct and effective in exactly solving partial differential equations. © 2023 The Author(s)

ABSTRACT: Objectives: Rhinitis is classified into several types with allergic rhinitis (AR) being the most common. AR is among the inflammatory diseases, such as asthma and chronic obstructive pulmonary disease (COPD), in which corticosteroids are administered to overcome the decrease in cortisol production. The treatment options available for AR vary with 1st line treatment being intranasal corticosteroids (INCS). The responsiveness to corticosteroids is due to their binding to corticotropin-releasing hormone receptor-1 (CRHR1). Various studies have studied the responsiveness to corticosteroids treatment in patients with asthma and COPD in association with CRHR1 gene single nucleotide polymorphisms (SNPs). Methods: In our study, we investigated the association of three SNPs of CRHR1 gene (rs242941, rs242940, and rs72834580) with symptoms improvement post-treatment in AR patients. Blood samples were collected from 103 patients for DNA extraction and gene sequencing. Those patients started to receive INCS for 8 weeks and their symptoms were assessed, through a questionnaire, before treatment and post-treatment to check for symptoms improvement. Results: Our data showed that improvement of eye redness is significantly less following INCS treatment in patients with allele (C) (AOR=0.289, p-value-0.028, 95% CI=0.096-0.873) and genotype (CC) (AOR=0.048, p-value-0.037, 95% CI=0.003-0.832) of rs242941 SNP. There was no correlation with other genotypes, alleles, or haplotypes of the investigated SNPs. Conclusions: Our findings show that there is no correlation between CRHR1 gene polymorphism and symptoms improvement following INCS treatment. Further studies are required to evaluate the association of INCS and symptoms improvement post-treatment with larger sample size. © 2023 Walter de Gruyter GmbH, Berlin/Boston.

ABSTRACT: Background: Intrinsic or acquired resistance to HER2-targeted therapy is often a problem when small molecule tyrosine kinase inhibitors or antibodies are used to treat patients with HER2 positive breast cancer. Therefore, the identification of new targets and therapies for this patient group is warranted. Activated choline metabolism, characterized by elevated levels of choline-containing compounds, has been previously reported in breast cancer. The glycerophosphodiesterase EDI3 (GPCPD1), which hydrolyses glycerophosphocholine to choline and glycerol-3-phosphate, directly influences choline and phospholipid metabolism, and has been linked to cancer-relevant phenotypes in vitro. While the importance of choline metabolism has been addressed in breast cancer, the role of EDI3 in this cancer type has not been explored. Methods: EDI3 mRNA and protein expression in human breast cancer tissue were investigated using publicly-available Affymetrix gene expression microarray datasets ($n = 540$) and with immunohistochemistry on a tissue microarray ($n = 265$), respectively. A panel of breast cancer cell lines of different molecular subtypes were used to investigate expression and activity of EDI3 in vitro. To determine whether EDI3 expression is regulated by HER2 signalling, the effect of pharmacological inhibition and siRNA silencing of HER2, as well as the influence of inhibiting key components of signalling cascades downstream of HER2 were studied. Finally, the influence of silencing and pharmacologically inhibiting EDI3 on viability was investigated in vitro and on tumour growth in vivo. Results: In the present study, we show that EDI3 expression is highest in ER-HER2 + human breast tumours, and both expression and activity were also highest in ER-HER2 + breast cancer cell lines. Silencing HER2 using siRNA, as well as inhibiting HER2 signalling with lapatinib decreased EDI3 expression. Pathways downstream of PI3K/Akt/mTOR and GSK3 β , and transcription factors, including HIF1 α , CREB and STAT3 were identified as relevant in regulating EDI3 expression. Silencing EDI3 preferentially decreased cell viability in the ER-HER2 + cells. Furthermore, silencing or pharmacologically inhibiting EDI3 using dipyrindamole in ER-HER2 + cells resistant to HER2-targeted therapy decreased cell viability in vitro and tumour growth in vivo. Conclusions: Our results indicate that EDI3 may be a potential novel therapeutic target in patients with HER2-targeted therapy-resistant ER-HER2 + breast cancer that should be further explored. © 2023, The Author(s).

ABSTRACT: Twelve healthy eight-week-old male Wistar rats weighing 200 g were used. Rats were chosen randomly, and their tails were identified and separated into cages/groups. The first group received an oral dose of 11.5 mg of levetiracetam in 5 mL of water, and the second group was given date syrup (250 g mixed with 250 mL water) for seven days, then 11.5 mg LEV in 5 mL water on day 7. One week of preadministered date molasses significantly decreased levetiracetam pharmacokinetic parameters in rats, such as C_{max} (72 vs. 14 ng/mL, $p = 0.01$), T_{max} (1.78 vs. 0.44 h, $p < 0.001$), and AUC (880 vs. 258 ng.h/mL, $p < 0.001$). This decrease in plasma levetiracetam levels caused by date molasses could be attributed to decreased levetiracetam absorption. On the other hand, the current study discovered that rats given date molasses for a week had a reduced rate and extent of absorption. As a result, date molasses might increase the risk of epileptic seizures in oral LEV-treated ones. © 2023, The Author(s).

ABSTRACT: The aim of the study is to examine The Mediating Role of Organizational Capabilities on the relationship between Lean Supply Chain and Operational Performance. The study population consisted of the managers in the upper and middle management of industrial companies listed on the Amman Stock Exchange, which (84) companies. To achieve the study objectives, a questionnaire was formulated to measure the variables of the study. Data were primarily gathered through self-reported questionnaires created by Google Forms The structural model was used to test the study hypotheses. The study results show that Organizational Capabilities mediate the relationship between Lean Supply Chain and Operational Performance. © 2023 Growing Science Ltd. All rights reserved.

ABSTRACT: Management engages in earnings manipulation for different reasons. This article argues that low-growth firms with high free cash flow will opt for income-increasing earnings management in order to obscure the low profits derived from their investments in negative net present value (NPV) projects. On the other hand, we argue that the listed companies might be interested in being listed in the first market due to its privileges and to preserve the competitiveness, through managing their earnings upwardly, so that they can satisfy the condition of achieving a particular earnings limit. This article should advance the body of earnings management literature in the Jordanian context by examining the effect of the moderating role of an independent audit committee (IAC) in the association between surplus free cash flow (SFCF) and income-increasing discretionary accruals (DAC). Further, this is the initial empirical attempt to investigate the moderation effect of IAC between stock market segmentations (SMS) and positive DAC. The results of this current study offer original and beneficial information for the Jordanian government and other countries with a similar institutional environment because the study promotes the application of applying IAC as an efficient tool to constrain management behaviour towards manipulation of the accruals. On top of that, this research offers information concerning the prevailing situation of earnings management practices and corporate governance in Jordan, in which shareholders, local and international investors, policymakers, regulators and academic researchers are interested. Finally, panel data analyses and various statistical techniques are employed to derive conclusions. © 2020 IMI.

ABSTRACT: Purpose: This study aims to gain a deeper understanding of triggers of psychological distress among Jordanian patients with heart failure (HF). Design/methodology/approach: A

phenomenological study was adopted. In-depth, semi-structured, audio-taped interviews were conducted for 25 patients with HF. The analysis was done using interpretative phenomenological analysis. Findings: The main theme of the findings can be expressed as "faced with stressors that are unable to cope with", which encompasses circumstances and contexts associated with the psychological distress they faced. The following four sub-themes emerged from the data: being endorsed in significant life changes, feeling guilty about being a burden, financial burden aggravating stress and feeling overwhelmed by the fear of death. Originality/value: The findings revealed that psychological distress is affected directly by many triggers. The findings indicate the need for informing health-care providers to support these patients and address the challenges and develop clinical guidelines to assess psychological distress among these patients. © 2022, Emerald Publishing Limited.

ABSTRACT: A library of novel benzamide-thiazolyl-chalcone compounds was synthesized via Claisen-Schmidt reaction and spectroscopically characterized using FT-IR, ¹H-NMR, ¹³C-NMR, LC-MS, and HR-MS. The synthesized compounds were biologically evaluated using in vitro MTT assay against different cancer cell lines (MCF-7, MDA-AMB-231, Caco-2, A549, and H1299). Amongst all compounds screened, (E)-N-(5-(3-(4-hydroxyphenyl)-3-oxoprop-1-en-1-yl)thiazol-2-yl)benzamide and (E)-N-(5-(3-(4-methoxyphenyl)-3-oxoprop-1-en-1-yl)thiazol-2-yl)benzamide showed potent anti-proliferation against breast (MCF-7) and colon cancer cell lines reaching 88.56 % and 84.36 % with IC₅₀ values of 44.00 μM and 58.88 μM, respectively. All synthesized compounds exhibited no significant cytotoxicity to normal cells. Structure-activity relationship studies demonstrated the effect of electron-donating and electron-withdrawing groups on the anticancer activity of the molecules under investigation. This was also corroborated by theoretical DFT studies. Thus, these molecules may serve as potential lead candidates for further development of novel anticancer agents against breast and colon cancers. © 2023 Wiley-VCH GmbH.

ABSTRACT: Purpose: This study aims to investigate the extent to which newly certified public accountants (CPAs) and accounting graduate students possess a comprehensive understanding of cryptocurrencies and the skills they have acquired throughout their education.

Design/methodology/approach: A qualitative analysis was used through semi-structured interviews to obtain an in-depth insight into cryptocurrencies, which could not be investigated easily through quantitative methods, and to provide an understanding of the context for cryptocurrencies from CPA and non-CPA students' points of view. This was in addition to focusing on understanding the differences between the students' thoughts. Findings: This study found that recent accounting graduates and CPA members have the least awareness of cryptocurrencies, likely due to a lack of

professors' comprehension or exposure to the concept. However, students involved in forensic courses provided more information about cryptocurrencies compared with other students. Research limitations/implications: The data are limited to only a single country. Given that cryptocurrencies are a relatively new notion in accounting, there is an alarming lack of legislation. Further, the authors found that recent accounting graduates and CPAs had the same level of knowledge of cryptocurrencies, most probably due to a lack of exposure during their education and academics' limited understanding of the concept. Practical implications: The students' differing answers about cryptocurrencies show differences in their current level of understanding of cryptocurrencies. Originality/value: This study has identified that the vast majority of accounting graduates lack adequate knowledge about cryptocurrencies or access to adequate resources, despite understanding the fundamental concepts of cryptocurrency. © 2023, Emerald Publishing Limited.

ABSTRACT: In the last two decades, there have been many calls to integrate sustainability into projects. However, there are conflicting views about the relationship between sustainability and project success. Some contend that project sustainability could adversely affect project success, while others maintain the contrary. Yet, the exploration of this relationship has been insufficient thus far. Notably, no existing work specifically investigates this relationship within the software domain. Therefore, this paper aims to contribute significantly by introducing a conceptual framework that assists in inspecting the relationships between software project sustainability (SPS) and project success. The proposed framework was developed based on well-defined aspects of both concepts. The findings show that most of the relationships between the two concepts are expected to be significant and positive. Our propositions were built after analysing the best of relevant contributions. However, an empirical examination is needed, especially with the presence of control variables such as country, company size, and project complexity. This work could be an initial motion for future empirical studies and provide a significant theoretical foundation for researchers and practitioners in this domain. © 2023 by the authors.

ABSTRACT: This paper is interested in studying the one-phase Stefan problem. For this purpose, we use the nonlinear sentinel method, which relies typically on the approximate controllability and the Fanchel-Rockafellar duality of the minimization problem, to prove the existence and uniqueness of a solution to this problem. In particular, our research focuses on the application of the nonlinear sentinel method to the single-phase Stefan problem. This approach aids in identifying an unspecified boundary section within the domain undergoing a liquid-solid phase transition. We track the evolution of the temperature profile in the liquid-solid material and the corresponding movement of its interface over time. Eventually, the local convergence used for the iterative numerical scheme is demonstrated. © 2023 The Author(s).

ABSTRACT: Jordan has significant renewable energy potential due to its remarkable geographical location and climate conditions. This potential elevates engaging several innovative renewable alternatives in energy development, which may efficiently minimize the excessive import of traditional energy sources. The objective of this research is to study the potential of utilizing clean and affordable solar energy along roadways such as Jordan's Desert Highway-15 to be in line with the United Nations Sustainable Development Goals (UN-SDG's) by installing selected solar panels that possess adequate friction and the ability to allow solar radiation to reach the solar cells, in addition to allowing the load to be bypassed around the cells. The shoulder of the highway, with a length of 315 km and a width of 3.0 meters, has been exploited in order to supply the neighboring areas with energy for those roads, particularly those paved roads, which are poorly lit at night. Furthermore, this study provides direction and guidance concerning the structural performance of non-traditional pavement materials, which are a form of subgrade or pavement reinforcement. The performance of a prototype board on a variety of structural bases has also been evaluated. Overall, this paper found that it is possible to design a solar road panel to withstand traffic loading and that the concrete structural base allows for a significant improvement of the analyzed prototype design, especially in countries with limited energy sources and dependent on imports such as Jordan. © 2023 by the authors. ABSTRACT: Because they are useful for both enabling numerical simulations and containing well-defined physical phenomena, discrete fractional reaction-diffusion models have attracted a great deal of interest from academics. Within the family of fractional reaction-diffusion models, a discrete form is examined in detail in this study. Furthermore, we investigate the complex synchronization dynamics of a suggested discrete master-slave reaction-diffusion system using the accuracy of linear control techniques combined with a fractional discrete Lyapunov approach. This study's deviation from the behavior of equivalents with integer orders makes it very fascinating. Like the non-local nature inherent in Caputo fractional derivatives, it creates a memory Lyapunov function that is closely linked to the historical background of the system. The investigation provides a strong basis to the theoretical results. © 2023 by the authors.

ABSTRACT: Structural fiber-reinforced polymer (FRP) composite materials consisting of a polymer matrix reinforced with layers of high-strength fibers are used in numerous applications, including but not limited to spacecraft, vehicles, buildings, and bridges. Researchers in the past few decades have suggested the necessary integration of sensors (e.g., fiber optic sensors) in polymer composites to enable health monitoring of composites' performance over their service lives. This work introduces an innovative cognizant composite that can self-sense, compute, and implement decisions based on sensed values. It is a critical step towards smart, resilient infrastructure. We describe a method to fabricate textile sensors with flexible circuitry and a microcontroller within the polymer composite, enabling computational operations to take place in the composite without impacting its integrity. A microstructural investigation of the sensors showed that the amount of oxidative agent and soaking time of the fabric play a major role in the adsorption of polypyrrole (PPy) on fiberglass (FG). XPS results showed that the 10 g ferric chloride solution with 6 h of soaking time had the highest degree of protonation (28%) and, therefore, higher adsorption of PPy on FG. A strain range of 30% was achieved by examining different circuitry and sensor designs for their resistance and strain resolution under mechanical loading. A microcontroller was added to the circuit and then embedded within a composite material. This composite system was tested under flexural loading to demonstrate its self-sensing, computing, and actuation capabilities. The resulting cognizant composite demonstrated the ability to read resistance values and measure strain using the embedded microcontroller and autonomously actuate an LED light when the strain exceeds a predefined limit of 2000 $\mu\epsilon$. The application of the proposed FRP system would provide in situ monitoring of structural composite components with autonomous response capabilities, as well as reduce manufacturing, production, and maintenance costs. © 2023 by the authors.

ABSTRACT: Diabetes mellitus is a prevalent global chronic condition affecting individuals of all ages. People with diabetes face an elevated risk of lower respiratory tract infections such as pulmonary tuberculosis, influenza, and pneumonia. Additionally, the influenza virus increases the likelihood of deep venous thrombosis and pulmonary embolism. This study examined the knowledge, attitudes, and practices of diabetic patients regarding the influenza vaccine. This study involved 418 diabetic patients (53.3% female) at Jordanian outpatient respiratory clinics, with an average age of 49 (± 14) years. The results showed that 70.6% had never received the influenza vaccine, and only 23.7% intended to do so in the current year. A positive attitude toward the influenza vaccine significantly reduced hesitancy to get vaccinated (OR = 0.505, 95% CI 0.424–0.601, $p < 0.001$). The duration of diabetes exhibited a positive association with vaccine hesitancy (OR = 1.053, 95% CI 1.006–1.102, $p = 0.028$). The primary reason for not getting vaccinated was a lack of awareness of its benefits (42.6%). Future health education programs should emphasize the importance of the influenza vaccine for diabetic patients and address their concerns. © 2023 by the authors.

ABSTRACT: Mitochondrial complex V (ATP synthase) is a remarkable molecular motor crucial in generating ATP and sustaining mitochondrial function. Its importance in cellular metabolism cannot be overstated, as malfunction of ATP synthase has been linked to various pathological conditions. Both natural and synthetic ATP synthase inhibitors have been extensively studied, revealing their inhibitory sites and modes of action. These findings have opened exciting avenues for developing new therapeutics and discovering new pesticides and herbicides to safeguard global food supplies. However, it is essential to remember that these compounds can also adversely affect human and animal health, impacting vital organs such as the nervous system, heart, and kidneys. This review aims to provide a comprehensive overview of mitochondrial ATP synthase, its structural and functional features, and the most common inhibitors and their potential toxicities. © 2023 The Author(s)

ABSTRACT: A validated self-reported questionnaire was used to evaluate pharmacists' knowledge about isotretinoin and their awareness of isotretinoin dispensing practice. The majority were not able to recognize the initial dose of isotretinoin, the potential side effects such as dyslipidemia and liver toxicity, the potential interaction with tetracycline and Vitamin A and the contraindications of isotretinoin. Around 41.3 % of the pharmacists dispensed isotretinoin without a prescription, and the majority did not recognize that isotretinoin should be dispensed for only 30 days, should not be dispensed without an emphasis on the appropriate indication, and did not know the appropriate duration of isotretinoin therapy. Male gender and postgraduate degree were associated with better awareness, while increased work experience and postgraduate degree were associated with better knowledge about isotretinoin therapy. Nevertheless, both male and female pharmacists demonstrated equivalent knowledge levels. The current study demonstrates the need to implement educational programs to improve pharmacists' knowledge and awareness about isotretinoin and its dispensing practice. © 2023 The Authors

ABSTRACT: There has been a dramatic change in everyday life due to COVID-19 around the world. The lockdowns, closure of schools and universities, and the loss of jobs has placed a lot of pressure on the family, particularly women. One of the main outcomes of the pandemic in Jordan has been the increase in the workload of women outside and inside the home. Despite the efforts made to empower women throughout the years, they continue to struggle and gender inequality remains overlooked and even normalized in Jordanian society. The aim of the study is to unfold the way Covid- 19 has disrupted women's lives and made gender equality less achievable, and explore the challenges they have faced in terms of the added paid and unpaid work they have been forced to do during the pandemic and to this end, in-depth interviews were carried out with 20 working mothers who were selected using purposive sampling. The study is largely informed by feminist standpoint theory whose main concern is the female voice and making it a valuable instrument in the process of knowledge production. The findings show that most women suffered from traditionally prescribed gender roles imposed by society, pressure and discrimination at work, and a lack of understanding and empathy at home and the workplace. Very few shared responsibilities with their husbands and their burdens with coworkers and

employers, and an even smaller number was able to use the pandemic to their advantage and found ways to regain female power and self-assertion. The findings indicate that serious changes in policies need to be made to protect women's rights at work and in the domestic world, and the institution of marriage reconstructed within the Jordanian imaginary, and gender roles redefined. © 2023

ABSTRACT: Background Defensive medicine (DM) is a deviation from medical practice that is induced primarily by a threat of liability. While the DM behavior is well studied in the developed countries, little is known in developing countries and never been evaluated in Jordan. Objective To evaluate the prevalence of DM practice in Jordan among physicians and to investigate reasons behind its practice and potential strategies to alleviate this practice. Methods In this Cross-sectional study, self-administered questionnaire was distributed to a sample of physicians in both public and private sectors in Jordan. The collection period was from Jan 2021 to June 2021. The prevalence of DM practice was estimated among the study sample. Frequency scores of different DM behaviors, reasons of DM behaviors, and effectiveness of strategies in changing DM behaviors were summarized as average frequency scores with standard deviations. Multivariable linear regression models were conducted to evaluate potential predictors of total assurance and avoidance behavior scores. Results A total of 175 Jordanian physicians completed the survey. The prevalence of adopting (or witnessing) DM behaviors among the study sample was 68% (n = 119). Diagnostic laboratory exams followed by prescribed medications were the most practiced behaviors in excessive rate during a typical working week. Unfavorable legislation for the physician was reported as the headmost reason for practicing DM, followed by pressure from the public and mass media opinion. Continuous update of knowledge, abilities, and performance and following specific protocols and/or appropriate clinical evidence and appropriate multidisciplinary and multi-professional communication were the most effective strategies that can mitigate DM behaviors. Conclusions Defensive medicine practice is common among Jordanian physicians with concerns about increasing pattern in the future. © 2023 Al-Balas et al.

ABSTRACT: Pipeline installation is a time-consuming and expensive process in the oil sector. Because of this, a pipe is often utilized to carry diverse petroleum products; hence, it is crucial to use a precise and dependable control system to identify the kind and quantity of oil products being transported. This study attempts to identify four petroleum products by using an X-ray tube-based system, feature extraction in the frequency and temporal domains, and feature selection using Particle Swarm Optimization (PSO) in conjunction with a Group Method of Data Handling (GMDH) neural network. A sodium iodide detector, a test pipe that simulates petroleum compounds, and an X-ray source make up the implemented system. The detector's output signals were transmitted to the frequency domain, where the amplitudes of the top five dominant frequencies could be determined. Furthermore, the received signals were analyzed to extract five temporal characteristics-MSR, 4th order moment, skewness, WL, and kurtosis. The PSO system takes into account the extracted time and frequency features as input in order to introduce the optimal combination. Four different GMDH neural networks were constructed, and the chosen characteristics were used as inputs for those networks.

Finding the volume ratio of each product was the responsibility of each neural network. The four designed neural networks were able to predict the amount of ethylene glycol, crude oil, gasoil, and gasoline with RMSE of 0.26, 0.17, 0.19, and 0.23, respectively. One compelling argument for using the proposed approach in the oil industry is that it can calculate the volume ratio of products with a root mean square error of no more than 0.26. The adoption of a feature selection method to choose the best ones is credited with this remarkable degree of precision. By providing appropriate inputs to neural networks, the control system has significantly outperformed its predecessors in terms of precision and efficiency. © 2023 THE AUTHORS

ABSTRACT: A nanocomposite (nanoclay/conductive polymer) was prepared by a template-free method for supercapacitor applications. Halloysite Nanotubes (HNTs) were used as a nanoclay material, and synthesized polyaniline (PANI) by ammonium persulfate-initiated polymerization was used as a conductive polymer. The HNTs/PANI nanocomposite was deposited on an indium tin oxide (ITO) coated glass to obtain a working electrode by an electrochemical deposition method. Morphological and structural examination of the HNTs/PANI nanocomposite proved that the PANI nanoparticles were attached to the HNTs surface. The structural analysis demonstrated that the PANI and HNTs crystal size significantly decreased in the HNTs/PANI as a result of the composition of PANI molecules with HNTs structure. The main characteristic bonds and functional groups of HNT, PANI, and HNTs/PANI nanocomposites were determined by FT-IR analysis. Using cyclic voltammetry (CV), the electrochemical performance of the HNTs//PANI nanocomposite electrode was investigated. The specific capacitance values were reported via the CV curves as 264, 230.22, 175.2, and 154.8 F/g at scan rates of 50, 100, 200, and 300 mV/s respectively. The results showed that the specific capacitance at the slow scan rates revealed higher maximum specific capacitance values. © 2023 The Author(s)

ABSTRACT: This study examines the relationship between various financial inclusion measures and banks' performance across multiple countries with varying institutional, regulatory and income levels. To construct an aggregate bank performance index, we employ principal component analysis, which utilises a set of critical indicators summarised by the CAMEL rating system, including banks' solvency, asset quality, efficiency, profitability and liquidity. Our primary findings indicate that different measures of financial inclusion exhibit varying associations with bank performance. Specifically, there is a trade-off between bank performance and credit deepening, especially in high-income nations. Conversely, in low-income nations, higher financial inclusion, measured by deposits to GDP, number of deposits, and number of borrowers, does not affect bank performance adversely. Banks in low-income nations could achieve significant gains by improving financial access and enhancing regulatory environments. © 2023 Banca Monte dei Paschi di Siena SpA.

ABSTRACT: Chimp Optimization Algorithm (ChOA) is one of the recent metaheuristics swarm intelligence methods. It has been widely tailored for a wide variety of optimization problems due to its impressive characteristics over other swarm intelligence methods: it has very few parameters, and no derivation information is required in the initial search. Also, it is simple, easy to use, flexible, scalable, and has a special capability to strike the right balance between exploration and exploitation during the search which leads to favorable convergence. Therefore, the ChOA has recently gained a very big research interest with tremendous audiences from several domains in a very short time. Thus, in this review paper, several research publications using ChOA have been overviewed and summarized. Initially, introductory information about ChOA is provided which illustrates the natural foundation context and its related optimization conceptual framework. The main operations of ChOA are procedurally discussed, and the theoretical foundation is described. Furthermore, the recent versions of ChOA are discussed in detail which are categorized into modified, hybridized, and paralleled versions. The main applications of ChOA are also thoroughly described. The applications belong to the domains of economics, image processing, engineering, neural network, power and energy, networks, etc. Evaluation of ChOA is also provided. The review paper will be helpful for the researchers and practitioners of ChOA belonging to a wide range of audiences from the domains of optimization, engineering, medical, data mining, and clustering. As well, it is wealthy in research on health, environment, and public safety. Also, it will aid those who are interested by providing them with potential future research. © 2023, Jilin University.

ABSTRACT: Decision-makers in the Middle East and North Africa (MENA) region are looking for ways to recycle wastewater to meet the demand for water amidst scarcity. Reusing treated wastewater is crucial for managing water resources sustainably, particularly in water-stressed nations in arid regions of the world that rely on desalination and groundwater to meet their water needs. This study looks into how socio-demographic factors affect how the general public feels about utilizing wastewater for various purposes. A structured questionnaire was used to collect data from 1206 respondents throughout the MENA region, and descriptive and inferential statistics were used to analyze the results. The MENA region is found to recognize the environmental benefits of reuse, but prefers applications that have less direct human interaction such as flushing toilets, non-food industries, car washes, home cleaning, and firefighting. The public is open to reuse as long as it is approved by professionals such as medical experts, university professors and experts. Gender and wealth did not significantly influence the confidence to use treated wastewater for most reuse applications. Still, age and education level did not have a major impact. All respondents agreed to use treated wastewater for non-food business, car washing, home cleaning, and firefighting. Study findings provide insight into the attitudes and perceptions of individuals toward treated wastewater reuse, and can inform future efforts to promote the acceptance and implementation of these applications. © 2023

ABSTRACT: Uncontrolled blood pressure (BP) has been associated with increased risk of cardiovascular events including heart failure. This study aimed to explore the factors associated with poor BP control among patients with heart failure at two major outpatient cardiology clinics in Jordan. Variables including socio-demographics, biomedical variables, in addition to disease and medication characteristics were collected using medical records and custom-designed questionnaire. The validated 4-item Medication Adherence Scale was used to assess medication adherence. Binary logistic regression analysis was conducted to explore the significant and independent predictors of poor BP control. Regression analysis results revealed that being not satisfied with the prescribed medication (OR = 2.882; 95% CI: 1.458-5.695; $P < 0.01$), reporting moderate medication adherence (OR = 0.203; 95% CI: 22 0.048-0.863; $P < 0.05$), not receiving digoxin (OR = 3.423; 95% CI: 1.346-8.707; $P < 0.05$), and not receiving aldosterone antagonist (OR = 2.044; 95% CI: 1.038-4.025; $P < 0.05$) were associated with poor BP control. Future interventions should focus on increasing medication satisfaction and enhancing medication adherence, in order to improve BP control among patients with heart failure. © 2023, The Author(s), under exclusive licence to Springer Nature Limited.

ABSTRACT: Purpose: The purpose of this study is to examine the impact of intellectual capital (IC) components and absorptive capacity (ACAP) on entrepreneurial orientation (EO). Furthermore, it attempts to investigate the mediating role of ACAP between intellectual components and EO.

Design/methodology/approach: Using a self-administered survey to sample the Jordanian pharmaceutical industry, the research measurement scale was adapted from previous studies, and data were collected from 24 pharmaceutical companies. The proposed conceptual model and associated hypotheses were tested using structural equation modeling. Findings: The empirical findings indicate that relational capital (RC) and structural capital (SC) have a significant impact on EO and account for 72.2% of this aspect. However, it is somewhat unexpected to find that human capital does not have a significant direct impact on EO. ACAP positively mediates the relationships between RC and SC and EO. Finally, this study has several theoretical and practical implications with regard to the business literature and management practices. Originality/value: This research bridges gaps in the literature and highlights the importance of ACAP in knowledge-based industries. The assessment and estimation of how knowledge ACAP is associated with entrepreneurship orientation has not been previously provided. From a practical perspective, the findings of this research can be used by firms in the pharmaceutical industry to enhance ACAP and better exploit their IC, leading to a more proactive and innovative entrepreneurship orientation. This, in turn, can lead to the development a new products and services. Furthermore, by examining the mediating role of ACAP between intellectual capacity components and EO in the pharmaceutical industry, the research contributes to the growing body of literature on entrepreneurship orientation in developing countries. © 2023, Emerald Publishing Limited.

ABSTRACT: The Internet of Things (IoT) plays a well-known role in connecting physical and virtual objects to exchange information. IoT environments can connect billions of devices and objects, and

each one has a unique identity. IoT is regarded as one of the most revolutionary technologies of the last few years. It focuses on many fields, including healthcare, industry, agriculture, military applications, and space science. Consequently, it is more vulnerable to cyber-attacks. This paper presents a comprehensive review and classification of cybersecurity schemes used in IoT-based healthcare and categorizes them based on the cybersecurity techniques applied in each method. Research on cybersecurity for IoT systems in healthcare has been conducted between 2011 and 2022 in the context of this survey © 2023 Author(s).

ABSTRACT: With the spread of the Internet and a large number of network users, the problem of congestion on the network has arisen. This paper presents a strategy to reduce network congestion using clustering algorithms, K-means, and shortest path algorithms. The paper aims to solve the problems of congestion control, access to quality of service, reduce time wasted when sending and receiving network users, take advantage of network devices, and provide quality of service without data loss. The results of the proposed system simulation showed its effectiveness and accuracy through the simulation of the system. © 2023 Author(s).

ABSTRACT: In the current era, society is searching for the best and most secure ways in the field of health. The biggest role is security and speed in implementation. These challenges are almost completely solved with the applications of blockchain, as they provide a very large and safe field for preserving and accessing information. In this study, we present the idea of having more than one chain in the medical field, and how those chains interblock and interblock communicate decentralized communication through the healthcare systems. © 2023 Author(s).

ABSTRACT: Recommendation systems are an important feature in our computerized world, where users are often stuck with choices most of the time and need help to be able to find what they are looking for. Since we cannot search the website for all the content and products, whether books, clothes, or others, the primary goal of recommendation systems is to help all users on websites find what they are looking for. Artificial intelligence has contributed to the development of recommendation systems to improve prediction accuracy. This paper presents a comparative study of approaches in recommender systems, starting with a general presentation of each, and then addressing the advantages, limitations, and techniques. All the notes in the paper will help researchers to understand new trends and developments in recommender systems. © 2023 AIP Publishing LLC.

ABSTRACT: Combining chemotherapeutic agents with bioactive natural products is an attractive cancer treatment modality to reduce the dose and side effects of chemotherapy. Combination treatments with drugs having different mechanisms of action can also be beneficial in combatting the development of

drug resistance by cancer cells. Nanoparticle (NP)-mediated drug delivery can further improve the therapeutic index of cytotoxic agents by enabling passive and/or active targeting to tumor tissues in vivo. Using doxorubicin (DOX) as a model chemotherapeutic agent, we developed three NP formulations based on polyquercetin (pQCT), an emerging nanocarrier platform. The NPs were co-assembled with DOX, pQCT, and either Pluronic P123, methoxy poly(ethylene glycol)-amine, or D- α -tocopheryl poly(ethylene glycol) 1000 succinate (TPGS). Physicochemical characterization of the NPs revealed them to have a spherical morphology with high monodispersity, excellent drug loading capacity, and sustained drug release. Then, the NPs were evaluated in vitro to determine their potential synergism when combined with the bioactive natural products curcumin (CUR), tannic acid (TA), and thymoquinone (TQ) against breast cancer cells (MCF-7 and MDA-MB-231). Surprisingly, most of the combinations were found to be antagonistic. However, combinations containing CUR exhibited greater pro-apoptotic effects compared to the single agents, with polymer-modified pQCT NPs presenting as a promising nanoplatfor for enhancing DOX's ability to promote cancer cell apoptosis. Our findings provide insights into the potential application of pQCT in nanomedicine, as well as the use of bioactive natural products in combination with DOX as a free agent and as an NP formulation in the treatment of breast cancer. © 2023 Elsevier B.V.

ABSTRACT: Active ingredients of biopharmaceuticals consist of a wide array of biomolecular structures, including those of enzymes, monoclonal antibodies, nucleic acids, and recombinant proteins. Recently, these molecules have dominated the pharmaceutical industry owing to their safety and efficacy. However, their manufacturing is hindered by high cost, inadequate batch-to-batch equivalence, inherent instability, and other quality issues. This article is an up-to-date review of the challenges encountered during different stages of biopharmaceutical production and mitigation of problems arising during their development, formulation, manufacturing, and administration. It is a broad overview discussion of stability issues encountered during product life cycle i.e., upstream processing (aggregation, solubility, host cell proteins, color change), downstream bioprocessing (aggregation, fragmentation), formulation, manufacturing, and delivery to patients. © 2023 Elsevier B.V.

ABSTRACT: This paper discusses the possibilities of using machine learning models to analyze the keys in public key encryption algorithms that are based on various mathematical hard problems. Given their distinct domains within computer science, machine learning and public key cryptosystems may appear unrelated at first glance. Nonetheless, there are intriguing correlations and potential points of convergence between these two domains. In general, machine learning models have the potential to help with differential cryptanalysis, a technique that uses statistical differences between plaintext-ciphertext pairs to deduce parts of the key. As a result, breaking encryption keys using machine learning is a complex and evolving research area that investigates cryptanalysis machine learning techniques. While public key encryption algorithms were designed to be secure against various attacks such as brute force, advances in computing power and machine learning have raised concerns about the potential emergence of new attack vectors. © 2023 ACM.

ABSTRACT: Background: The purpose of this study is to design, implement, and evaluate the impact of a total quality management intervention on job performance and commitment among Jordanian nurses working in government hospitals. Methods: A quasi-experimental multiple time series was conducted starting in September 2017 and ending in June 2018. 140 nurses were sampled using the proportionate stratified random sampling technique; 132 were completed the study 67 the intervention group, while 65 in the control group. Results: There were no significant differences in nurses' job performance or commitment between the 2 groups (control and intervention). A repeated measure MANOVA test for both groups revealed that the interaction between group and time was statistically significant ($F(4, 127) = 144.841$; $P = .001$; Wilk's $\Lambda = 0.180$; $\eta^2 = .820$), indicating that groups had a significantly different pattern of job performance and commitment over time. A repeated test The MANCOVA test for both groups across time revealed significant differences in nurses' job performance and nurses' commitment at a less than 0.05 significance level ($F(2127) = 320.724$; $P = .001$; Wilk's $\Lambda = 0.165$; $\eta^2 = 0.835$), and the overall effect of time was significant for all dependent variables ($F(4125) = 36.879$; $P = .001$; Wilk's $\Lambda = 0.459$; $\eta^2 = 0.541$). Conclusion: The educational intervention was effective in improving nursing job performance among the study sample. The improved commitment of respondents in the intervention group was attributed to the improvement in job performance. ABSTRACT: Purpose: The aim of this research is to determine the impact of a learning organisation (LO) on developing quality improvement practices (QIPs) and to propose knowledge-sharing (KS) as a moderator which is anticipated to support the beneficial effect of a LO on QIP. A further objective is to establish whether training provision raises the abilities of healthcare organisations (HCOs) to attain greater standards of QIP via a LO and KS. Design/methodology/approach: A total of 240 responses, obtained from employees working at private HCOs in Jordan, comprised the valid dataset. Structural equation modeling (SEM) was utilised for data analysis. Multigroup analysis (MGA) was performed to compare the impact of workers who had or had not undergone training. Findings: The findings indicated that QIP was significantly enhanced by LO. HCOs with the objective of converting a KS-moderated LO could attain improved QIP standards, but within the surveyed establishments, this effect was only appreciated at modest degrees. By performing MGA, no variations were identified in the impact of workers. Practical implications: Managers should place more emphasis on training and learning within HCOs. However, respondents did indicate that their establishments had notable degrees of KS, suggesting a potential strength that could be used positively by the managerial hierarchy. Originality/value: This study encompasses an original contribution to contemporary scholarship in the field of knowledge management and quality through its examination of the moderating effect of KS on LO and QIP. © 2023, Emerald Publishing Limited.

ABSTRACT: The present study aims to investigate teachers' attitudes toward the integration of culture within the distance English language education process. With relevant theoretical background, this

paper will particularly probe EFL teachers' perceptions of the barriers hindering them from integrating culture into their distance learning (DL) classes. Data was collected from 66 teachers of secondary schools in different cities in Morocco and Jordan following the mixed method research design (questionnaires and interviews). The findings demonstrated that teachers exhibited enough willingness to support the cultural objectives, yet limited is the culture integration in the distance teaching of the English language. Based on the study findings, this study offers some inferences and recommendations for curriculum developers, material designers, teachers, and practitioners who already use or are considering using online tools with regard to culture learning and the teaching process. © 2023 ACADEMY PUBLICATION.

ABSTRACT: This paper proposes a novel numerical approach for handling fractional boundary value problems. Such an approach is established on the basis of two numerical formulas; the fractional central formula for approximating the Caputo differentiator of order (Formula presented.) and the fractional central formula for approximating the Caputo differentiator of order (Formula presented.), where (Formula presented.). The first formula is recalled here, whereas the second one is derived based on the generalized Taylor theorem. The stability of the proposed approach is investigated in view of some formulated results. In addition, several numerical examples are included to illustrate the efficiency and applicability of our approach. © 2023 by the authors.

ABSTRACT: In this research, two modified forms of the $G'G$ -expansion method are employed to investigate various kinds of solitary wave solutions that include kink, lump, periodic, and rogue wave solutions within the framework of the fractional coupled Higgs system. The underlying patterns in the targeted model are revealed by using extended and generalized G' -expansion methods. The first step involves converting the model into nonlinear ordinary differential equations via a fractional complex transformation. Following that, the suggested improved versions of the G' -expansion approach are used to provide numerous solitary wave solutions. Some solitary wave solutions are represented by two- and three-dimensional graphs, demonstrating their typical propagating behavior. This research finishes by summarizing the vast findings and exploring their implications for high-energy physics. © 2023 Author(s).

ABSTRACT: This study examines how regularized kappa distributed (RKD) electrons affect the characteristics of the ion-acoustic cnoidal waves (IACWs) in normal plasma. The RKD is a generalized form of the standard kappa distribution that accounts for the impacts of thermal broadening and finite size effects on the plasma particles. By employing the reductive perturbation technique, the Korteweg-de Vries equation is derived, and its nonlinear cnoidal wave (CW) solution is obtained and analyzed both analytically and numerically. It is found that the amplitude of compressive IACWs increases with an enhanced cutoff parameter α and decreases with increasing superthermality κ . Rarefactive IACWs yield opposing results as compared to compressive IACWs under the impact of κ and α . The results provide insight into the behavior of CWs in normal plasmas with non-Maxwellian distributions and contribute to the understanding of wave-particle interactions in laboratory and space plasmas. © 2023 Author(s).

ABSTRACT: Three Schiff base ligands, NQ, CQ and HQ, were prepared from the reaction of quinoline-3-carbohydrazide with 2-nitrobenzaldehyde, 2-chlorobenzaldehyde and 2,4-dihydroxybenzaldehyde, respectively, and were investigated for their coordination to Cu (II), Ni(II), Co(II), Cd(II), Cr(III) and Fe(III) chlorides. The NQ preparation and the X-ray structure of NQ and CQ, as well as the transition metal complexes of NQ, CQ and HQ, were reported for the first time. FTIR, 1H-NMR, magnetic susceptibility and elemental analysis were used to study the coordination of ligands to the metal ions. Based on the magnetic susceptibility and elemental analysis results, octahedral structures of the complexes such as [CuL2Cl(OH)], [FeL2Cl2(OH)] and [CoL2Cl(OH)] were proposed for L = NQ, CQ and HQ. The relatively large Cd(II) exhibited [CdL3(OH)2]. The FTIR study revealed that NQ and CQ are coordinated to the metal ions via azomethine nitrogen and carbonyl oxygen while HQ through azomethine nitrogen and phenolic oxygen. Despite the high solvation power of DMSO solvent in 1H-NMR experiments, the azomethine HC=N peak at 9.3 ppm is the most affected by complexation with metal ions. On the other hand, quinoline nitrogen seems to be a weaker coordinating site than the azomethine nitrogen. The HQ ligand, containing phenolic groups, and its complexes with Cu and Ni were found to have inhibitory effects on human breast adenocarcinoma MCF-7 and human chronic myelogenous leukemia K562. Nevertheless, metal ions did not exhibit a significant synergistic effect on the antiproliferative activity of the ligands investigated. © 2023 by the authors.

ABSTRACT: Background: The level of fasting blood glucose (FBG) is influenced by several factors, including health status, genetics, and diet. Some studies have reported a beneficial effect of Ramadan Intermittent Fasting (RIF) on diabetic patients. However, clinical observations have shown that diabetes is exacerbated in some patients. Aim: This study aims to investigate the influence of RIF on the FBG level, a biomarker of hyperglycemia and diabetes, and to identify factors associated with variations in FBG levels during RIF among diabetic patients. Methods: This study is a cross-sectional study. We monitored the FBG levels of 181 type II diabetic patients over a two-month period, from 20 February to 20 April 2023, which represents the Islamic lunar months of Shaban (8th month) and Ramadan (9th month). Ramadan provides a prominent month of intermittent fasting practice for studying its physiological effects on diabetes. We collected clinical data from each participant, including demographic information, co-morbidities, and medications used during this period. Results: Based on our findings, diabetic patients were classified into three groups depending on the influence of RIF on FBG levels: the positively affected group (44%), whose average FBG levels were reduced; the neutrally affected group (24%), whose average FBG levels did not change; and the negatively affected group (32%), whose average FBG levels increased during the fasting month of Ramadan compared to the previous month. Furthermore, we found that the positive effect of RIF was more frequent among obese, non-geriatric, and male diabetic patients, while the negative effect of RIF was more frequent among patients who were not adhering to the medication. Conclusions: This study concludes that RIF affects FBG levels differently among diabetic patients. These findings should be taken into consideration when treating diabetic patients during the fasting month of Ramadan, and further studies are needed to identify (1) factors associated with inter-individual variation in the response to RIF and (2) those who are great candidates for RIF. © 2023 by the authors.

ABSTRACT: Objective The present study aimed to evaluate HRQOL and to explore the factors associated with poor HRQOL among patients with COPD. Methods In the present cross-sectional study, the validated St George's Respiratory Questionnaire for COPD patients (SGRQ-C) was used to evaluate HRQOL among 702 patients with COPD at two major hospitals in Jordan in the period between January and April 2022. Quantile regression analysis was used to explore the factors associated with HRQOL among the study participants. Results According to SGRQ-C, the HRQOL of the study participants was greatly impaired with a total SGRQ of 55.2 (34-67.8). The highest impairment in the HRQOL was in the impact domain with a median of 58.7 (29-76.3). Increased number of prescribed medications ($\beta = 1.157$, $P < 0.01$), older age ($\beta = 0.487$, $P < 0.001$), male gender ($\beta = 5.364$, $P < 0.01$), low education level ($\beta = 9.313$, $P < 0.001$), low and moderate average income ($\beta = 6.440$, $P < 0.05$, and $\beta = 6.997$, $P < 0.01$, respectively) were associated with poorer HRQOL. On the other hand, being married ($\beta = -17.122$, $P < 0.001$), living in rural area ($\beta = -6.994$, $P < 0.01$), non-use of steroids inhalers ($\beta = -3.859$, $P < 0.05$), not receiving long acting muscarinic antagonists (LAMA) ($\beta = -9.269$, $P < 0.001$), not receiving LABA ($\beta = -8.243$, $P < 0.001$) and being adherent to the prescribed medications ($\beta = -6.016$, $P < 0.001$) were associated with improved HRQOL. Furthermore, lower disease severity (stage A, B, and C) ($\beta = -23.252$, -10.389 , and

-9.696 respectively, $P < 0.001$), and the absence of comorbidities ($\beta = -14.303$, $P < 0.001$) were associated with better HRQOL. Conclusions In order to maximize HRQOL in patients with COPD, future COPD management interventions should adopt a multidisciplinary approach involving different healthcare providers, which aims to provide patient-centered care, implement personalized interventions, and improve medication adherence, particularly for patients who are elderly, males, have low socioeconomic status, receive multiple medications and have multiple comorbid diseases. © 2023 Jarab et al. ABSTRACT: This study aimed to develop and verify a simple HPLC-based quantitative approach to simultaneously determine the phosphodiesterase-5 inhibitors (PDE5Is) sildenafil, vardenafil, udenafil, avanafil, and tadalafil in a tablet dosage form mixed with honey obtained from Jordanian market in rat plasma. PDE5Is block phosphodiesterase-5 (PDE-5). This blockage, in turn, triggers vasodilation by phosphorylating downstream effector molecules. Chromatographic separation was performed on a Hypersil™ C18 column (150 mm × 4.6 mm, 5 μm, Thermo Fisher Inc., Waltham, MA, USA). An acetonitrile:10% Triethylamine solution (57:43) at pH 5.5 (adjusted with orthophosphoric acid), 20 μL injection volume, 1 mL/min flow rate, 25 °C temperature, and eluent monitoring at 250 nm was used to execute the current approach. Linearity was observed in the 9.6–14.4 μg/mL concentration ranges for sildenafil, udenafil, avanafil, and tadalafil, and 2.4–3.6 μg/mL for vardenafil. Each dosage form was recovered within acceptable limits at three distinct concentrations, and the assay selectivity indicated no interference from the inactive substances in the formulation. Sildenafil, vardenafil, udenafil, avanafil, and tadalafil had retention times of 3.5, 4.3, 6.2, 9.7, and 12.8 min, respectively, and tadalafil was 12.8 min. The present analytical method is comprehensive and universal for measuring the five drugs. Such an analytical method can be routinely used to detect the combination of these drugs. © 2023 by the authors.

ABSTRACT: Repurposing existing drugs appears to be a potential solution for addressing the challenges in the treatment of non-small cell lung cancer (NSCLC). β-adrenoceptor antagonist drugs (β-blockers) have tumor-inhibiting effects, making them promising candidates for potential NSCLC treatment. This study investigates the anticancer potential of a subset of β-blockers in NSCLC cell lines; A549 and H1299. Additionally, it investigates the underlying mechanism behind β-blockers' anticancer effect by

influencing a potential novel target named aldehyde dehydrogenase (ALDH). The MTT assay assessed β -blockers' cytotoxicity on both cell lines, while Western blot and NADH fluorescence assays evaluated their influence on ALDH protein expression and activity. Carvedilol (CAR) was the most effective blocker in reducing cell survival of A549 and H1299 with IC50 of 18 μ M and 13.7 μ M, respectively. Significantly, CAR led to a 50% reduction in ALDH expression and 80% decrease in ALDH activity in A549 cells, especially when combined with β -agonists, in comparison to the control. This effect might be attributed to β -agonist blockade or an alternative pathway. This novel finding adds to our understanding of CAR's multifaceted anticancer properties, implying that combining CAR with β -agonists could be a useful strategy for lung cancer treatment. © 2023 by the authors.

ABSTRACT: Using fractional difference equations to describe fractional and variable-order maps, this manuscript discusses the dynamics of the discrete 4D sinusoidal feedback sine iterative chaotic map with infinite collapse (ICMIC) modulation map (SF-SIMM) with fractional-order. Also, it presents a novel variable-order version of SF-SIMM and discusses their chaotic dynamic behavior by employing a distinct function for the variable fractional-order. To establish the existence of chaos in the suggested discrete SF-SIMM, some numerical methods such as phase plots, bifurcation and largest Lyapunov exponent diagrams, (Formula presented.) complexity and θ -1 test are utilized. After that, two different control schemes are used for the conceived discrete system. The states are stabilized and asymptotically forced towards zero by the first controller. The second controller is used to synchronize a pair of maps with non-identical parameters. Finally, MATLAB simulations will be executed to confirm the results provided. © 2023 by the authors.

ABSTRACT: The primary goal of this research is to initiate the pairwise c-compact concept in topological and bitopological spaces. This would make us to define the concept of c-compact space with some of its generalization, and present some necessary notions such as the H-closed, the quasi compact and extremely disconnected compact spaces in topological and bitopological spaces. As a consequence, we derive numerous theoretical results that demonstrate the relations between c-separation axioms and the c-compact spaces. © 2023 by the authors

ABSTRACT: In this study, we expand a 2D sine map via adding the discrete memristor to introduce a new 3D fractional-order sine-based memristor map. Under commensurate and incommensurate orders, we conduct an extensive exploration and analysis of its nonlinear dynamic behaviors, employing diverse numerical techniques, such as analyzing Lyapunov exponents, visualizing phase portraits, and plotting bifurcation diagrams. The results emphasize the sine-based memristor map's sensitivity to fractional-order parameters, resulting in the emergence of distinct and diverse dynamic patterns. In addition, we employ the sample entropy ((Formula presented.)) method and (Formula presented.) complexity to quantitatively measure complexity, and we also utilize the 0-1 test to validate the presence of chaos in the proposed fractional-order sine-based memristor map. Finally, MATLAB simulations are be executed to confirm the results provided. © 2023 by the authors.

ABSTRACT: In this work, the propagation of nonlinear electrostatic shock wave structures in an anisotropy pressure magnetoplasma composed of warm inertial ions and inertia-less Maxwellian electrons is reported. For this purpose, the technique of reductive perturbation is applied for reducing fluid equations of the current model to the Korteweg-de Vries Burgers (KdVB) equation with a second-order dissipative term and the KdVB-Kuramoto (KBK) equation with both second- and fourth-order dissipative terms. The impact of various plasma parameters, including the parallel ion pressure, perpendicular ion pressure, and dissipation parameter, on the significant characteristics of the shock wave profile is examined and discussed. In addition, a comparison between the profiles of KdVB shocks and KdVB-Kuramoto shocks is reported. We expect that KBK shock wave amplitudes become larger than the KdVB ones by taking the fourth-order dissipative into consideration. Thus, the results of the KBK equation may treat the difference between the theoretical and laboratory results or satellite observations. © 2023 Author(s).

ABSTRACT: The goal of this study is to see if there is a link between dividends per share, retained profits per share, and Jordanian stock prices. Previous studies examined these factors separately;

however, in this study, all of these variables were included, in addition to financial leverage, which served as the control variable. The sample used for this purpose was acquired as panel data from 9 Jordanian enterprises from 2015 to 2019. To assess data, fixed effect models were used. The share price was employed as the dependent variable in this study. As independent variables, dividends per share and retained earnings per share were used. In addition, financial leverage is used as a control variable. The results show that share price has been positively impacted by dividends per share, while it has been insignificantly impacted by retained earnings per share and financial leverage. © 2023, SRAC - Romanian Society for Quality. ABSTRACT: The sustained and controlled delivery of antimicrobial drugs has been largely studied using nanomaterials, like metal organic frameworks (MOFs), and various polymers. However, not much attention has been given to combining MOFs and biodegradable polymers towards the potentially more sustained release of active pharmaceutical ingredients. Herein, we report a comparative study of two widely used antimicrobial drugs, cephalexin and metronidazole, from zinc-based MOF-5 incorporated into biodegradable polycaprolactone (PCL) and poly-lactic glycolic acid (PLGA) composites. Cephalexin and metronidazole were separately loaded into MOF-5 post-synthetically, followed by their integration into biodegradable PLGA and PCL composites. The pristine MOF-5 and the loaded MOFs were thoroughly characterised using Fourier-transformed infrared (FT-IR) spectroscopy, scanning electron microscopy (SEM), thermogravimetric analysis (TGA) and powder X-ray diffraction (PXRD). Ultraviolet-visible (UV-Vis) spectroscopy studies were carried out to assess the release of the drugs in PBS for up to 72 h, showing a cumulative release of 24.95 wt% and 27.84 wt% for cephalexin and metronidazole, respectively. The antibacterial properties of the pristine MOF, pure drugs, drug-loaded MOFs and the loaded composites were assessed against Gram-positive and Gram-negative bacterial strains, *Staphylococcus aureus* or *Staphylococcus epidermidis* and *Escherichia coli* or *Acinetobacter baumannii*, respectively. A cephalexin-loaded MOF-5 composite of PCL (PCL-ceph@MOF-5) showed the best efficiency for the controlled release of drugs to inhibit the growth of the bacteria compared to the other composites. This study demonstrates that the combination of MOFs with biodegradable polymers can provide an efficient platform for the sustained release of antimicrobial drugs and can be a promising tool to manage antimicrobial resistance (AMR). © 2023 by the authors.

ABSTRACT: Patients with heart failure (HF) are generally at higher risk of developing type 2 diabetes and having uncontrolled blood glucose. Furthermore, the prevalence of uncontrolled blood glucose in patients with HF is largely unknown. Identifying the factors associated with poor blood glucose control is a preliminary step in the development of effective intervention programs. The current cross-sectional study was conducted at two major hospitals to explore the factors associated with blood glucose control among patients with heart failure and type 2 diabetes. In addition to sociodemographic, medical records were used to collect medical information and a validated questionnaire was used to evaluate medication adherence. Regression analysis showed that poor

medication adherence (OR = 0.432; 95%CI 0.204-0.912; $P < 0.05$) and increased white blood cells count (OR = 1.12; 95%CI 1.033-1.213; $P < 0.01$) were associated with poor glycemic control. For enhancing blood glucose control among patients with HF and diabetes, future intervention programs should specifically target patients who have high WBC counts and poor medication. © 2023 S. ABSTRACT: The coefficient of performance (COP) and exergy efficiency of a single and double-effect ammonia-water absorption refrigeration system powered by compound parabolic concentrating collectors were analyzed under various operating situations. A novel method was proposed using support vector machine regression and particle swarm optimization to identify optimal operating parameters. The optimal pressure-temperature conditions, including evaporator pressure (P_e), generator pressure (P_g), and absorber temperature (T_a) that maximize the COP and exergy efficiency while minimizing generator temperature (T_g) and evaporator temperature (T_e), were investigated. The generator temperature was the main independent variable, ranging from 370 to 470 K. The findings demonstrated that the gain in COP and exergy efficiency caused by raising the generator temperature to more than 430 K is not cost-effective. The COP increased when the evaporator temperature increased along the investigated range of generator temperatures but yielded lower exergy efficiency in all cases. The exergy destruction rate in condenser, pump, re-cooler, reheater, and expansion valves is insignificant compared to other components. The generator has the highest exergy destruction rate regardless of operating conditions, making it the most crucial component of the absorption system. The optimization process findings showed that, at $P_e = 2.8$ bar, $P_g = 14.5$ bar, and $T_a = 303.15$ K, the maximum COP and exergy efficiency were 0.8483 and 0.3605, respectively, concerning the minimization of T_g and T_e , which were 408 and 267 K, respectively. The model produced an acceptable performance with a high prediction accuracy (coefficient of determination > 0.99 and mean square error < 0.0064). © 2023 Elsevier Ltd and IIR

ABSTRACT: With antimicrobial resistance (AMR) increasing at an alarming rate, there is a need to develop better antibiotic delivery platforms at the point of need, to reduce over-exposure to antibiotics that are delivered systemically. Recent studies have suggested the use of metal-organic frameworks (MOFs) as potential vehicles for controlled and efficient delivery of various active pharmaceutical ingredients (APIs). Development of MOF-polymer composite materials can assist in the development of medical devices that can deliver APIs to local sites in a targeted approach. This study reports the encapsulation of a widely used antibiotic - ciprofloxacin (CIP) - into two Zr-based MOFs (UiO-66 and UiO-66-NH₂) and their subsequent integration into a biodegradable polymer; polycaprolactone (PCL), via solvent casting, to obtain a PCL-MOF composite membrane. The MOFs and PCL-MOF composites were characterised by Fourier-transformed infrared (FT-IR) spectroscopy, powder X-ray diffraction (PXRD), thermogravimetric analysis (TGA) and scanning electron microscopy (SEM). The results demonstrated that the structural integrity of the pristine MOFs was maintained after drug

loading and incorporation into the PCL membranes. The ciprofloxacin release was studied using ultraviolet-visible (UV-Vis) spectroscopy, and the results showed that the PCL-MOF composites had a more controlled drug release profile compared to the MOF alone, when monitored for seven days in phosphate buffered saline (PBS) and accelerated ageing (AA) release media. In addition, release studies showed pH-dependence with faster release of ciprofloxacin at both acidic and basic conditions. Antimicrobial assay showed excellent efficacy for both CIP-loaded MOFs and their PCL composites against *S. aureus* and *E. coli*, a Gram-negative and Gram-positive bacterium, respectively, with inhibition zone as high as ≥ 50 mm against *E. coli* for UiO-66-NH₂-CIP, indicating their potential applications in purpose-specific medical devices. © 2023 The Authors

ABSTRACT: Purpose: Exploring the factors that are associated with diminished health-related quality of life (HRQOL) in patients with asthma is essential to reach the optimal HRQOL. This study aim to assess HRQOL and its associated factors in patients with asthma in Jordan. Methods: This cross-sectional study was conducted on patients with asthma attending King Abdullah University Hospital and Jordan University Hospital in Jordan. In addition to socio-demographic variables, the study survey included mini asthma quality of life questionnaire (mini AQLQ) to measure HRQOL and asthma control test (ACT) to assess the degree of asthma control in asthmatic patients. Binary logistic regression was used to build a model of the independent predictors of poor HRQOL in the study participants. Results: Of the 314 participating patients, 70.1% were females, with a mean age of 51.47 ± 16.37 years. 61.1% of the participants had low HRQOL, with a total mean mini AQLQ score of 4.30 ± 1.30 . Results revealed that advanced age (OR=0.961; 95% CI: 0.936-0.986; $p < 0.05$) and lack of daily exercise (OR=0.233; 95% CI: 0.085-0.637; $p < 0.01$) were significant predictors of poor HRQOL in patients with asthma, while better controlled disease, manifested by higher ACT score was associated with better HRQOL in these patients (OR=1.499; 95% CI: 1.344-1.672; $p < 0.01$). Conclusions: HRQOL represents an area for improvement in patients with asthma. The current study provides insight on the factors associated with poor HRQOL. Future interventions and asthma management programs should focus on improving asthma control and encouraging physical activity, particularly for older patients, with the aim of improving HRQOL among patients with asthma. © 2023 by Author/s and Licensed by Modestum.

ABSTRACT: Our paper examines and compares the influence of oil prices, international geopolitical risks, and government expenditures on Saudi Arabia's economic diversification during 1970-2020. We employ the bounds testing approach to cointegration to estimate the parameters of the Autoregressive Distributed Lag model to attain the paper's goal. Our results show that oil prices and international geopolitical risk harm the KSA diversification process in the short run. The destructive effect of oil prices continues in the long run, while the impact of the international geopolitical risk does not persist. On the other hand, government expenditures encourage the diversification attitude in the short and long run. This outcome highlights the capability of the KSA government to stimulate the diversification process. It is a positive sign of the state capitalism doctrine's impact on the KSA economic diversification mechanism. From a policy implication perspective, our paper suggests prioritizing economic diversification clearly on the KSA government's agenda. Simultaneously, strengthening the KSA institutional framework and developing new forms of the social contract are critical to motivating the diversification process. © 2023

ABSTRACT: In this paper, we propose a simple simulation model for analyzing and evaluating the low energy adaptive clustering hierarchy (LEACH) protocol's performance in a noisy realistic wireless environment. A general parameter called probability of reception (pr) describes the noise level in this model. The success or failure of packet reception between sender and receiver can be used to assess the impact of network noise. The LEACH algorithm's energy model has been modified to include the noise factor (pr). Based on the new modified energy model, new analytical formulas for the optimal number of clusters and the optimal probability of a node becoming a cluster head are derived. Furthermore, we investigate what network dimensions are required to achieve the optimal number of clusters in a noisy environment, as this will increase the network's lifetime. It is demonstrated that the optimal number of clusters, and thus the optimal probability of CHs, are shown to be achieved by two factors: short wireless links formed within the clusters and equal network layout dimensions. Noise is shown to have a significant negative impact on the LEACH protocol's operation, particularly on network life time, throughput, and the protocol's stability and instability periods. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

Intelligent Shoes for Detecting Blind Falls Using the Internet of Things

(2023) KSII Transactions on Internet and Information Systems, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173609984&doi=10.3837%2ftiis.2023.09.005&partnerID=40&md5=1951529ba581ef5409e2d3cf4171437c>

AFFILIATIONS: Computer Science Department., Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: In our daily lives, we engage in a variety of tasks that rely on our senses, such as seeing. Blindness is the absence of the sense of vision. According to the World Health Organization, 2.2 billion people worldwide suffer from various forms of vision impairment. Unfortunately, blind people face a variety of indoor and outdoor challenges on a daily basis, limiting their mobility and preventing them from engaging in other activities. Blind people are very vulnerable to a variety of hazards, including falls. Various barriers, such as stairs, can cause a fall. The Internet of Things (IoT) is used to track falls and send a warning message to the blind caretakers. One of the gaps in the previous works is that they were unable to differentiate between falls true and false. Treating false falls as true falls results in many false alarms being sent to the blind caretakers and thus, they may reject the IoT system. As a means of bridging this chasm, this paper proposes an intelligent shoe that is able to precisely distinguish between false and true falls based on three sensors, namely, the load scale sensor, the light sensor, and the Flex sensor. The proposed IoT system is tested in an indoor environment for various scenarios of falls using four models of machine learning. The results from our system showed an accuracy of 0.96%. Compared to the state-of-the-art, our system is simpler and more accurate since it avoids sending false alarms to the blind caretakers. © 2023 Korean Society for Internet Information. ABSTRACT: This study delves into recent legislation in Jordan regarding the decriminalization of narcotics and traces the evolution of related legislation in the country. It explores the definition and underlying philosophy of decriminalization while examining arguments from both proponents and opponents of drug decriminalization from a jurisprudential perspective. Additionally, the research

sheds light on practices that have emerged in response to the decriminalization of narcotics in other jurisdictions. The study thoroughly examines the advantages and disadvantages of decriminalizing narcotics, analyzing its potential impact on drug consumption. Finally, the researcher proposes the implementation of a gradual and partial systematic plan within Jordanian legislation to address the growing trend of drug decriminalization. The paper also provides insights into the stances of the United States and other countries on this issue and how their legislations have addressed it. © 2023 DSR Publishers/The University of Jordan. ABSTRACT: The protein corona forms spontaneously on nanoparticle surfaces when nanomaterials are introduced into any biological system/fluid. Reliable characterization of the protein corona is, therefore, a vital step in the development of safe and efficient diagnostic and therapeutic nanomedicine products. 2134 published manuscripts on the protein corona are reviewed and a down-selection of 470 papers spanning 2000–2021, comprising 1702 nanoparticle (NP) systems is analyzed. This analysis reveals: i) most corona studies have been conducted on metal and metal oxide nanoparticles; ii) despite their overwhelming presence in clinical practice, lipid-based NPs are underrepresented in protein corona research, iii) studies use new methods to improve reliability and reproducibility in protein corona research; iv) studies use more specific protein sources toward personalized medicine; and v) careful characterization of nanoparticles after corona formation is imperative to minimize the role of aggregation and protein contamination on corona outcomes. As nanoparticles used in biomedicine become increasingly prevalent and biochemically complex, the field of protein corona research will need to focus on developing analytical approaches and characterization techniques appropriate for each unique nanoparticle formulation. Achieving such characterization of the nano-bio interface of nanobiotechnologies will enable more seamless development and safe implementation of nanoparticles in medicine. © 2023 The Authors. ABSTRACT: A tremendous number of solar tracking systems are available in the market, no design however offers a fully autonomous operation that could track the sun with no prior information about

the location, or the season. The proposed paper presents a design, development and control of dual-axes solar tracking systems. The tracking system consists of two DC-motor for two different axes, the incidence and declination angles, and a set of solar sensors. A set of sensors is employed to acquire the required data to compute the optimum zenith and azimuth angles. The advantage of the proposed that it can be used anywhere with no information needed regarding latitude nor longitude coordinates. The experimental results show a significant improving, like 76%, of performance obtained using dual axes tracking system compared with the fixed horizontal surfaces in the summer in Jordan, and 41% in winter. © (2023), (International Journal of Renewable Energy Research). ABSTRACT: The emergence of resistance to first-line antimalarial drugs calls for the development of new therapies for drug-resistant malaria. The efficacy of quinoline-based antimalarial drugs has prompted the development of novel quinolines. A panel of 4-aminoquinoline hydrazone analogues were tested on the multidrug-resistant K1 strain of *Plasmodium falciparum*: IC₅₀ values after a 48 h cycle ranged from 0.60 to 49 μM, while the 72 h cycle ranged from 0.026 to 0.219 μM. Time-course assays were carried out to define the activity of the lead compounds, which inhibited over 50% growth in 24 h and 90% growth in 72 h. Cytotoxicity assays with HepG2 cells showed IC₅₀ values of 0.87–11.1 μM, whereas in MDBK cells, IC₅₀ values ranged from 1.66 to 11.7 μM. High selectivity indices were observed for the lead compounds screened at 72 h on *P. falciparum*. Analyses of stage specificity revealed that the ring stages of the parasite life cycle were most affected. Based on antimalarial efficacy and in vitro safety profiles, lead compound 4-(2-benzylidenehydrazinyl)-6-methoxy-2-methylquinoline 2 was progressed to drug combination studies for the detection of synergism, with a combinatory index of 0.599 at IC₉₀ for the combination with artemether, indicating a synergistic antimalarial activity. Compound 2 was screened on different strains of *P. falciparum* (3D7, Dd2), which maintained similar activity to K1, suggesting no cross-resistance between multidrug resistance and sensitive parasite strains. In vivo analysis with 2 showed the suppression of parasitaemia with *P. yoelii* NL (non-lethal)-treated mice (20 mg/kg and 5 mg/kg). © 2023 by the authors.

ABSTRACT: The nuclear dependence of the inclusive inelastic electron scattering cross section (the EMC effect) has been measured for the first time in B10 and B11. Previous measurements of the EMC effect in $A \leq 12$ nuclei showed an unexpected nuclear dependence; B10 and B11 were measured to explore the EMC effect in this region in more detail. Results are presented for Be9, B10, B11, and C12 at an incident beam energy of 10.6 GeV. The EMC effect in the boron isotopes was found to be similar to that for Be9 and C12, yielding almost no nuclear dependence in the EMC effect in the range $A=4-12$. This represents important new data supporting the hypothesis that the EMC effect depends primarily on the local nuclear environment due to the cluster structure of these nuclei. © 2023 American Physical Society.

ABSTRACT: Gold nanoparticles (AuNPs) are one of the most stable nanoparticles that have been prevalently used as examples for biological and biomedical applications. Herein, we evaluate the effect of AuNPs on the biological processes of dental pulp stem cells derived from exfoliated deciduous teeth (SHED). Two different shapes of PEGylated AuNPs, rods (AuNR-PEG) and spheres (AuNS-PEG), were prepared and characterized. SHED cells were treated with different concentrations of AuNR-PEG and AuNS-PEG to determine their effect on the stemness profile of stem cells (SCs), proliferation, cytotoxicity, cellular uptake, and reactive oxygen species (ROS), for cells cultured in media containing-fetal bovine serum (FBS) and serum-free media (SFM). Our results showed that both nanoparticle shapes maintained the expression profile of MSC surface markers. Moreover, AuNS-PEG showed a stimulatory effect on the proliferation rate and lower toxicity on SHED, compared to AuNR-PEG. Higher concentrations of 0.5–0.125 nM of AuNR-PEG have been demonstrated to cause more toxicity in cells. Additionally, cells treated with AuNPs and cultured in FBS showed a higher proliferative

rate and lower toxicity when compared to the SFM. For cellular uptake, both AuNS-PEG and AuNR-PEG were uptaken by treated cells efficiently. However, cells cultured in SFM media showed a higher percentage of cellular uptake. For ROS, AuNR-PEG showed a significant reduction in ROS at lower concentrations (<0.03 nM), while AuNS-PEG did not show any significant difference compared to the control untreated cells. Thus, our results give evidence about the optimum concentration and shape of AuNPs that can be used for the differentiation of stem cells into specific cell lineages in tissue engineering and regenerative medicine. © 2023 by the authors.

ABSTRACT: Most university campuses, such as the campus of Al-Zaytoonah University of Jordan (ZUJ), are usually large and comprise many buildings. Finding the location of an office, a lecture hall, a service center, etc. is not an easy task for most visitors and even for many students and employees. Therefore, a virtual tour of the campus and its buildings will provide a valuable tool that eases this task, especially when it is available on a public website and accessible without the need for special virtual reality devices. Previous studies on virtual tours focused on their important marketing aspect. On the other hand, this study is focused on using virtual tours as a guide for finding the specific locations that different users seek to visit. Consequently, a virtual tour of ZUJ has been designed and provided via the university website. The building names and numbers are provided on the website in Arabic and English with links to their tours. The tours that lead to the important locations include many significant details inside the buildings such as room numbers, bathroom signs, and door signs. The study showed user satisfaction with the tours and the efficacy of using the website without special virtual reality devices. © 2023 NSP.

ABSTRACT: This paper establishes a novel fractional-order version of a recently expanded form of the Susceptible-Exposed-Infectious-Recovery (SEIR) Mpox model. This model is investigated by means of demonstrating some significant findings connected with the stability analysis and the vaccination impact, as well. In particular, we analyze the fractional-order Mpox model in terms of its invariant region, boundedness of solution, equilibria, basic reproductive number, and its elasticity. In accordance with an effective vaccine, we study the progression and dynamics of the Mpox disease in compliance with various scenarios of the vaccination ratio through the proposed fractional-order Mpox model. Accordingly, several numerical findings of the proposed model are depicted with the use of two numerical methods; the Fractional Euler Method (FEM) and Modified Fractional Euler Method (MFEM). Such findings demonstrate the influence of the fractional-order values coupled with the vaccination rate on the dynamics of the established disease model. © 2023 by the authors.

ABSTRACT: The aim of this work is to describe the dynamics of a discrete fractional-order reaction-diffusion FitzHugh-Nagumo model. We established acceptable requirements for the local asymptotic stability of the system's unique equilibrium. Moreover, we employed a Lyapunov functional to show that the constant equilibrium solution is globally asymptotically stable. Furthermore, numerical simulations are shown to clarify and exemplify the theoretical results. © 2023 by the authors.

ABSTRACT: In this paper, we study a class of spherical integral operators (Formula presented.). We prove an inequality that relates this class of operators with some well-known Marcinkiewicz integral operators by using the classical Hardy inequality. We also attain the boundedness of the operator (Formula presented.) for some (Formula presented.) whenever (Formula presented.) belongs to a certain class of Lebesgue spaces. In addition, we introduce a new proof of the optimality condition on (Formula presented.) in order to obtain the (Formula presented.) -boundedness of (Formula presented.). Generally, the purpose of this work is to set up new proofs and extend several known results connected with a class of spherical integral operators. © 2023 by the authors.

ABSTRACT: Purpose: Nurses are susceptible to unfavorable effects of workplace accidents and injuries, therefore, perceived management commitment to safety and psychological empowerment can help nurses to participate in safety measures and adhere to safety performance. Thus, this study aimed to examine the relationship between perceived management commitment to safety, psychological empowerment, and safety performance among emergency nurses in Jordan. Methods: A cross-sectional, descriptive correlational design was used and 306 registered nurses working in the emergency department in Jordanian governmental hospitals were recruited. A self-structured questionnaire consisting of the perceived management commitment to safety scale, psychological empowerment scale, and safety performance scale was used to collect data during the period from July 2022 to August 2022. Results: The findings demonstrated that the levels of study variables revealed as follows: the perceived management commitment to safety mean was 3.1 (SD = 0.66) out of 5, which indicated an acceptable level, the mean score of psychological empowerment was 5.37 (SD = 0.94) out of 7, which reflected that the nurses perceived the work environment to be psychologically empowered, and the mean score for safety performance was 4.02 (SD = 0.56) out of 5, which indicated an acceptable level of safety performance among the participants, and the mean for subscales (safety compliance and participation) was 4.07 (SD = 0.57) and 3.93 (SD = 0.69) out of 5, respectively. Also, there was a positive correlation between safety performance and perceived management commitment to safety ($r = 0.334$, $p < 0.001$), and psychological empowerment ($r = 0.592$, $p < 0.001$). Conclusion: It is necessary to

implement continuous interventions centered on empowering emergency nurses psychologically, which has a positive effect on safety performance. Given management's commitment to safety as a priority topic of discussion at group meetings creating a work environment that encourages nurses' safety performance should be encouraged. © 2023 Elsevier Ltd

ABSTRACT: –This paper provides a new argument for the specifier-to-specifier anti-locality constraint from covert movement. The argument is based on an observed asymmetry behavior of the Quantifier Raising (QR) of the superlative morpheme in two superlative adjectives modifying relative clauses in Levantine Arabic (LA): the two superlative modifiers give rise to different paradigms of high and low interpretations.1 The paper shows that a configuration restricted by the specifier-to-specifier anti-locality constraint straightforwardly explains the asymmetry lending further evidence supporting this syntax-economy condition from covert movement. © 2023 ACADEMY PUBLICATION.

ABSTRACT: This study investigates the factors that influence the sharing of information on social media platforms and examines the effects of perceived security, perceived privacy, and user awareness on users' trust in social media platforms, as well as the moderating effects of age, gender, educational attainment, and internet proficiency on information sharing. The study collected data from 837 social media users in Jordan and analyzed them using structural equation modeling (SEM), con-firmatory factor analysis (CFA), and machine learning (ML) methods. The findings of the study indicate that perceived security, perceived privacy, and user awareness all have a significant impact on users' trust in social media platforms. Trust, in turn, has a significant impact on the amount of information shared on these platforms. Also, the findings of this study provide valuable insights into the dynamics of information sharing on social networks. This knowledge will be of interest to managers, policymakers, and developers of social media platforms. In addition, the findings of the study also have implications for the privacy and security of social media users. For example, social media users can be more careful about the information they share on social media platforms, and they can take steps to protect their privacy. © 2023 by the authors; licensee Growing Science, Canada.

ABSTRACT: The study aimed to investigate the impact of creative thinking on marketing ideas and their influence on the structure of modern Jordanian advertisements for telecommunications companies. The methodology involved developing a survey instrument with four independent variables and one dependent variable. The independent variables were Creative Marketing (CM), Marketing Strategy (MS), Online

Marketing (OM), and Social Media Marketing (SMM). The dependent variable was the Structure of the Modern Jordanian Advertisement (SMJA). The study population is customers of Jordanian telecommunications companies who reside in Jordan. A sample size of 270 respondents was selected through a convenience sampling method. The data were analyzed using statistical software, such as SPSS and AMOS 27 version, to test the research hypotheses. The results indicate that all four paths are statistically significant. The first hypothesis, which relates to creative marketing, has the highest estimated result of 0.62, while the second, third and the fourth hypotheses have estimated results of 0.152, 0.133, and 0.111, respectively. Overall, the results support the hypothesis that all four marketing domains have a significant impact on SMJA. © 2023 by the authors; licensee Growing Science, Canada.

ABSTRACT: This paper investigates the driving factors behind sustainable supply chains in Jordan, focusing on the implementation of blockchain technology, customs ports practices, and technological infrastructure. The primary data for the study was collected through questionnaires distributed to employees working in the Jordanian customs. A random sampling method was employed to select participants, and a total of 184 valid questionnaires were retrieved for analysis. The collected data was analyzed using the statistical software Smartpls PLS4. The results of quantitative research reveal that the implementation of blockchain technology and technological infrastructure positively affects the driving of sustainable supply chains in Jordan, also customs ports practices also have a positive impact on driving sustainable supply chains, emphasizing the significance of efficient and resilient customs operations for sustainability. Additionally, compliance with environmental regulations enhances the effectiveness of blockchain technology in achieving sustainability objectives. Moreover, underscoring the role of robust technological capabilities in supporting sustainable operations within customs ports. The study contributes to the understanding of the key drivers of sustainable supply chains in Jordan, providing valuable insights for policymakers, supply chain managers, and other stakeholders involved in promoting sustainability within the customs ports industry. The findings can guide decision-making and inform strategies aimed at enhancing eco-efficiency and resilience in supply chain operations. © 2023 Growing Science Ltd. ABSTRACT: The objective of this study was to showcase the influence of Business Intelligence (BI) tools, such as Online Analytical Processing (OLAP), Extract, Transform, Load (ETL) processes, Data Mining (DM), Relational Database Management Systems (RDBMS), and Document Management Systems (DMS), on maintaining the quality of financial reports in Jordanian commercial banks listed on the Amman Stock Exchange. Two approaches were employed to achieve the research objectives: a descriptive-analytical approach involving the development of a questionnaire to gather primary data on the independent variables associated with BI tools (OLAP, ETL, DM, RDBMS, DMS), and an applied approach to evaluate the dependent variable represented by the sustainability of financial report quality, utilizing the financial statements of commercial banks listed on the Amman Stock Exchange from (2016 to 2021). Data analysis and hypothesis testing were conducted using statistical software (SPSS) through multiple regression analysis. The results of the statistical data analysis and input from the research community indicated that the sustainability of financial report quality, as a valuable asset for banks, relies on the utilization of Business Intelligence tools. IT professionals in commercial

banks perceive a statistically significant impact of BI tools on maintaining the quality of financial reports. Consequently, the management of commercial banks listed on the Amman Stock Exchange should prioritize the effective utilization of Business Intelligence tools, as their potential lies in aiding the accounting process to achieve its objectives, which ultimately contribute to the sustainability of financial reports. By employing these tools accurately and efficiently in accounting practices, all stages of the accounting process can be influenced, enabling the transformation of available data into information that benefits decision-makers both internally and externally within the banking environment. © 2023 Growing Science Ltd. ABSTRACT: The article aims at investigating whether audit quality impacts the relationship between ownership structure and dividends in companies listed on the Amman Stock Exchange (ASE). The article is constructed on the analysis of time-series-cross-section (TSCS) (Panel Data). The study sample comprises 34 companies listed on the Amman Stock Exchange between 2016 and 2021. The study sample's content of the financial reports is analyzed to attain appropriate data for the study. The Findings indicate that family ownership and ownership of board members negatively impact dividends. In contrast, institutional ownership and concentrated ownership positively impact dividends, as no effect of foreign ownership is found on dividends. By introducing audit quality as a modified variable on the relationship between ownership structure and dividends, the findings demonstrate that audit quality positively enhances and strengthens this relationship. This article with its results is of great significance to future stockholders and shareholders, as they help in selecting companies capable of distributing higher dividends than other companies and achieving satisfactory investment returns. The findings of the study also focus on the significance of audit quality as a guarantor for regulating the relationship between forms of ownership structure and the distribution of dividends. This study is regarded among the little research investigating the factors that would impact the relationship between ownership structure and dividends. This article plays a key role in bridging the research gap related to the lack of studies dealing with the relationship between ownership structure and dividends in emerging markets. © 2023 Growing Science Ltd. ABSTRACT: Introduction: Drug-related problems (DRPs) are events or circumstances involving drug therapy that actually or potentially interferes with desired health outcomes. Objectives: To assess community pharmacists' knowledge and practice regarding DRP-reduction services, as well as the barriers and factors associated with decreased provision of these services. Methods: This cross-sectional study utilized a validated questionnaire to assess pharmacists' knowledge, practice, and barriers to the provision of DRP-reduction services in the community pharmacy setting. Binary regression model was used to assess the variables associated with the practice of DRP-reduction services. Results: A total of 412 pharmacists participated in the study. The pharmacists demonstrated

strong knowledge but inadequate practice of DRP-reduction services. The most reported DRPs were inappropriate combination of drugs, or drugs and herbal medications, or drugs and dietary supplements (52.4%), patients' inability to understand instructions properly (46.1%), inappropriate drug according to guidelines (43.7%), and too high dose (40.3%). The most common barriers to these services were increased workload (60.5%), limited time (53.2%), and lack of good communication skills (49.8%). The presence of a counselling area in the pharmacy increased the practice of DRP-reduction services (OR: 3.532, 95%CI: 2.010-5.590, $P < 0.001$), while increased weekly working hours (OR: 0.966, 95%CI: 0.947-0.986), $P < 0.01$) and serving < 10 patients daily (OR = 0.208, 95%CI: 0.072-0.601, $P < 0.01$) decreased it. Conclusions: Community pharmacists' practice of DRP-reduction services showed a scope for improvement. Future pharmaceutical care initiatives should increase the number of personnel working in the pharmacy and provide them with opportunities for continued education and training in order to improve the provision of DRP services and optimize patients' outcomes. © 2023 The Author(s)

ABSTRACT: The efficiency of a photovoltaic (PV) panel decreases as its temperature increases, which is caused by an increase in solar irradiation. To maintain high electricity efficiency, it is necessary to keep the PV's operating temperature low. Therefore, a cooling system is needed to decrease the temperature of PV panels, especially when solar irradiation is high. Hybrid nanoparticles have attracted considerable interest in the field of PV cooling because of their distinctive characteristics and potential uses. They have the ability to significantly improve the performance and efficiency of solar panels. By offering advantages such as effective heat dissipation, improved heat transfer, favorable optical properties, increased stability, and cost-effectiveness, hybrid nanoparticles play a critical role in enhancing PV cooling. Leveraging these unique attributes, hybrid nanoparticles hold the potential to elevate the efficiency, reliability, and overall performance of photovoltaic systems. This study involved a three-stage process. The initial two stages focused on identifying the optimal concentration of Zinc oxide water-based nanofluid and Titanium oxide water-based nanofluid. The third stage sought to determine the ideal combination of these two nanofluids. Throughout each stage, five identical PV modules were utilized and placed adjacent to one another. During the experiment, one PV module was used as a base, while the other four were coated on their backside with a specific concentration of the corresponding nanofluid type. During the study, K-type thermocouples were employed to measure the hourly averaged backside temperature of each module. These thermocouples were attached to the backside of the modules to obtain accurate readings. Additionally, a GL 220 midi logger was utilized to record the voltage, current, and power of each PV throughout the duration of the experiment. Based on the findings of the study, it was found that in general, the performance of each PV was improved upon the coating process, with the best PV panel performance obtained when using a mixture of 0.4% TiO₂ and 0.2% ZnO concentration by increasing the output power by 22.81% and increasing the efficiency by 29.47%. © 2023

ABSTRACT: Agriculture is an important sector that plays a key role in the economic growth of countries. Innovative agricultural advancements has undoubtedly supported the expansion of the capacity and efficiency of different agricultural activities. According to the United Nations Food and Agriculture Organization assessment, the world's population is expected to reach 8.5 billion by 2030, and 9.6 billion by 2050 which will result in an unprecedented demand for food and agriculture products. It is estimated that the food production should increase by 70 percent to meet such a

demand. Given the limited farming space, lack of water, climate change, and constantly changing environmental conditions, new and innovative smart agriculture solutions must be developed. In general, there has been an increase in the agricultural production volume over the time to ensure the food security. Efforts are being made to increase the quality and quantity of agribusiness products by transforming them into smart and connected products through a smart agriculture industry. Smart and precision agriculture refers to the integration of technology, such as the Internet of things, sensors, robotics, artificial intelligence, smart supply chains, big data analytics, and blockchain, into the agriculture industry. The Internet of things era is the umbrella that covers and enables the other technological tools. Smart technology integration can lead to a more productive and efficient agriculture via reducing the need for manual human interactions and making proactive intelligent decisions. This article aims at providing a survey on smart and sustainable agriculture focusing on its enabling technologies while providing future directions for improvement. © 2023 Elsevier Ltd

ABSTRACT: Background: Suicidal thoughts and behaviours (STBs) are significant public health challenges that affect a variety of individuals and communities. Despite numerous efforts to discover and refine psychotherapy treatments to minimize STBs, the efficacy of STB treatments remains unclear. Objective: Conduct a scoping review to assess the efficacy of using psychotherapy treatments to minimize STBs among individuals with obsessive-compulsive disorder (OCD). Method: A scoping review was conducted using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews guidelines (PRISMA-ScR) to screen 163 studies published between 2010 and 2021. Results: A total of seven articles that fulfil the eligibility criteria reported that psychotherapy treatments for obsessive-compulsive disorder were found to be effective and applicable approaches to minimize the severity of the OCD symptoms and STBs, despite variance in studies' target samples, types of interventions, periods and indicators. Conclusion: The current review has provided evidence showing the significant effects of psychotherapy treatments on various health-related aspects of life for individuals diagnosed with obsessive-compulsive disorder, and it is recommended to use them for enhancing treatment outcomes and minimizing STBs. Implication for Practice: This scoping review verifies the formalization and incorporation of psychotherapy treatments for OCD to minimize STBs into standard practice and highlights the importance of mental health professionals being part of the implementation of these treatments. © 2023 John Wiley & Sons Ltd.

ABSTRACT: Purpose: This study purposed to evaluate the effect of the Incredible Years Autism Spectrum and Language Delays (IY-ASD) program in reducing parents' stress and improving aggressive and disruptive behaviors in the parents among parents of children with autism spectrum disorder in Palestine. Design and methods: A one-group pre-posttest design was used. Thirty-four parents who enrolled in the Palestinian Child Institute in Nablus were recruited. Results: Findings revealed a significant difference between parents' total stress pre and post-IY-ASD ($t = 1.2$, $p < 0.01$ and parents' behavioral management skills toward their children with autism spectrum disorder. The study demonstrated that the IY-ASD program for 16 sessions reduced stress among parents of children with autism spectrum disorder in Palestine and improved aggressive and disruptive behaviors in the parents. Conclusion: The IY-ASD program can be successfully implemented for parents of this cohort group. Practice implications: Healthcare providers can adopt such a program for enhancing parenting

roles with their children experiencing autism spectrum disorder. © 2023 Elsevier Inc.

ABSTRACT: Background: The combinations of BRAF + MEK inhibitors—encorafenib (ENC) + binimetinib (BIN), cobimetinib (COB) + vemurafenib (VEM), and dabrafenib (DAB) + trametinib (TRA)—are recommended for the treatment of BRAF-mutated advanced melanoma. Objective: To assess the cost-effectiveness and cost-utility of ENC + BIN versus COB + VEM versus DAB + TRA from a US payer perspective. Methods: A Markov model was constructed to simulate a hypothetical cohort over a time horizon of 10 years. The overall survival (OS) and progression-free survival (PFS) curves were independently digitized from a randomized controlled trial for ENC + BIN and fitted using R software. Published and indirectly estimated hazard ratios were used to fit OS and PFS curves for COB + VEM and DAB + TRA. Costs, life-year gains, and quality-adjusted life years (QALYs) associated with the 3 treatment combinations were estimated. A base case analysis and probabilistic sensitivity analysis (PSA) were conducted to estimate the incremental cost-utility ratio (ICUR). A discount rate of 3.5% was applied on cost and outcomes. Results: The ENC + BIN versus COB + VEM comparison was associated with an ICUR of \$656 233 per QALY gained. The ENC + BIN versus DAB + TRA comparison was associated with an ICUR of \$3 135 269 per QALY gained. The DAB + TRA combination dominated COB + VEM. The base case analysis estimates were confirmed by the PSA estimates. ENC + BIN was the most cost-effective combination at a high willingness-to-pay (WTP) threshold of \$573 000 per QALY and \$1.5 million/QALY when compared to COB + VEM and DAB + TRA, respectively. Conclusion and Relevance: Given current prices and acceptable WTP thresholds, our study suggests that DAB + TRA is the optimum treatment. In this study, ENC + BIN was cost-effective only at a very high WTP per QALY threshold. © The Author(s) 2023.

ABSTRACT: Purpose: This paper assesses the continuance intention (CI) for mobile-based payment (M-payment) services following the COVID-19 pandemic by combining the self-efficacy construct with the electronic service quality model. Design/methodology/approach: This exploratory, cross-sectional research employs qualitative and quantitative research methods; specifically, a questionnaire and interviews. A total of 403 Jordanian participants completed valid questionnaires. Mediation and moderation evaluations assessed the M-payment service quality (MPSQ), self-efficacy and health concerns (HC) to determine CI. Findings: The results verify the significance of MPSQ and self-efficacy in developing CI and show the mediating influence of self-efficacy between MPSQ and CI. Moreover, HC negatively impact the self-efficacy/CI link. Practical implications: This research benefits M-payment service providers seeking to secure customer loyalty via improved M-payment services. The behavioral intention investigation will provide rich information about potential customers' CI and illuminate areas for development. Originality/value: This research makes an original contribution to the existing M-payment literature by investigating the impact of customers' perception of service quality on their CI to utilize M-payment services, balanced with self-efficacy and HC. © 2022, Emerald Publishing Limited.

ABSTRACT: This study, entitled: "The legal aspects and the enhanced role of cybersecurity in protecting the electronic voting process", dealt with the concept of the electronic voting process, in addition to the most important characteristics of that process, as well as highlighting the pros and cons related to the electronic voting system. Then, the researchers singled out a proposed approach for the electronic voting process in terms of the adopted mechanism and cyber protection in accordance with the provisions of the Jordanian Election Law No. (4) of 2022. At the end of the research, the researchers recommended activating the text of Article 40 of the electoral law by issuing legislation that regulates the electronic voting process and enhances the protection of cyber security, and then updating the technical and legislative system of the Independent Election Commission and the Ministry of Political Development. © 2023 NSP Natural Sciences Publishing Cor.

ABSTRACT: From the perspective of the importance of the fractional-order linear time-invariant (FoLTI) system in plenty of applied science fields, such as control theory, signal processing, and communications, this work aims to provide certain generic solutions for commensurate and incommensurate cases of these systems in light of the Adomian decomposition method. Accordingly, we also generate another general solution of the singular FoLTI system with the use of the same methodology. Several more numerical examples are given to illustrate the core points of the perturbations of the considered singular FoLTI systems that can ultimately generate a variety of corresponding solutions. © 2023 by the authors.

ABSTRACT: Discrete fractional models with reaction-diffusion have gained significance in the scientific field in recent years, not only due to the need for numerical simulation but also due to the stated biological processes. In this paper, we investigate the problem of synchronization-control in a fractional discrete nonlinear bacterial culture reaction-diffusion model using the Caputo h-difference operator and a second-order central difference scheme and an L1 finite difference scheme after deriving the discrete fractional version of the well-known Degn-Harrison system and Lengyel-

Epstein system. Using appropriate techniques and the direct Lyapunov method, the conditions for full synchronization are determined. Furthermore, this research shows that the L1 finite difference scheme and the second-order central difference scheme may successfully retain the properties of the related continuous system. The conclusions are proven throughout the paper using two major biological models, and numerical simulations are carried out to demonstrate the practical use of the recommended technique. © 2023 by the authors.

ABSTRACT: In general, construction projects are vulnerable to various risks during their life cycle. These risks may negatively affect the project cost and duration, in addition to other factors, including environmental impact, health and safety, and quality of construction work. The COVID-19 pandemic has brought more challenges to construction projects. This study presents an assessment of 47 major risks affecting construction projects. The research investigates and assesses the risk factors associated with a special type of construction project, namely, projects funded by external sources, due to their importance, characteristics, and sensitivity. Furthermore, the study was carried out under the impact of the special conditions and constraints associated with the COVID-19 health pandemic. These conditions provided specific types of risks, results of risk assessment, and recommended responses to the risks. The studied risks were categorized using the PESTLE technique, an external factor analysis technique, which includes six groups of Political, Economic, Social, Technological, Legal, and Environmental risks. A questionnaire survey was conducted on 34 construction organizations that implemented or supervised projects funded by external sources. The aim of the survey was to assess the risks affecting the construction projects in terms of probability of occurrence and severity on the projects' cost and time schedule. Then, the importance of each risk was calculated, and the risks were ranked according to their importance. The results showed the high importance of environmental and legal risks and indicated that the most important risk factors are the difficulty of issuing licenses and permits and the inappropriate definition of the scope of work. This study would help managers and fund providers make decisions regarding risks during uncontrolled pandemic or disastrous circumstances. Although the current study was conducted in Jordan, its procedures and results can be useful in other locations with different properties and conditions. © 2023 by the authors.

ABSTRACT: In the last few years, reaction-diffusion models associated with discrete fractional calculus have risen in prominence in scientific fields, not just due to the requirement for numerical simulation but also due to the described biological phenomena. This work investigates a discrete equivalent of the fractional reaction-diffusion glycolysis model. The discrete fractional calculus tool is introduced to the discrete modeling of diffusion problems in the Caputo-like delta sense, and a fractional discretization diffusion model is described. The local stability of the equilibrium points in the proposed discrete system is examined. We additionally investigate the global stability of the equilibrium point by developing a Lyapunov function. Furthermore, this study indicates that the L1 finite difference scheme and the second-order central difference scheme can successfully

preserve the characteristics of the associated continuous system. Finally, an equivalent summation representing the model's numerical formula is shown. The diffusion concentration is further investigated for different fractional orders, and examples with simulations are presented to corroborate the theoretical findings. © 2023 by the authors.

ABSTRACT: Variable-order fractional discrete calculus is a new and unexplored part of calculus that provides extraordinary capabilities for simulating multidisciplinary processes. Recognizing this incredible potential, the scientific community has been researching variable-order fractional discrete calculus applications to the modeling of engineering and physical systems. This research makes a contribution to the topic by describing and establishing the first generalized discrete fractional variable order Gronwall inequality that we employ to examine the finite time stability of nonlinear Nabla fractional variable-order discrete neural networks. This is followed by a specific version of a generalized variable-order fractional discrete Gronwall inequality described using discrete Mittag-Leffler functions. A specific version of a generalized variable-order fractional discrete Gronwall inequality represented using discrete Mittag-Leffler functions is shown. As an application, utilizing the contracting mapping principle and inequality approaches, sufficient conditions are developed to assure the existence, uniqueness, and finite-time stability of the equilibrium point of the suggested neural networks. Numerical examples, as well as simulations, are provided to show how the key findings can be applied. © 2023 by the authors.

ABSTRACT: The study of the blow-up phenomenon for fractional reaction-diffusion problems is generally deemed of great importance in dealing with several situations that impact our daily lives, and it is applied in many areas such as finance and economics. In this article, we expand on some previous blow-up results for the explicit values and numerical simulation of finite-time blow-up solutions for a semilinear fractional partial differential problem involving a positive power of the solution. We show the behavior solution of the fractional problem, and the numerical solution of the finite-time blow-up solution is also considered. Finally, some illustrative examples and comparisons with the classical problem with integer order are presented, and the validity of the results is demonstrated. © 2023 by the authors.

ABSTRACT: A significant addition to fuzzy set theory for expressing uncertain data is an n,m-th power root fuzzy set. Compared to the nth power root, Fermatean, Pythagorean, and intuitionistic fuzzy sets, n,m-th power root fuzzy sets can cover more uncertain situations due to their greater range of displayed membership grades. When discussing the symmetry between two or more objects, the innovative concept of an n,m-th power root fuzzy set over dual universes is more flexible than the current notion of an intuitionistic fuzzy set, a Pythagorean fuzzy set, and a nth power root fuzzy set. In this study, we demonstrate a number of additional operations on n,m-th power root fuzzy sets along with a number of their special aspects. Additionally, to deal with choice information, we create a novel weighted aggregated operator called the n,m-th power root fuzzy weighted power average (FWPA (Formula presented.)) across n,m-th power root fuzzy sets and demonstrate some of its fundamental features. To rank n,m-th power root fuzzy sets, we also define the score and accuracy functions. Moreover, we use this operator to identify the countries with the best standards of living and show how we can select the best option by contrasting aggregate results using score values. Finally, we contrast the results of the FWPA (Formula presented.) operator with the square-root fuzzy weighted power average (SR-FWPA), the nth power root fuzzy weighted power average (nPR-FWPA), the Fermatean fuzzy weighted power average (FFWPA), and the n,m-rung orthopair fuzzy weighted power average (n,m-ROFWPA) operators. © 2023 by the authors.

ABSTRACT: This study's objective is to examine the role of natural resources (NRS) in promoting sustainable development in industrialized economies, with a focus on G7 member states. Using data from 1990 to 2020, we employ rigorous panel data approaches, including second-generation unit root testing, slope heterogeneity analysis, an error correction cointegration approach, and cross-section dependency concerns. Given the nonlinear nature of the data distribution, we employ a cutting-edge approach known as moment quantile regression to accurately capture the correlations. The results indicate that NRS plays a significant role in promoting economic growth in the G7 nations. Alternative forms of energy and expenditure on research and development have been shown to have a negative effect on long-term economic growth. In contrast, forests have a long-term positive impact on sustainable performance. The findings, which are supported by quantile regression analysis, emphasize the significance of each factor in determining the aggregate results. Based on these

findings, the report makes recommendations for increasing investments in R&D and maximizing the use of NRS and forests to improve the sustainable performance of regional ecosystems. In addition, it highlights the importance of confronting forestry and forest management practices to advance sustainability initiatives. These evidence-based recommendations aim to mitigate several aspects of environmental deterioration in the considered setting. © 2023

ABSTRACT: This paper focuses on designing and assessing Pumped Hydroelectric Energy Storage Systems (PHESs) connected to the grid and a PV system for self-consumption constructed at Mutah University in an area of high solar potential. By focusing on the PHES and PV literature, data in the field were acquired based on the grid code needed in Jordan. Next, a search to find a suitable location for installation was conducted. Afterwards, a load profile was added to calculate the energy demand of the university. Then the productivity of the solar power plant of Mutah University was included. Finally, MATLAB software was used to realize the amount of energy to be stored; these data were used to implement the system that was chosen and dimensioned. A PHES layout was created to find the most accurate values for parameters to optimize system performance and to investigate loss analysis. The main finding is that the system attains 9230.89 MWh/year. An annual load yields 4430 MWh/year, which covers the Mutah University demand with an estimated saving of USD 287,607,993. © 2023 by the authors.

ABSTRACT: In this investigation, a novel (3+1)-dimensional Lax integrable Kadomtsev-Petviashvili-Sawada-Kotera-Ramani equation is constructed and analyzed analytically. The Painlevé integrability for the mentioned model is examined. The bilinear form is applied for investigating multiple-soliton solutions. Moreover, we employ the positive quadratic function method to create a class of lump solutions using distinct parameters values. The current study serves as a guide to explain many nonlinear phenomena that arise in numerous scientific domains, such as fluid mechanics; physics of plasmas, oceans, and seas; and so on. © 2023 by the authors.

ABSTRACT: Encrypted currencies have become an undeniable reality among investors and speculators in various countries around the world, which necessitates standing on the most prominent issues raised

by these currencies, so the researchers decided to discuss in detail the theoretical side of encrypted currencies from various perspectives such as the concept, history, reality, future, and the Islamic perspective on it. In this article, we discuss the notion of financial technology, how it began, and where it has reached, coinciding with the business world seeing a new revolution symbolized by the birth of cryptocurrencies and how the world is rapidly approaching it. Furthermore, we discuss the types of currencies and the most famous cryptocurrencies with their advantages and disadvantages in dealing with their applications, their legal regulation, and the extent of legal liability arising from their misuse, followed by a detailed presentation about the blockchain, we also talk about the relationship between cryptocurrencies, their requirements, risks, and struggles, and finally we will talk about cryptocurrencies from the point of view of investors. © 2023 NSP Natural Sciences Publishing Cor.

ABSTRACT: Background: Artificial intelligence (AI) is the capacity of machines to perform tasks that ordinarily require human intelligence. AI can be utilized in various pharmaceutical applications with less time and cost. Objectives: To evaluate community pharmacists' willingness and attitudes towards the adoption of AI technology at pharmacy settings, and the barriers that hinder AI implementation. Methods: This cross-sectional study was conducted among community pharmacists in Jordan using an online-based questionnaire. In addition to socio-demographics, the survey assessed pharmacists' willingness, attitudes, and barriers to AI adoption in pharmacy. Binary logistic regression was conducted to find the variables that are independently associated with willingness and attitude towards AI implementation. Results: The present study enrolled 401 pharmacist participants. The median age was 30 (29–33) years. Most of the pharmacists were females (66.6%), had bachelor's degree of pharmacy (56.1%), had low-income (54.6%), and had one to five years of experience (35.9%). The pharmacists showed good willingness and attitude towards AI implementation at pharmacy (n = 401). The most common barriers to AI were lack of AI-related software and hardware (79.2%), the need for human supervision (76.4%), and the high running cost of AI (74.6%). Longer weekly working hours (attitude: OR = 1.072, 95% C.I (1.040–1.104), P < 0.001, willingness: OR = 1.069, 95% C.I. 1.039–1.009, P-value = 0.011), and higher knowledge of AI applications (attitude: OR = 1.697, 95% C.I (1.327–2.170), willingness: OR = 1.790, 95% C.I. (1.396–2.297), P-value < 0.001 for both) were significantly associated with better willingness and attitude towards AI, whereas greater years of experience (OR = 20.859, 95% C.I (5.241–83.017), P-value < 0.001) were associated with higher willingness. In contrast, pharmacists with high income (OR = 0.382, 95% C.I. (0.183–0.795), P-value = 0.010), and those with <10 visitors (OR = 0.172, 95% C.I. (0.035–0.838), P-value = 0.029) or 31–50 visitors daily (OR = 0.392, 95% C.I. (0.162–0.944), P-value = 0.037) had less willingness to adopt AI. Conclusions: Despite the pharmacists' positive willingness and attitudes toward AI, several barriers were identified, highlighting the importance of providing educational and training programs to improve pharmacists' knowledge of AI, as well as ensuring adequate funding support to overcome the issue of AI high operating costs. © 2023 The Author(s)

ABSTRACT: The modulational instability (MI) of Schamel/modified nonlinear Schrödinger equation (SNLSE) or (mNLSE) and the associated envelope excitations, including bright solitons in a multicomponent dense plasma consisting of relativistically degenerate electrons, trapped ions, and non-degenerate dust species are reported. A conventional multiple scales perturbative technique is utilized to get a SNLSE. This equation is different from the standard NLSE which the SNLSE has a nonlinear term with fractional order (3/2). The MI criteria are derived in detail. Also, the occurrence of envelope solitary wave and the effects of the different physical parameters on its profile are briefly discussed. The current results are advantageous to understand the mechanism of the propagation of the envelope excitations in complex plasmas with trapped ions and relativistically degenerate electrons, such as those observed in space observations and laboratory complex plasma. © 2023 The Author(s)

ABSTRACT: Background: There has been increasing recognition of internet gaming disorder as a psychiatric problem that is linked with serious impairment and distress and correlated with psychological reactions and social consequences. Thus, this study proposed that psychological problems (stress, anxiety, and depression) and social support could be associated with IGD and social support had a mediating role between these psychological problems and IGD among university students in Jordan. Methods: A cross-sectional, descriptive correlational design was adopted. The university students (N = 1020) were selected randomly from four universities (two public and two private) in Jordan. A self-structured questionnaire was used to collect data using the Internet Gaming Disorder Test (IGD-20 Test), Depression Anxiety Stress Scales-21 (DASS-21), Multidimensional Social Support Scale (MSPSS), and sociodemographic data. Findings: Findings of this study found that the mean age of the participants was 21.38 (S.D ± 2.12) and 55.9% of them were males. The prevalence of internet gaming disorder was 12.16% among the participants, where the cut-off point for internet gaming disorder was 71 out of 100. Internet gaming disorder was significantly correlated with stress, anxiety, social support, and depression. However, stress, anxiety, and social support had a direct effect on internet gaming disorder, while social support had the strongest effect on internet gaming disorder. It was found that social support had a mediating role between anxiety and stress ($\beta = -0.172$, T-Statistics = 3.92, $p < 0.001$; $\beta = -0.268$, T-Statistics = 5.45, $p < 0.001$, respectively) and internet gaming disorder ($p < 0.001$). Conclusion: This study can help policymakers and instructors develop health education programs and/or health training programs that focus on using social support as a coping method when experiencing psychological problems including stress and anxiety and adopt social support in management programs for excessive use of internet gaming. © 2023 Elsevier Ltd

ABSTRACT: Objective: Biosimilar (BSM) drugs are currently being manufactured and dispensed in several pharmaceutical markets worldwide, including Jordan. They are clinically similar to biological drugs

in terms of safety, purity, and potency, but with lower cost, hence they are of great interest. Pharmacists play a fundamental role as health care providers, due to their direct contact with patients, in terms of providing information and guidance about BSM drugs and their use for patients. Thus, the aim of this study was to assess the knowledge, familiarity, and attitude with BSM drugs among practicing Jordanian pharmacists. Materials and Methods: A questionnaire which was composed of 25 close-ended questions, was distributed via email and various social media applications to Jordanian pharmacists working in different fields. Results: A total of 400 pharmacists responded to the questionnaire. Overall, the level of knowledge and familiarity about BSM drugs among Jordanian pharmacists was low, as 75% of the respondents had a knowledge score of 66.7%. Poor knowledge was noticed in terms of variability of biological drug formulation lots and the BSM drug, the approval process of BSM drugs, and their cost, with correct answers of the respondents being 30.8%, 16%, and 7.5%, respectively. Nevertheless, the attitude of respondents towards BSM drug dispensing, and increasing patients' access to a variety of treatment options (73.8% and 82.3%, respectively) was rather favorable. Conclusions: The results of our study recognized three knowledge gaps: the variability between the biological drug formulation lots and the BSM drug, the cost of biological and BSM drugs, and understanding the approval process of biological and BSM drugs. So, these findings highlight a significant need for evidence-based education about BSM drugs among Jordanian pharmacists. © 2023 The Author(s)

ABSTRACT: Glass fibre reinforced polymers (GFRP) bars have attracted increasing interest as a promising alternative for conventional steel reinforcement for its contribution towards sustainability and significantly improving the flexural performance of structural members. To mitigate the excessive deflections and crack widths exhibited by the FRP reinforced concrete members, fibre reinforced concrete (FRC) is employed which improves the toughness and cracking capacity of members. However, available research on the structural performance of FRC has focused on metallic fibres. The research presented in this paper is aimed at experimentally evaluating the influence of synthetic fibres on the time-dependent flexural behaviour of FRC beams reinforced with GFRP bars. Eight simply supported beams with varying synthetic fibre contents and GFRP bar diameters (but same reinforcement ratio) were tested under sustained service load. Creep under compression, concrete shrinkage, cracking moment, and deflection behaviour over 90 days were monitored and analyzed. Investigation revealed that the inclusion of synthetic fibres reduced the concrete deformations under creep and shrinkage by up to 22% and 26% respectively, increased the cracking capacity by 27%, increased the effective moment of inertia by 75%, and also resulted in up to 43% lower deflections. Suitability of several codes to predict the deformations and deflections under short and long-term conditions was also evaluated through comparison of the prediction models to the experimental results. Model proposed by ACI 440.1R-15 was found to predict the instantaneous deflection in beams without fibres with reasonable accuracy, however in FRC-GFRP beams, all models tend to overestimate the deflection. Presented research highlights the need for further investigation on non-metallic fibres and their contribution towards improvement of residual and flexural performance of FRC members to improve the validity of existing analytical prediction models. © 2023

ABSTRACT: This study assessed the effect of virtual reality therapy on the stress and anxiety symptoms, in addition to physiological measures, including mean arterial pressure (MAP) and pulse rate among university students. A one group pretest-posttest design was used. The participants were baccalaureate students who enrolled in all faculties at Al-Zaytoonah University of Jordan, Amman

Governorate. This study was conducted between December and January, 2019. The intervention involved an experience as a therapy called River Relaxation virtual reality (VR), which downloaded through Stream VR. The participants attended eight sessions for 15 min two sessions weekly over one month in the VR laboratory. There was a significant difference between the pre-post virtual reality therapy intervention for perceived stress ($t = 8.411$, $p < 0.001$), anxiety ($t = 10.145$, $p < 0.001$), MAP ($t = 6.393$, $p < 0.001$), and pulse ($t = 2.571$, $p < 0.05$). There was a statistically significant lowering in perceived stress, anxiety, and physiological measures including, MAP and pulse as a result of the Virtual Reality Therapy. The findings suggest the importance of integrating virtual reality therapy as an effective intervention to minimize stress and anxiety, and enhance physiological measures among university students. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Electrospun zein mats are known to have poor mechanical and water uptake properties limiting their usefulness as wound dressings. In this study, the effects of the solvent system used, the incorporation of the polymeric additives; polyethylene glycol 20000 (PEG20K) and polyvinylpyrrolidone K30 (PVPK30); and the crosslinking agent Tannic Acid (TA) on the mechanical and water uptake characteristics of zein - based nanofiber mats were investigated. The incorporation of either PEG20K or PVPK30 resulted in an improvement in water vapor sorption and a reduction in water contact-angle of the nanofiber mats. In addition, the incorporation of PEG20K and PVPK30 reduced the ultimate tensile strength, and Young's modulus while increasing the percent elongation of the nanofiber mats. The use of tannic acid as a crosslinking agent led to an increase in the water vapor sorption, ultimate tensile strength, and Young's modulus of the nanofiber mats. Mats with smaller average fiber diameter, greater ultimate tensile strength, higher Young's modulus, and greater water vapor sorption were obtained when using 80% (v/v) aqueous ethanol as a solvent system during the preparation of the nanofiber mats when compared to those produced using 60% (v/v) aqueous ethanol. In addition, using solutions with lower zein concentration resulted in mats with lower average fiber diameter, lower ultimate tensile strength and Young's modulus, and higher percent elongation. Selected formulations were loaded with tetracycline hydrochloride and drug release was evaluated in bulk liquid and using Franz diffusion cells. The use of Franz diffusion cells allowed the discrimination between formulation performance as a function of composition and water uptake properties. Drug release from nanofiber mats was also confirmed by observing the formation of an inhibition zone in cultures of *E. coli* and *S. aureus* using the agar diffusion assay. Improved performance of zein nanofiber mats was achieved using polymeric modifiers and crosslinking with tannic acid improving their suitability for wound dressing applications. © 2023 DSR Publishers/The University of Jordan. ABSTRACT: The hypolipidemic effect of furan carboxamide derivatives was investigated using the Triton WR-1339 rat model. Nineteen compounds were synthesized, including furan-2-carboxamides of benzophenones and acetophenones (a(1-4)), anilines and amine derivatives (a(5-9)), picolinic-2-carboxamide derivatives of benzophenones and acetophenone (a(10-12)) and furan-2-carboxylate esters

of benzophenones and acetophenones, substituted phenols and alcohols (b(1-7)). All the necessary steps were taken to synthesize, purify, and characterize these compounds. They were synthesized by reacting acyl chlorides of the heterocycles with their corresponding amines in the presence of pyridine and tert-butyl acetate. While the conventional heating method yielded acceptable yields for some of the reactions under reflux, the microwave synthesis reactor achieved significantly higher yields for others. Rats with hyperlipidemia were induced with Triton WR-1339 and then subjected to in vivo testing via an intraperitoneal injection of 200 mg kg⁻¹ Triton WR-1339. The model was tested using an oral dose of bezafibrate (100 mg kg⁻¹). After 7 hours of treatment with Triton, the new derivatives represented by compounds a(1-2), a(4-5), a7, and a(10-12) showed significant activity against the complete lipid profile, including a decrease in triglyceride, total cholesterol, and low-density lipoprotein cholesterol and an increase in high-density lipoprotein cholesterol plasma levels. At 20 mg kg⁻¹ dose, these compounds were superior to other lipid-lowering agents in reducing triglyceride levels and slightly increased high-density lipoprotein cholesterol levels. These results indicate a mutual mechanism of action of novel compounds with fibrates, where they have a marked effect on triglyceride and high-density lipoprotein cholesterol levels; for example, a5 causes a significant reduction (p 0.0001) of triglyceride levels by 86%, and a remarkable increase (p 0.0001) in high-density lipoprotein cholesterol plasma levels by 65% as compared to hyperlipidemic rats. © 2023 The Royal Society of Chemistry.

ABSTRACT: Vitamin C, ascorbic acid, is a water-soluble vitamin that is considered as one of the most potent antioxidant agent. It delays early skin aging, protects against harmful free radicals, improves wrinkles appearance under-eye circles, and reduces redness and hyperpigmentation. One of the most common way to deliver vitamin C to the body's tissue is through skin layers. Nevertheless, the effect of such ingredient might be limited due to the stratum corneum barrier which decreases the ability to reach the site of action. In this study, we provide an innovative strategy of utilization dissolving microneedles (MNs) to enhance skin-drug delivery system and overcome problems associated with the conventional formulations. A delivery system of micro-molds which provide a diverse range of three-dimensional (3D) MNs were used for the fabrication of vitamin C patches. Vitamin C MNs were examined for mechanical force tolerance, drug release, dimensional evaluation, dissolution, insertion, and permeation tests. Drug, polymers, and stabilizers were mixed at different ratios. Hydrogels were filled into the molds, centrifuged and left for air dry for 24-48 h. Appearance was visualized under light microscope. Patches were analyzed to determine percent assay of drug loaded, mechanical force, and penetration through the skin. The amount of vitamin C loaded into MNs was found to be 102%. MNs were easily inserted and dissolved through skin within 30 s. The dissolution rate of MNs were tested by using rat skin to determine the release of vitamin C within several time intervals. The in vitro release of vitamin C loaded MNs showed cumulative release percentage up to 70% in 9-10 h. Therefore, MNs as dermal drug delivery system was successfully developed, providing efficient release of vitamin C through the skin. © 2023 DSR Publishers/The University of Jordan. ABSTRACT: Background: The phosphatidylinositol 3-kinase (PI3K α) has been spotlighted as a potential oncogene and therapeutic target for anticancer drug design. Objective: Target compounds were designed employing ligand- and structure-based drug design approaches to address the effect of the compounds' backbones and functionalities on their biological activity. Methods: Synthesis of the targeted compounds, biological evaluation tests against human cancer cell lines, and molecular docking studies. Results: Fortunately, 20 novel series of diverse scaffolds were prepared and characterized by means of FT-IR, ¹H and ¹³C NMR, HRMS, and elemental analysis. In addition, the identity of one core nucleus was successfully interpreted with the aid of X-ray crystallography. Biological activity of prepared compounds was investigated in vitro against human cancer cell lines. Results that these compounds inhibit cell proliferation and induce apoptosis through an increase in caspase-3 activity and a decrease in DNA cellular content. Furthermore, ligand-based pharmacophore modeling showed that the newly synthesized analogues match PI3K α inhibitors fingerprint and the molecular docking studies against PI3K α revealed that the analogues fit PI3K α kinase catalytic domain and form H-bonding with

key binding residues. Conclusion: The harvested series exhibited a potential PI3K α inhibitory activity in human cancer cell lines. © 2023 DSR Publishers/The University of Jordan. All Rights Reserved.

ABSTRACT: Cardiovascular diseases, as coronary heart disease, heart failure, and hypertension are the first leading cause of death in the United States and the third globally. CETP is a glycoprotein excreted mainly from the liver and found in plasma. Normal plasma CETP concentration is 1-4 $\mu\text{g/ml}$, while the ratio increased 70-80% in dyslipidemic patients. There is a growing need for new CETP inhibitors which encourages us to conduct this research. In this work, synthesis and in vitro study for four new 4-bromophenethylbenzamides 9a-d were carried out. In vitro study showed that the targeted compounds 9a-d exhibit acceptable activity against CETP, where compound 9a has a % inhibition of 40.7 at 10 μM concentration. It was found that the presence of the oxy group in both 9a and 9c enhances their activity which could be attributed to Hydrogen-bond formation with the amino acid residues of the CETP binding site. © 2023, University of Jordan, Deanship of Scientific Research. ABSTRACT: Natural products are known to exhibit antimicrobial, anticancer, and antioxidant activities. Among these natural products is cinnamon which contains cinnamaldehyde. Cinnamaldehyde and its derivatives have been reported to have anticancer and antioxidant activities. Coniferyl aldehyde, a non-cytotoxic compound and a cinnamaldehyde derivative, has also been shown to have anticancer activity. In this study, several derivatives of coniferyl aldehyde were synthesized and evaluated for their anticancer and antioxidant activities. Compounds 1, 2, 4, and 8-11 showed cytotoxic activity against H1299 cell line, a non-small cell lung cancer cells, with 4 being the most potent with IC₅₀ value of 6.7 μM . The antioxidant assay experiment showed that compounds 1, 2, and 4 resulted in half the scavenging activity of vitamin C at all tested concentrations. The coniferyl aldehyde itself showed dose-dependent antioxidant activity, with a proposed free radical stabilization mechanism. Thus, our study showed that the synthesized coniferyl aldehyde derivatives exhibit anticancer and antioxidant activities, which might act as potential therapeutic agents. © 2023, University of Jordan, Deanship of Scientific Research. ABSTRACT: The metabolic pathogenesis of thymic carcinomas (TCs) is poorly understood and adjuvant therapy has limited success in metastatic disease and tumor recurrence. Most studies on TCs use two-dimensional (2D) cell culture models, which are not considered as physiologically relevant, and consequently translation to the in-vivo situation remains challenging. Tissue-specific architecture, based in part on interactions with the microenvironment is an essential component of tumors and may be better recapitulated in three-dimensional (3D) cell culture models. Therefore, our goal is to establish 3D thymoma models which will then be used to understand the pharmacokinetics and pharmacodynamics of anticancer drug therapy via metabolic profiling of living cells. Our novel approach using NMR allows for the measurement of small tissue-like models, which are normally not

feasible with standard analytical techniques. The currently-available methods only provide a “snapshot” of the measured time point and tend to be destructive, e.g. dissecting or optical cleaning of the specimen to gain 3D Information – a limitation we overcome with our current method using NMR spectroscopy. In addition, anticancer therapy is only partially effective, mainly due to inherent or drug-induced resistance of tumor cells to standard chemotherapeutics and radiotherapy. Therefore, novel therapeutic strategies are urgently needed. © 2023 DSR Publishers/The University of Jordan. All Rights Reserved.

ABSTRACT: The rate of smokers in Jordan has been among the highest globally. Electronic Nicotine Delivery systems (ENDs) are considered helpful in smoking cessation but also have the potential for metals exposure resulting from their transfer from the metallic coils to the e-liquid upon use. Metal exposure is associated with severe health outcomes. We sought to assess the levels of toxic metals (Cr, Cd, Pb, Ni and Al) transfer from two of the most popular coils used in ENDs among users in Jordan. The validated inductively coupled plasma-optical emission spectroscopy (ICP-OES) with limit of detections (LODs) of 0.10, 0.90, 0.15, 0.13 and 1.00 mg.kg⁻¹ was employed to measure the levels of toxic metals in the e-liquid samples. Following a repetitive usage of coils in both tank and pod systems for five continuous days, the cumulative amount of toxic metals; Ni, Cr, Al and Pb levels were significantly increased in all e-liquids used ($p \leq 0.0001$) compared to the fresh unheated samples. The obtained results showed a time-dependent increase of metals transfer from coils to e-liquids, thus highlighting the need for additional studies to re-assess the safety claims of using ENDs for smoking cessation. © 2023, University of Jordan, Deanship of Scientific Research. ABSTRACT: Fifteen compounds were synthesized and tested as potential carbonic anhydrase III (CAIII) and carbonic anhydrase IX (CAIX) inhibitors, six of which are novel. Amides (a1-4), hydroxamic acids (b1-2), and imines (c1-9) derivatives were evaluated for their inhibitory activity against CAII and CAIX using gas chromatography with modified pH-sensitive pellets. The derivatives showed inhibition percentages between 12-56% for CAIII and 44-59% for CAIX, compared to 49% and 63% for captopril (the positive control), respectively. Imines showed the best inhibition of CAIII, while all derivatives showed comparable activity against CAIX. It is hypothesized that the nitrogen atom in imine, amide, or hydroxamic acid moieties in the vicinity of an ionizable group is in coordination with the zinc ion in the active site. Furthermore, the candidates were tested for their antimicrobial and antifungal activity. Generally, they showed low to zero activity against some gram-positive and negative bacteria. This supports the theory of their ability to bind to human carbonic anhydrase but not to bacterial one. These compounds could serve as useful scaffolds to develop more potent and selective carbonic anhydrase inhibitors as anti-obesity and anticancer candidates. © 2023, University of Jordan, Deanship of Scientific Research. ABSTRACT: Background: Cancer is one of the greatest troubling maladies currently. It is believed that it is the second reason for death following cardiovascular maladies. Owing to the multiplicity of its types, stages and genetic basis, there is no existing drug to cure all types of cancer. Resistance to present drugs and severe adverse effects are other challenges in the struggle against cancer. In such pursuit, fluoroquinolones (FQs) have the potential as antiproliferative compounds due to safety, low cost, and absence of resistance. Aims: In this study, we aim to synthesize biologically active compounds that have dual anticancer and anti-lipase potential. Sixteen compounds were prepared, fully characterized, and studied through identification of IC₅₀ values against the highly susceptible cancer cell lines. Methods: In this work we are concerned with synthesizing biologically active compounds that belong to fluoroquinolones (FQs) with dual anti-colorectal cancer and anti-lipase activity, owing to association between cancer and obesity, conduct titration and docking experiments to validate our hypothesis. Results: In vitro findings indicated that these compounds demonstrated promising anticancer activity against tested cell lines in micromolar range with a potency comparable to cisplatin. Compound 11 exhibited approximately doubled potency compared to cisplatin against SW620 colorectal cancer cell line with IC₅₀ 3.2 μ M which proposes FQs as potent antiproliferative agents. The synthesized Fluoroquinolone (FQ) compounds were further screened for their in vitro anti-lipase potential. The findings demonstrated that all the screened compounds have demonstrated remarkable anti-lipase activity, as compared to control molecule orlistat. Compound 9 exhibited comparable activity to orlistat against pancreatic lipase with IC₅₀ 0.4 μ M which proposes FQs as potent pancreatic lipase inhibitors. Conclusions: The anticancer potential of these derivatives is referred to their ability to inhibit Topo II which indicates that chelation is the mechanism of inhibition of Topo II emphasized with titration and docking experiments. © 2023 DSR Publishers/The University of Jordan. ABSTRACT: In this paper, we address the Bernstein expansion of rational polynomial continuous dynamical systems over simplices. We consider rational Lyapunov functions and controllers both expanded into rational Bernstein form. Rational control functions are optimized by the smallest and largest rational Bernstein coefficients of maximum degree. Bounds for certifying the existence of rational functions in the monomial and Bernstein forms are given. Subsequently, the maximum degree of Bernstein basis is sufficiently optimized. © 2023 ACM.

ABSTRACT: Pregnant women are at higher risk of developing severe COVID-19 symptoms. Therefore, booster dose against COVID-19 was recommended for this special population in Jordan. However, vaccine hesitancy/refusal remains the main obstacle to providing immunity against the spread of COVID-19. Thus, the aim of this study is to examine the intention of pregnant/planning to get pregnant and lactating women towards receiving a booster dose against COVID-19 and its associated factors. A questionnaire was given to Jordanian pregnant/planning to get pregnant and lactating females. A total of 695 females were enrolled in the study. Older age, having a chronic disease, high education, high

income, and high perceived risk of COVID-19 were significantly associated with higher knowledge about COVID-19. High perceived risk of COVID-19 was significantly associated with better practice. Participants who anticipated they might contract COVID-19 in the next six months, had high perceived risk of COVID-19, had high knowledge, had received the COVID-19 vaccine based on conviction, and smokers had higher intention to receive a booster dose of the COVID-19 vaccination. In order to increase pregnant and lactating women's intention to receive a booster dose of the COVID-19 vaccine, public health organizations should consider developing comprehensive health education campaigns. © 2023 by the authors.

ABSTRACT: Nanoemulsions and bigels are biphasic delivery systems that can be used for topical applications. The aim of this study was to incorporate an oil-in-water ciprofloxacin hydrochloride nanoemulsion (CIP.HCl NE) into two types of bigels, Type I (oleogel (OL)-in-hydrogel (WH)) and Type II (WH-in-OL) to enhance drug penetration into skin and treat topical bacterial infections. Bigels were prepared at various ratios of OL and WH (1:1, 1:2, and 1:4). Initially, CIP.HCl NE was prepared and characterized in terms of droplet size, zeta potential, polydispersity index, morphology, and thermodynamic and chemical stability. Then CIP.HCl NE was dispersed into the OL or WH phase of the bigel. The primary physical stability studies showed that Type I bigels were physically stable, showing no phase separation. Whereas Type II bigels were physically unstable, hence excluded from the study. Type I bigels were subjected to microstructural, rheological, in vitro release, antimicrobial, and stability studies. The microscopic images showed a highly structured bigel network with nanoemulsion droplets dispersed within the bigel network. Additionally, bigels exhibited pseudoplastic flow and viscoelastic properties. A complete drug release was achieved after 4–5 h. The in vitro and ex vivo antimicrobial studies revealed that bigels exhibited antimicrobial activity against different bacterial strains. Moreover, stability studies showed that the rheological properties and physical and chemical stability varied based on the bigel composition over three months. Therefore, the physicochemical and rheological properties, drug release rate, and antimicrobial activity of Type I bigels could be modified by altering the OL to WH ratio and the phase in which the nanoemulsion dispersed in. © 2023 by the authors.

ABSTRACT: In this investigation, the fractional Fornberg-Whitham equation (FFWE) is solved and analyzed via the variational iteration method (VIM) and Adomian decomposition method (ADM) with the help of the Aboodh transformation (AT). The FFWE is an important model for describing several nonlinear wave propagations in various fields of science and plasma physics. The AT provides a powerful tool for transforming fractional-order differential equations (DEs) into integer-order ones, making them more amenable to analytical solutions. Accordingly, the main objective of this investigation is to demonstrate the effectiveness and accuracy of ADM and VIM in deriving some approximations for the FFWE. Furthermore, we highlight the advantages and potential applications of these methods in solving other fractional-order nonlinear problems in several scientific fields, especially in plasma physics and some engineering problems. © 2023 by the authors.

ABSTRACT: Matrix metalloproteinases (MMPs) are identifiable members of proteolytic enzymes that can degrade a wide range of proteins in the extracellular matrix (ECM). MMPs can be categorized into six groups based on their substrate specificity and structural differences: collagenases, gelatinases, stromelysins, matrilysins, metalloelastase, and membrane-type MMPs. MMPs have been linked to a wide variety of biological processes, such as cell transformation and carcinogenesis. Over time, MMPs have been evaluated for their role in cancer progression, migration, and metastasis. Accordingly, various MMPs have become attractive therapeutic targets for anticancer drug development. The first generations of broad-spectrum MMP inhibitors displayed effective inhibitory activities but failed in clinical trials due to poor selectivity. Thanks to the evolution of X-ray crystallography, NMR analysis, and homology modeling studies, it has been possible to characterize the active sites of various MMPs and, consequently, to develop more selective, second-generation MMP inhibitors. In this review, we summarize the computational and synthesis approaches used in the development of MMP inhibitors and their evaluation as potential anticancer agents. © 2023 by the authors.

ABSTRACT: The role of women in Africa is one of the most notable issues in modern African literature. African novelists focus on roles held by women in the pre-colonial, colonial, and post-colonial periods, alongside the effect of colonization on African women. This study is a serious attempt at providing a comprehensive analytical investigation of the role of women in Bessie Head's selected works: *When Rain Clouds Gather* (1969), *The Collector of Treasures*, and *Other Botswana Village Tales* (1977). It demonstrates how traditional societies and colonizers treat African women and the influence of Head's personal life and background on her literary works. Various studies focus on the issue of women using the feminist approach. This study, however, concentrates on women's issues using feminist and post-colonial theories. © 2023 ACADEMY PUBLICATION.

ABSTRACT: Despite the importance of sustainable highway construction projects in achieving sustainable development, unsustainable construction highway projects still prevail in Jordan. Therefore, this article aims to identify barriers affecting sustainability implementation in Jordan's highway construction projects. These barriers were identified from the previous literature. Questionnaire surveys were developed and distributed to experts to rank the degree of importance of each barrier. Moreover, a case study was assessed to evaluate the sustainability level of highway projects in Jordan. The research found that the sustainability concept should be supported financially to protect the environment by using a legislative framework to implement sustainability principles. There are several barriers to implementing the concept, like the lack of sustainability education, improper communication amongst team members, and the lack of familiarity with the techniques and the necessary skills to employ them properly. The use of sustainability assessment tools is needed to evaluate the sustainability level for highway projects. For the case study, a sustainability assessment tool was applied to the most recent important highway project in Jordan, "Bus Rapid Transit project," to determine its sustainability level and to show how the barriers affect the implementation of the sustainable highway project and lower the sustainability level in the project. © 2023 by the authors.

ABSTRACT: Grape seed of Obeidi, a white Lebanese autochthonous variety, was previously tested in different studies as a valuable source of bioactive molecules such as polyphenols, oils, and proteins by means of extraction procedures for the development of cosmetic and therapeutic products. However, an un-valorized, exhausted grape seed residue remains as "secondary waste" after the extraction processes. In this study, the exhausted seeds have been further exploited to produce cosmetic scrubs capable of releasing antioxidant molecules during the exfoliation process, in accordance with the principles of the circular economy and going toward a zero-waste process. The deep characterization of the exhausted seeds confirmed the presence of antioxidant phenolic molecules including gallic acid, catechins and protocatechuic acid (0.13, 0.126, and 0.089 mg/g of dry matter DM), and a high phenolic content (11.85 mg gallic acid equivalents (GAE)/g of dry matter (DM)). Moreover, these residues were shown to possess a sandy texture (Hausner ratio (HR): 1.154, Carr index (CI): 0.133, and angle of repose: 31.62 (°) degrees), similar to commercial natural exfoliants. In this respect, exhausted Obeidi grape seed residues were incorporated at increasing concentrations (0.5, 1, 1.5, and 2% w/w) in a cosmetic scrub, and stored for 5 weeks at 4, 25, and 50 °C for stability testing. All tested scrub formulations exhibited good spreadability with a spread diameter of 3.6–4.7 cm and excellent physical stability, as no phase separation or color change were observed after four cycles of heat shock at 4 and 50 °C. Finally, an in vivo skin irritation test showed that the scrub enriched with 1.5% of exhausted Obeidi grape seed residues was the most promising formulation, as it possessed a high amount of phenolic molecules (0.042 ± 0.001 mg GAE/mL of scrub) and good stability and could be safely applied to the skin with no irritation phenomena. Overall results underlined that exhausted grape seed residues can be transformed into promising systems for both physical and chemical exfoliation, thus confirming the importance of the effective exploitation of agro-industrial by-products for the development of high value cosmeceutics towards a more sustainable and zero-waste approach. © 2023 by the authors.

ABSTRACT: This paper presents a multistable discrete memristor that is based on the discretization of a continuous-time model. It has been observed that the discrete memristor model is capable of preserving the characteristics of the continuous memristor model. Furthermore, a three-dimensional memristor discrete-time FitzHugh-Nagumo model is constructed by integrating the discrete memristor into a two-dimensional FitzHugh-Nagumo (FN) neuron model. Subsequently, the dynamic behavior of the proposed neuron model is analyzed through Lyapunov exponents, phase portraits, and bifurcation diagrams. The results show multiple kinds of coexisting hidden attractor behaviors generated by this neuron model. The proposed approach is expected to have significant implications for the design of advanced neural networks and other computational systems, with potential applications in various fields, including robotics, control, and optimization. © 2023 by the authors.

ABSTRACT: The increasing demand for clean energy and the global shift towards renewable sources necessitate reliable solar radiation forecasting for the effective integration of solar energy into the energy system. Reliable solar radiation forecasting has become crucial for the design, planning, and operational management of energy systems, especially in the context of ambitious greenhouse gas emission goals. This paper presents a study on the application of auto-regressive integrated moving average (ARIMA) models for the seasonal forecasting of solar radiation in different climatic conditions. The performance and prediction capacity of ARIMA models are evaluated using data from Jordan and Poland. The essence of ARIMA modeling and analysis of the use of ARIMA models both as a reference model for evaluating other approaches and as a basic forecasting model for forecasting renewable energy generation are presented. The current state of renewable energy source utilization in selected countries and the adopted transition strategies to a more sustainable energy system are investigated. ARIMA models of two time series (for monthly and hourly data) are built for two locations and a forecast is developed. The research findings demonstrate that ARIMA models are suitable for solar radiation forecasting and can contribute to the stable long-term integration of solar energy into countries' systems. However, it is crucial to develop location-specific models due to the variability of solar radiation characteristics. This study provides insights into the use of ARIMA models for solar radiation forecasting and highlights their potential for supporting the planning and operation of energy systems. © 2023 by the authors.

ABSTRACT: Ribociclib is a newly approved orally administered drug for breast cancer. This study aimed to prepare, characterize, and evaluate hybrid lipid-polymer nanoparticles (PLNs) of ribociclib to enhance its in vitro dissolution rate, pharmacokinetics, and anticancer efficacy. Ribociclib-loaded PLNs were prepared by solvent evaporation using the Box-Behnken design to optimize formulation variables. Particle size, entrapment efficiency, differential scanning calorimetry (DSC), thermogravimetric analysis (TGA), Fourier transform infrared spectroscopy (FTIR), atomic force microscopy (AFM), in vitro release cytotoxicity, molecular modeling, and pharmacokinetic studies were examined. The ribociclib-loaded PLN (formula 1, F1) was optimized in terms of particle size (266.9 ± 4.61 nm) and encapsulation efficiency (59.1 ± 2.57 mg/mL). DSC and thermogravimetric characterization showed the absence of a crystalline structure in the prepared PLNs, confirmed by FTIR, and showed no interactions between the components and the drug. AFM showed well-dispersed heterogeneously shaped nanoparticles. The in vitro release profile exhibited significant results for the optimized formula, reaching 100% at 600 and 90 min at pH 6.8 and 1.2, respectively. The low IC50 obtained by the 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl-2H-tetrazolium bromide (MTT) assay suggests that optimized PLN might serve as an effective delivery vehicle for cancer treatment, especially breast and lung cancer. Molecular modeling revealed several hydrogen bonds. A pharmacokinetic study in rats showed that the ribociclib formula had a 6.5-fold increase in maximum concentration (Cmax) and a 5.6-fold increase in area under the curve (AUC). Regarding the everted intestinal sac absorption, formula 1 increased ribociclib penetration relative to the physical combination and pure medication. In conclusion, optimized PLNs with enhanced physicochemical and cytotoxic properties and improved pharmacokinetic parameters were successfully prepared. © 2023 by the authors.

ABSTRACT: Background: Hospital pharmacists can play an important role in the detection, prevention, and reporting of adverse drug reaction (ADR) since they interact with patients in hospital settings. The ADR reporting practice by Pharm D students, who represent the future hospital pharmacists, has not been adequately investigated in the literature. Objective: To evaluate Pharm D students' knowledge, attitude, and practice regarding ADR reporting, and the associated barriers and motivators to ADR reporting during clinical training at different hospital sites in Jordan. Methods: The present cross-sectional study was conducted on sixth year pharm D students during clinical training at different hospital departments in different hospital sites Jordan. In addition to socio-demographic variables, a structured self-reported questionnaire was used to assess students' knowledge, attitude, practice, barriers, and motivators towards ADR reporting. Binary logistic regression was used to explore the variables associated with the study outcomes. Results: A total of 497 students participated in the study. The participants showed inadequate knowledge regarding ADR reporting, with a mean knowledge score of 3.20 (± 1.78). On the other hand, the study participants showed positive attitude towards ADR reporting with a total mean score of 13.6 (± 1.96). However, the ADR reporting practice was low with a mean score of 5.78 (± 1.88). Not knowing how to report (60.2%) and not knowing where to report (55.9%) were the most common barriers to ADR reporting, while the most reported motivators for ADR reporting were seriousness of reaction (84.1%) and involvement of new drug (51.1%). Logistic regression analysis showed that time from the start of training (OR = 0.510; 95%CI = 0.305-0.852; P = 0.010), female gender (OR = 1.759; 95%CI = 1.083-2.857; P = 0.022), and attending a course/workshop about pharmacovigilance (OR = 0.213; 95%CI = 0.137-0.332; P = 0.00) were significant predictors of knowledge about ADR reporting. Increased age (OR = 0.93; 95%CI = 0.880-0.997; P = 0.041) and low knowledge (OR = 0.564; 95%CI = 0.380-0.837; P = 0.004) were significantly associated with negative attitude toward ADR reporting. Female gender (OR = 0.481; 95%CI = 0.302-0.766; P = 0.002) and attitude level (OR = 1.837; 95%CI = 1.205-2.802; P = 0.005) were significant predictors of ADR reporting practice. Conclusions: Pharm D students showed positive attitude towards ADR reporting, however, the knowledge and practice of ADR reporting were inadequate and the participants reported several barriers. Therefore, the topic of ADR reporting and pharmacovigilance, as well as, educational training programs need to be included in future pharmacy curriculum in order to improve students' awareness and practice of ADR reporting. © 2023 The Author(s)

ABSTRACT: This article is about, the new analytical wave solitons, breather-wave, lump-kink and interaction between lump-kink and rogue wave solutions of Laksmanan-Porsezian-Daniel equation with parabolic law along a new definition of derivative has been explored. For this purpose, the exp a function, the extended sinh-Gordon equation expansion scheme and Hirota bilinear schemes have been utilized. The resulting solutions are dark, bright, dark-bright, periodic, singular and other kinds of solitons. These results are obtained and also verified by Mathematica and Maple tools. Our gained solutions are newer than the existing results in the literature. Some of the gained results are explained by 2-dimensional, 3-dimensional and contour plots. Results may be useful for the progress of the model in further study. The schemes used in this research are effective, easy and reliable to handle the other fractional nonlinear partial differential equations. © 2023, The Author(s), under

ABSTRACT: Antioxidant-rich plant extracts have demonstrated tremendous value as inflammatory modulators and as nanomaterial precursors. Chronic cigarette smoking alters neurotransmitter systems, particularly the glutamatergic system, and produces neuroinflammation. This study aimed to investigate the behavioral and molecular correlates of cigarette smoking withdrawal-induced anxiety-like behavior in rats, and whether these effects could be mitigated by the administration of antioxidant nanoassemblies prepared by spontaneous oxidation of dark-roasted Arabica coffee bean aqueous extracts. Four experimental groups of female Sprague-Dawley rats were randomly assigned to: (i) a control group that was only exposed to room air, (ii) a COF group that was administered 20 mg/kg of the coffee nanoassemblies by oral gavage, (iii) a SMOK group that was exposed to cigarette smoke and was given an oral gavage of distilled water, (iv) and a SMOK + COF group that was exposed to cigarette smoke and administered 20 mg/kg of the coffee nanoassemblies. Animals were exposed to cigarette smoke for 2 h per day, five days per week, with a 2-day withdrawal period each week. At the end of the 4th week, rats began receiving either distilled water or the coffee nanoassemblies before being exposed to cigarette smoke for 21 additional days. Weekly behavioral tests revealed that cigarette smoking withdrawal exacerbated anxiety, while the administration of the coffee nanoassemblies reduced this effect. The effect of cigarette smoking on astroglial glutamate transporters and nuclear factor kappa B (NF- κ B) expression in brain subregions was also measured. Smoking reduced the relative mRNA and protein levels of the glutamate transporter 1 (GLT-1) and the cystine/glutamate antiporter (xCT), and increased the levels of NF- κ B, but these effects were attenuated by the coffee nanoassemblies. Thus, administration of the antioxidant nanoassemblies decreased the negative effects of cigarette smoke, which included neuroinflammation, changes in glutamate transporters' expression, and a rise in anxiety-like behavior. ABSTRACT: Online Social Networks (OSN) such as Facebook, Instagram, Twitter, and others have seen rapid growth in recent years. Such applications provide attractive online social networks and communications with the opportunity to connect with relatives and acquaintances, meet new people, enter communities, talk, exchange photos, organize events, and network with others who are close to real-life; unfortunately, on the other hand, they also raise privacy and security issues. We identified OSN threats in this paper and recommended a digital face-processing authentication method as a double-factor authentication after entering the password using Matlab. After applying deep learning classification by attending to a real dataset from the live webcam to train the model, we achieved the best accuracy rate of 95%. However, such methods have yet to be deployed to all social networks, so we also mentioned the problem of fake accounts, which is one of the most significant problems in OSN. These are effective tools for executing spam campaigns and spreading malware and phishing attacks. Fake accounts could lead to the loss of money for businesses, loss of reputation, stealing information for malicious purposes, and much more. This study is related to detecting fake

and legitimate profiles on OSN. For this purpose, we chose two datasets that contain fake and legitimate accounts on Facebook and Instagram. Each contains different features after applying machine learning using Naive Bayes, Logistic Regression, Support Vector Machines, K-Nearest Neighbour, Boosted Tree, Neural Networks, SVM Kernel, and Logistic Regression Kernel. SVM achieved the highest classification accuracy for the Fake Profiles detection datasets with 97.1%. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: An Enhanced Chameleon Swarm Algorithm (ECSA) by integrating roulette wheel selection and Lévy flight methods is presented to solve non-convex Economic Load Dispatch (ELD) problems. CSA has diverse strategies to move towards the optimal solution. Even so, this algorithm's performance faces some hurdles, such as early convergence and slumping into local optimum. In this paper, several enhancements were made to this algorithm. First, its position updating process was slightly tweaked and took advantage of the chameleons' randomization as well as adopting several time-varying functions. Second, the Lévy flight operator is integrated with roulette wheel selection method and both are combined with ECSA to augment the exploration behavior and lessen its bias towards exploitation. Finally, an add-on position updating strategy is proposed to develop a further balance between exploration and exploitation conducts. The optimization performance of ECSA is shown by testing it on five various real ELD cases with a generator having 3, 13, 40, 80 and 140 units, each with different constraints. The results of the ELD systems' analysis depict that ECSA is better than the parent CSA and other state-of-the-art methods. Further, the efficacy of ECSA was experimented on several benchmark test functions, and its performance was compared to other well-known optimization methods. Experimental results show that ECSA surpasses other methods on complex benchmark functions with modest computational burdens. The superiority and practicality of ECSA is demonstrated by getting new best solutions for large-scale ELD cases such as 40-unit and 140-unit test systems. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Objective: Healthcare professionals particularly nurses should be professionally prepared with knowledge about the standards of palliative care and their roles in providing palliative care. Nurses' knowledge about palliative care and influencing factors has not been examined adequately in Arab countries including Palestine. Thus, this study aimed to assess the adequacy of knowledge level and influencing factors (socio-demographic) about palliative care among nurses in West Bank/ Palestine. Methods: A descriptive-correlational design was utilized. A cluster random sampling method was applied to select 12 hospitals from the three regions in West Bank. Then, four hospitals were selected from each region using a simple random method. All registered nurses working in critical

care units and medical and surgical wards in the selected hospitals were recruited. The sample consists of 424 registered nurses and data were collected using Palliative Care Quiz for Nursing (PCQN). Results: The Findings revealed that nurses' level of knowledge about palliative care was low/inadequate ($M = 7.75$, $SD = 2.96$). Knowledge about palliative care was influenced by age ($B = -.106$; $p < 0.05$), gender ($B = -.223$; $p < 0.001$), and hospital ward ($B = -.597$; $p < 0.001$), in which younger nurses, females, and those who work in critical care units reported higher levels of knowledge about palliative care. Conclusions: Findings of this study emphasized the need for developing educational and training courses, seminars, and workshops on palliative care to increase nurses' knowledge in order to enhance the quality of patient care. Also, policymakers should develop national strategic plans and policies regarding palliative care and apply these plans in all hospitals in West Bank/ Palestine. © The Author(s) 2022.

ABSTRACT: Under the acceleration in the body of information regarding AI technology and the paucity of instruments that assess the views and reactions of consumers, we have constructed this instrument to measure the attitudes, benefits, and threats (ABT) toward using Artificial Intelligence (AI) tools in higher education. Google Form was used in August of 2023 to collect data from students and teachers at higher education institutions in 11 Asian and African countries. After the ABT instrument obtained a sufficient score in content validity, additional statistical analyses were done.

Exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) were performed. This study included 503 participants who are familiar with AI tools. Over 56% have Bachelor's degrees and 35% have Master's or Doctoral degrees. The most popular AI tool was ChatGPT. One model out of six models created for the factor structure of the 35 items that measure attitudes, benefits, and threats was chosen. The selected model provides the highest explained variance (55.6%). The CFA, using AMOS software, demonstrated that the fit indices were satisfactory for the adopted model. Attitude (15), benefits (6), and threats (14 items) are the three factors of the model. The CFA supports the EFA with the ABT three-factor structure model. The high factor loadings and communalities suggest that the factors are reliable and valid measures of the attitude, benefits, and threats toward AI tools among highly educated personnel. © 2023. ABSTRACT: Objective: This study assesses misconceptions about coronavirus disease 2019 (COVID-19) vaccine and the factors associated with misconception among Jordanians. Methods: A cross-sectional online survey was conducted. The survey was formulated on Google Forms, and was hosted on an online platform. These questions were created based on extensive review of online information about the vaccines. Frequencies and percentages (%) were used for categorical variables, while means and standard deviations (SDs) were used for continuous variables. Stepwise binary logistic regression was conducted to evaluate variables associated with participant's misconception questions. Results: Of 1195 survey respondents who participated in the study, 41.3% had received the COVID-19 vaccine. The mean misconception score was (60.0 ± 19.1). The statement with the highest mean was The vaccine hasn't been tested on enough people (3.6 ± 1.0). The statement with the lowest mean was The COVID-19 vaccine includes a microchip to control us (2.2 ± 1.1) in the conspiracy theory portion. Females, 18- to 29-age group, higher educational level, living in a city, the participants who took lectures about the COVID-19 vaccine and vaccinated participants had higher odds of being in the low misconception level group. Conclusion: Targeted campaigns and vaccine safety information should be part of a broader health education campaign to alleviate vaccination safety concerns. © The Author(s), 2022. ABSTRACT: The Minbar of Salah Al-Din is considered a masterpiece of traditional Islamic arts and crafts heritage. It stood in Al-Aqsa Mosque in Jerusalem for nearly 800 years until it was burned down completely in 1969. In 1993, King Hussein of Jordan gave instructions to initiate the process of reconstructing the Minbar based on old photos of the original one and small wooden pieces that remained after the fire. The reconstruction job was commissioned in 2002 and finished in 2006 as a replica of the original one. This paper discusses the lessons learned from the reconstruction process through the analysis of geometric principles and features of the design process and construction of the Minbar, towards the rekindling of this artistic heritage. The Minbar geometric patterns are constructed of many interlocking pieces of wood, each carefully carved to fit together like a three-dimensional puzzle. The novel contribution of this study is in the relationship between the geometric construction of the patterns and the Interlock (ta'sheeq) construction methodology. Which will hopefully provide a deeper understanding of the structure of the Minbar, allowing architects and craftsmen to achieve improved control over their new design's compositions and structure. © 2023 Universitatea "Alexandru Ioan Cuza" din Iasi. ABSTRACT: Background: Medication adherence has been recognised as one of the greatest areas to improve health outcomes and reduce health expenditure. Poor medication adherence has multifactorial causes that need to be understood. Aim: To determine the levels of medication adherence and examine the factors associated with medication adherence among patients with cardiovascular diseases (CVDs) in Jordan. Methods: A cross-sectional, descriptive correlational design was used to conduct this study. A convenience sample was used to recruit 250 patients with CVDs from outpatient clinics of Jordanian hospitals. Data were collected using the Multidimensional Scale of Perceived Social Support and Morisky Medication Adherence Scale, in addition to sociodemographic and clinical-related factors during the period from June to September 2019. Results: It was found that the total mean score of medication adherence was 2.84 (standard deviation = 1.9), which reflected low adherence. A significant positive correlation was found between medication adherence and marital status and the number of diseases. However, smoking was negatively correlated with medication adherence. Smoking was the predictor of medication adherence. Conclusions: Medication adherence among patients with CVDs needs to be improved. Thus, healthcare professionals should develop strategies and interventions based on identifying factors to enhance medication adherence among those patients. © The Author(s) 2023.

ABSTRACT: In his highly influential work *Culture and Imperialism*, Edward Said unravels the imperialist undertones in Jane Austen's *Mansfield Park*. Throughout the chapter entitled "Jane Austen and the Empire," Said demonstrates how this seemingly domestic novel of manners, not normally associated with imperialism, is actually densely saturated with colonialist discourse. For Said, the marginalized representation of the colonized territory of Antigua as simply a "colonial garden" for the British imperial patriarch further accentuates the superior sense of colonialist entitlement. Thus, Said's approach in decolonizing the imperialist discourse in *Mansfield Park* may be extended to other canonical works not generally considered imperialist in nature. In this article, the researchers utilize Said's strategies involved in his reading of *Mansfield Park* to probe the imperialist nuances in Austen's *Persuasion*, a novel usually categorized as a romance/novel of manners

which depicts two lovers' second chance at happiness despite all the social obstacles in their way. The researchers attempt to foreground the imperialist rhetoric in this novel, specifically Austen's tendency to romanticize and glorify the rising British naval society as the champions of the Empire. Furthermore, this article investigates the absent, peripheral representation of colonial terrains as opposed to the privileged, central position of the British Empire in the narrative. © 2023 Pluto Journals. ABSTRACT: Introduction: Although males and females have the same prevalence of COVID-19, a variation in the severity of symptoms between males and females has been observed. We hypothesize that this variation can partly be explained by the effect of androgens on the infectious activity of the SARS-Cov2 virus. Aims: This study investigated the effect of sex and two androgenic drugs testosterone and oxandrolone on the mRNA expression of several SARS-Cov2 entry genes: angiotensin-converting enzyme 2 (ACE2), transmembrane protease serine 2 (TMPRSS2), and cathepsin 1 (CatL) in mouse lungs. Methods: Twenty-eight BALB/c mice were divided into four groups; the first three groups (all male mice) were treated with the vehicle, testosterone, and oxandrolone, respectively, while the fourth group consisted of untreated female mice. The androgenic drugs were administered for 21 days in doses equivalent to the human one. Accordingly, the expressions of ACE2, TMPRESS2, and CatL genes were measured using real-time PCR assay. In addition, the histopathological alterations in the lungs and the levels of total serum testosterone were analyzed. Results: We found that the expression of ACE2 was significantly upregulated in the lungs of the testosterone-treated group by 2.5 times. The expression of TMPRSS2 was also significantly upregulated in the lungs of oxandrolone-treated mice by 6.6 times. Moreover, these molecular alterations were associated with a high elevation of the serum testosterone and the induction of inflammation and oxidative stress. In addition, we found that the mRNA levels of ACE2, TMPRSS2, and CatL were significantly higher in the lungs of the female compared to male mice. Conclusion: We found several significant differences between the mRNA expression of ACE2, TMPRSS2, and CatL genes in the lungs of male and female mice. We showed how the administration of testosterone and oxandrolone to male mice upregulated the lungs' mRNA expression of ACE2 and TMPRSS2, respectively. These results can expand our molecular understanding of the roles of sex and androgenic drugs on the expression of SARS-Cov2 entry genes. © 2023 DSR Publishers / The University of Jordan. ABSTRACT: The main protease of SARS-CoV-2, 3-chymotrypsin-like protease (3CLpro), is a prominent target for antiviral development due to its essential role in the viral life cycle. Research has largely focused on competitive inhibitors of 3CLpro that target the active site. However, allosteric sites distal to the peptide substrate-binding region are also potential targets for the design of reversible noncompetitive inhibitors. Computational analyses have examined the importance of key contacts at allosteric sites of 3CLpro, but these contacts have not been validated experimentally. In this work, four druggable pockets spanning the surface of SARS-CoV-2 3CLpro were predicted: pocket 1 is the active site, whereas pockets 2, 3 and 4 are located away from the active site at the interface of domains II and III. Site-directed alanine mutagenesis of selected residues with important structural interactions revealed that 7 of 13 active site residues (N28, R40, Y54, S147, Y161, D187 and Q192) and 7 of 12 allosteric site residues (T111, R131, N133, D197, N203, D289 and D295) are essential for maintaining catalytically active and thermodynamically stable 3CLpro. Alanine substitution at these key amino acid residues inactivated or reduced the activity of 3CLpro. In addition, the thermodynamic stability of 3CLpro decreased in the presence of some of these mutations. This work provides experimental validation of essential contacts in the active and allosteric sites of 3CLpro that could be targeted with competitive and noncompetitive inhibitors as new therapeutics against COVID-19. © 2023 The Author(s). ABSTRACT: The paper introduces a novel two-dimensional fractional discrete-time predator-prey Leslie-Gower model with an Allee effect on the predator population. The model's nonlinear dynamics are explored using various numerical techniques, including phase portraits, bifurcations and maximum Lyapunov exponent, with consideration given to both commensurate and incommensurate fractional orders. These techniques reveal that the fractional-order predator-prey Leslie-Gower model exhibits intricate and diverse dynamical characteristics, including stable trajectories, periodic motion, and chaotic attractors, which are affected by the variance of the system parameters, the commensurate fractional order, and the incommensurate fractional order. Finally, we employ the θ -1 method, the approximate entropy test and the (Formula presented.) algorithm to measure complexity and confirm chaos in the proposed system. © 2023 by the authors.

ABSTRACT: Asthma is the most common chronic disease in childhood. Exacerbation is a significant problem for asthmatic patients, and viral infections remain the most frequent triggers of asthma exacerbations. This study explored knowledge, attitudes, and practices (KAP) of parents of asthmatic children towards providing influenza vaccine to their children. This cross-sectional study enrolled parents of asthmatic children who visited the outpatient respiratory clinics of two Jordanian hospitals. The present study enrolled 667 parents of asthmatic children (62.8% female). The median age of the participants' children was 7 years. The results showed that 60.4% of the children with asthma never received a flu vaccine. Most of those who had received the flu vaccine reported that the side effects were mild (62.7%). Asthma duration was positively and significantly associated with increased vaccine hesitancy/rejection (OR = 1.093, 95% CI = (1.004-1.190), $p = 0.04$; and OR = 1.092, 95% CI = (1.002-1.189), $p = 0.044$, respectively). As the attitude towards flu vaccine score increases, odds of vaccination hesitancy/rejection decreased (OR = 0.735, 95% CI = (0.676-0.800), $p < 0.001$; and OR = 0.571, 95% CI = (0.514-0.634), $p < 0.001$, respectively). The main reasons for vaccination hesitancy/refusal included "I don't think my child needs it" (22.3%) followed by "I forget it" (19.5%). The rate of vaccination among children was low and emphasized the necessity of encouraging parents with asthmatic children to vaccinate their children by conducting health awareness campaigns and also emphasized the role of doctors and other healthcare professionals. © 2023 by the authors.

ABSTRACT: Robots can be equipped with a range of senses to allow them to perceive and interact with the world in a more natural and intuitive way. These senses can include vision, hearing, touch, smell, and taste. Vision allows the robot to see and recognize objects and navigate its environment. Hearing enables the robot to recognize sounds and respond to vocal commands. Touch allows the robot to perceive information about the texture, shape, and temperature of objects through the sense of touch. Smell enables the robot to recognize and classify different odors. Taste enables the robot to

identify the chemical composition of materials. The specific senses used in a robot will depend on the needs of the application, and many robots use a combination of different senses to perceive and interact with the environment. This paper reviews the five senses used in robots, their types, how they work, and other related information, while also discussing the possibility of a Sixth Sense. © 2023 by the authors.

ABSTRACT: In the era of IoT gaining traction, attacks on IoT-enabled devices are the order of the day that emanates the need for more protected IoT networks. IoT's key feature deals with massive amounts of data sensed by numerous heterogeneous IoT devices. Numerous machine learning techniques are used to collect data from different types of sensors on the objects and transform them into information relevant to the application. Furthermore, business and data analytics algorithms help in event prediction based on observed behavior and information. Routing information securely over the internet with limited resources in IoT applications is a key problem. The study proposes a model for detecting network anomalies in IoT devices to enhance the security of the devices. The study employed the IoT Botnet dataset, and K-fold cross-validation tests were used for validating the values of evaluation metrics. The average values of Accuracy, Precision, Recall, and F Score was 97.4. © 2023, Growing Science. All rights reserved.

ABSTRACT: This study examines tourist satisfaction and its relationship with demographic variables in Nablus, Palestine. Two hundred two tourists were surveyed using a structured questionnaire to collect data on their satisfaction level and demographic information. The results reveal that the overall tourist satisfaction level in Nablus is high. However, significant differences in satisfaction were found based on gender, education level, number of family members, occupation, and income. The study highlights the importance of considering demographic factors in shaping visitor satisfaction and tailoring tourism services to meet the needs and preferences of diverse clients. The findings also shed light on the negative impact of tourist blackmailing, which is the exploitation of tourists by various stakeholders, and the role of positive perceptions of the destination in attracting tourists and mitigating the impact of security threats. The study provides valuable insights for tourism service providers and stakeholders in promoting sustainable and competitive tourism in Nablus and the West Bank region. © 2023

ABSTRACT: This study aimed to demonstrate the impact of big data analytics techniques on reducing information asymmetry in industrial companies listed on the Amman Stock Exchange from the point of view of workers in Jordanian financial intermediation companies. Two approaches have been adopted to achieve the target of this research. The first approach is the analytical descriptive approach through a survey to collect primary data that measures the elements of the independent variable related to big data analytics techniques (Volume, Velocity, Variety, and Veracity). The second approach is an applied approach that measures the dependent variable of information asymmetry based on the financial statements of industrial companies listed on Amman Stock Exchange for the period (2015-2021). The statistical program (SPSS) has been used to analyze data and test the hypotheses through multiple regression testing. Based on the results of the statistical analysis of the data and the opinions of the research community, it was found that the huge volume of big data has become difficult to process using traditional data processing applications. Further-more, there is a statistically significant relationship between big data analytics techniques and the reduction of information asymmetry from the point of view of employees in intermediation firms in Jordan. Consequently, it is necessary for those in charge of the industrial companies listed on the Amman Stock Exchange to develop modern techniques capable of analyzing big data with high efficiency. It can also assist in providing target groups including investors, stakeholders, and other beneficiaries with reliable and efficient data required to make rational decisions, as well as to reduce the risks of information asymmetry. © 2023, Growing Science. AFFILIATIONS: Department of English Literature, Faculty of Arts, Al-Zaytoonah University of Jordan, P.O. Box 130, Amman, 11733, Jordan

ABSTRACT: The current paper shows colonialism as a concept and how European countries have created colonies in Australia, Asia, Africa, and America, capturing and overexploiting the colonies' natural resources and dominating the colonies' natives. The new nation discoveries accomplished by Europeans stuck in Shakespeare's mind, naming these discoveries the "New World". Shakespeare's The Tempest approaches Prospero's colonial attitude and Caliban's postcolonial standpoint. With that being said, this paper aims to demonstrate that Shakespeare stands in the middle making no approval or disapproval of the European colonization. The Tempest by Shakespeare can be reviewed from a colonial and postcolonial lens. Fanon (1991) establishes that violence-based struggle is a component of the decolonization process represented by Caliban. Towards the end of the paper, key related interpretations of India's overexploitation by Great Britain are adopted to make a piece of evidence that one of the deadly sins of European history rests in colonialism. © 2023 ACADEMY PUBLICATION.

ABSTRACT: Companies utilize competitive advantage as a tool to assist them gain more value for their products at a cheaper cost without sacrificing quality to provide greater features and services. Companies and services must use cybersecurity tools, training, and risk management strategies, as well as regularly upgrade systems as technology changes and evolves, to secure organizations, employees, and individuals. As a result, with the mediating function of cybersecurity, this study clarified the influence of strategic intelligence and asset management on boosting competitive advantage. A questionnaire was designed, and 300 questionnaires were collected out of 350 distributed to respondents working in Jordanian telecom companies. The study found a positive impact of both

strategic intelligence and asset management on enhancing competitive advantage through the presence of the mediating role of cybersecurity. © 2023 Growing Science Ltd. All rights reserved. and by the authors; licensee Growing Science, Canada.

ABSTRACT: The construction sector in Jordan faces various obstacles, one of the most significant being poor communication, which negatively impacts project performance and can even lead to project failure. The primary objective of this study is to identify and evaluate the causes and effects of poor communication in Jordan. A questionnaire containing 32 causes and 21 effects of poor communication was used to gather data. The top ten causes of poor communication are; possessing different levels of education among construction teams; a lack of communication plan; a lack of an appropriate communications medium; a lack of communication procedures and training; a slow flow of information between parties; diversity of culture among construction teams; construction teams possessing different skill levels; contractual barriers; the unavailability of information at the time of need, and a lack of understanding among parties. Poor communication is a prevalent issue in the Jordanian construction industry, Jordan's construction industry needs to improve its current communication state. Both contractors and consultants are affected by this issue and there is a high level of agreement between them on the causes and effects of poor communication. © 2023 Akram Suleiman et al., published by Sciendo.

ABSTRACT: Background Practice-based pharmacists (PBPs) have been introduced into general practice across the UK to relieve some of the pressures within primary care. However, there is little existing UK literature that has explored healthcare professionals' (HCPs') views about PBP integration and how this role has evolved. Aim To explore the views and experiences of GPs, PBPs, and community pharmacists (CPs) about PBPs' integration into general practice and their impact on primary healthcare delivery. Design and setting A qualitative interview study in primary care in Northern Ireland. Method Purposive and snowball sampling were used to recruit triads (a GP, a PBP, and a CP) from across five administrative healthcare areas in Northern Ireland. Sampling of practices to recruit GPs and PBPs commenced in August 2020. These HCPs identified the CPs who had most contact with the general practices in which the recruited GPs and PBPs were working. Semi-structured interviews were recorded, transcribed verbatim, and analysed using thematic analysis. Results Eleven triads were recruited from across the five administrative areas. Four main themes in relation to PBPs' integration into general practices were revealed: evolution of the role; PBP attributes; collaboration and communication; and impact on care. Areas for development were identified such as patient awareness of the PBP role. Many saw PBPs as a 'central hub-middleman' between general practice and community pharmacies. Conclusion Participants reported that PBPs had integrated well and perceived a positive impact on primary healthcare delivery. Further work is needed to increase patient awareness of the PBP role. © The Authors.

ABSTRACT: Health literacy (HL) is an essential component of public health. Few tools are used to measure HL in Arabic-speaking countries, essentially the ShortTest of Functional Health Literacy in Adults and the Single Item Literacy Screener. The new 12-item version of the European Health Literacy Survey Questionnaire (HLS-Q12), has not been validated in the Arabic language. This study aimed to translate the English version of HLS-Q12 into Arabic, test its structure and explain any variance in HLS-Q12 scores, allowing its use in Arabic-speaking healthcare contexts. A forward-backward translation was adopted. Reliability was assessed using Cronbach's α . Confirmatory factor analysis (CFA) and Rasch Model evaluated the model fit of the Arabic version of HLS-12. The effects of different patient-related variables on HLS-Q12 scores were tested using linear regression. A total of 389 patients visiting the site hospital outpatient clinics participated in the study. HLS-Q12 mean \pm SD score was 35.8 ± 5.0 , 50.9% of the participants showed an intermediate HL score. Good reliability ($\alpha = 0.832$) was observed. CFA confirmed the scale unidimensionality. Rasch analysis indicated HLS-Q12 items to be within the fit acceptable thresholds except for Item 12. The only item that displayed unordered response categories was Item 4. Most of the items were considered relatively easy by respondents. Linear regression revealed age, education, healthcare-related education and income to have effects significantly different from zero on HLS-Q12 score. Interventions targeting the most health-disparate groups of individuals with characteristics contributing to lower HL, are needed. © The Author(s) 2023. Published by Oxford University Press. ABSTRACT: Morin (3,5,7,2',4'-pentahydroxyflavone; MR) is a bioactive plant polyphenol whose therapeutic efficacy is hindered by its poor biopharmaceutical properties. The purpose of this study was to develop a nanoparticle (NP) formulation to enhance the bioactivity and oral bioavailability of MR. The nanoprecipitation technique was employed to encapsulate MR in lipid-cored poly(lactide-co-glycolide) (PLGA) NPs. The optimal NPs were about 200 nm in size with an almost neutral surface charge and a loading efficiency of 82%. The NPs exhibited sustained release of MR within 24 h. In vitro antioxidant assays showed that MR encapsulation did not affect its antioxidant activity. On the other hand, anti-inflammatory assays in lipopolysaccharide-stimulated macrophages revealed a superior anti-inflammatory activity of MR NPs compared to free MR. Furthermore, oral administration of MR NPs to mice at a single dose of 20 mg/kg MR achieved a 5.6-fold enhancement in bioavailability and a prolongation of plasma half-life from 0.13 to 0.98 h. The results of this study present a promising NP formulation for MR which can enhance its oral bioavailability and bioactivity for the treatment of different diseases such as inflammation. © 2023 The Author(s)

ABSTRACT: In this article, the nonlinear fractional Kudryashov's equation and the space-time fractional nonlinear Tzitzeica-Dodd-Bullough (TDB) equation are solved using the new auxiliary equation method, which yields innovative analytical solutions using β and M-Truncated fractional derivatives. The fractional wave and Painlevé transformations are implemented to transform the space and time fractional nonlinear equations into a nonlinear ordinary differential equation. The model

solutions are compared by utilizing the two fractional derivatives. Hyperbolic, trigonometric, rational, exponential, and other sorts of soliton solutions are discovered, and these forms of the outcomes illustrate the superiority of the method's uniqueness. The solutions provided in this piece are sophisticated and comprehensive, and the results of the literature review are one instance of the findings. The key advantage of this approach over remedies is that it possesses higher options with flexible constraints. By plotting 3D as well as 2D graphs of the acquired results and analyzing the effect of the fractional parameter ρ on the wave profiles of the phenomenon, it has been determined that the fractional parameter significantly affects the wave profiles. The findings are carried out in such a way as to showcase the applicability and expertise of fractional derivatives and the proposed approach to evaluate several nonlinear fractional partial differential equations. Finally, the comprehensive sensitivity analysis of the proposed models is done by first transforming it into the format of a planer dynamical system using the Galilean transformation. © 2023 The Author(s)

ABSTRACT: This paper aims to present a new numerical modification for solving fractional initial value problem. The proposed modification, which is named Modified Fractional Euler Method (MFEM), attempts to further improve the Fractional Euler Method (FEM) in terms of attaining more accuracy. The error bound generated by the proposed method is analysed and estimated by demonstrating a specific theoretical result. In order to validate the efficiency of the proposed method, several numerical comparisons are performed using MATLAB routines. © 2023 ICIC International. All rights reserved.

ABSTRACT: Introduction: *Parkinsonia aculeata* L. (Caesalpiniaceae), native to the Sonoran and Chihuahuan deserts of southwestern USA and northern Mexico, has been introduced and successfully propagated in Jordan within the Greening the Desert Project. No phytochemical or biological studies have been carried out with this species grown in Jordan. Methods: The hydrodistilled essential oils of *P. aculeata*, from the fresh leaves and flowers (fully grown and at the pre-flowering stage), as well as their spontaneous emitted volatiles, were determined by Solid-Phase-Micro-Extraction (SPME), and analyzed by GC and GC-MS. Water and ethanol extracts were screened by LC-MS and evaluated for their antiproliferative activities on two colorectal- (Caco2 and HCT116) and two breast cancer- (MCF7 and T47D) cell lines. Results: The monoterpene trans-ocimene appeared as the major compound of the aroma profile of all the studied organs while the hydro-distilled oils contained larger percentages of non-terpenoid volatile substances. LC-MS analyses of the water extract of the aerial parts revealed the presence of sixteen compounds, with 4-methylumbelliferone, succinic acid, vitexin, and hyperoside being the major identified compounds. In the ethanol extract of the aerial parts eleven compounds were identified, with iso-orientin and chrysoeriol-7-glucoside as the major compounds. Biologically, the water extract of the *P. aculeata* showed promising antiproliferative activity against the four tested cell lines with IC50s ranging between 17.5 and 77 $\mu\text{g/mL}$. Conclusion: Findings encourage future studies to isolate the water extract components of *P. aculeata* to investigate their anticancer activities against different cancer cell lines and to consider it as a complementary therapy for colorectal cancer. © 2023 Elsevier GmbH

Impact of risk-taking tendency and transformational leadership style on the use of management accounting system information: a direct-mediation model

(2023) *Baltic Journal of Management*, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152300149&doi=10.1108%2fBJM-01-2022-0003&partnerID=40&md5=d05f63a44805143080ff62900244fbb1>

AFFILIATIONS: Department of Accounting, Al-Zaytoonah University of Jordan, Amman, Jordan; Department of Accounting, Tien Giang University, My Tho, Viet Nam

ABSTRACT: Purpose: This research aims to determine the impact of the CEO's risk-taking tendencies and the transformational leadership style on the use of the management accounting system information, as well as the mediating impact of product creativeness and organizational citizenship behavior in this context. It also provides empirical evidence from Vietnamese enterprises.

Design/methodology/approach: The current research was conducted using quantitative methods. It was conducted during the ongoing Covid-19 pandemic in Vietnam. The study population is represented by all of the Vietnamese enterprises listed on stock exchanges. Therefore, an online email questionnaire was used for data collection. Specifically, 670 emails were sent to CEOs and 146 complete responses were collected (21.79% rate). Findings: By using the partial least squares structural equation modeling (PLS-SEM), the study results show that the CEO's risk-taking tendencies and transformational leadership style have a significant positive effect on the use of the management accounting system information. Additionally, product creativeness mediates the relationship between the CEO's risk-taking tendency, and the use of the management accounting system information. Also, organizational citizenship behavior mediates the relationship between transformational leadership style and the use of the management accounting system information. Research limitations/implications: Despite attempts to overcome by GDP contribution ratio, convenience sampling tends to cause common method bias.

Furthermore, small sample sizes can lead to heterogeneity and unstable estimates of the parameter. Causality issues may also arise because the model has no control variables. Therefore, later studies should take the necessary additional steps when sampling to stay consistent with the study population, possibly conducting surveys in several batches to determine the correlation between changes in variables, and allowing the ability to discover and add any necessary control variables. Originality/value: This research acts as a bridge between management and management accounting, confirming the importance of this combination when efficiently using the management accounting system. © 2023, Emerald Publishing Limited.

Faculty of Pharmacy, Jordan University of Science and Technology, Irbid, Jordan

ABSTRACT: In this retrospective study, the medical records of hypertensive patients with type 2 diabetes attending two major hospitals were reviewed to find the factors associated with poor blood pressure control in patients who have diabetes as a comorbid disease with hypertension. Binary regression analysis was conducted to find the factors independently associated with BP control. A total of 522 participants were included in the study. Most of the participants had uncontrolled hypertension (63.4%) and uncontrolled type 2 diabetes (51.3%). Regression results revealed that having retinopathy (OR=1.468 (95% CI: 1.020-2.113), $p<0.05$), and not receiving dipeptidyl-peptidase 4 (DPP4) inhibitors were independently associated with uncontrolled BP (OR=0.633 (95%CI 0.423-0.946), $p<0.05$). Therefore, greater efforts should be exerted to improve BP control in hypertensive patients with type 2 diabetes, particularly in those suffering from retinopathy. © 2023 by Author/s and Licensed by Modestum.

ABSTRACT: Herein, silica nanoparticles (NPs) and gold-silica NPs were loaded with the anti-cancer agent quercetin (QC) to produce silica NPs-QC and gold coated silica NPs-QC, respectively. The nanosystems were characterized using transmission electron microscopy (TEM), dynamic light scattering (DLS) and Fourier transform infrared (FTIR). Drug encapsulation efficiency (EE), loading capacity (LC) and release rate were measured using UV spectrophotometer. The drug was encapsulated in silica NPs in a high percentage (71%) and reduced by about 16% after gold coating. The mean particle size increased after coating and QC loading with a polydispersity index (PDI) between ($\sim 0.2 - 0.6$) and negative zeta potential (-13 to -15 mV). The intensity of FTIR peaks of silica NPs has been significantly decreased upon gold coating indicating a successful attachment of the gold thin layer. The drug release was slightly faster from coated compared to uncoated NPs but both slower than free QC. The percentages of their cell toxicity were almost the same but lower than free QC and generally were higher against HeLa cells compared to fibroblast cells. Both nanosystems could be considered as promising nanocarriers with reasonable EE, slower release rate and lower toxicity compared to the free drug. © 2023 American Pharmacists Association

ABSTRACT: Aims: We examined the predictive factors of COVID-19 vaccine hesitancy among Jordanian older adults. Background: Vaccine hesitancy among older adults is influenced by several factors. Design: This study employed a cross-sectional design. Methods: Online surveys were conducted between November 2021 and April 2022. The surveys included socio-demographic variables, COVID-19 vaccine-related information, the Vaccine Attitude Examination Scale and the Fear of COVID-19 Scale. Results: Participants were 350 older adults (aged 68.1 ± 7.21 years; 62.9% females). Linear regression analyses were performed to assess the impact of correlated variables on the explanation of anti-vaccination attitudes. Participants reported a moderate level of fear of COVID-19 and a moderate level of hesitancy towards receiving the COVID-19 vaccine. The linear regression model revealed that several chronic illnesses, fear of COVID-19 and number of family incidences of COVID-19 explained vaccine hesitancy. Conclusions: Raising awareness among older adults about the desired effect of the COVID-19 vaccine in terms of minimizing hospitalization, disease consequences and mortality rate is required. Well-tailored interventions are essential to reduce vaccine hesitancy among older adults and reinforce the importance of receiving the vaccine for those with multi-morbidities. © 2023 John Wiley & Sons Australia, Ltd.

ABSTRACT: In this paper, the learning process of multilayer perceptron (MLP) neural network is boosted using hybrid metaheuristic optimization algorithms. Normally, the learning process in MLP requires suitable settings of its weight and bias parameters. In the original version of MLP, the gradient descent algorithm is used as a learner in MLP which suffers from two chronic problems: local minima and slow convergence. In this paper, six versions of memetic algorithms (MAs) are proposed to replace gradient descent learning mechanism of MLP where adaptive β -hill climbing (ABHC) as a local search algorithm is hybridized with six population-based metaheuristics which are hybrid flower pollination algorithm, hybrid salp swarm algorithm, hybrid crow search algorithm, hybrid grey wolf optimization (HGWO), hybrid particle swarm optimization, and hybrid JAYA algorithm. This is to show the effect of the proposed MA versions on the performance of MLP. To evaluate the proposed MA versions for MLP, 15 classification benchmark problems with different size and complexity are used. The ABHC algorithm is invoked in the improvement loop of any MA version with a probability of Br parameter, which is investigated to monitor its effect on the behavior of the proposed MA versions. The Br setting which obtains the most promising results is then used to set the hybrid MA. The results show that the proposed MA versions excel the original algorithms. Moreover, HGWO outperforms all other MA versions in almost all the datasets. In a nutshell, MAs are a good choice for training MLP to produce results with high accuracy. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

Does earnings management mediate the relationship between audit quality and company performance? Evidence from Jordan

(2023) Journal of Financial Reporting and Accounting, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121456279&doi=10.1108%2fJFRA-08-2021-0245&partnerID=40&md5=bad3ec929a4e779e03fab93964b4ae1d>

AFFILIATIONS: Department of Accounting, Al-Zaytoonah University of Jordan, Amman, Jordan; Department of Accounting, The World Islamic Sciences and Education University, Amman, Jordan

ABSTRACT: Purpose: The purpose of this study is to look at the direct relationship between audit quality, earnings management (EM) practices and company performance, as well as the indirect influence (mediation) of EM practices in the relationship between audit quality and company performance. It offers empirical evidence from the Jordanian market, which is considered an emerging market. Design/methodology/approach: The population of this study is represented in Jordanian service companies listed on the Amman Stock Exchange (ASE), with a total of 344 company-year observations. Furthermore, panel data analysis was used in this study, and data for the study were acquired from yearly reports as well as the ASE's database. Findings: Based on generalized method of moments model, the present findings demonstrate that the size of the audit firm and the tenure of the audit firm have a positive and negative influence on EM practices, respectively, but that industry-specialist audit firm has a negative and insignificant effect. EM practices have a negative impact on two company performance proxies (ROA and ROE), but have no effect on earnings per share (EPS). Furthermore, the size of the audit firm has a positive and significant influence on the performance proxies of the company [i.e. return on assets (ROA) and return on equity (ROE)]. The presence of an industry-specialist audit firm has a positive and significant influence on two proxies of company performance (ROE and EPS), but a negative and significant impact on ROA. An audit firm's tenure has a negative and significant impact on two performance proxies (ROA and EPS), but a positive and significant impact on ROE. Then, EM practices either fully or partially mediate the relationship between audit quality proxies and company performance as assessed by ROA, ROE and EPS. Research limitations/implications: The current study's limitation is that it only searched in Jordanian service companies listed on ASE from 2012 to 2019 to meet the study's objectives; thus, the authors recommend that future work investigate the study model for other sectors, whether in Jordan or other emerging markets such as the Middle East and North Africa. Another limitation of this study is that the study models lack important variables, which may affect EM and company performance, such as corporate governance and ownership structure characteristics; as a result, the authors recommend that future work includes such variables in future research models to have more explanations in this context. Practical implications: Analysts, investors and other strategic decision makers may use the findings of this study to improve the efficiency and efficacy of Jordan's financial market. These findings will enhance policymakers' willingness to establish appropriate regulations, which might improve Jordan's financial market performance and efficacy. These findings may help investors make better judgments by using audit quality proxies and EM indicators, which can forecast business success. Originality/value: First, this study distinguishes itself from prior studies through establishing a new research model, by investigating the mediating effect of EM in the relationship between audit quality and company performance. It provides empirical evidence from the Jordanian market; hence, it increases the body of the knowledge in this context. Second, to the best of the authors' knowledge, this is the first study to look into the link between audit quality, EM and company performance together; hence, the model of this study is developed using agency theory and information asymmetry theory. Third, the current study adds new evidence to the role of audit quality

and EM in companies, as well as how audit quality and EM practices affect company performance in emerging markets such as Jordan. © 2021, Emerald Publishing Limited.

Mediating influence of earnings management in the nexus between audit quality and company value: new proof from Jordanian market

(2023) Accounting Research Journal, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152265900&doi=10.1108%2fARJ-03-2021-0102&partnerID=40&md5=ed3bead9bf63e92b58f3cbabbca04f67>

AFFILIATIONS: Department of Accounting, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Purpose: This paper aims to recognize the direct influence of audit quality (AQ) on earnings management practices (EMP) and company value (CV), as well as the mediating role of EMP in the link between AQ and CV. It presents new factual proof from the Jordanian market, which is still in its early stages. Design/methodology/approach: A pattern of 43 service firms listed on the Amman Stock Exchange (ASE) was collected for the timeframe (2012-2019), giving an amount of 344 firm-year observances. The data was collected from the annual reports extracted from the ASE's database and tested with panel data analysis. Findings: The results show that audit firm industry specialization positively affects EMP while its size and tenure do not, which implies that its industry specialization does not restrict earnings management but rather leads to an increase in opportunistic behaviors. Audit firm size and audit firm industry specialization positively affect CV, whilst audit firm tenure does not. Additionally, the findings indicate that EMP negatively affect CV, and EMP act as a mediator for the AQ-CV nexus. Research limitations/implications: Stakeholders can use the findings to enhance the capacity and effectiveness of Jordan's fiscal market. For example, our results will boost policymakers' eagerness to institute suitable statutes improving Jordan's fiscal market performance. Besides, the results can assist existing and potential investors make sound adjudication by using AQ proxies and earnings management as signals to predict future company's value. Originality/value: The paper differentiates itself from previous papers through initiating a new proposed model by exploring the role of earnings management as a mediator in the nexus between AQ and CV by presenting new factual proof from the Jordanian market. © 2023, Emerald Publishing Limited.

ABSTRACT: In this paper, we review and analyze the commonly available wound healing models reported in the literature and discuss their advantages and issues, considering their relevance and translational potential to humans. Our analysis includes different in vitro and in silico as well as in vivo models and experimental techniques. We further explore the new technologies in the study of wound healing to provide an all encompassing review of the most efficient ways to proceed with wound healing experiments. We revealed that there is not one model of wound healing that is superior and can give translatable results to human research. Rather, there are many different models that have specific uses for studying certain processes or stages of wound healing. Our analysis suggests that when performing an experiment to assess stages of wound healing or different therapies to enhance healing, one must consider not only the species that will be used but also the type of model and how this can best replicate the physiology or pathophysiology in humans. © 2023 American Chemical Society

ABSTRACT: Mixing cement with water in mass concrete production is associated with hydration heat

generation, which may cause concrete mixes to dry out and crack. The experimental work aims to evaluate the effects of using liquid nitrogen (LN) in cooling mortar mixes and concrete. LN was used in doses of 0, 25, 50, 75 and 100% by water volume to either cool the mixing water at $T = 4^{\circ}\text{C}$ or to inject it into concrete mixtures directly. The concrete mix proportions were based on ACI PRC-207.1-21 for mass concrete. The mortars' initial and final setting times and temperatures indicated that a greater percentage of LN delayed the hardening process and the peak hardening rates, exhibiting slower cement hydration. LN cooling enhances the compressive strength of mortar and concrete cubes when $V_{LN}/V_{water} \leq 1$. However, concrete compressive strength decreased due to ice formation that turned into voids when $V_{LN}/V_{water} > 1$. Cooling concrete with chilled water ($T = 4^{\circ}\text{C}$) showed a 30% and 34.51% increase in mortar and concrete cubes' compressive strength, respectively, and a maximum of 16.45% and 12.97% when LN was injected into mortars and concrete mixes. Cooling the concrete with chilled water ($T = 4^{\circ}\text{C}$) showed a slower cooling process, which improved cement hydration results. © 2023 ICE Publishing. All rights reserved.

ABSTRACT: This paper is an experimental study of the effectiveness of using internal and external alkali-resistant glass fabric textile (AR-GT) layers for flexural strengthening of reinforced concrete (RC) beams. The experimental work compares internal single and triple layers of AR-GT as supplemental flexural reinforcement with textile-reinforced mortar (TRM) in RC beams subjected to four-point bending loading. In addition, a control beam specimen is cast with no AR-GT fabric. Monitoring the load-deflection curves, crack patterns, and strengthening layer performance showed that using AR-GT for internal and external layers increased the load-carrying capacity of RC beams. The failure patterns of beams with one external AR-GT layer and three internal AR-GT layers showed a similar trend, with higher loading capacity and lower deflections than the other beams. Three internal textile AR-GT layers recorded higher flexural strength (52%) than one internal layer (6.3%), compared to the control beam specimen. Moreover, using one layer of external AR-GT fabric exhibited higher flexural strength than using one or three internal layers (56.8%). © 2023 by the authors.

ABSTRACT: This work purposes to establish two small numerical modifications for the Fractional Euler method (FEM) and the Modified Fractional Euler Method (MFEM) to deal with fractional initial value problems. Two such modifications, which are named Improved Modified Fractional Euler Method 1 (IMFEM 1) and Improved Modified Fractional Euler Method 2 (IMFEM 2), endeavor to further enhance FEM and MFEM in terms of attaining more accuracy. By utilizing certain theoretical results, the resultant error bounds of the proposed methods are analyzed and estimated. Several numerical comparisons are carried out to validate the efficiency of our proposed methods. © 2023 by the authors.

ABSTRACT: In this article, we introduce and study the behavior of the modules of the first two coefficients for the classes (Formula presented.) and (Formula presented.) of normalized holomorphic and bi-univalent functions that are connected with the prestarlike functions. We determine the upper bounds for the initial Taylor-Maclaurin coefficients (Formula presented.) and (Formula presented.) for the functions of each of these families, and we also point out some special cases and consequences of our main results. The study of these classes is closely connected with those of Ruscheweyh who in 1977 introduced the classes of prestarlike functions of order (Formula presented.) using a convolution operator and the proofs of our results are based on the well-known Carathéodory's inequality for the functions with real positive part in the open unit disk. Our results generalize a few of the earlier ones obtained by Li and Wang, Murugusundaramoorthy et al., Brannan and Taha, and could be useful for those that work with the geometric function theory of one-variable functions. © 2023 by the authors.

ABSTRACT: –This paper investigates the L2 acquisition of the morphosyntax of number agreement of French by L1 learners. The study is based on a pilot study that investigates learners' knowledge of number agreement of two paradigms of subject-verb number agreement in French: the so-called matching paradigm in which agreement in number is expressed audibly via an alternation of the verb stem between a singular and plural forms and the mismatching paradigm in which the number agreement is not audible realized via singular vs. plural alternation. We discussed our sample's proficiency in (de-)normalizing number agreement and the implications it has for the theory of corrective feedback and linguistic input in L2 processing in Language acquisition. © 2023 ACADEMY PUBLICATION.

ABSTRACT: The marginalized and oppressed women in Sudan, alongside the subaltern women living on the margin, are depicted in the current work. "The Ostrich" by Laila Aboulela shows the protagonist's life of Sumra both in Khartoum, Sudan, and London in the UK. Sumra represents Sudanese women struggling hard to find their place in a patriarchal society. The structure of this article can be articulated in two arguments; the empowerment of patriarchal supremacy and the power of tradition implanted in Sudan and most third-world countries to marginalize and silence the role of women so that they can never be heard. Although women have got their studies at universities, they are still marginalized and have no full right to decide for themselves. Appropriating the analytical descriptive approach, the current study aims to demonstrate the marginalization and oppression of women in Sudan. © 2023 ACADEMY PUBLICATION.

ABSTRACT: The current research study was carried out to explore the mediating influence of management awareness on the relationship between employee empowerment and accounting information systems (AIS) outcomes. A quantitative approach was adopted through the distribution of an online questionnaire to (97) financial managers and accounting managers within banks in Jordan. SPSS was used in order to analyze the primary data, and it was seen that management awareness mediates the relationship between employee empowerment and AIS outcomes, which is attributed to the fact that management needs to be aware of organizational goals and the financial information needed to achieve these goals. This includes an understanding of the latest accounting technology that is available to assist in this process. Additionally, management needs to be aware of the costs associated with the implementation of new systems, and any potential risks that could arise. By being actively involved in the implementation and decision-making process, management can ensure that AIS is efficient and produces the desired results. Finally, management should ensure that appropriate user training is available for all users of the information system. This ensures that the system can be utilized in the most efficient manner possible and produces the desired financial results. This study recommended the need to utilize integrated cloud-based systems to increase the availability of information and reduce the need for manual data entry. Further recommendations were presented in the study. © 2023 by the author.

ABSTRACT: Introduction: Berberine is a natural isoquinoline alkaloid with anti-cancer properties. Nevertheless, the underlying mechanism of its action in human colorectal cancer (CRC) has not been thoroughly elucidated. We investigated the anti-cancer effect of berberine on HT-29, SW-480 and HCT-116 human CRC cell lines. Methods: Cell proliferation, migration and invasion were studied by MTT assay, wound healing, transwell chambers and flow cytometry. Reverse transcription-quantitative polymerase chain reaction (RT-qPCR) and immunostaining were used to evaluate the expression of aquaporins (AQPs) 1, 3 and 5 in colon cancer cell lines before and after treatment with berberine (10, 30 and 100 µM). RT-qPCR and Western blotting were used to further explore the PI3K/AKT signaling pathway and the molecular mechanisms underlying berberine-induced inhibition of cell proliferation. Results: We demonstrated that treatment of these CRC cell lines with berberine inhibited cell proliferation, migration and invasion through induction of apoptosis and necrosis. HT-29, SW-480 and

HCT-116 stained positively for AQP 1, 3 and 5, and berberine treatment down-regulated the expression of all three types of AQPs. Berberine also modulated PI3K/AKT pathway activity through up-regulating PTEN and down-regulating PI3K, AKT and p-AKT expression as well as suppressing its downstream targets, mTOR and p-mTOR at the protein level. Discussion/Conclusions: These findings indicate that berberine inhibited growth, migration and invasion of these colon cancer cell lines via down-regulation of AQP 1, 3 and 5 expressions, up-regulating PTEN which inhibited the PI3K/AKT pathway at the gene and protein levels, and that AQP 1, 3 and 5 expression level can be used as prognostic biomarkers for colon cancer metastasis. © 2023 by the authors.

ABSTRACT: This study assessed the effects of website design on the intention to visit the Museum of Parliamentary Life, and the moderating role of E-service quality and digital content in the relationship between website design and the intention to visit the Museum of Parliamentary life. This study utilized two theories namely the technology acceptance model and planned behavior. A total of 153 responses from visitors were analyzed using Smart Partial Least Squares. The findings reported that website design positively impacts the intention to visit the Museum of Parliamentary life. Additionally, E-service quality and digital content moderate the relationship between website design and the intention to visit the Museum of Parliamentary life. The study focused on visitors' motivation which forms their intention to visit the Museum of Parliamentary life. The goal here is to guide relevant organizations in increasing-service quality and enhancing digital content to encourage people to visit the museum. © 2023, SRAC - Romanian Society for Quality. ABSTRACT: The use of direct thermal energy storage can improve the reliability of solar dish technology by providing a steady source of heat, even when solar radiation levels are low or intermittent. In this experimental study, a solar-thermal hybrid system that transmits light to interior photovoltaic panels through an optical fiber while producing hot household water was developed. The system employs a parabolic solar dish (PSD) with a cylindrical solar receiver designed to capture both heat and solar radiation. Fiber optics are used to transport light from the solar collector to the building as a source of illumination. To improve the system efficiency, a design of a direct storage system with phase change material (PCM) of petroleum Jelly was employed in this experimental work to heat water for a longer discharge duration. Furthermore, Al₂O₃ nanoparticles account for 1% of the total volume of the PCM material are added to the PCM material to improve heat transfer during heat charge and discharge. In addition, a low-cost two-axis tracking system for a PSD was developed. The study examined the efficiency of the system and analyzed the temperature profiles inside the solar receiver using a direct energy storage system. The discharge time is approximately six hours with a water temperature of more than 30 °C. The results revealed that the use of Al₂O₃ nanoparticles boosted thermal efficiency by around 5.68%. The proposed system could assist in solving the limited space challenges by utilizing the roof of the building. © 2023 The Author(s)

ABSTRACT: The current study attempts to improve the performance of SI engines by employing two alternative acetone-gasoline mixtures. This investigation applies the Artificial Bees Colony Algorithm (ABC) to determine the optimum acetone-gasoline blends and engine speed to increase engine performance further and minimize fuel consumption. The SI engine performance of one-cylinder, four-stroke powered by neat gasoline fuel (AC0), 5% of acetone by volume (AC5), and 10 % of acetone by volume (AC10) has been investigated experimentally. Tests were carried out at speed rates from 1,000 to 3,600 rpm. The gasoline engine was integrated into an eddy-current dynamometer to evaluate the performance indexes. It was revealed that the overall performance of the gasoline engine is enhanced when acetone is blended with gasoline. The AC10 exhibited better engine brake torque (BT) and brake thermal efficiency (BTE) than pure gasoline, with 4.39 % and 6.9 %, respectively. According to the optimization findings, a 10% acetone concentration and engine speeds of 2889 rpm and 2769 rpm produced the best results in terms of BT and BTE, which were 7.776 N.m and 29.992%, respectively. However, at 2401 rpm of engine speed, a minimum BSFC of 0.2986 was reached without acetone. This result demonstrates that the ABC algorithm can precisely forecast the optimal position in terms of engine effectiveness and fuel consumption. © 2022 The Author(s)

ABSTRACT: This paper introduces a comprehensive survey of a new population-based algorithm so-called gradient-based optimizer (GBO) and analyzes its major features. GBO considers as one of the most effective optimization algorithm where it was utilized in different problems and domains, successfully. This review introduces set of related works of GBO where distributed into; GBO variants, GBO applications, and evaluate the efficiency of GBO compared with other metaheuristic algorithms. Finally, the conclusions concentrate on the existing work on GBO, showing its disadvantages, and propose future works. The review paper will be helpful for the researchers and practitioners of GBO belonging to a wide range of audiences from the domains of optimization, engineering, medical, data mining and clustering. As well, it is wealthy in research on health, environment and public safety. Also, it will aid those who are interested by providing them with potential future research. © 2022, The Author(s) under exclusive licence to International Center for Numerical Methods in Engineering (CIMNE).

ABSTRACT: BACKGROUND: Given the restrictions associated with COVID-19, feelings of loneliness among youth may increase. AIMS: The aims of the current study were to assess the prevalence of loneliness among young people at the time of COVID-19 and to identify whether selected variables related to the pandemic predicted the level of loneliness. METHOD: A cross-sectional study using WhatsApp and Facebook social media platforms was conducted to survey 1,057 young people aged 15 to 24 years from six Middle Eastern countries. Participants completed survey items including demographic and COVID-19-related questions; the Depression, Anxiety and Stress Scale (DASS); the Satisfaction With Life Scale (SWLS); and the UCLA Loneliness Scale. RESULTS: The prevalence of experienced loneliness was 1 (0.1%), 625 (59.1%), 429 (40.6%), and 2 (0.2%), reflecting low, moderate, moderately high, and high experiences for loneliness, respectively. History of depression or anxiety, being dissatisfied with life, and having depression at the time of COVID-19 were significant predictors of loneliness among youth. The model was significant ($F = 44.95$, $p < .05$) and accounted for 29.8% of the variance in UCLA Loneliness Scale scores. CONCLUSIONS: We found that the high prevalence rate of loneliness during the COVID-19 pandemic was correlated with depression and impaired life satisfaction among Middle Eastern youth. Thus, special attention and interventional action plans need to be developed taking into consideration the youths' special situation during COVID-19. © The Author(s) 2021.

In vitro Assessment of the Antidiabetic Activity of Aqueous and Ethanolic Extracts from the Aerial Parts of *Ajuga orientalis* L.

(2023) Research Journal of Pharmacy and Technology, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164601561&doi=10.52711%2f0974-360X.2023.00300&partnerID=40&md5=91f27259d3a7cc2120a1c041b8773045>

AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, 11733, Jordan

ABSTRACT: *Ajuga orientalis* L. is a member of the Lamiaceae family. Many biological properties of *A. orientalis*, such as antibacterial, anticancer, antioxidant, and anti-inflammatory activities, have been documented. The current study aims to assess the in vitro antidiabetic efficacy of aerial parts *A. orientalis* extracts through digestive enzymes inhibition assay (α -amylase and α -glucosidase), which are responsible for the digestion of poly and oligosaccharides. Acarbose, aqueous, and ethanolic extracts of *A. orientalis* were utilized in various concentrations (100, 200, 300, 400, and 500 μ g/ml). The absorbance values for the enzymes α -amylase and α -glucosidase at 540nm and 400nm, respectively, were measured using a spectrophotometer. Both extracts demonstrated significant inhibition of α -amylase and α -glucosidase enzymes in a dose-dependent manner. Furthermore, the ethanolic extract showed more inhibitory activity than the aqueous extract. In conclusion, *A. orientalis* extracts exhibited in vitro antidiabetic activity. © 2023, Research Journal of Pharmacy and Technology. All rights reserved.

ABSTRACT: In our current research article, based on a general configuration of a 3-step Peano kernel, new versions of integral inequality of Ostrowski's type are developed for differentiable mappings that have second derivatives belong to L_∞ . Then we utilized these versions to generate new perturbed trapezoid like inequalities. These new perturbed trapezoid like inequalities are proposed with error bounds smaller than and similar to those reported by previous studies. Moreover, some of the obtained perturbed trapezoid like inequalities reveal the relationship between the Euler-Maclaurin summation and the trapezoidal rule. Finally, certain implementations to numerical composite quadrature rules are provided for completeness. © 2023 The Authors.

ABSTRACT: Background and Objectives: Venous thromboembolism is one of the leading causes of mortality and disability worldwide. Treatment with anticoagulation therapy is essential and requires a delicate approach to select the most appropriate option to improve patient outcomes, including the length of hospital stay (LOS). The aim of this study was to determine the LOS among patients with acute onset of VTE in several public hospitals in Jordan. Materials and Methods: In this study, we recruited hospitalized patients with a confirmed diagnosis of VTE. We reviewed the electronic medical records and charts of VTE admitted patients in addition to a detailed survey to collect the patients' self-reported data. Hospital LOS was categorized into three levels: 1-3 days, 4-6 days, and ≥ 7 days. An ordered logistic regression model was used to study the significant predictors of LOS. Results: A total of 317 VTE patients were recruited, with 52.4% of them were male and 35.3% aged between 50 and 69 years. Most patients had a deep vein thrombosis (DVT) diagnosis (84.2%), and most of the VTE cases were admitted for the first-time (64.6%). The majority of the patients were smokers (57.2%), overweight/obese (66.3%), and hypertensive (59%). Most of the VTE patients received Warfarin overlapped with low molecular weight heparins as their treatment regimen ($>70\%$). Almost half of the admitted VTE patients (45%) were hospitalized for at least 7 days. Longer LOS was significantly associated with hypertension. Conclusions: We recommend using therapies that have been proven to reduce hospital LOS, such as non-vitamin K antagonist oral anticoagulants or direct oral anticoagulants, to treat VTE patients in Jordan. Additionally, preventing and controlling comorbidities such as hypertension is essential. © 2023 by the authors.

ABSTRACT: In this paper, we aim to present a novel n-point composite fractional formula for approximating a Riemann-Liouville fractional integral operator. With the use of the definite fractional integral's definition coupled with the generalized Taylor's formula, a novel three-point central fractional formula is established for approximating a Riemann-Liouville fractional integrator. Such a new formula, which emerges clearly from the symmetrical aspects of the proposed numerical approach, is then further extended to formulate an n-point composite fractional formula for approximating the same operator. Several numerical examples are introduced to validate our findings. © 2023 by the authors.

ABSTRACT: Chronic use of antihistamines can induce abnormalities in lipid absorption with potential excessive accumulation of lipids in the mesentery that can lead to the development of obesity and a metabolic syndrome. The focus of the present work was to develop a transdermal gel formulation of desloratadine (DES) to prevent/reduce obesity and metabolic syndromes. Nine formulations were

prepared to contain hydroxypropyl methylcellulose (2–3%), DES (2.5–5.0%), and Transcutol® (15–20%). The formulations were evaluated for cohesive and adhesive properties, viscosity, drug diffusion through synthetic and pig ear skin, and pharmacokinetics in New Zealand white rabbits. Drug permeation was faster through the skin compared to synthetic membranes. The drug had good permeation, as indicated by very short lag time (0.08–0.47 h) and high flux (59.3–230.7 $\mu\text{g}/\text{cm}^2\cdot\text{h}$). The maximum plasma concentration (C_{max}) and area under the curve (AUC) of transdermal gel formulations were 2.4 and 3.2 fold that of the Clarinex tablet formulation. In conclusion, as indicated by the higher bioavailability, transdermal gel formulation of DES may decrease the dose of the drug, compared to commercial formulation. It has the potential to reduce or eliminate metabolic syndromes associated with oral antihistamine therapy. © 2023 by the authors.

ABSTRACT: Plant diseases represent one of the critical issues which lead to a major decrease in the quantity and quality of crops. Therefore, the early detection of plant diseases can avoid any losses or damage to these crops. This paper presents an image processing and a deep learning-based automatic approach that classifies the diseases that strike the apple leaves. The proposed system has been tested using over 18,000 images from the Apple Diseases Dataset by PlantVillage, including images of healthy and affected apple leaves. We applied the VGG-16 architecture to a pre-trained unlabeled dataset of plant leaf images. Then, we used some other deep learning pre-trained architectures, including Inception-V3, ResNet-50, and VGG-19, to solve the visualization-related problems in computer vision, including object classification. These networks can train the images dataset and compare the achieved results, including accuracy and error rate between those architectures. The preliminary results demonstrate the effectiveness of the proposed Inception V3 and VGG-16 approaches. The obtained results demonstrate that Inception V3 achieves an accuracy of 92.42% with an error rate of 0.3037%, while the VGG-16 network achieves an accuracy of 91.53% with an error rate of 0.4785%. The experiments show that these two deep learning networks can achieve satisfying results under various conditions, including lighting, background scene, camera resolution, size, viewpoint, and scene direction. © 2023 by the authors.

ABSTRACT: This work proposes a new numerical approach for dealing with fractional stochastic differential equations. In particular, a novel three-point fractional formula for approximating the Riemann-Liouville integrator is established, and then it is applied to generate approximate solutions for fractional stochastic differential equations. Such a formula is derived with the use of the generalized Taylor theorem coupled with a recent definition of the definite fractional integral. Our approach is compared with the approximate solution generated by the Euler-Maruyama method and the exact solution for the purpose of verifying our findings. © 2023 by the authors.

ABSTRACT: This research aims to identify and interpret the main traffic characteristics affecting the pavement condition index (PCI) of asphalt within parking areas. The study also examines the effect of

severity and type of asphalt pavement distress on parking decisions. Previous literature examines the impact of the environment on asphalt pavement deterioration. This paper will focus on the shape of traffic operations within a parking area. The methodology includes applying a multilevel mixed regression model to reveal the hidden hierarchical relationship between traffic activities and the different types of pavement distresses and then discovering their effect on asphalt PCI. The resulting models showed that parking lots are aging faster than the common traveling roads due to the increased impact of axial loads on their surfaces at low and static speeds and some distinctive traffic characteristics. Moreover, some types of pavement distress, such as alligator cracks, potholes and depressions, appear more widely than others on the parking lot surface and significantly influence the parking decision. The conclusion of the research may significantly impact pavement design and maintenance management for parking lots. © 2023 by the authors.

ABSTRACT: Cigarette smoke withdrawal can cause anxiety-like behavior and modulate neurotransmitter-related proteins in the brain. We examined the effects of cigarette smoke with and without aspirin treatment on the concentrations of neurotransmitters, including dopamine, serotonin, glutamate, glutamine, and GABA in the amygdala and hippocampus. Sprague-Dawley rats were randomly assigned to four different groups: (1) control group exposed only to standard room air, (2) cigarette smoke exposed group treated with saline vehicle, (3) cigarette smoke exposed group treated with aspirin (30 mg/kg), and (4) control group treated only with aspirin (30 mg/kg). Cigarette smoke exposure was performed for 2 h/day, 5 days/week, for 31 days. Behavioral testing was carried out weekly, 24 h after cigarette smoke exposure, during acute withdrawal. At the end of week 4, rats were given either distilled water (1 mL) or aspirin 45 min before cigarette exposure for 11 days. Dopamine, serotonin, glutamate, glutamine, and GABA were extracted from both the amygdala and hippocampus and were separated and quantified using a developed and validated HPLC-MS/MS method. Cigarette smoke withdrawal induced anxiety behaviors, and aspirin treatment reduced this effect. Cigarette smoke exposure increased tissue content of dopamine, serotonin, glutamate, glutamine, and GABA, and aspirin treatment reversed this effect. Cigarette smoke caused an increase in tissue content of several neurotransmitters as well as anxiety-like behavior, and these effects were normalized by aspirin treatment. © 2023 by the authors.

ABSTRACT: Paracetamol (acetaminophen, APAP) is the most common non-prescription analgesic drug used during pregnancy. The aim of this study was to investigate the effect of vitamin E on acute APAP toxicity in pregnant rats. Toxicity in the liver, kidney, and brain (hippocampus, cerebellum, and olfactory bulb) was examined. Twenty pregnant female Wistar rats at gestational day 18 were used. Pregnant rats were divided into four groups: Control, APAP, E + APAP, and APAP + E. The Control group was treated with 0.5 mL p.o. corn oil. The APAP group received 3000 mg/kg p.o. APAP. The E + APAP group received 300 mg/kg p.o. vitamin E one hour before 3000 mg/kg APAP. The APAP + E group received 3000 mg/kg paracetamol one hour before 300 mg/kg p.o. vitamin E. Twenty-four hours after the last treatment administration, rats were euthanized and blood, brain, liver, and kidney samples were collected. Alanine aminotransferase (ALT), aspartate aminotransferase (AST), blood urea nitrogen

(BUN), creatinine levels, uric acid (UA), and superoxide dismutase (SOD) levels, as well as the relative mRNA expression of Cyp1a4, Cyp2d6, and Nat2, were determined. Acute APAP treatment upregulated ALT, AST, BUN, and creatinine levels. APAP treatment downregulated UA and SOD levels. APAP treatment upregulated the relative mRNA expression of Cyp1a4 and Cyp2d6, but downregulated Nat2 expression. Vitamin E treatment, either before or after APAP administration, attenuated the toxic effects of APAP. In conclusion, the results showed that an acute toxic APAP dose in late pregnancy can cause oxidative stress and dysregulation in Cyp isoform expression, and that vitamin E treatment attenuates these effects. © 2023 by the authors.

ABSTRACT: Organizations are shifting their focus towards utilizing green energy in the business process to enhance environmental sustainability. Similar to other business roles, the managerial team in the financial sector has also engaged in environment-friendly operations. A green bond is a new financial approach integrating the protection of the ecosystem into economic profits. This paper analyzes green bonds' intellectual structure, publication, and networking. The bibliometric statistics utilized in the green bonds emerged from the Scopus database. The research examines published works from the most resourceful nations, institutions of higher learning, scholars, and high-profile publications on green bonds. Additionally, the study maps bibliographic coupling and co-citation to visualize the knowledge network. © 2023 by the authors.

ABSTRACT: The binary metal oxides show advantages in energy storage devices. Specifically, nickel cobaltite (NiCo2O4) materials showed promising pseudocapacitive properties, high electrical conductivity and large surface area by virtue of their effective porous structure. NiCo2O4 nanosheets were hydrothermally grown in this work over flexible tapes of Aluminum (Al) and Copper (Cu). A nanosheets structure obtained of NiCo2O4 as confirmed by SEM and AFM images. The measured thickness by 3D profilometer of NiCo2O4 nanosheets based Al framework found to be 4.3 µm compared to 8.4 µm thick of film based-Cu framework. Asymmetric supercapacitor prepared from graphite and NiCo2O4 electrodes separated by filter paper. Acidic aqueous electrolyte of H2SO4 and basic aqueous electrolyte of KOH were employed to verify the cyclic activity and electrochemical reaction of asymmetric prepared supercapacitor devices. The basic KOH electrolyte shows a high stability and better charge transfer/ionic diffusion compared to the acidic H2SO4 electrolyte in particular for NiCo2O4 film-based Cu framework. The energy density and power density values were 0.9 W h kg⁻¹ and 66.45 W kg⁻¹, respectively. The highest specific capacity (in F.g⁻¹) = 10.09 coincides with NiCo2O4/Cu supercapacitor in the basic KOH electrolyte. The charge storage in the supercapacitor system of NiCo2O4 and graphite can be ascribed in the form of Faradic charge transfer and capacitive non-faradic double layer, respectively. © 2023, The Author(s).

ABSTRACT: Background and Objective: Self-medication (SM) has significantly increased worldwide in the past decades, which may have detrimental health consequences including antimicrobial resistance, adverse drug reactions, drug-drug interaction, and dependency. Although several studies have evaluated the extent of SM, such studies are still limited in Jordan. The aim of this study was to explore sources of SM information, attitudes toward SM and the practice of SM and its associated factors. Methods: The data of this cross-sectional study was collected between February and July 2022. A validated questionnaire was distributed to patients attending pharmacies from different locations in Jordan. The survey evaluated sources of information and attitudes toward SM, extent of SM practice, and attitudes towards SM, symptoms that the participants treat with SM and those that usually requires medical doctor consolation, followed by questions about the classes of medications mostly used for SM and the reasons for SM. Results and Discussion: The study enrolled 695 Jordanian adults. The most reported indications for SM included headache (86.9 %), flu (76.4 %), and fever (69.6 %). The most common causes for SM included previous knowledge about the diseases and its treatments (84.2 %), and full knowledge of the medicine to be purchased (55.2 %). Results of the ordinal regression showed that physician counseling frequency was positively and significantly associated with "not being on chronic medication" (p-value = 0.001), and having a positive SM attitude level (p-value = 0.019), while negatively correlated with being in medical field (p-value < 0.001), having no children (p-value = 0.009), and relaying on non-scientific sources to obtain information for SM (p-value = 0.014). The frequency of SM practice was positively associated with being in medical field (p-value < 0.001, having no insurance (p-value < 0.001), and relaying on nonscientific sources (p-value = 0.017). Lastly, having a positive SM attitude level (p-value < 0.001) and not being on chronic medications (p-value = 0.007) were associated with decreased SM practice. Conclusion: The study participants demonstrated increased SM practice due to the wrong perceptions toward SM and the reliance on non-scientific source of information about SM practice. © 2023 The Author(s)

ABSTRACT: Viscoelastic materials are used extensively in energy dissipation applications to mitigate large lateral displacements and attenuate vibrations. One way of exploiting the capabilities of viscoelastic materials is using shear-damping mechanisms such as seismic damping devices. This study utilizes the freedom of design offered by additive manufacturing to produce 3D- printed thermoplastic parts that act as the viscoelastic layer in an energy damping device. A mechanically interlocked damping device with a bio-inspired jigsaw-like interlocking mechanism was designed and manufactured. The damping device is composed of a hard and soft phase. The hard phase is made of steel, while the soft phase is 3D-printed thermoplastic polyurethane (TPU). The mechanically interlocked damper was cyclically tested under different amplitudes and frequencies. TPU was mechanically characterized using uniaxial cyclic tension tests under different rates and different printing processing parameters. Stress relaxation tests were also conducted to obtain the viscoelastic behavior of the TPU material. Material characterization of TPU was used to develop a finite element (FE) model that is used to simulate the mechanically interlocked damper. The FE model was validated with the experimental observations and was then used to examine the significance of damper geometry on the efficiency of energy dissipation. © 2023 The Author(s)

ABSTRACT: Background: Cytochrome 4F2 (CYP4F2) is a major arachidonic acid-metabolizing enzyme which produces 20-Hydroxyeicosatetraenoic acid (20-HETE). It is found that 20-HETE is involved in the pathophysiology of many diseases, including diabetes mellitus. The genetic variants of CYP4F2 can affect its enzymatic activity as well as the 20-HETE production. Aims: Our aim with this paper was to find out the genotype frequency of CYP4F2 rs2108622 C>T, the major functional variant in the CYP4F2 gene, among a sample of type II diabetes (TIIDM) and its effects on diabetes complications and lipid profile. Methods: The CYP4F2 rs2108622 variant was genotyped among 90 healthy volunteers and 90 TIIDM patients that attending the University of Jordan Hospital, using the DNA Sanger sequencing method. The data of lipid profile and diabetes complications were obtained from the electronic records available in the hospital. Results: We found that the frequency of CYP4F2 rs2108622C>T variant is significantly ($P = 0.02$) lower among TIIDM patients in comparison to healthy subjects using both co-dominant and dominant genotyping models. In addition, the CYP4F2 rs2108622 T/T genotype was significantly ($P = 0.02$) more frequent among TIIDM patients with retinopathy complications (OR=4.36, CI: 1.32-14.37). Lastly, the CYP4F2 rs2108622C>T variant was not associated ($P > 0.05$) with the glycaemic and lipid profile of patients. Conclusions: It can be concluded from this study that the frequency of CYP4F2 rs2108622 T/T genotype is lower among TIIDM, but this genotype is associated with an increased risk of retinopathy complications in patients of Jordanian origin. Further studies with a larger sample size are needed to validate the findings of this study. © 2023 Elsevier Inc.

ABSTRACT: Purpose: We aimed to evaluate the cost effectiveness of Favipiravir treatment versus standard of care (SC) in moderately to severely ill COVID-19 patients from the Saudi healthcare payer perspective. Methods: We used the patient-level simulation method to simulate a cohort of 415 patients with moderate to severe COVID-19 disease who were admitted to two Saudi COVID-19 referral hospitals: 220 patients on Favipiravir and 195 patients on SC. We estimated the incremental cost-effectiveness ratio (ICER) of Favipiravir versus SC in terms of the probability to be discharged alive from hospital and the mean time in days to discharge one patient alive. The model was performed twice: first, using unweighted, and second, using weighted clinical and economic data. Weighting using the inverse weight probability method was performed to achieve balance in baseline characteristics. Results: In the unweighted model, base case (probabilistic) ICER estimates favored Favipiravir at savings of Saudi Riyal (SAR)1,611,511 (SAR1,998,948) per 1% increase in the probability of being discharged alive. As to mean time to discharging one patient alive, ICERs favored Favipiravir at savings of SAR11,498 (SAR11,125). Similar results were observed in the weighted model with savings using Favipiravir of SAR1,514,893 (SAR2,453,551) per 1% increase in the

probability of being discharged alive, and savings of SAR11,989 (SAR11,277) for each day a patient is discharged alive. Conclusion: From the payer perspective, the addition of Favipiravir in moderately to severely ill COVID-19 patients was cost-savings over SC. Favipiravir was associated with a higher probability of discharging patients alive and lower daily spending on hospitalization than SC. © 2023 The Author(s)

ABSTRACT: In this study, the performance of a Tri-Generation cooling system employing two adsorption chillers will be analysed experimentally and theoretically utilizing the TRNSYS software. The purpose of this study is to assess the performance of two adsorption chillers and to evaluate how operational and design factors affect the performance of the tri-generation cooling system. The system was developed and validated at the Mutah University in Jordan, it consists of 240 m² parabolic trough solar matrix. The trough matrix heated thermal oil to 260 °C, producing 13.7 bar of 210 °C superheated steam. The power cycle is completed by evaporating brackish water with the engine's 120 °C steam. Distillation yields 150 L of distilled water each hour. The rejected heat from distillation is stored in a thermally isolated hydraulic storage tank and used to power a unique two-stage air cooled adsorption chiller with a cooling capacity of 10 kW each. As a result, adsorption chillers' COP and normalized capacity were calculated. Their optimum values were obtained at 94 °C hot water, 15 °C chilled water, and 35 °C condensation temperature. The lowest COP and normalized capacity values were recorded at 65 °C hot water, 7 °C chilled water, and 38 °C condensation temperature. © 2023 The Authors

ABSTRACT: Sumac [*Rhus coriaria* L. (Anacardiaceae)] is a widely used spice in the Middle East. In this study, the hepatoprotective effects of sumac fruit were evaluated using a rat model of paracetamol-induced liver injury. The experimental design relies on the pretreatment of rats with intraperitoneal sumac extract followed by a toxic dose of paracetamol. Tissue alterations, serum levels of oxidative stress markers, as well as gene expression of immunomarkers were evaluated. Rats pre-treated with sumac displayed attenuated signs of toxicity. Upon paracetamol intoxication, sumac-pretreated animals showed a minimal increase in liver enzyme levels. In parallel, serum albumin and total protein levels were close to normal. Moreover, pretreated sumac animals had preserved hepatocyte morphology, whereas unprotected animals had necrotic deformations. Importantly, these effects were dose-dependent and comparable to the silymarin-treated positive control group. In conclusion, sumac extract offers a potential hepatoprotective regimen against xenobiotic-induced hepatotoxicity and for oxidative stress management. © 2023 Elsevier Ltd

ABSTRACT: This study explores three issues with reference to times of crisis: the impact of government use of social media, and of social media contradictions, on trust in government, and on citizens' attitudes toward government use of social media. The crisis that provided the context of

this study was the COVID-19 pandemic. Therefore, the study explored the impact of trust in government and social media contradictions on citizens' attitudes toward pandemic prevention measures and vaccination. Data were collected from 379 respondents who were Facebook users in Jordan. PLS-SEM was utilised to validate the research model and analyse data. The results reveal a positive impact on trust in government of a number of dimensions of government use of social media, including transparency, participation, and collaboration. They also confirm that social media contradictions negatively impact trust in government and citizens' attitudes towards vaccination. © 2023 Elsevier Inc.

Faculty of Pharmacy, Al-Zaytoonah University of Jordan, P.O.Box 130, Amman, 11733, Jordan

ABSTRACT: Background: With increasing numbers of pharmacists working in general practices and undertaking patient-facing roles, it has been recognised that they must have the necessary clinical skills. However, previous studies have highlighted that practice-based pharmacists (PBPs) do not feel confident regarding their clinical skills, and it is unclear what skills are needed. Objective: To develop a core set of clinical skills (CSs) required for pharmacists who intend to practise as independent prescribers working in general practice/family medicine. Methods: Based on a previous study, 18 CSs were selected for inclusion in a three-round Delphi consensus questionnaire. These skills were rated by a Delphi panel on a 9-point Likert scale (ranging from 1 = limited importance to 9 = critical). The Delphi panel comprised designated leads of pharmacist independent prescribing programmes in each United Kingdom educational provider listed on the General Pharmaceutical Council website. A CS was included in the core set if 80% or more of participants scored between 7 and 9, and 15% or less scored between 1 and 3. Results: Following Round 1, seven CSs met the criteria for inclusion: 'Measuring heart rate (radial pulse)', 'Assessing respiratory rate', 'Measuring blood pressure (manual, e.g. with aneroid sphygmomanometer)', 'Measuring blood pressure (automated, i.e. electronic blood pressure monitor)', 'Measuring peripheral oxygen saturation (using pulse oximeter)', 'Measuring temperature', 'Measuring Peak Expiratory Flow Rate'. After two further rounds, a further four CSs were included consisting of 'Undertaking a urinalysis', 'Respiratory examination (includes inspection, palpation, percussion and listening to breath sounds)', 'Screening for/assessment of depression and anxiety using a validated questionnaire (e.g. Patient Health Questionnaire-9 [PHQ-9] scoring)', and 'Patient assessment via National Early Warning Score (NEWS)'. No consensus was reached on nine CSs. Conclusion: This study has produced a core set of CSs for prescribing pharmacists. This study may contribute to standardisation of training and assessment for pharmacist prescribers working in general practice/family medicine. © 2023

ABSTRACT: Non Orthogonal Multiple Access (NOMA) successfully drew attention to the deployment of 5th Generation (5G) wireless communication systems, and it is now considered a significant technology in 5G communications. The primary enhancement in 5G is the speed, which may be 100 times faster than 4G. Due to the rising number of internal or external attacks on the Network, wireless intrusion detection systems are a vital aspect of any system connected to the Internet, and 5G will demand considerable improvements in data rate and security. In this paper, we have built a simulator for NOMA and applied a dropping attack to extract a dataset from the simulation model. The accuracy for detecting dropping attacks using the extracted data after applying ML algorithms was 95.7% for LR. Furthermore, this work suggests a methodology for wireless cyberattack detection in 5G networks based on applying several ML and DL techniques such as Decision Trees, KNN, Multi-class Decision Jungle, Multi-class Decision Forest, and Multi-class Neural Network. The proposed work is implemented and tested using a comprehensive Wi-Fi network benchmark dataset. The conducted experiments resulted in an outstanding performance with an accuracy of 99% for the KNN algorithm and 93% for DF and Neural Network. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Satisfaction Detection is one of the most common issues that impact the business world. So, this study aims to suggest an application that detects the Satisfaction tone that leads to customer happiness for Big Data that came out from online businesses on social media, in particular, Facebook and Twitter, by using two famous methods, machine learning and deep learning (DL) techniques. There is a lack of datasets that are involved with this topic. Therefore, we have collected the dataset from social media. We have simplified the concept of Big Data analytics for business on social media using three of the most famous Natural Language Processing tools, stemming, normalization, and stop word removal. To evaluate the performance of the classifiers, we calculated F1-measure, Recall, and Precision measures. The result showed superiority for the Random Forest classifier the highest value of F1-measure with (99.1%). The best result achieved without applying pre-processing techniques, through Support Vector Machine with F1-measure (93.4%). On the other hand, we apply DL techniques, and we apply the feature extraction method, which includes Word Embedding and Bag of Words on the dataset. The results showed superiority for the Deep Neural Networks DNN algorithm. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: In this paper, a multi agent recommender system is designed and developed for user interests extraction The system consists of eight agents such as age, identity, personality, social, financial, location, and needs. The agents works with each others in a collaborative way to make recommendation to the users according to their interest. The relation between the agents and the users are controlled by a well developed protocol and pre-defined senses. The information between the users and the agents are collected in information center agent (ICA). The data collected in ICA can be used to rearrange the videos in way such that it is more relative to the user depending on his interest. This interest can be extracted from the information that the user initially provides to the

system which can be then analyzed from the multi agent system to decide whether the user is interested in a video or not. This is done by creating video -important term matrix, user important term matrix and agent -feature matrix. Then, these matrices are used by the multi-agent system to get video-Agent effective matrix for the users which leads to most ordered videos in order to be presented to the user. The proposed model was verified by intensive simulations using eight agents using JADE platform. The results show that the accuracy of the system for 50 videos that were well arranged for 40 users is 87%. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

AFFILIATIONS: Al-Zaytoonah University of Jordan, Faculty of Business, Jordan

ABSTRACT: The purpose of this research is to look into the impact of audit quality on company performance. It offers empirical evidence from the Jordanian market, which is considered an emerging market. In this study, audit quality is proxied by auditor tenure, auditor industry specialization, and auditor firm size, while company performance is proxied by ROA, ROE, and EPS. A panel data analysis of all Jordanian industrial public shareholding companies listed on the Amman Stock Exchange during the timeframe (2012 to 2017) is used in this study. The primary findings are that auditor tenure has a negative influence on ROA, but auditor industry specialization and auditor firm size have no influence on ROA. Auditor firm size has a positive influence on both ROE and EPS, but auditor tenure and auditor industry specialization have a non-significant negative influence on both ROE and EPS. According to these results, companies in emerging markets should be encouraged to overcome the barriers that limit the link between audit quality and company performance. The study also suggests more research on the impact of audit quality on information asymmetry and earnings management. Future study might potentially identify characteristics that influence audit quality, particularly in emerging countries (such as MENA countries), where there has been little effort to explore the level of audit quality and its relationship with other factors. © 2023, Hrvatsko Društvo Ekonomista. Big Data analytics and financial reporting quality: qualitative evidence from Canada

(2023) Journal of Financial Reporting and Accounting, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133480745&doi=10.1108%2fJFRA-12-2021-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133480745&doi=10.1108%2fJFRA-12-2021-0489&partnerID=40&md5=b6c3e37f05ffc1818b7278ebeeabc00c)

[0489&partnerID=40&md5=b6c3e37f05ffc1818b7278ebeeabc00c](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133480745&doi=10.1108%2fJFRA-12-2021-0489&partnerID=40&md5=b6c3e37f05ffc1818b7278ebeeabc00c)

ABSTRACT: Purpose: Big Data analytics (BDA) and its implications for the accounting profession continue to be a key issue that requires more research and evaluation. As a result, the purpose of this study is to evaluate the impact of BDA on financial reporting quality, as well as to assess the accounting challenges associated with Big Data. It provides qualitative evidence from Canada. Design/methodology/approach: This study used a qualitative approach to ascertain the thoughts and perceptions of auditors, financial analysts and accountants at Canadian audit and accounting firms in BDA and its impact on financial reporting quality, using semi-structured interviews. To obtain their consent to participate in the interview, 127 auditors, financial analysts and accountants from Canadian audit and accounting firms were initially approached. The final number of respondents was 41, representing a response rate of 32%. Findings: The authors' findings underscored the relevance of Big Data and BDA in affecting financial report quality and revealed that BDA had a significant effect on improving financial reporting quality. Big Data improves accounting reporting and expert judgment by providing professional. In summary, participants agreed that when analytical methods in Big Data are implemented effectively, businesses may possibly achieve a variety of benefits, including customized goods, simplified processes, improved risk assessment process and, finally, increased risk management. Practical implications: The authors' findings indicate that BDA may help predict investment returns and risks, estimate future investment opportunities, forecast revenues, detect

fraud and susceptibility early and identify economic growth opportunities. As a result, auditors, financial analysts, accountants, investors and other strategic decision-makers should be aware of these findings to make informed choices. Originality/value: Big Data has become the norm in recent years; accountants and other decision-makers have struggled to analyze massive amounts of data. This limits their capacity to profit from such data even more. Therefore, this study is motivated by the lack of research on Big Data's influence on financial report quality. © 2022, Emerald Publishing Limited.

Blockchain adoption in accounting by an extended UTAUT model: empirical evidence from an emerging economy

(2023) Journal of Financial Reporting and Accounting, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127336730&doi=10.1108%2fJFRA-12-2021-0434&partnerID=40&md5=de401609f7e637cfd4fe59a989d18218>

Department of Student Affairs, Tien Giang University, My Tho, Viet Nam

ABSTRACT: Purpose: The purpose of this study is to use an extended Unified Theory of Acceptance and Use of Technology (UTAUT) model to investigate the intention to use blockchain from the accountant's point of view. The proposed model is expected to provide the necessary incentives for accountants to adopt blockchain. The authors build external constructs based on discussions of blockchain properties for accounting such as accounting information quality, job relevance and trust. In addition, the study also considers computer self-efficacy and compatibility as factors related to practitioners' blockchain acceptance. Design/methodology/approach: By using the developed online-questionnaire, the data is collected from the responses of 317 accountants working in listed enterprises in Vietnam. The main analyzes are performed by Smart partial least squares structural equation modeling technique to present both direct and indirect effects on the intention to use blockchain. Findings: Experimental results provide many interesting and valuable things. First, performance and effort expectancy have a positive influence on intention to use blockchain, while social influence has a lower influence. Second, trust has a direct and positive effect on effort and performance expectancy, as well as intention to use blockchain. Quite surprisingly, accounting information quality has a positive effect on performance expectancy, while job relevance has a negative effect. Fourth, computer self-efficacy and compatibility have a positive effect on effort expectancy. It is more interesting that the intention to use blockchain has nothing to do with compatibility. The results of this study also show that performance and effort expectancy play a mediating role in the indirect effects of trust, computer self-efficacy and compatibility on intention to use blockchain. Research limitations/implications: The study shows that accountants in Vietnam have a high intention to use blockchain. This implies that the Vietnamese Government and the professional association should design training programs or open training sessions on blockchain. Accountants can clearly understand the importance of blockchain in their work as well as the positive effect of blockchain on performance. They are consulted on how to use blockchain. They also perceive that using blockchain is not too difficult, and the acceptance of this technology will be higher. Additionally, universities should put triple-entry accounting into their teaching, so accounting students can improve their skills and knowledge relevant to blockchain to meet their career needs in the future. Originality/value: The study proposes an extended UTAUT model with external constructs built on blockchain's effects on accounting. The model makes more sense in promoting the use of blockchain in accounting. © 2022, Emerald Publishing Limited.

ABSTRACT: BACKGROUND: Adherence to medications is a significant element of self-care behaviors for patients with cardiovascular diseases (CVDs). Non-adherence to cardiovascular medications is the major risk for poor outcomes following any cardiac event. However, there is a lack of studies that addressed medication adherence among patients with CVDs attending outpatient clinics in Arabic

countries, including Jordan. Thus, this study purposed to assess the psychosocial factors (e.g. depression, anxiety, stress, social support and self-esteem) and their correlation with adherence to medications among patients with CVDs attending outpatient clinics in Jordan. METHODS: A total of 395 Jordanian patients attending CVDs outpatient clinics at government, military and private healthcare facilities were recruited. RESULTS: Our study findings showed that 31.4% of the patients reported complete adherence to their medications. The proportion of psychological reactions reported by the participants was 72.1% for depressive symptoms, 62.6% for anxiety and 50.1% for stress; 79.7% had moderate and normal social support, and 44% had low self-esteem. Depression, anxiety and stress had a significant negative correlation with adherence to medications; however, self-esteem had a significant positive relationship with adherence to medications. In addition, depression, anxiety and stress were the main predictors of adherence to medications. CONCLUSION: Our findings might aid in paving the road for designing and developing strategies and interventions to increase adherence to medications and minimize these psychosocial problems among CVD patients in outpatient clinics. © The Author(s) 2021. ABSTRACT: Background: Palliative care is one of the most important areas of practice because it includes caring for vulnerable people who are mostly in their last stage of life. Palliative care is a relatively new specialty in the Middle East and little is known about student nurses knowledge of and attitudes towards it. Aim: The aim of this study was to explore students knowledge of and attitudes towards palliative care in the Middle East, and to use the findings to make recommendations to higher education institutions about its importance. Design: An integrative review following an established framework was used. Hawker s Assessment Tool was employed to evaluate the quality of the research articles. Results: The search found seven quantitative studies from four countries in the Middle East. Their focus was on students knowledge (n=5) and attitudes (n=2). The number of participants ranged from 110 to 452, with knowledge scores ranging from 5.23 to 8.0 out of 20 on all or part of the Palliative Care Quiz for Nursing. Students attitudes were marginally positive toward palliative care and dying patients. Conclusion: There are few studies in the Middle East investigating student nurses knowledge of and attitude toward palliative care; consequently, more attention needs to be given to this area of practice. © 2023 MA Healthcare Ltd. ABSTRACT: Fruits irrigated with contaminated water can transmit various pathogens. High sugar content in fruits such as black cherry (BC) fruit encourages microbial proliferation. A novel water-soluble decanoic acid (WSDA) was evaluated as a fruit sanitizer and compared with other traditional fruit sanitizers such as ethanol, bleach, or dishwasher surfactants. WSDA sanitizer killed yeasts, molds and bacteria including E. coli microbes effectively as other sanitizers with (4 log cycle reduction) of microbial load. Furthermore, the bacterial sanitization mechanism i.e. bactericidal or bacteriostatic was evaluated for alcohol, bleaching and WASDA solutions. E. coli was selected as the model pathogen used for such comparison. Results indicated that the mechanism of action for the three sanitizer solutions against E. coli was bactericidal. The problem with most used fruit sanitizers is their negative influence on fruit quality in terms of physical, mechanical and taste properties. In addition, some led to toxicological and ecological concerns. Thus, studies were conducted to explore the changes in the exocarp cell structure of BC fruit upon exposure to WSDA and other sanitizers using microscopic investigation. WSDA could have a very mild or gentle effect on the BC fruit cells compared to other sanitizers. Alcohol, bleaching and dishwasher surfactant changed the cellular structures and the intercellular spaces. Sanitizers may also affect fruit swelling. WSDA showed an increase in percent weight gain but it was significantly ($p < 0.05$) much lower than dishwasher surfactant and bleaching solution. BC Fruit flesh firmness and hardness were investigated upon exposure to different sanitizer solutions. BC fruit treated with WSDA showed the highest firmness values. Some liquid sanitizers could affect fruit quality in terms of fruit taste. Sensory evaluation

in terms of the sanitizer's smell, texture and hedonic of BC fruit after soaking in different sanitizers was carried out. All sensory parameters of BC fruit soaked with WSDA were similar with insignificant differences ($p > 0.05$) compared to BC fruit soaked in tap water. However, the sensory parameters were significantly different ($p < 0.05$) when compared with alcohol, bleach and dishwasher surfactant. This ensures that WSDA was superior to other evaluated sanitizers in terms of physical, mechanical and fruit quality. © 2022 Elsevier B.V.

ABSTRACT: The behavior of modal QAD in Standard Arabic presents a twofold puzzle: first, QAD has an inherent epistemic-denoting conversational background with its lexically-encoded quantificational force being controlled by the temporal-aspectual properties of QAD's prejacent. Second, universal QAD triggers an actuality entailment by default. We resolve this puzzle by proposing a compositional analysis of modal QAD that derives QAD's lexically-encoded duality of force and accounts for universal QAD's automatic implicativity. © 2023, Yarmouk University. William J. Shakespeare's Hamlet: An Analysis of Revenge Quest & Procrastination

(2023) World Journal of English Language, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152276862&doi=10.5430%2fwjel.v13n2p317&partnerID=40&md5=2fec73ce4af8752e6bc62b1525b8c1bc)

AFFILIATIONS: Al-Zaytoonah University of Jordan, Jordan

ABSTRACT: In expounding Shakespeare's Hamlet, a trio of important plots comes to the top with great significance; the revenge plot, the Hamlet-Ophelia romance story, and Norway's looming war. The trio of significant plots has laid the first stone for Hamlet to procrastinate the act of revenge as it is undone until the final act of Shakespeare's drama. On the other hand, Hamlet's playwright gives a picture of the tradition's direct reference using the literary device Metadrama, i.e. the play within the play exemplified by The Murder of Gonzago. Attaining true justice for his father's murder, Hamlet beautifies The Murder of Gonzago with grim insistence; Hamlet is determined to recognize the culprit behind the death of his father. Having this uneasy mission comes true causes Hamlet to ponder and slow down about various things. Along these lines, Hamlet goes through a slow decision process to revenge on his father's murderer. Consequently, various deaths happen, namely: Polonius, Ophelia, Rosencrantz, Guildenstern, Laertes, and Gertrude. Shakespeare's exposition of various characters incapable of revenging heroically and determinedly draws a picture of Hamlet's incapability to promptly avenge. Laertes, for example, plots to murder Hamlet to avenge for murdering Polonius, Laertes's father, and in the last part of this play, Laertes successfully kills Hamlet with the poisonous sword. As various studies focus on the issues of romance, politics, and throne successions using descriptive and historical approaches, this study using the analytical approach, however, demonstrates Hamlet as a play structured on revenge, as the whole revenge events are appropriately incorporated by Shakespeare. © 2023 World Journal of English Language.

ABSTRACT: Ad hoc networks, known as infrastructure-less networks, are composed of mobile nodes that connect without a centralized system controlling them. These networks have a wide range of potential applications, including emergency response, events, military operations, wireless access, and intelligent transportation. They can take on various forms, such as wireless sensor networks, wireless mesh networks, and mobile ad hoc networks. Because users in these networks can move around at any time, routing protocols must adapt to the constantly changing network layout. However, these networks are also susceptible to various security threats, including DDoS attacks. This paper aims to analyze the performance and impact of security attacks on the performance of reactive and proactive routing protocols in CBR connection patterns with different pause times. The analysis is provided in metrics such as throughput, packet loss, end-to-end delay, and load. The simulation results show that, on average, the OPNET Modeler simulator analyzed the performance results under DDoS attacks under voice and video traffic conditions. Furthermore, the paper explores the use of Honeypot intelligent agents as a solution to increase security by creating a dummy node to fool DDoS attackers. The results show that the OLSR protocol is most affected by DDoS attacks in terms of quality-of-service metrics such as packet loss, throughput, end-to-end delay, and load. The number of responses to the honeypot solutions differs for each protocol. © 2023 by the authors; licensee Growing Science, Canada.

ABSTRACT: The aim of this study was to investigate and identify the influence of performance expectation, effort expectation, and perceived usefulness on the usage of electronic banking services by Jordanian bank customers. The study used a quantitative method, with questionnaires administered to Jordanian bank clients. The statistics support the association between performance expectation, effort expectation, perceived utility, and the usage of electronic banking services. This implies that these characteristics have a major influence on Jordanian bank customers' electronic banking services. The association between performance expectation and use of electronic banking services is the strongest, followed by effort expectation and use of electronic banking services, and the poorest between perceived usefulness and use of electronic banking services. Even the most tenuous association (perceived usefulness and use of electronic banking services) is statistically significant. These findings also imply that banks seeking to boost the usage of electronic banking services should concentrate on improving consumers' perceptions of performance and effort expectations, as well as perceived usefulness. © 2023 by the authors; licensee Growing Science, Canada.

ABSTRACT: This study aimed to assess the antioxidant and antidiabetic properties of ethanolic phytoextracts of *Calamintha incana* (Sm.) Helder leaves. Initially, the chemical characterization of the phytocomplex was performed using high-performance liquid chromatography (HPLC)/mass spectrometry (MS). The cytotoxicity of the ethanolic extract was assessed using an MTT assay in HepG2 cells. Subsequently, antioxidant activity was evaluated using a DPPH test. Finally, enzymatic tests with α -amylase, α -glucosidase, pancreatic lipase, and dipeptidyl peptidase IV (DPP-IV) were performed to evaluate their effects on glucose metabolism. The chemical composition of the extract is p-linolenic acid (13.2%), myristic acid (12.1%), and p-cymene (10.5%). The extract demonstrated low toxicity, with none of the tested concentrations inducing 50% cell death. Furthermore, the ethanolic extract revealed potent antioxidant activity using DPPH (IC50 was 35.9 ± 0.7 μ g/mL) and reducing power

capacity (IC₅₀ was 90.3 ± 0.8 µg/mL). Regarding the antidiabetic activity, the extract caused a significant inhibition of α-amylase, α-glucosidase (IC₅₀ 46.3 ± 0.2, 56.8 ± 0.1 µg/mL, respectively), weak inhibition of pancreatic lipase and no notable inhibition of dipeptidyl peptidase IV. In conclusion, *C. incana* has antioxidant and antidiabetic properties and appears to exert insulin-independent hypoglycemic action. © 2023 by the authors.

ABSTRACT: The overall aim of this study is to determine the prevalence of vitamin D deficiency and its association with diabetic nephropathy in elderly patients with type 2 diabetes mellitus. This study is a single center retrospective cross-sectional design conducted at private medical center. The study group included all patients (18 years or older) suffering from type 2 diabetes mellitus that attended the diabetic clinic from September 2019 to January 2021. The main outcome variable is a trough level of (<20 ng/mL) for 25OHD. The patients were categorized as having diabetic nephropathy based on estimated glomerular filtration rate (eGFR). Total glycosylated hemoglobin (HbA1c), creatinine serum, Alb: Cr ratio, total cholesterol (TC), triglyceride (TG), high-density lipoprotein (HDL-C), low-density lipoprotein (LDL-C), systolic blood pressure (SBP) and diastolic blood pressure (DBP) were compared between vitamin D deficiency groups. Univariate and multivariate logistic regression was used to investigate the association between vitamin D deficiency and other significant anthropometric and biochemical factors. A p value < 0.05 was chosen as the criterion to make decisions regarding statistical significance. Among the 453 diabetic patients included in study, 48.6% (n = 220) were male and 51.4% (n = 233) were female. The mean age ± S.D of the patients was 54.5 ± 10.6 years old. Out of 453 diabetic patients, 71.1% (95% CI: 66.9%–75.3%) had vitamin D deficiency (25OHD < 20 ng/mL). There was a statistically significant association between 25OHD level and diabetic nephropathy in elderly patients with type 2 diabetes mellitus. Diabetic patients with e-GFR < 60 mL/min more likely to have vitamin D deficiency (p < 0.001). Similarly, individuals with Alb: Cr ratio > 30 mg/g were more likely to have vitamin D deficiency (p < 0.001). Moreover, diabetic patients with serum creatinine > 1.8 mg/dL were more likely to have vitamin D deficiency (p < 0.001). The study revealed a high prevalence of vitamin D deficiency in elderly patients with type 2 diabetes mellitus. A significant association was reported between 25-hydroxyvitamin D, e-GFR and Alb: Cr ratio. © 2023 by the authors.

ABSTRACT: This paper aims to investigate the impact of strategic intelligence on strategic flexibility, in addition, to identify the effective decision-making on Logistics Performance. Nevertheless, partial least squares (Smart-PLS-4.0.8.7) are used to examine the hypotheses, the results indicate that strategic intelligence (organized thinking, strategic vision, foresight, partnership, and motivation) significantly affect Strategic flexibility. In addition, effective decision-making mediates the effect of strategic intelligence and strategic flexibility towards the performance of logistics companies. Moreover, the influence of effective decision-making on logistics performance is therefore clear and significant towards logistics performance. However, the study

supports managers in enhancing sustainability practices in logistics organizations while also offering policy guidance to decision-makers. © 2023 Growing Science Ltd. All rights reserved.

ABSTRACT: Hospitals may keep track of all financial transactions using an accounting system. It can produce thorough hospital reports that give management or other interested parties a clear set of information to help them raise the efficiency of the supply chain. Therefore, the goal of this study was to look into the role of the application of an accounting system (AS) in raising the efficiency of the supply chain (SC) in Jordanian hospitals. A questionnaire was used as the data collection method. The descriptive statistical analysis was carried out using SPSS. In addition, 134 employees from these hospitals took part in the survey, according to the results of this study, AS plays a significant role in developing and raising the efficiency of SC in Jordanian hospitals. © 2023 Growing Science Ltd. ABSTRACT: Water-in-diesel (W/D) emulsion fuel is a potentially viable diesel fuel that can simultaneously enhance engine performance and reduce exhaust emissions in a current diesel engine without requiring engine modifications or incurring additional costs. In a consistent manner, the current study examines the impact of adding water, in the range of 5-30% wt. (5% increment) and 2% surfactant of polysorbate 20, on the performance in terms of brake torque (BT) and exhaust emissions of a four-cylinder four-stroke diesel engine. The relationship between independent factors, including water addition and engine speed, and dependent factors, including different exhaust released emissions and BT, was initially generated using machine learning support vector regression (SVR). Subsequently, a robust and modern optimization of the sea-horse optimizer (SHO) was run through the SVR model to find the optimal water addition and engine speed for improving the BT and lowering exhaust emissions. Furthermore, the SVR model was compared to the artificial neural network (ANN) model in terms of R-squared and mean square error (MSE). According to the experimental results, the BT was boosted by 3.34% compared to pure diesel at 5% water addition. The highest reduction in carbon monoxide (CO) and unburned hydrocarbon (UHC) was 9.57% and 15.63%, respectively, at 15% of water addition compared to diesel fuel. The nitrogen oxides (NOx) emissions from emulsified fuel were significantly lower than those from pure diesel, with a maximum decrease of 67.14% at 30% water addition. The suggested SVR-SHO model demonstrated superior prediction reliability, with a significant R-Squared of more than 0.98 and a low MSE of less than 0.003. The SHO revealed that adding 15% water to the W/D emulsion fuel at an engine speed of 1848 rpm yielded the optimum BT, CO, UHC, and NOx values of 49.5 N.m, 0.5%, 57 ppm, and 369 ppm, respectively. Finally, these outcomes have important implications for the potential of the SVR-SHO approach to minimize engine exhaust emissions while maximizing engine performance. © 2023 by the authors.

ABSTRACT: In the context of reaching the best way to control the movement of autonomous cars linearly and angularly, making them more stable and balanced on different roads and ensuring that they avoid road obstacles, this manuscript chiefly aims to reach the optimal approach for a fractional-order PID controller (or (Formula presented.) -controller) instead of the already classical one used to provide smooth automatic parking for electrical autonomous cars. The fractional-order (Formula presented.) -controller is based on the particle swarm optimization (PSO) algorithm for its design, with two different approximations: Oustaloup's approximation and the continued fractional expansion (CFE) approximation. Our approaches to the fractional-order PID using the results of the PSO algorithm are compared with the classical PID that was designed using the results of the Cohen-Coon, Ziegler-Nichols and bacteria foraging algorithms. The scheme represented by the proposed (Formula presented.) -controller can provide the system of the autonomous vehicle with more stable results than that of the PID controller. © 2023 by the authors.

ABSTRACT: Aldehyde dehydrogenase (ALDH) enzymes are involved in the growth and development of several tissues, including cancer cells. It has been reported that targeting the ALDH family, including the ALDH1A subfamily, enhances cancer treatment outcomes. Therefore, we aimed to investigate the cytotoxicity of ALDH1A3-affinic compounds that have been recently discovered by our group, on breast (MCF7 and MDA-MB-231) and prostate (PC-3) cancer cell lines. These compounds were investigated on the selected cell lines as single treatments and in combination with doxorubicin (DOX). Results showed that the combination treatment experiments of the selective ALDH1A3 inhibitors (compounds 15 and 16) at variable concentrations with DOX resulted in significant increases in the cytotoxic effect on the MCF7 cell line for compound 15, and to a lesser extent for compound 16 on the PC-3 cell line, compared to DOX alone. The activity of compounds 15 and 16 as single treatments on all cell lines was found to be non-cytotoxic. Therefore, our findings showed that the investigated compounds have a promising potential to target cancer cells, possibly via an ALDH-related pathway, and sensitize them to DOX treatment. © 2023 by the authors.

ABSTRACT: This research paper aims to evaluate the effectiveness of internal audit standards as a foundation for carrying out and promoting a wide variety of value-added tasks in emerging markets. Three Jordanian telecommunications firms were the subject of the study. In each firm, the non-executive directors, who serve on the Audit Committee, also received a questionnaire that was designed for this objective. In total 85 questionnaires were accepted and analyzed using traditional statistical methods such as descriptive statistics, arithmetic means, standard deviations, and percentages, and resolution data were examined using the statistical application SPSS. According to the annual report for the year 2021, telecommunication businesses generally followed IIA International Internal Audit Standards. Application Standards were employed to a high degree in second place, after Attribute Standards, which were used primarily in the first place. In those firms, performance standards were not used. The study also found that this form of application is moderately constrained by a few challenges and barriers. The study recommended that these

organizations broaden the scope and scale of internal auditing standards, particularly performance requirements. Finally, the generalization of research findings is limited because the study is limited to three Jordanian telecommunication companies. © 2023 by the authors.

ABSTRACT: This study investigates the wave solutions of the time-fractional Sawada-Kotera-Ito equation (SKIE) that arise in shallow water and many other fluid mediums by utilizing some of the most flexible and high-precision methods. The SKIE is a nonlinear integrable partial differential equation (PDE) with significant applications in shallow water dynamics and fluid mechanics. However, the traditional numerical methods used for analyzing this equation are often plagued by difficulties in handling the fractional derivatives (FDs), which lead to finding other techniques to overcome these difficulties. To address this challenge, the Adomian decomposition (AD) transform method (ADTM) and homotopy perturbation transform method (HPTM) are employed to obtain exact and numerical solutions for the time-fractional SKIE. The ADTM involves decomposing the fractional equation into a series of polynomials and solving each component iteratively. The HPTM is a modified perturbation method that uses a continuous deformation of a known solution to the desired solution. The results show that both methods can produce accurate and stable solutions for the time-fractional SKIE. In addition, we compare the numerical solutions obtained from both methods and demonstrate the superiority of the HPTM in terms of efficiency and accuracy. The study provides valuable insights into the wave solutions of shallow water dynamics and nonlinear waves in plasma, and has important implications for the study of fractional partial differential equations (FPDEs). In conclusion, the method offers effective and efficient solutions for the time-fractional SKIE and demonstrates their usefulness in solving nonlinear integrable PDEs. © 2023 by the authors.

ABSTRACT: Deep eutectic solvents (DESs) and ionic liquids (ILs) offer novel opportunities for several pharmaceutical applications. Their tunable properties offer control over their design and applications. Choline chloride (CC)-based DESs (referred to as Type III eutectics) offer superior advantages for various pharmaceutical and therapeutic applications. Here, CC-based DESs of tadalafil (TDF), a selective phosphodiesterase type 5 (PDE-5) enzyme inhibitor, were designed for implementation in wound healing. The adopted approach provides formulations for the topical application of TDF, hence avoiding systemic exposure. To this end, the DESs were chosen based on

their suitability for topical application. Then, DES formulations of TDF were prepared, yielding a tremendous increase in the equilibrium solubility of TDF. Lidocaine (LDC) was included in the formulation with TDF to provide a local anaesthetic effect, forming F01. The addition of propylene glycol (PG) to the formulation was attempted to reduce the viscosity, forming F02. The formulations were fully characterised using NMR, FTIR and DCS techniques. According to the obtained characterisation results, the drugs were soluble in the DES with no detectable degradation. Our results demonstrated the utility of F01 in wound healing in vivo using cut wound and burn wound models. Significant retraction of the cut wound area was observed within three weeks of the application of F01 when compared with DES. Furthermore, the utilisation of F01 resulted in less scarring of the burn wounds than any other group including the positive control, thus rendering it a candidate formula for burn dressing formulations. We demonstrated that the slower healing process associated with F01 resulted in less scarring potential. Lastly, the antimicrobial activity of the DES formulations was demonstrated against a panel of fungi and bacterial strains, thus providing a unique wound healing process via simultaneous prevention of wound infection. In conclusion, this work presents the design and application of a topical vehicle for TDF with novel biomedical applications. © 2023 by the authors.

ABSTRACT: Herein, we investigated the applicability of thick film and bulk disk forms of aluminum-doped zinc oxide (AZO) for low-dose X-ray radiation dosimetry using the extended gate field effect transistor (EGFET) configuration. The samples were fabricated using the chemical bath deposition (CBD) technique. A thick film of AZO was deposited on a glass substrate, while the bulk disk form was prepared by pressing the collected powders. The prepared samples were characterized via X-ray diffraction (XRD) and field emission scanning electron microscope (FESEM) to determine the crystallinity and surface morphology. The analyses show that the samples are crystalline and comprise nanosheets of varying sizes. The EGFET devices were exposed to different X-ray radiation doses, then characterized by measuring the I-V characteristics pre- and post-irradiation. The measurements revealed an increase in the values of drain-source currents with radiation doses. To study the detection efficiency of the device, various bias voltages were also tested for the linear and saturation regimes. Performance parameters of the devices, such as sensitivity to X-radiation exposure and different gate bias voltage, were found to depend highly on the device geometry. The bulk disk type appears to be more radiation-sensitive than the AZO thick film. Furthermore, boosting the bias voltage increased the sensitivity of both devices. © 2023 by the authors.

ABSTRACT: An energy audit (EA) is a crucial step in boosting factory energy efficiency and obtaining certification for cleaner manufacturing. The results of a preliminary energy audit carried out at a sizable industrial facility in Jordan that creates some of the most well-known foods in the Middle East are presented in this study. The monthly demand of the factory for diesel ranged from 75,251.545 to 166,666.67 L. The factory energy model which is used to examine the impact of various energy-saving practices on the factory's primary energy consumption, was developed with the help of the energy audit. It has been established that optimizing the factory's energy use and the boiler systems' performance with regards to diesel consumption can withstand an expected monthly financial savings of 14205.85 Jordanian Dinar (JD). This has allowed a reduction in energy use of up to 18%. The CO₂ harmful emissions were also decreased. Additionally, it is estimated that switching from the proposed motors to energy-efficient motors will cost less overall over time, saving around 3472.314 JD/month or 0.33576/year on average. Moreover, it was discovered that a total of 772.82021 Ton CO₂/year emissions may be avoided each year. © 2023 The Authors

ABSTRACT: Worldwide, nurses employed in the Emergency Department (ED) face many challenges that negatively influence their well-being and ability to provide high-quality patient care. Previous researchers have investigated these challenges regarding their causes, consequences, and how to deal with them. However, most of the previous research addressed these challenges using quantitative research. The current study is the first qualitative study that examined these challenges in the Jordanian context. A descriptive naturalistic qualitative design was used to explore the most critical challenges facing nurses employed in the ED and described the suggested solutions for these challenges from nurses' perspectives. Ten registered nurses employed in the most prominent ED in Jordan were selected through purposive sampling. Semi-structured interviews were used to collect data. Thematic analysis technique was used to analyze data. Six main themes emerged: the definition of challenge, challenges facing registered nurses in the emergency department (five sub-themes), preventive measurements, possible solutions (five sub-themes), effects of the challenges (two sub-themes), and future challenges. The outcomes of this study could be integrated into the educational curricula to prepare new nurses to deal with these challenges in the future after graduation and contribute to finding solutions and solving some significant problems facing registered nurses in the ED. The hospital administrators and the policymakers should develop effective interventions to overcome the challenges facing nurses in the ED to ensure a better work environment and high-quality patient care. © 2023 The Authors

ABSTRACT: In this paper, we evaluate certain type superlinear nonlocal problems that are a class of parabolic equations with the second-type integral condition. We use the Fadeo-Galarkin method to establish the existence of the weak solution and we prove the uniqueness of this solution for the problem by using an a priori estimate. In addition, we study the theoretical blowup solution and

perform several numerical simulations of finitetime blow-up of a particular example of the main problem. © 2023, IAENG International Journal of Applied Mathematics. All Rights Reserved.

ABSTRACT: In this paper, we prove the common fixed point theorems for weakly compatible mappings in non-Archimedean Menger PM-spaces, that use the common limit range property. In addition, we give some examples of these results. Then we will extend our main result to four finite families of self-mappings by the notion of pairwise commuting. Finally, we will give applications for our main theorem. © 2023, IAENG International Journal of Applied Mathematics. All Rights Reserved.

ABSTRACT: Supercapacitors are a promising candidate in applications that necessitate high electrochemical stability and storage energy. In this study, NiCo 20 4 nanosheets were prepared hydrothermally on an ITO substrate and investigated to be utilized as supercapacitor electrodes. The morphology of NiCo 20 4 nanosheets was examined by scanning electron microscopy (SEM) and atomic force microscopy (AFM). The SEM results showed a 3D-flower-like nanostructure with interconnected nanosheets which was confirmed by the AFM results. However, X-ray fluorescence (XRF) results showed that the as-prepared sample has stoichiometry of Nickle(1):Cobalt(2). The electrochemical measurements of the as-prepared NiCo 20 4 supercapacitor electrode such as cyclic voltammetry (CV) and galvanostatic charge/discharge (GCD) studies were done in a two-electrode system with 1.0 M KOH and 1.0 M H 2SO 4. CV curves showed quasi-rectangular shape and high electrochemical stability in KOH and H2SO4 electrolyte solutions. In addition, the integral areas of CV curves for both electrolytes are almost identical, indicating efficient charge transfer and ion transport at the electrode/electrolyte interface. Electrochemical impedance spectroscopy (EIS) curves of KOH and H 2SO 4 electrolyte revealed a significant difference. This difference indicates that, the charge transfer in H 2SO 4 electrolyte is faster than charge transfer in KOH , resulting in a linear behavior of the EIS curve. A fabricated hybrid asymmetric supercapacitor (SC) composed of NiCo 20 4/ ITO anode and graphite/ITO cathode delivered a specific capacity of around 235F/g in KOH solution and 723F/g in H 2SO 4 electrolyte at 10 mV/s scan rate. The superior electrochemical performances could be attributed to the large surface area that facilitates charge transfer at the electrode/electrolyte interface. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: At present, the multistability analysis in discrete nonlinear fractional-order systems is a subject that is receiving a lot of attention. In this article, a new discrete non-equilibrium point memristor-based map with γ - th Caputo fractional difference is introduced. In addition, in the context of the commensurate and non-commensurate instances, the nonlinear dynamics of the suggested discrete fractional map, such as its multistability, hidden chaotic attractor, and hidden hyperchaotic attractor, are investigated through several numerical techniques, including Lyapunov exponents, phase attractors, bifurcation diagrams, and the $\theta - 1$ test. These dynamic behaviors suggest that the fractional discrete memristive map has a hidden multistability. Finally, to validate the presence of chaos, a complexity analysis is carried out using approximation entropy (ApEn) and the $C \theta$ measure. The findings show that the model has a high degree of complexity, which is affected by the system parameters and the fractional values. © 2023 IOP Publishing Ltd.

ABSTRACT: Big Data and analytics have become essential factors in managing the COVID-19 pandemic. As no company can escape the effects of the pandemic, mature Big Data and analytics practices are essential for successful decision-making insights and keeping pace with a changing and unpredictable marketplace. The ability to be successful in Big Data projects is related to the organization's maturity level. The maturity model is a tool that could be applied to assess the maturity level across specific key dimensions, where the maturity levels indicate an organization's current capabilities and the desirable state. Big Data maturity models (BDMMs) are a new trend with limited publications published as white papers and web materials by practitioners. While most of the related literature might not have covered all of the existing BDMMs, this systematic literature review (SLR) aims to contribute to the body of knowledge and address the limitations in the existing literature about the existing BDMMs, assessment dimensions, and tools. The SLR strategy in this paper was conducted based on guidelines to perform SLR in software engineering by answering three research questions: (1) What are the existing maturity assessment models for Big Data? (2) What are the assessment dimensions for Big Data maturity models? and (3) What are the assessment tools for Big Data maturity models? This SLR covers the available BDMMs written in English and developed by academics and practitioners (2007-2022). By applying a descriptive qualitative content analysis method for the reviewed publications, this SLR identified 15 BDMMs (10 BDMMs by practitioners and 5 BDMMs by academics). Additionally, this paper presents the limitations of existing BDMMs. The findings of this paper could be used as a grounded reference for assessing the maturity of Big Data. Moreover, this paper will provide managers with critical insights to select the BDMM that fits within their organization to support their data-driven decisions. Future work will investigate the Big Data maturity assessment dimensions towards developing a new Big Data maturity model. © 2022 by the authors.

ABSTRACT: The present study examines the relationships between e-supply chain collaboration, collaborative innovation, supply chain agility, and value co-creation. The empirical data was collected from essential industries and analysed using the Smart-PLS-SEM approach. The sample consisted of 221 participants from different managerial levels. The findings show that e-supply chain collaboration has a significant impact on collaborative innovation, supply chain agility, and value co-creation. They also show that collaborative innovation and corporate sustainability significantly impact value co-creation. These findings provide valuable contributions in the fields of e-supply chain collaboration, supply chain management, collaborative innovation, and dynamic capabilities theory as it applies to responses to unprecedented worldwide emergencies and crises. © 2023 Elsevier Inc.

ABSTRACT: Purpose: This paper aims to estimate the use of solar water heaters in Jordanian households and their impact on improving quality of life as well as the Human Development Index (HDI) using data of Jordan. Also to estimate the impact of the rise in electricity prices and power consumption intensity on the installing capacity. Then to predict the solar water heaters characteristics using analytical equations for comparison with the statistical data. Methodology: The study was conducted through a survey covered an area of 10 km in diameter from Al Zaytoonah University of Jordan. The area sampling method was implemented. The number of flats studied by the survey was 1033, with a total of 5597 occupants. The survey included questions dealing with the number of households, number of occupants in a given household, area of each flat, and the type and number of solar water heaters installed. Findings: The results obtained showed that the overall number of households who enjoyed solar water heaters was 33%. The Jordanian average solar water heaters area reached 0.22 m²/capita. The increase in the use of solar energy led to an increase in the per capita share of electrical energy, which pushup Jordan's classification from medium class (0.622) to high class (0.729) on the global human development index. Originality: For the first time, a study has been conducted to study the effect of installing solar water heaters on the human development index (HDI). Practical value: Jordan Energy Strategy "2020-2030" aims to equip 30% of the households with a SWH system by 2030. More use of renewable energy in solar water heaters means less dependence on conventional power and more reduction in CO₂ emissions, which means more developments in human quality of life and high HDI. © The Author(s) 2022.

ABSTRACT: Background: Anxiety is one of the most frequent psychiatric disorders, affecting 33.7% of the general population. However, the consumption of healthy diets has been found to help, at least in part, in the prevention and treatment of anxiety-like disorders. Methods: In this study, the anxiety behaviors of mice subjected to chronic intake of low-and high doses of ethanolic extract of Medjool dates (Phoenix Dactylifera) were evaluated in comparison to the counterparts of control mice. The elevated zero maze (EZM) test and marbles burying test were used as models of choice for evaluating anxiety behaviors in these mice. In addition, aphytochemical analysis of major secondary metabolite groups was done. Results: The findings of this study revealed that the ethanolic extract of dates is rich in flavonoids and steroids with known activity as anxiolytics, such as kaempferol. Mice received a low dose (300 mg/kg) of the extract exhibited lower anxiety in the EZM than the untreated mice (negative control), which was determined by a significant increase in the latency to the closed area, a significant decrease in the time spent in the closed area and a significant increase in the number of the entries to the open quadrants. The anxiolytic effect of low dose extract was comparable to that produced in positive control mice treated with diazepam (1.5 mg/kg, i.p) in all tested

parameters. Data obtained from the marble burying test also showed a significant anxiolytic effect by low dose (300 mg/kg) of the extract as compared to untreated mice, which was manifested by significant decrease in the total number of buried marbles. The anxiolytic effect of low dose extract in the marbles burying test was comparable to that produced in counterparts of positive control mice treated with fluoxetine (5mg/kg, i.p). On the other hand, chronic intake of high doses (2583 mg/kg) of the extract did not cause any significant anxiolytic effect in the EZM and marbles burying tests. Conclusions: Overall, these results indicate that regular intake of low dose of ethanolic extract of Medjool dates may help to prevent and manage anxiety disorders. However, further studies are recommended to elucidate the putative mechanism underlying the anxiolytic effect of these dates. © 2023 DSR Publishers/The University of Jordan.

ABSTRACT: Diabetes mellitus is a metabolic endocrine disease characterized by chronic hyperglycemia with disturbances in metabolic processes, such as those related to carbohydrates, fat, and protein. There are two main types of this disease: type 1 diabetes (T1D) and type 2 diabetes (T2D). Insulin therapy is pivotal to the management of diabetes. Over the last two decades, many routes of administration, including nasal, pulmonary, rectal, transdermal, buccal, and ocular, have been investigated. Nevertheless, subcutaneous parenteral administration is still the most common route for insulin therapy. To overcome poor bioavailability and the barriers to oral insulin absorption, novel approaches in the field of oral drug delivery and administration have been brought about by the coalescence of different branches of nanoscience and nanotechnology, such as nanomedicine, nanobiochemistry, and nano-pharmacy. Novel drug delivery systems, including nanoparticles, nano-platforms, and nanocarriers, have been suggested. The objective of this review is to provide an update on the various promising approaches that have been explored and evaluated for the safe and efficient oral and buccal administration of insulin. © 2023 Elsevier B.V.

ABSTRACT: Substance abuse is a worldwide problem with serious repercussions for patients and the communities where they live. Pregabalin (Lyrica), is a medication commonly used to treat neuropathic pain. Like other analgesic medications there has been concern about pregabalin abuse and misuse. Although it was initially suggested that pregabalin, like other gabapentinoids, has limited abuse liability, questions still remain concerning this inquiry. Changes in glutamate system homeostasis are a hallmark of adaptations underlying drug dependence, including down-regulation of the glutamate transporter 1 (GLT-1; SLC1A2) and the cystine/glutamate antiporter (xCT; SLC7A11). In this study, it was found that pregabalin (90 mg/kg) produces a conditioned place preference (CPP), indicative of reinforcing effects that suggest a potential for abuse liability. Moreover, like other drugs of abuse, pregabalin also produced alterations in glutamate homeostasis, reducing the mRNA expression of Slc1a2 and Slc7a11 in the nucleus accumbens (NAc) and medial prefrontal cortex (mPFC). Amoxicillin clavulanic acid, a β -lactam antibiotic, blocked the reinforcing effects of pregabalin and normalized glutamate homeostasis. These results suggest that pregabalin has abuse potential that should be examined more critically, and that, moreover, the mechanisms underlying these effects are similar to those of other drugs of abuse, such as heroin and cocaine. Additionally, these results support previous findings showing normalization of glutamate homeostasis by β -lactam drugs that provides a novel potential therapeutic approach for the treatment of drug abuse and dependence. © 2022 Elsevier B.V.

ABSTRACT: Radiation measurements are critical in radioanalytical, nuclear chemistry, and biomedical physics. Continuous advancement in developing economical, sensitive, and compact devices designed to detect and measure radiation has increased its capability in many applications. In this work, we presented and investigated the performance of a cost-effective X-ray radiation detector based on the extended gate field effect transistors (EGFET). We examined the sensitivity of Al-doped Zinc oxide (AZO) of varying thicknesses, fabricated by chemical bath deposition (CBD), following X-ray irradiation with low and high doses. EGFETs were used to connect samples for their detection capabilities. As a function of the absorbed dose, the response was analyzed based on the threshold voltage shift, and the sensitivity of each device was also evaluated. We demonstrated that thin films are less sensitive to radiation than their disk-type EG devices. However, performance aspects of the devices, such as radiation exposure sensitivity and active dosage region, were found to be significantly reliant on the composition and thickness of the materials used. These structures may be a cost-effective alternative for real-time, room-temperature radiation detectors. © 2023 by the authors.

ABSTRACT: In the 3-dimensional Euclidean space (Formula presented.), a quadric surface is either ruled or of one of the following two kinds (Formula presented.) or (Formula presented.). In the present paper, we investigate these three kinds of surfaces whose Gauss map (Formula presented.) satisfies the property (Formula presented.), where (Formula presented.) is a square symmetric matrix of order 3, and (Formula presented.) denotes the Laplace operator of the second fundamental form (Formula presented.) of the surface. We prove that spheres with the nonzero symmetric matrix (Formula presented.), and helicoids with (Formula presented.) as the corresponding zero matrix, are the only classes of surfaces satisfying the above given property. © 2023 by the authors.

ABSTRACT: Despite the great technological and medical advances in fighting viral diseases, new therapies for most of them are still lacking, and existing antivirals suffer from major limitations regarding drug resistance and a limited spectrum of activity. In fact, most approved antivirals are

directly acting antiviral (DAA) drugs, which interfere with viral proteins and confer great selectivity towards their viral targets but suffer from resistance and limited spectrum. Nowadays, host-targeted antivirals (HTAs) are on the rise, in the drug discovery and development pipelines, in academia and in the pharmaceutical industry. These drugs target host proteins involved in the virus life cycle and are considered promising alternatives to DAAs due to their broader spectrum and lower potential for resistance. Herein, we discuss an important class of HTAs that modulate signal transduction pathways by targeting host kinases. Kinases are considered key enzymes that control virus-host interactions. We also provide a synopsis of the antiviral drug discovery and development pipeline detailing antiviral kinase targets, drug types, therapeutic classes for repurposed drugs, and top developing organizations. Furthermore, we detail the drug design and repurposing considerations, as well as the limitations and challenges, for kinase-targeted antivirals, including the choice of the binding sites, physicochemical properties, and drug combinations. © 2023 by the authors.

ABSTRACT: Honey is considered to be a functional food with health-promoting properties. However, its potential health benefits can be affected by individual composition that varies between honey types. Although studies describing the health benefits of Tualang honey (TH), Kelulut honey (KH), and Sidr honey (SH) are scarce, these honey types showed a comparable therapeutic efficacy to Manuka honey (MH). The purpose of this review is to characterise the physicochemical, biological, and therapeutic properties of TH, KH, and SH. Findings showed that these honeys have antibacterial, antifungal, antiviral, antioxidant, antidiabetic, antiobesity, anticancer, anti-inflammatory and wound-healing properties and effects on the cardiovascular system, nervous system, and respiratory system. The physicochemical characteristics of TH, KH, and SH were compared with MH and discussed, and results showed that they have high-quality contents and excellent biological activity sources. Flavonoids and polyphenols, which act as antioxidants, are two main bioactive molecules present in honey. The activity of honey depends on the type of bee, sources of nectar, and the geographic region where the bees are established. In conclusion, TH, KH, and SH could be considered as natural therapeutic agents for various medicinal purposes compared with MH. Therefore, TH, KH, and SH have a great potential to be developed for modern medicinal use. © 2023 by the authors.

ABSTRACT: Diabetes is a metabolic disorder in which the body is unable to properly regulate blood sugar levels. It can occur when the body does not produce enough insulin or when cells become resistant to insulin's effects. There are two main types of diabetes, Type 1 and Type 2, which have different causes and risk factors. Early detection of diabetes allows for early intervention and management of the condition. This can help prevent or delay the development of serious complications associated with diabetes. Early diagnosis also allows for individuals to make lifestyle changes to prevent the progression of the disease. Healthcare systems play a vital role in the management and treatment of diabetes. They provide access to diabetes education, regular check-ups, and necessary medications for individuals with diabetes. They also provide monitoring and management of diabetes-related complications, such as heart disease, kidney failure, and neuropathy. Through early

detection, prevention and management programs, healthcare systems can help improve the quality of life and outcomes for people with diabetes. Current initiatives in healthcare systems for diabetes may fail due to lack of access to education and resources for individuals with diabetes. There may also be inadequate follow-up and monitoring for those who have been diagnosed, leading to poor management of the disease and lack of prevention of complications. Additionally, current initiatives may not be tailored to specific cultural or demographic groups, resulting in a lack of effectiveness for certain populations. In this study, we developed a diabetes prediction system using a healthcare framework. The system employs various machine learning methods, such as K-nearest neighbors, decision tree, deep learning, SVM, random forest, AdaBoost and logistic regression. The performance of the system was evaluated using the PIMA Indians Diabetes dataset and achieved a training accuracy of 82% and validation accuracy of 80%. © 2023 by the authors.

ABSTRACT: This paper defines the so-called pairwise r -compactness in topological and bitopological spaces. In particular, several inferred properties of the r -compact spaces and their connections with other topological and bitopological spaces are studied theoretically. As a result, several novel theorems of the r -compact space are generalized on the pairwise r -compact space. The results established in this research paper are new in the field of topology. © 2023 by the authors.

ABSTRACT: Clarithromycin (CLR), categorized as a Biopharmaceutical Classification System class II drug, has several gastrointestinal tract side effects and an extremely unpalatable bitter taste. The current study aimed to design transdermal patch-embedded CLR niosomes to overcome the aforementioned CLR-related challenges. Various niosomal formulations were successfully fabricated and characterized for their morphology, size, in vitro release, and antimicrobial efficacy. Subsequently, the CLR niosomes were loaded into transdermal patches using the solvent casting method. The polydispersity index of the niosomes ranged from 0.005 to 0.360, indicating the uniformity of the niosomes. The encapsulating efficiency (EE)% varied from 12 to 86%. The optimal Chol: surfactant ratio for drug release was found to be 0.5:1. In addition, the encapsulation of CLR into niosomal nanovesicles did not reduce the antibacterial activity of the CLR. The niosomal patch had a significantly higher permeability coefficient of CLR than the conventional patch. In addition to that, a shear-thinning behavior was observed in the niosomal gels before loading them into a niosomal patch. The flux (J_{ss}) of the niosomal patch was significantly higher than the conventional patch by more than 200 times. In conclusion, niosome-based transdermal patches could be a promising method for the transdermal drug delivery of class II drugs and drugs experiencing GIT side effects. © 2023 by the authors.

ABSTRACT: (1) Background: Water is necessary for the preparation of some medicines found in

pharmacies where the local water source does not meet the required purity. This study aimed to investigate the presence of coliform contamination in water used for drug reconstitution in community pharmacies in Jordan. (2) Methods: Two water samples from 50 randomly selected community pharmacies representing all Jordanian governorates were filtered and then cultured in plate count agars to determine total microbial count, and in m-Endo Agar Les and Eosin Methylene Blue (EMB) agar to cultivate *Escherichia coli* (*E. coli*). The presence of *E. coli* was further characterized with gram stains, biochemical tests, and Polymerase chain reaction (PCR). Antibiotic susceptibility of isolated *E. coli* was tested against a variety of standard antibiotics. (3) Results: Community pharmacies used droppers filled with water from coolers (62%), bottled water (20%), boiled tap water (16%) and tap water (2%). The majority of the sampled water contained coliform bacteria (88%), and *E. coli* was isolated from 26% of all samples. Statistical analysis showed no significant difference in the percentage of contaminated water samples based on its source location. Nonetheless, the results showed a tendency for higher proportions of contamination in droppers filled from boiled tap water (37.5%; SE: 17.1), followed by water from water coolers (25.8%; SE: 7.9), and then from bottled water (20%; SE: 12.7). All of the isolated *E. coli* were sensitive to gentamycin, ciprofloxacin and levofloxacin. The susceptibility of the isolates to ceftazidime, doxycycline, tetracycline, azithromycin and amoxicillin/clavulanic acid were 92%, 61%, 46%, 23% and 15%, respectively. (4) Conclusions: This study confirms the widespread presence of multidrug-resistant bacteria in water intended for reconstituting drugs in local pharmacies. These findings expose an alarming situation that needs special attention by the acting pharmacists and competent authorities. Higher levels of personal hygiene in the pharmacies coupled with regular inspection of water quality may reduce the risk of microbial contamination in compounded products, especially multidrug-resistant strains of *E. coli* and other index microorganisms. © 2023 by the authors.

ABSTRACT: Background: The free carboxylic acid group in the mefenamic acid (MFA) structure plays a potential role in developing various neuromuscular side effects after MFA administration. In this study, the hydroxypropyl promoiety was added to the carboxylic acid group of MFA in an attempt to reduce the neuromuscular side effects of MFA and improve its therapeutic effects. Methods: Hydroxypropylester of MFA (HPEMA) was synthesized and subjected to various in vivo investigations compared to MFA. The neuromuscular toxicity was conducted following high doses administration in mice and was evaluated at various measuring parameters, such as the percentage of catalepsy, clonic-tonic seizure, and death. In addition, the anti-inflammatory and anti-nociceptive effects of HPEMA were evaluated in the carrageenan-induced paw edema test and acetic acid-induced writhing test, respectively. Results: The findings of this study reveal that the percentage of catalepsy, clonic-tonic seizure, and death is significantly lower in mice treated with HPEMA than in those treated with equimolar doses of MFA. In addition, treatment with HPEMA caused a comparable anti-inflammatory activity in the carrageenan-induced paw edema test and a significantly higher anti-nociceptive effect in the acetic acid-induced writhing test than the MFA treatment. Conclusion: This study's findings suggest that HPEMA is a promising prodrug for MFA. © 2023 Bentham Science Publishers.

ABSTRACT: Daylighting has been associated with improved mood, enhanced morale, increased visual comfort and reduced fatigue. Glazing with varying transmittance, colour or configuration may have significant effects on the quality and quantity of daylight within a building, thus good glazing design has posed significant challenges for building designers. Coloured glazing is broadly applied

in modern offices worldwide and many studies have explored the effect of this glazing on human performance. Commonly studied are chromatic glazing typologies which offer a unidirectional shift in the colour of light to either bronze or blue. This alters the spectral ability of the glazing and thus changes the indoor luminous environment. It is reported that although occupants prefer warm light, people perform better under cool light condition. This project aims to implement patterns in chromatic glazing to introduce a two-directional colour distortion to alter the colorimetric characteristics of the glazing, heavily affecting the user's perception and performance in the luminous environment. More specifically, seven different indoor luminous conditions were created using various patterned chromatic glazing (100% CAR Blue, 70% CAR Blue, 30% CAR Blue, neutral clear glazing, 30% CAR Bronze, 70% CAR Bronze, and 100% CAR Bronze) to investigate their effect on human perception using a scaled test room (1:3 scaling) to simulate office working conditions. Both subjective (questionnaire on pleasantness, comfort, alertness) and objective (an achromatic Landolt ring test and a chromatic Landolt ring test) evaluations were carried out for the proposed window conditions. The results suggest that the patterned chromatic glazing conditions create a more desirable luminous indoor environment, as well as a more efficient working environment. The 30% blue and 70% blue glazing improved feelings of visual comfort compared to the 100% blue, whilst retaining the efficiency of task completion. Meanwhile the 30% bronze glazing increased the efficiency of task completion compared to the 100% bronze, whilst retaining the ratings for comfort and pleasantness. This implies that the design of patterned chromatic glazing which introduces the combination of two chromatic glazing may be a feasible solution to improve the indoor luminous environment. © 2022 The Authors

ABSTRACT: Low-temperature heat sources are widely available in nature, they are considered to be unusable, even though the conversion of such low-grade energy into electricity (high-grade energy) is highly desirable. Thermoelectric generators (TEGs) are achieving increasing interest in converting low temperature heat into electricity. TEG suffers from low performance, improving the performance of TEG will allow there use in huge engineering applications. In this paper the effect of heat transfer rate on the performance of TEGs will be analysed under both steady and transient conditions. Enhancing heat transfer from the TEG surface will be studied using a liquid saturated porous medium. Aluminium and copper particles are used and their influences are compared to forced convection heat transfer from TEG surfaces with and without liquids. The experimental results showed that power generated with Cu particles exceeds that of Al particles with 14%. The free to forced convection power generation ratio was 26.5% for Al,36% for Cu and the enhancement of TEG performance reached 149% for liquid saturated Cu particles. © 2022 The Author(s)

ABSTRACT: The objective of this study was to evaluate the bond behaviour of concrete-filled steel tubes (CFSTs) where waste chipped rubber, sourced from scrap tyres, partially replaces natural coarse aggregate. A series of push-out tests on 112 circular and square CFST specimens were investigated

with the main parameters considered in the tests being: (a) cross-sectional type (circular and square); (b) cross-sectional dimensions; (c) concrete type (normal and rubberised concretes); (d) replacement ratio of recycled chipped rubber; and (e) concrete age (28-365 days). Four rubber chip replacement ratios (0, 10, 20 and 30%) by volume of coarse aggregate were used. The experimental results indicated that cross-sectional type and dimensions have a high impact on the interfacial bond strength. The bond strength in larger circular tubes was about 60% more than the bond strength in smaller circular tubes, and about 127% and 42% more than the bond strength in large and small square tubes, respectively. It was also found that CFSTs incorporating chipped rubber shared a generally similar interface bond behaviour between the concrete core and steel tubes with conventional CFSTs. Moreover, the bond strength decreased remarkably with the increase of concrete age. © 2020 ICE Publishing: All rights reserved.

ABSTRACT: Purpose: Development and validation of a selective analytical method to accurately and precisely quantify nicotine and cotinine levels in rat's plasma after exposure to tobacco cigarettes and tobacco water-pipe. Methods: An easy HPLC-Photodiode-Array Detection (PDA) method was developed and validated for simultaneous determination of nicotine and cotinine levels in plasma of 15 rats (10 rats after tobacco products exposure and 5 control rats). Nicotine and cotinine were extracted in one step from plasma using acetonitrile and concentrated to lowest volume using nitrogen stream. Results: The developed method offered a rapid analysis time of 14 min with single step of analytes extraction from rat's plasma with recovery percentage range between 93 and 95% and excellent linearity with correlation factor more than 0.994 with analytical range between 50 and 1000 ng mL⁻¹ and LOD of 25 ng mL⁻¹ and 23 ng mL⁻¹ for nicotine and cotinine, respectively. The analysis of rat's plasma after 28 days of exposure to tobacco cigarettes and tobacco water-pipe revealed that the average concentrations of 376 ng mL⁻¹ for cotinine and 223 ng mL⁻¹ for nicotine were obtained after tobacco cigarettes exposure, and 220 ng mL⁻¹ for cotinine and 192 ng mL⁻¹ for nicotine after tobacco water-pipe exposure. Conclusion: Higher nicotine and cotinine levels were found in plasma after tobacco cigarettes exposure than water-pipe exposure which may have potential undesirable effects on passive smokers in both cases. © 2022 The Author(s).

ABSTRACT: Obtaining a high-performance hydrogen (H₂) gas sensor based on carbon nanotube (CNT) remains challenging. In this view, two CNT samples such as untreated (R-CNT) and nitric acid (HNO₃)-treated (called functionalized or F-CNT in short) were deposited on the SiO₂/Si substrate using an electrophoretic deposition technique. The structure, morphology, and electrical characteristics of these samples were evaluated. Fourier transform infrared (FTIR) spectra confirmed the presence of OH groups at the walls of nanotubes after acid treatment. Moreover, it found the current increased from 35 μA for R-CNT to 11 mA for F-CNT. In addition, both R-CNT and F-CNT were used to fabricate H₂ gas sensors. The sensing capacity of the obtained sensors was measured under the H₂ gas exposure range of 20 to 300 ppm operated at room temperature (RT), 50 °C, and 75 °C. The H₂ gas sensor made of F-CNT showed a much higher response (368%) and shorter response time (15 s) as well as recovery time (72 s) than the one made using R-CNT. It was asserted that the H₂ gas sensing performance of the proposed sensor can significantly be improved via the acid treatment or functionalization of CNT. © 2001-2012 IEEE.

ABSTRACT: Background: Chronic exposure to cigarette smoke produces neuroinflammation and long-term changes in neurotransmitter systems, especially glutamatergic systems. Objective: We examined the effects of cigarette smoke on astroglial glutamate transporters as well as NF- κ B expression in mesocorticolimbic brain regions, prefrontal cortex (PFC) and nucleus accumbens (NAc). The behavioral consequences of cigarette smoke exposure were assessed using open field (OF) and light/dark (LD) tests to assess withdrawal-induced anxiety-like behavior. Methods: Sprague-Dawley rats were randomly assigned to five experimental groups: a control group exposed only to standard room air, a cigarette smoke exposed group treated with saline vehicle, two cigarette smoke exposed groups treated with acetylsalicylic acid (ASA) (15 mg/kg and 30 mg/kg, respectively), and a group treated only with ASA (30 mg/kg). Cigarette smoke exposure was performed for 2 h/day, 5 days/week, for 31 days. Behavioral tests were conducted weekly, 24 h after cigarette smoke exposure, during acute withdrawal. At the end of week 4, rats were given either saline or ASA 45 min before cigarette exposure for 11 days.

Results: Cigarette smoke increased withdrawal-induced anxiety, and 30 mg/kg ASA attenuated this effect. Cigarette smoke exposure increased the relative mRNA and protein expression of nuclear factor κ B (NF κ B) in PFC and NAc, and ASA treatment reversed this effect. Also, cigarette smoke decreased the relative mRNA and protein expression of glutamate transporter1 (GLT-1) and the cystine-glutamate transporter (xCT) in the PFC and the NAc, while ASA treatment normalized their expression.

Conclusion: Cigarette smoke caused neuroinflammation, alterations in glutamate transporter expression, and increased anxiety-like behavior, and these effects were attenuated by acetylsalicylic acid treatment. Copyright © 2023 Hammad, Alzaghari, Alfaraj, Al-Qerem, Talib, Alasmari, Amawi and Hall.

ABSTRACT: A series of new 4-aryl-6-(2,5-dichlorothiophen-3-yl)-2-methylpyridine-3-carbonitrile derivatives 4(a-u) were synthesized starting with Friedel-Crafts acylation of 2,5-dichlorothiophene to form compound (1), which undergoes Claisen-Schmidt condensation with the corresponding aryl aldehyde 2(a-u) to produce chalcones 3(a-u) as intermediate compounds. The reaction of chalcones 3(a-u) and 3-aminocrotononitrile furnished the new title compounds 4(a-u). The pyridines 4(a-u) were characterized by elemental analysis, ATR-FTIR, ¹H NMR, ¹³C NMR, DEPT 135, ESIMS, and HRESIMS. The proposed structures agree with the expected physical as well as spectral data. Single crystal x-ray structure for some derivatives were determined and confirmed unambiguously the proposed structures. Compounds 4(a-u) exhibit distinct fluorescent properties in solution. The steady state fluorescence spectra of the compounds studied showed that all the compounds are blue emitters. Quantum chemical calculations have been performed to study the geometry of all compounds based on DFT/TDDFT calculations at B3LYP/6-311G (d,p) level of theory. The calculated geometries are in good agreement with determined single crystal structures. In order to get more shed into the red shifted emission of compounds 4(d-i) with respect to relevant absorption behavior, TD-DFT study was performed. The red shifted emission is found to be controlled by the conformational relaxation in the excited state on the emission spectra. © 2022

ABSTRACT: This experiment aimed to investigate the effect of cleaning on the performance of solar panels. The experiment measured the panels' voltage, current, and temperature before and after cleaning. The results showed that the panels' temperature was significantly reduced after the cleaning process, which led to an increase in efficiency and a longer lifespan of the panels. Moreover, filtering and cleaning the water used for cleaning and pumping helped save and rationalize water consumption. These findings confirm the importance of cleaning solar panels to maintain performance and prolong+ lifespan. © 2023 IEEE.

ABSTRACT: Curcumin (CUR) is a natural product with known anti-inflammatory, antioxidant, and hepatoprotective properties. The aim of this study was to formulate CUR into a polymeric nanoparticle (NP) formulation and examine its potential hepatoprotective activity in an animal model of diclofenac (DIC)-induced hepatotoxicity. CUR was loaded into polymeric NPs composed of poly(ethylene glycol)-polycaprolactone (PEG-PCL). The optimal CUR NPs were evaluated against DIC-induced hepatotoxicity in mice, by studying the histopathological changes and gene expression of drug-metabolizing cyp450 (cyp2c29 and cyp2d9) and ugt (ugt2b1) genes in the livers of the animals. The optimal NPs were around 67 nm in diameter with more than 80% loading efficiency and sustained release. Histological findings of mice livers revealed that CUR NPs exhibited a superior hepatoprotective effect compared to free CUR, and both groups reduced DIC-mediated liver tissue injury. While treatment with DIC alone or with CUR and CUR NPs had no effect on cyp2c29 gene expression, cyp2d9 and ugt2b1 genes were upregulated in the DIC-treated group, and this effect was reversed by CUR both as a free drug and as CUR NPs. Our findings present a promising application for nanoencapsulated CUR in the treatment of nonsteroidal anti-inflammatory drugs-induced liver injury and the associated dysregulation in the expression of hepatic drug-metabolizing enzymes. © 2024 The Authors. ABSTRACT: This paper explains the roadmap for running quantum circuit programs based on the Qiskit library in quantum simulators as well as real cloud-based IBM quantum computers. Qiskit is a free and open-source software development platform based on the Python programming language that is used in quantum programming. Qiskit acts as a link between quantum computing's theoretical foundations and the practical aspects of programming and experimentation. It also allows users to experiment with and develop quantum algorithms, as well as simulate and execute them on simulators and real-world cloud-based quantum devices. It also simplifies the quantum programming process and allows a diverse range of people to participate in the exciting world of quantum computing. The paper, on the other hand, provides the mathematical foundation for analyzing quantum circuits and algorithms using linear algebra principles, as they provide the tools needed to describe and manipulate quantum states and operations. Furthermore, the paper shows quantum circuit design and implementation using real Qiskit codes. © 2023 Published by ISRES Publishing: www.isres.org.

ABSTRACT: Application of the fibre-reinforced concrete has manifested a wider acceptability over time for its contribution towards significantly improving the flexural performance of structural members. A lot of work has been done to understand the influence of fibres on the mechanical and structural behaviour of reinforced concrete. Towards this end, several researchers have experimentally investigated the residual flexural strength to characterize the fibre-reinforced concrete. The number of influencing parameters to be investigated through experiments is mostly limited because of the time and cost implications. Consequently, validation of the experimental investigations through analytical models and further utilizing these models to study the behaviour in greater detail is a viable option for researchers. As part of this work, an analytical investigation has been performed to investigate the performance of full-scale polypropylene fibre-reinforced concrete beams. The models have been validated through comparison with the observed performance during an experimental investigation where tests on twelve full-scale FRC beams were performed. Three-dimensional finite element models of the beams under 4-point loading were prepared and the post-cracking flexural performance of FRC beams has been investigated by varying the dosage of polypropylene fibres obtained from shredding medical face masks. © 2023 Published by ISRES Publishing: www.isres.org.

ABSTRACT: This study investigates the roles played by echo chambers and the wisdom of the crowd in social innovation during unprecedented crises such as the recent COVID-19 pandemic. It also examines the impact of social trust on echo chambers, crowd wisdom, and social innovation during unprecedented crises. Using an online questionnaire, 432 members of Facebook pages and groups in Jordan provided data which were analysed using PLS-SEM. The results demonstrate that the wisdom of crowds has a significant positive impact on social innovation, that echo chambers significantly negatively affect social innovation, and that social trust significantly affects media echo chambers, the wisdom of the crowd, and social innovation. © Vilnius University, 2002-2023.

ABSTRACT: Aims of the Study: To evaluate medication adherence level and identify predictors of poor medication adherence in elderly patients with Cardiovascular (CVS) diseases and type 2 diabetes in Jordan. Methods: This cross-sectional study was conducted on elderly patients who attended King Abdullah University Hospital (KAUH) outpatient diabetes and cardiology clinics from March 6, 2023, to July 6, 2023. Data on age, sex, socio-demographics, biological variables, medication characteristics, and chronic comorbidities were obtained from electronic patients' medical records and a validated

questionnaire. Medication adherence levels (low, moderate, and high) were assessed using the Arabic version of the 4-item Morisky, Green, and Levine Medication Adherence Scale-Medication Assessment Questionnaire. Results: Data from 506 elderly patients were analyzed. The average age of the participants was 67.93 years (SD = 6.22). 7.9% of patients showed low adherence levels, 33.6% showed moderate adherence level, and 58.5% of patients showed a high level of adherence toward their prescribed medications. Multivariable ordinal logistic regression analysis revealed that single/currently unmarried patients and patients who were living with others were more likely to have a higher adherence level; Odd Ratios (ORs) were 4.75 and 4.10, respectively. Patients who took their medications ≥ 3 and 2 times a day showed higher adherence to their medications than those who only took them once a day.; ORs were 2.15 and 2.36, respectively. Conclusion: This study indicated an inadequate level of adherence among patients with type 2 diabetes and cardiovascular comorbidities. This study revealed the necessity of implementing programs to help in raising the awareness among elderly patients with type 2 diabetes and CVDs of the importance of adherence to prescribed long-term medication regimens. © 2023 Al-Azayzih et al.

ABSTRACT: This research proposal aims to leverage modern AI techniques, particularly ChatGPT, for transforming human resources in the Agriculture Credit Corporation. The focus is on AI's role in streamlining recruitment, personalizing employee experiences, mitigating biases, and enhancing decision-making. By utilizing AI and ChatGPT, this study seeks to boost competitiveness, efficiency, and HR effectiveness. The insights will guide AI-driven HR solutions in agriculture, benefiting the organization and the industry. In the era of foundation models and large language models (LLMs), understanding these models' potential and limitations is vital for this research, but access is limited to big tech companies due to resource constraints. Comprehensive research and multidisciplinary collaboration are essential to unravel the capabilities and challenges posed by these models. © 2023 IEEE.

ABSTRACT: The reputation of the organization is important for the survival of the organization. Therefore, this study aimed to examine the effect of information quality, structural assurance and corporate social responsibility on trust and corporate reputation. This study also examined the mediating role of trust as well. The data was collected from the users of the sports products manufactured in the UAE. A quantitative research methodology was adopted in the present research. The questionnaire was used to collect the data from the respondents. The usable response rate of the study was 65.14%. The collected data was analyzed using PLS-SEM. The study's findings show that trust is affected positively by information quality, structural assurance, and information quality. Moreover, trust also has a positive effect on corporate reputation. This paper provides guidelines to policymakers so they can improve the corporate reputation of their organizations. © 2023 IEEE.

ABSTRACT: Requirement engineering is a critical step in software engineering, influencing software development outcomes. The manual classification of software requirements into Functional Requirements and Non-Functional Requirements is a laborious and costly process with varying accuracy. Errors in classification can lead to misunderstandings and incomplete products. Arabic requirements pose additional challenges due to their structural and semantic characteristics, contributing to inherent ambiguity. In addition to the lack of Arabic Studies as well as the public datasets for requirements written in Arabic. This study proposes combining machine learning and deep learning algorithms, including K-nearest neighbors (KNN), Support Vector Machines (SVMs), Random Forest, XGBoost, and the Arabert model, with optimization techniques to streamline the categorization of Arabic requirements. Optimal configurations for several classifiers are identified and examined by stemming techniques. In addition, an Arabic data set for requirements was collected. The results demonstrate the effectiveness of the proposed approach, enhancing productivity and mitigating risks. The SVM classifier achieves an F1-Score of 0.93, while combining it with ISRIStemmer improves the score to 0.95. The Arabert model achieves the highest F1-Score of 0.97, highlighting its performance in classifying Arabic requirements accurately. © 2023 NSP Natural Sciences Publishing Cor.

ABSTRACT: Cancer immunotherapy has gained popularity in recent years in the search for effective treatment modalities for various malignancies, particularly those that are resistant to conventional chemo- and radiation therapy. Cancer vaccines target the cancer-immunity cycle by boosting the patient's own immune system to recognize and kill cancer cells, thus serving as both preventative and curative therapeutic tools. Among the different types of cancer vaccines, those based on nanotechnology have shown great promise in advancing the field of cancer immunotherapy. Lipid-based nanoparticles (NPs) have become the most advanced platforms for cancer vaccine delivery, but polymer-based NPs have also received considerable interest. This Review aims to provide an overview of the nanotechnology-enabled cancer vaccine landscape, focusing on recent advances in lipid- and polymer-based nanovaccines and their hybrid structures and discussing the challenges against the clinical translation of these important nanomedicines. © 2024 American Chemical Society.

ABSTRACT: The objective of this study was to investigate the influence of cash liquidity quality indicators on the long-term financial sustainability of publicly listed joint-stock industrial companies on the Amman Stock Exchange from 2014 to 2021. The study encompassed a population of 53 such companies, from which a purposive sample of 35 companies was selected based on the availability of comprehensive financial data meeting the study's variables throughout the designated period. The collected data were subjected to appropriate statistical analysis methods. The findings of the study revealed that cash liquidity quality indicators, specifically net cash flow from all activities to total assets, net cash flow from all activities to total profit, and operating net cash flow to total assets, exhibited a statistically significant impact on the sustainability of crucial indicators for these companies, including working capital, retained earnings, the market value of stocks, operating profit, and net sales. However, the study results indicated that the cash liquidity quality indicator

represented by net cash flow from all activities to total equity did not affect the sustainability of operating profit and net sales indicators for these companies. Nevertheless, it did have an impact on indicators such as working capital, retained earnings, and market value of stocks, contributing to their sustainability within these companies. © 2023- All Rights Reserved.

ABSTRACT: Background: Nursing students learn principles of infection prevention and control (IPC) and hand hygiene (HH) in clinical courses, and their learning is reflected in their practice. Objectives: The knowledge, attitude, and practice of principles of IPC and HH of the students were measured prior to and after attending an educational workshop. The adherence of the students to the IPC and HH protocols at the hospital was also observed. Methods: This study included a pretest-posttest time series follow-up and an observational part. During the first part of the study, students attended a workshop, which was preceded by a pretest. It was then followed by a posttest directly after finishing the workshop and in 12 weeks. Participants were submitted to an observational part by a trained observer to document certain skills taught earlier during the workshop. Settings: Students from three nursing schools in Saudi Arabia participated in the study. Participants: A total number of 130 completed the study protocol, and 100 completed the observation part. Results: Students were found to experience an improvement in their knowledge, beliefs, and commitment scales after the workshop. The attitude scale remained relatively unchanged over different tests. Most students performed the skills properly and adequately, but some failed to perform certain skills, like hand rub, and the proper use of disinfectants. ABSTRACT: This study aimed to evaluate the effectiveness of Moodle LMS as an alternative delivery mode for education, particularly in the higher education system of Jordan, which has not been evaluated before. The research is based on Moore's transactional distance learning theory, which considers interactions among students, instructors, and course material, as well as personal characteristics of students. The study included 50 participants who have taken courses on Moodle LMS at the University of Jordan. Both interviews and research surveys were conducted to gather in-depth perceptions and analysis of the participants' experiences with Moodle LMS. The findings suggest that Moodle LMS was an effective alternative study tool during the COVID-19 pandemic and the user-friendly course design enhanced the user experience of using Moodle LMS. Participants also provided suggestions to optimize the system for better integration in the University of Jordan. Fixing Moodle LMS based on the recommendations of the study participants will significantly improve the learning experience of students. This study contributes to the advancement of the state of the art by evaluating the effectiveness of Moodle LMS in the higher education system of Jordan and providing recommendations for improvement. © 2023 Ahmad Althunibat et al.

ABSTRACT: The advent of the Internet of Things (IoT) has ushered in the concept of smart cities - urban environments where everything from traffic lights to waste management is interconnected and digitally managed. While this transformation offers unparalleled efficiency and innovation, it opens the door to myriad cyber-attacks. Threats range from data breaches to infrastructure disruptions, with one subtle yet potent risk emerging: fake clients. These seemingly benign entities have the potential to carry out a multitude of cyber attacks, leveraging their deceptive appearance to infiltrate and compromise systems. This research presents a novel simulation model for a smart city based on the Internet of Things using the Netsim program. This city consists of several sectors, each of which consists of several clients that connect to produce the best performance, comfort and energy savings for this city. Fake clients are added to this simulation, who are they disguise themselves as benign clients while, in reality, they are exploiting this trust to carry out cyber attacks on these cities, then after preparing the simulation perfectly, the data flow of this system is captured and stored in a CSV file and classified into fake and normal, then this data set is subjected to several experiments using the Machine Learning using the MATLAB program. Each of them shows good results, based on the detection results shown by Model Machine Learning. The highest detection accuracy was in the third experiment using the k-nearest neighbors classifier and was 98.77%. Concluding, the research unveils a robust prevention model. © 2023 IEEE.

ABSTRACT: Cybersecurity challenges are a real concern for any Internet of Things (IoT) systems, especially the industrial sector. Supervisory Control and Data Acquisition (SCADA) systems are one of the applications of the IoT that facilitate remote control of industrial systems, save time and effort, increase the accuracy of systems, and have many other advantages. With these facilities provided by these systems, cyber attackers are increasingly greedy about them for various reasons, including material, espionage, or sabotage, so strict security controls must be put in place to maintain the reliability of these systems. This paper proposes an ML-based model to detect Man In The Middle (MitM) attacks; we applied several artificial intelligence algorithms, this study showed high accuracy detection results of up to 98.22% using Random Forest, which indicates the possibility of applying it on the ground to enhance cyber security in SCADA industrial systems. © 2023 IEEE.

ABSTRACT: This paper explores the relationship between management accounting systems (MAS) characteristics and managerial performance in the context of technology development and increasing competitive pressure in Vietnam. Based on quantitative analysis techniques with 272 questionnaires answered by middle managers, the study results provide many interesting things. Firstly, MAS characteristics (scope, timeliness and aggregation) are simultaneously influenced by environmental factors such as technology and competition based on contingency theory. Secondly, the characteristics of MAS (broad scope, timely and aggregated information) had a significant effect on managerial performance while integrated MAS did not. Further analysis shows that technology and competition have an indirect influence on managerial performance through the mediating role of MAS characteristics (broad scope and timeliness information). A rather interesting finding that the effect of MAS timeliness on managerial performance is only moderated by perceived environmental uncertainty. Finally, the study also provides some implications, limitations and recommendations for future research. Copyright © 2023 Inderscience Enterprises Ltd.

ABSTRACT: Objectives: The current study aims to elucidate the role of Prince Mawdud in resisting the Crusader invasion and adopting the Jihad policy against the Crusader forces in the Islamic Al-Mashriq (the Islamic Eastern part of the Arab world). Method: To achieve the study objectives, the analytical approach is used in examining the events of the study period and the most important interactions shaping the history of the Al-Mashriq region The information included in the relevant sources, were analyzed. Results: The results show that Sharaf Al-Din Mawdud played a complementary role to previous Emirs of Mosul in countering the Crusader tide. The findings reveal that Sharaf Al-Din Mawdud advocated for an Islamic alliance, contributing to the founding of the resistance against the Crusader invasion in the Islamic Al-Mashriq and setting the stage for future leaders to continue this approach. Mawdud's Atabekiya marked a crucial turning point in the Crusader struggle, and his efforts led to the unification of Islamic forces under Salah Al-Din's leadership, resulting in his ultimate sacrifice for his unwavering stance. Conclusion: The study recommends investigating various Islamic figures having a great impact on the formulation of the history of the Islamic Al-Mashriq region by reexamining the texts incorporated into the sources. © 2023 DSR Publishers/ The University of Jordan.

ABSTRACT: Objectives: This study aims at highlighting the rhetoric of the Science of Occasion among rhetoricians, critics, and Tafsir scholars. It also aims to unearth the mechanisms by which the text is constructed to suit the occasion in which it was articulated and demonstrate its performative rhetorical dimensions. In addition, the study intends to shed light on the efforts scholars have exerted to establish an independent and specialized science of occasion. Methods: The study depends on the inductive and analytical method to clarify the text and highlight its rhetorical aspects. It thus places the different viewpoints in conversation and presents the attitude that Muslim scholars have toward the Science of Occasion and the critical tools they employ to show the text's unity and the extent to which the text echoes the occasion in which it was compiled or articulated. Results: The study stresses the strenuous efforts exerted by critics, rhetoricians and interpreters in exploring the text through its occasion. The study also stresses the fact that the Science of Occasion constitutes one of the Quranic sciences which strives to show the internal connections between verses and surahs according to the commendable Tafsir, highlighting the fact that this science has recently been evolving independently. Conclusions: The study recommends the necessity of paying attention to the importance of the efforts exerted by rhetoricians and critics in tracing the occasion concepts within the Quranic lesson and its connection to the Quran as one of the indispensable types of Tafsir. © 2023 DSR Publishers/ The University of Jordan.

ABSTRACT: The purpose of this article is to assess whether the change in earnings of Jordanian food companies influenced by activity ratios evaluated TATR and FATR. Prior authors rely on various

metrics to estimate activity ratios, however, relied on two indicators in this article (total assets turnover ratio and fixed assets turnover ratio) as independent variables and used (change in earnings) as dependent variable. To fulfill this objective, the study's population comprises the food companies sector. The sample, on the other hand, comprises 7 firms that are actively operating in Jordan and are listed on the Amman Stock Exchange. This sample is considered as panel data, encompassing the period from 2015 to 2019, the data for this study was acquired from the annual financial reports submitted by these firms. The results reached reveal that a positive influence of TATR and FATR on change in earnings achieved by Jordanian food companies. The results outlined above are in line with the current literature reviews integrated into this study, providing further support for the theoretical discussions on the interaction between TATR and FATR, as well as their impact on earnings changes. © 2023, Society of History and Cultural Studies. ABSTRACT: Background: The American Academy of Pediatrics and the World Health Organization recommend exclusive breastfeeding (EBF) for up to 6 months. Despite the importance of breast milk, EBF is far less prevalent in Nigeria than is recommended for developing countries. Worse still, the odds of EBF practice are very low in rural communities. Hence, the aim of this study was to assess the knowledge, attitude, and practice of EBF as well as identify the factors associated with EBF practice among mothers of childbearing age in Chamo town, Jigawa State, Nigeria. Methods: The study is a cross-sectional design using a questionnaire to assess the required information. The methodology involved the use of simple random sampling to select mothers of reproductive age from Chamo town, which is a rural community located in Jigawa State, Nigeria. A semi-structured questionnaire was used to assess the mother's knowledge, attitude, and practices regarding EBF. Simple and multiple logistic regression analyses were performed to determine the factors associated with the practice of EBF.

Results: A total of 400 mothers between the ages of 18 and 41 took part in the study. More than half of the participants (57.8%) were between the ages of 26 and 33 and had a primary level of education (30.5%). Only 26.8% of the respondents practice EBF. Those with a tertiary education (AOR = 10.00, $p < 0.001$), civil servants (AOR = 12.51, $p < 0.001$), those aware of EBF (AOR = 3.65, $p = 0.002$), those with correct EBF knowledge (AOR = 4.61, $p < 0.001$), those with a positive attitude toward EBF demand (AOR = 0.51, $p = 0.050$), and those who received encouragement from their community (AOR = 9.87, $p < 0.001$) were more likely to practice EBF. Conclusion: The findings of the study revealed that the majority of the respondents' knowledge, attitude, and practice of EBF were minimal. This shows the need to step up efforts to educate mothers about the advantages of EBF for both their own health and that of their children while they are in the hospital recovering from childbirth. ABSTRACT: Main pharmacological activities observed with the aromatic herbs celery, coriander, dill, and fennel have been attributed primarily to their essential oils, obtained by hydro-distillation. Still, there is a lack in research on the flavor of these selected four aromatic plants with multiple biological activities. The current study sought to identify and quantify the chemical composition of the spontaneous emitted volatile organic compounds (VOCs) of their fresh leaves, and to statistically analyze their composition using principal component analysis (PCA) and hierarchical cluster analysis (HCA). In vitro cytotoxic activities of their hydro-distilled essential oils were evaluated against MCF-7 and HCT-116 cell lines using MTT assay. The emitted VOCs, captured by solid phase micro extraction (SPME) method were analyzed by GC/GC-MS. The main terpenoid components of the aroma profile of celery and coriander were limonene, that of dill α -phellandrene, and of fennel α -terpinene. The systematic analysis using both, HCA and PCA of the spontaneous emitted VOCs of the fresh leaves of the four Apiaceae members growing in Jordan, revealed a clear picture of the distinct odor of these edible aromatic plants. The hydro-distilled essential oil of fennel exhibited the best antiproliferative activity against MCF-7 and HCT-116 cell lines with respective IC₅₀'s of 0.35, and 0.42 mg/mL. The composition of the VOCs of the leaves of celery, coriander, dill, and fennel, growing in Jordan was determined for the first time, in addition to their antiproliferative activities. © 2023 Har Krishan Bhalla & Sons.

ABSTRACT: This paper aimed to investigate whether the profit generated by banking sector in Jordan influenced by change on current ratio or not. Analysts utilize liquidity ratios to assess whether banks have the capability to fulfill their short-term obligations based on their current assets. Previous researchers depend on different measures for liquidity and profitability, however, in this study depend on one liquidity indicator (current ratio) and used (net profit margin) to measure of profitability. For this purpose, the population used of this study will represents banking sector, whereas the sample consist of 8 banks operating in Jordan listed at Amman Stock Exchange (ASE) as a panel data covering the period from 2015 to 2019. The information of this study was obtained from financial reports that presented annually from these banks. The implemented model to analyze data is the fixed effect model. This paper relied on net profit margin as dependent variable. Using current ratio as independent variables. The results illustrate that the net profit margin has positively affected by current ratio. © 2023, Society of History and Cultural Studies. All rights reserved.

ABSTRACT: Vitamin B12 deficiency and insufficiency can lead to both hematological and neurological impairments. This review examines nondisease causes and risk factors associated with dietary availability, such as eating habits, food processing, cooking techniques, and bioavailability, as well as increased physiological needs and iatrogenic factors linked to medication use or surgical procedures. As a result of these nondisease influences, groups at higher risk include vegans, vegetarians, older adults, individuals with limited diets, breastfed and preterm infants, and those who primarily consume foods prepared or cooked in ways that reduce vitamin B12 content, as well as individuals on certain medications or who have undergone specific surgeries. Recognizing these diverse risk factors helps develop strategies for prevention and intervention to minimize the adverse

health effects related to B12 deficiency and insufficiency. © 2023 Medisinsk Fysiologisk Forenings Forlag (MFFF).

ABSTRACT: The primary objective of this research is to examine the potential influence of environmental, social, and governance (ESG) disclosure on cash holdings. Additionally, the study explores the role of earnings management (EM) practices as a mediating factor in this relationship. The sample comprises 797 companies listed on financial markets across 19 European countries, and the data spans from 2013 to 2019. The outcomes indicate a significant negative correlation between ESG disclosure and cash holdings, implying that ESG performance can be used by management to resolve disputes with stakeholders. The outcomes further indicate that the existence of EM practices partially mediates the link between ESG disclosure and cash holdings. Moreover, they are robust by substitute cash holdings specification, three distinct initiatives of ESG disclosure (i.e., environment, social, and governance), and a two-stage least squares assessment. Therefore, the findings document that nonfinancial reporting in the form of ESG disclosure can assist in controlling agency conflict, leading to better valuations of company performance by stakeholders. © 2023 John Wiley & Sons Ltd.

ABSTRACT: The high volatility and inherent high-risk nature of cryptocurrency investments promote the study of the determinants of value perception and the various factors influencing individuals' intentions regarding whether to adopt, abstain from, or continue their investments in these dynamic cryptocurrency markets. The main aim of this study is to examine the determinants of behavioral intention to continue using cryptocurrencies. In addition, it is aimed at exploring the effect of gambling attitudes on the perceived benefits and legal environment in the cryptocurrency context. An online questionnaire was developed in order to gather data from 258 respondents in the United Arab Emirates (UAE). The research model was assessed, and the hypotheses were tested using PLS-SEM. The outcomes of the PLS analysis revealed that gambling attitudes, perceived benefits, legal environment, and market uncertainty are significant determinants of behavioral intention to continue using cryptocurrencies. This study also revealed a significant effect of gambling attitudes and legal environment on the perceived benefits of cryptocurrencies. This study adds to the body of knowledge on cryptocurrency adoption by providing new insights into the factors that influence consumers' continued investment. Furthermore, the study has crucial practical implications for cryptocurrency firms in promoting this financial technology to users by increasing policymakers' understanding of how investors think and get inspired to continue investing in cryptocurrencies. © 2023 Ayman Abdalmajeed Alsmadi et al.

ABSTRACT: Varicocele is a disease characterized by abnormal dilatation of the scrotal venous plexus pampiniformis. It is a common cause of infertility and may cause pain or discomfort in some cases. In this article, we present a new approach for automatic classification of varicocele using Deep

Learning convolutional neural networks. The available dataset consists of images converted to different color modes. Each color mode dataset is partitioned, augmented, and trained using a Deep Learning network. Experiments were conducted with all possible combinations of four different pre-trained models and over three color modes to determine the best combination that achieves the highest performance, with and without augmentation. Training and testing were evaluated using various metrics. Analysis of the results demonstrated the effectiveness of the proposed system. Results showed an accuracy of 83.1% with the RGB color mode when using ResNet50, and that the effect of augmentation was small. © 2023 IEEE.

ABSTRACT: TIn an age dominated by internet usage, the threat of phishing attacks continues to plague users and organizations alike. Traditional cybersecurity mechanisms often fail to cope with the evolving tactics of cybercriminals, leading to a growing interest in machine learning-based solutions. This research evaluates the performance of four different machine learning classifiers-K-Nearest Neighbors (KNN), Naïve Bayes (NB), Decision Tree, and Artificial Neural Network (ANN)-in identifying phishing activities. A Python code framework is utilized for this evaluation, employing stratified k-fold cross-validation for reliable results. Multiple performance metrics indicate that machine learning provides an adaptable and effective tool against phishing. This research serves as a stepping stone for future development in this crucial area, urging continuous advancements to stay ahead of ever-evolving cybersecurity threats. © 2023 IEEE.

ABSTRACT: This research paper presents a system for classifying and detecting ovarian CT scan images using transfer learning and examines the effects of different tools on the solution quality. The methodology involves preprocessing, data augmentation, training, transformation, and filtering. The implementation experiments evaluate the system's performance with regard to using different combinations of color modes, filters, and training methods with and without augmentation of the training dataset in addition to the effect of using the discrete wavelet transform (DWT). Analysis of the implementation results indicated that augmentation and the DWT generally improved the results, while the choice of filters and color mode had a limited impact. Furthermore, using the stochastic gradient descent with momentum (SGDM) training method yielded better results compared to the Adam method. Overall, the recommended approach for the best outcomes consists of using the RGB color mode, SGDM training, augmentation, and the DWT without additional filters. © 2023 IEEE.

ABSTRACT: Due the importance of using commercially Zamak5 in a wide range in industrial applications, however, this study was focused on the enhancing its machining issues by adding pure copper, so the effect of the addition of (1 to 3)% Cu to commercially Zamak5 on its mechanical properties, microhardness, surface texture and corrosion resistance was investigated. A CNC machining tests, microhardness tests, corrosion test, compression test, and microhardness test were performed. It was found that there is an enhancement on the flow stress at 0.2 strain of about 19% for 3% Cu addition followed by 17% and 15% in the case of 2% Cu and 1% Cu respectively. There was an enhancement in microhardness of about 11.6% in the case of 3% Cu addition. The surface finish was improved by increasing the number of copper contents (1 to 3)% to the base material Za5. Polarization measurements revealed that 3% alloy specimen inhibit the corrosion by more than 70% compared with the blank sample. © 2023. The Author(s).

ABSTRACT: This study aims to investigate the role of financial accounting technology in improving customer relationship management (CRM) in Jordanian banks. The study used a questionnaire survey based on previous relevant literature to obtain the necessary data. Using a quantitative analysis method, a random sample of 113 employees working in Jordanian banks was selected. The bootstrapping method was used to investigate the connection between financial accounting technology and CRM. To comprehend the significance levels, the path coefficients, T-values, and p-values are the most typical outcomes in the structural model. The direct effects showed that financial accounting technology, including innovation, flexibility and transparency, had a significant positive effect on CRM. In line with the results, relying on financial accounting technology in banking transactions enables the creation of global electronic markets that contribute to economic growth, and banks' use of financial accounting technology can provide high-quality services for customers. The outcome of this study lays the groundwork for future research to advance the knowledge in this field. © 2023 AESS Publications. All Rights Reserved.

ABSTRACT: This study analyzes the effects of nanofluids on the efficiency of a coated indirect solar collector under various operating conditions. The irradiance level improved the efficiency of the coated solar collector by approximately 1-3% using a water-based aluminum nanofluid for the same nanoparticle size and volume fraction. The solar collector efficiency was significantly affected by the irradiance level, as opposed to the small impact of the nanoparticle percentages. Moreover, a higher irradiance level increases the energy of the nanoparticles and enhances their impact. The impact of the nanofluid mass flow rate was also investigated and evaluated by varying the volume fraction of the nanoparticles. The improvement was promising, at approximately 3%. Because of the superior thermal conductivity, heat capacity, and fluid field provided by the nanoparticles, solar collectors are more efficient. The study also evaluated the impact of varying the nanoparticle types using Al₂O₃, ZnO, and TiO₂ at the same mass flow rate, irradiance level, and volume fraction. The solar collector efficiency values changed slightly owing to the change in the nanoparticle type for the same concentration and mass flow rate. The results showed similar efficiencies for all types of

nanoparticles. Owing to the thermophysical properties and particle size of TiO₂, the solar collector efficiency was slightly higher than that of ZnO and Al₂O₃ in this case. © 2023 IEEE.

ABSTRACT: Assessing the void fraction in diverse multiphase flows across industries, including petrochemical, oil, and chemical sectors, is crucial. There are multiple techniques available for this objective. The capacitive sensor has gained significant popularity among these methods and has been extensively utilized. Fluid properties have a substantial impact on the performance of capacitance sensors. Factors such as density, pressure, and temperature can introduce significant errors in void fraction measurements. One approach to address this issue is a meticulous and laborious routine calibration process. In the current study, an artificial neural network (ANN) was developed to accurately Assess the proportion of gas in a biphasic fluid motion, irrespective of variations in the fluid phase form or variations, eliminating the need for frequent recalibration. To achieve this objective, novel combined capacitance-based sensors were specifically designed. The sensors were simulated by employing the COMSOL Multiphysics application. The simulation encompassed five distinct liquids: oil, diesel fuel, gasoline, crude oil, and water. The input for training a multilayer perceptron network (MLP) came from data gathered through COMSOL Multiphysics, simulations for estimating the Percentage of gas content of an annular two-phase fluid with a specific liquid form. The MATLAB software was utilized to construct and model the proposed neural network. The utilization of the novel and precise apparatus for measuring the intended MLP model demonstrated the ability to prognosticate the volume percentage with a mean absolute error (MAE) of 0.004. © 2013 IEEE.

ABSTRACT: Several researchers have dealt with the one-dimensional fractional heat conduction equation in the last decades, but as far as we know, no one has investigated such a problem from the perspective of developing suitable fractional-order methods. This has actually motivated us to address this problem by the way of establishing a proper fractional approach that involves employing a combination of a novel fractional difference formula to approximate the Caputo differentiator of order α coupled with the modified three-point fractional formula to approximate the Caputo differentiator of order 2α , where $0 < \alpha \leq 1$. As a result, the fractional heat conduction equation is then reexpressed numerically using the aforementioned formulas, and by dividing the considered mesh into multiple nodes, a system is generated and algebraically solved with the aid of MATLAB. This would allow us to obtain the desired approximate solution for the problem at hand. © 2023, Tech Science Press. All rights reserved.

ABSTRACT: The increasing prevalence of cyber threats necessitates the exploration of cybersecurity challenges in sustainable operating systems. This research paper addresses these challenges by examining the dynamic landscape of cyber threats and the modifications required in operating systems to ensure robust security measures. Through the classification of these threats, the diverse nature of attacks faced by operating systems is revealed, highlighting the need for proactive security measures. Furthermore, the study investigates current cyber security solutions and prevention mechanisms employed to mitigate these threats. It also explores the modifications and challenges that operating systems must undergo in response to cybersecurity crimes, emphasizing the significance of proactive measures to address vulnerabilities exploited by cybercriminals. © 2023 IEEE.

ABSTRACT: Recently, the use and development of a blockchain systems such as Ethereum has increased rapidly, and many systems have relied on a third party as an intermediary between the sender and the receiver. Despite the attempts of developers to protect smart contracts, smart contracts contain many vulnerabilities that hackers resort to exploiting and using due to the attack that caused many financial and economic losses, and with the increase of errors in smart contracts, there are many tools and methods. For the analysis of smart contracts, machine learning models have appeared that facilitate their discovery instead of extracting them manually. In this paper, We have built a model that attempts to cancel the third party and we used machine learning to identify valid and invalid smart contracts. We have used several models and compared them with previous results of previous work in the same field. The result of this research was as expected of height accuracy achieved with approximately.99%. © 2023 IEEE.

ABSTRACT: Purpose: Drawing on the resource-based view, ecological modernization theory and upper-echelon theory, this study aims to explore how green manufacturing practices (GMGP) affect the sustainable performance of small and medium enterprises (SMEs). Design/methodology/approach: It also examines the mediating role of green innovation (GIN) and the moderating role of managerial discretion (MD). To test the hypothesized model, the data was collected from 394 manufacturing SMEs through survey and analyzed using SPSS and AMOS (SEM). Findings: The results provide evidence for the positive relationship between GMGP and corporate sustainable performance (CSPR), mediated by GIN. Furthermore, the presence of MD enhances the positive effect of GMGP on CSPR through GIN. Thus, this study enhances the understanding of the relationship between GMGP and CSPR, including its underlying mechanism and conditional effects. Research limitations/implications: This study collected sample from SMEs located in Punjab province of Pakistan which represents majority of the SMEs; however, future research can take data from other province and with large sample size. Practical implications: The findings highlight the significance of GMGP and GIN in the manufacturing sector for attaining CSPR goals. GMGP guides business leaders to be more inclined toward the energy and resource consumption as well as waste generation within their organizations which lead to improved CSPR outcomes. Originality/value: The findings of this study make significant contributions to the existing literature, shedding light on the dynamics between GMGP and CSPR. Moreover, the study offers

managerial implications for organizations aiming to enhance their sustainable performance by implementing effective GMGP. © 2023, Emerald Publishing Limited.

ABSTRACT: This paper delineates how telecommunications companies in Jordan can harness the power of big data analytics to enhance their digital marketing strategies. Its role is substantial in promoting creative businesses concerning intelligent technologies, as the telecommunications industry is fundamentally associated with it. The dynamic capability of an organization's aptitude to build and reconfigure its external and internal competencies to tackle rapid environmental changes is unavoidable. This perspective suggests that digital marketing can promptly adjust its resources and processes to address environmental threats and opportunities. The capability of the dynamic framework is a persuasive instrument in the digital economy for producing, employing, and transforming business models. On the other hand, digital marketing enhances business performance, focusing on customer retention, brand loyalty, and customer satisfaction. Primary data was collected through the questionnaires for Zain Jordan, Umniah, and Orange Jordan, which was analyzed by SPSS to develop regression analysis. The curve analysis shows that the p-value for Zain Jordan and Orange Jordan are 0.576 and 0.339, respectively. Although subscribers showed confidence in Zain Jordan, but they need to minimize the complexity to enhance the performance. © 2023 IEEE.

ABSTRACT: Coloring agents in foods and drinks have been popular for centuries. This study aims to analyze the presence of ten synthetic colors (namely, (allura red (E129), amaranth (E123), sunset yellow (E110), tetrazine (E102), fast green (E143), ponceau 4R (New Coccine) (E124), erythrosin B (E127), brilliant blue FCF (E133), brilliant black (E151) and carmoisine (E122))) in food and drink samples using ultra-high-performance liquid chromatography diode array detection (UHPLC-DAD). The present analytical method was carried out using Agilent Poroshell 120 HPH-C18 column, 3 × 100 mm, 2.7 µm, and a mobile phase consisting of 10 mM Na₂HPO₄, pH 7, mixed with methanol as a time-increment gradient solution until the time was 20 min, then decreased with time until the time was 26 min. The pH was set by orthophosphoric acid at 7 and 5 µL injection volume, 0.50 mL flow rate, and the elution systems were monitored at 428 nm for E102, 518 nm for E124, E110, E129, E122, 530 nm for E151, E127, 622 nm for E143, and E133, respectively. The limit of detection and quantification for all colors ranged from 0.017 to 0.025 and 0.057 and 0.082 mg L⁻¹, respectively. The correlation coefficient values ranged between 0.9991 and 1.0. The selectivity of the assay revealed no interference from other components in the analyzed samples. The percent recovery and precision (intra- and inter-day) of the spiked samples were within the acceptable limits of the ICH guidelines. Five analytical parameters were employed, and the results showed a new, novel, and robust method according to ICH guidelines for analyzing these colors. While most of the investigated food and drinks fell within the accepted range, some fell outside. The current sample preparation and analytical methods are comprehensive and universal for extracting and measuring synthetic colors in various food and drink samples. © 2023 The Author(s).

ABSTRACT: The Probe attack is one of the most perilous kinds of cyberattacks since its primary objective is to get knowledge on the vulnerabilities of the target network. In the course of this research, an Intrusion Detection and Prevention Systems (IDPS) detection model that can identify Probe attacks will be developed using machine learning approaches. The proposed Probe attack detection model was examined by utilizing the NSL-KDD dataset in conjunction with the Support Vector Machine method, Naive Bayes method, Decision Tree method, Random forest method, Logistic Regression method, and K-nearest neighbor method. Matthews Correlation Coefficients (MCC), Recall, Precision and Accuracy are the metrics that are utilized in order to make a comparison between these six methods. In general, the performance of all methods is satisfactory when using the suggested model. On the other hand, the Random forest approach has shown the best performance across all six measures, while the Naive Bayes method gave the worst results possible. © 2023 IEEE.

ABSTRACT: Nurses' psychological wellness and satisfaction are threatened by exposure to many stressors. Adopting a promising leadership style has beneficial impacts at different levels, especially during crises. This study aimed to examine the impact of inclusive leadership on nurses' satisfaction and psychological distress during crises, focusing on three Arabic countries. A cross-sectional descriptive design was utilized to meet the study goal. Data were collected electronically in the three countries using the Kessler Psychological Distress Scale (K-10), Minnesota Satisfaction Questionnaire, and Carmel's Inclusive Leadership Scale. Two hundred seventy-four participants fully responded: 90 from Egypt, 82 from Saudi Arabia, and 102 from Jordan. Descriptive statistics, Pearson R, Spearman Rho, Point biserial, and ANOVA tests were used to answer the research questions. There were statistically significant differences between countries in the mean scores of inclusive leadership and psychological distress. In addition, statistically significant relationships between inclusive leadership, psychological distress, and job satisfaction were found. The study focused on the importance of approaching inclusive leadership to increase employee satisfaction, reduce psychological distress, and achieve organizational goals. © 2023, Carol Davila University Press. ABSTRACT: Unquestionably, all nations' top priorities are international peace and long-term, sustainable economic growth. The objective of this study is to scientifically assess how Jordan's military spending has affected economic development between 1970 and 2020. The current study defined a growth equation proposed by Solow based on the body of knowledge already available on growth theories. As a result, we add to the empirical literature in this work by utilizing the OLS approach to investigate the connection between military spending and economic growth. As a result, the goal of this study is to examine the relationship between military spending and economic development in

Jordan from 1970 to 2020. Jordan has a rapidly rising economy and a middle-level military budget. According to the empirical findings, military spending has little effect on GDP. Additionally, the result indicates that the macro factors each represents (GDP per Capita, Gross Capital Formation, and Population Growth) have a favorable influence on GDP in Jordan. © The Author(s), under exclusive license to Springer Nature Singapore Pte Ltd 2023.

ABSTRACT: The potential impact of sustainability reporting on a company's financial performance could be measured through its stock price, profitability, or other financial metrics. This research aims to investigate the relationship between sustainability reporting and financial performance, in order to provide insights for companies, investors, and other stakeholders on the potential benefits and drawbacks of sustainability reporting. The research community of this study is formed out of all the 13 Jordanian commercial banks listed in the Amman Stock Exchange, and covering the period from 2012-2021. The study is a census study as it involves collecting data from every member of the study population, which allows for a comprehensive analysis of the relationship between sustainability reporting and financial performance. The data was collected from publicly available sources and analyzed using multiple regression analysis. The results of the study suggest that there is a strong linear relationship between sustainability reporting and the dependent variables return on assets (ROA) and financial leverage (LEV), but the relationship between sustainability reporting (SR) and return on equity (ROE) is not statistically significant. These findings provide insights for companies, investors, and other stakeholders on the potential benefits and drawbacks of sustainability reporting and can inform decisionmaking around sustainability initiatives. © 2023 The Authors.

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The study examined the relationship between the legal liquidity ratio and profitability of Jordanian commercial banks over 18 years from 2003 to 2021. The research employed a longitudinal research design using secondary data obtained from the Central Bank of Jordan's annual reports. The data was analyzed using descriptive statistics, correlation analysis, and multiple regression analysis. The results showed that there is a significant negative relationship between the legal liquidity ratio and profitability in the short term, while in the long term, there is a significant positive relationship between the legal liquidity ratio and profitability. The study also found that the size of the bank has a significant positive impact on profitability, while the age of the bank has a significant negative impact on profitability. Furthermore, the ownership structure of the bank was found to have a significant positive impact on profitability. The study recommends that commercial banks in Jordan should maintain a balanced legal liquidity ratio to ensure short-term stability while aiming for long-term profitability. Banks should also consider their size, age, and ownership structure when making decisions regarding their legal liquidity ratio and profitability. © 2023 The Authors.

ABSTRACT: Many particle accelerators rely on maintaining low pressures to ensure efficient operation, minimize beam losses, and reduce radiation background. To ensure a beam lifetime of 1–20 hours for the Synchrotron-light for Experimental Science and Applications in the Middle East (SESAME) vacuum system, an ideal average dynamic pressure of 1×10^{-9} mbar was targeted. This pressure was intended to be maintained while running the accelerator at a current of 400 mA after a cumulative dose of 100 Ah. In this study, a MATLAB code was employed to develop a series of one-dimensional equations that simulate the behavior of the vacuum system within the SESAME storage ring. The proposed model was then compared with the results generated by the VACCALC software and the Particle Monte Carlo (TPMC) MOLFLOW code, establishing a comprehensive assessment framework. The collected data from the model was subsequently compared with the recorded static and dynamic pressure measurements obtained during more than 1000 Ah of beam conditioning at 2.5 GeV. In results, the projected and actual values of dynamic pressures exhibited a satisfactory degree of agreement across the investigated range of beam conditioning doses, with a consistency factor exceeding 2 after a 100 Ah dose. © 2023, Politechnika Lubelska. ABSTRACT: The tremendous increase of using intelligent devices brought by the Internet of Things technology was a success to change the shape and nature of provided services in the digital world. That paradigm is based on sensors, actuators, and other smart devices that collect process, and store data. The variety of smart devices, platforms, applications, and protocols used in different IoT systems led to the emergence of many challenges. In this paper, the authors highlighted the most critical four challenges: security, interoperability, heterogeneity, and scalability. A literature review of the latest proposed solution is conducted and an analysis of the effectiveness of these approaches is provided. As a result of the analysis, no one proposed solution can satisfy the requirements for solving obstacles, since each approach deals with a specific component of the IoT system. The authors concluded that the solution should start with developers to produce more capable, adaptable, and compatible devices that meet the required and emergency requirements besides the need for unified standards to govern the deployment of IoT systems. © 2023 IEEE.

ABSTRACT: Web shell attacks through malicious PHP scripts allow attackers to execute system commands remotely and take control of web servers. Most existing PHP shell detection methods rely on signature matching, which can be evaded by obfuscation. This paper proposes an alternative static taint analysis framework to detect PHP web shell attacks by modeling data flows from untrusted inputs to sensitive sinks. The proposed web shell attacks detector takes PHP source code as input and performs a staged analysis, including lexical analysis to tokenize the code, syntactic analysis to generate a parse tree, semantic analysis to extract variables and functions into a dependency control flow graph (D-CFG), dataflow analysis to track taint through the D-CFG and identify flows from untrusted sources like `$_GET` to sinks like shell commands, and evaluation to compare identified flows to known malicious patterns and check for indications of a web shell attack. Each stage builds on the previous one, and the whole process aims at reliably detecting PHP web shell threats through static taint analysis of program flows from origin to system execution. It conducts a hybrid analysis using lexical, syntactic, and semantic analysis of the abstract syntax tree. Static taint analysis is a program analysis technique used to identify how untrusted data propagated through a codebase without executing the program. Also, static taint analysis helps find security issues by modeling how untrusted inputs interact with critical operations via a static code inspection rather than dynamic execution. Results on a PHP web shells dataset showed that our framework could achieve 95% recall and 90% precision, outperforming existing static and dynamic analysis methods. The approach also had fewer false positives than signature-based methods. The evaluation demonstrates the framework's capabilities in precisely detecting web shell attacks with high accuracy. © Al-Zaytoonah University

ABSTRACT: Artificial intelligence (AI) refers to a field of computer science that focuses on developing intelligent machines capable of performing tasks that require human-level cognition, such as natural language processing and object recognition. This technology has the potential to address some of society's most challenging problems. Social media platforms have become ubiquitous in our daily lives, with platforms like Facebook, Twitter, Instagram, Pinterest, and YouTube facilitating connections and content sharing among users. To function properly, these platforms are increasingly reliant on AI technology. AI is transforming the way social media operates, and its use in this context is growing at an unprecedented rate. This paper aims to examine the various AI tools currently available and their impact on social media companies, paving the way for a deeper understanding of the role of AI in the social media landscape. © 2023 IEEE.

ABSTRACT: Vaccines are instrumental tools to fight against novel and re-emerging pathogens and curb pandemics. Vaccination has been an integral part of the multifaceted public health response to the COVID-19 pandemic. Diverse vaccine platforms have been designed and are currently at different stages of development. Some vaccines are still in early biological testing, while others have been launched after being approved by regulatory agencies worldwide. Genomic vaccines that deliver parts of the viral DNA or RNA to host cells have gained popularity recently due to their high efficiency and fast manufacture. Furthermore, recent clinical studies encouraged the use of different vaccine platforms within the primary vaccination course to enhance the efficacy of vaccination. Herein, we discuss COVID-19 genomic vaccines, which deliver viral genetic material to host cells through diverse biotechnology platforms, including viral vector vaccines, messenger RNA nucleic acid vaccines, and DNA nucleic acid vaccines. We compare and contrast vaccine characteristics, composition, and pros and cons among different genomic vaccine platforms as well as non-genomic vaccines. This review summarizes all current knowledge about COVID-19 genomic vaccines, which could be highly valuable to researchers interested in public health and vaccine development. © 2023 Bentham Science Publishers.

ABSTRACT: Rapid technological changes cause several challenges for established processes and approaches to the auditing. A special role in this context is assigned to the blockchain as a key driving force in changes in auditing. The aim of the article is to identify the key features of blockchain's impact on auditing. The research employs economic and statistical methods, namely trend analysis, in-depth semi-structured interviews, assessment of the economic effect to identify the main changes in auditing under the influence of blockchain technologies. The experience of using blockchain was studied through a sample of 27 auditors from Azerbaijan, Israel, and Jordan. The respondents indicated changes in the operational work of auditors (88,9% of respondents) among the main areas of influence of blockchain technologies. The surveyed auditors also consider it necessary to improve auditors' IT skills under the influence of blockchain (88,9% of respondents). The respondents emphasize the appropriateness to change the audit methodology under the influence of blockchain (77,8% of respondents). The surveyed auditors see the prospect in using real-time auditing (55,6% of respondents) and other higher value-added services (44,4% of respondents). Data from the financial statements of the 4 largest auditing companies were analyzed to determine the economic effect of the impact of blockchain on auditing. It was determined that the average annual growth rate under the basic scenario is 6.9% for 2023-2025, or \$72.1 billion on average per company in 2025. The prospects for further research are studying the directions of strategic and operational transformations in auditing because of the influence of blockchain in terms of audit methodology, organizational structure of audit companies. © Authors 2023.

ABSTRACT: Aims. This study evaluates the epidemiology of headache and migraine among adolescents aged 12 to 15. Methods. A school-based cross-sectional study was conducted to collect and analyze data from students in grades 7-10 over the course of one month, using a simple random sampling method. The overall number of participants in this study was 692, with an average age of 13.9 years (SD = 1.3). Descriptive measures and Fisher's exact test were computed. Multivariate regression was calculated to assess the predictors of headache and migraine. Findings. Approximately one-half of the students reported having headaches: tension-type headaches (10.3%), migraines (4.8%), and other headache types (31.5%). Moreover, girl students in the age group of 14-15 reported more headaches and migraines. Conclusion. The prevalence of headache and migraine in Jordan is high and increasing as students grow older. Health education programs led by school nurses and other healthcare practitioners are urgently needed. © 2023 Mohammed Albashtawy et al.

ABSTRACT: The current article pinpoints technical service error as a pillar of administrative responsibility for artificial intelligence (AI) operations. To achieve the research objectives, the descriptive and analytical approach is appropriated and adapted. The technical service error, being one of the pillars of administrative responsibility for artificial intelligence work, necessitates pointing out that the service error has degrees of seriousness. The administrative judiciary distinguishes between serious and non-serious errors, depending on the nature of administrative activities and services, especially after the digital transformation of numerous services provided by the government carried out through artificial intelligence technology. The awareness about the legal system for service errors in the field of administrative responsibility resulting from the use of artificial intelligence techniques is attained through identifying the errors committed by the administration during the exercise of its physical and legal work, considering that service errors play a major role in establishing administrative responsibility, especially with the technical development witnessed by public facilities. © Al-Zaytoonah University of Jordan (ZUJ).

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Current study aimed at examining the requirements of AIS in building modern operating business environment within retail trading unit in Jordan including malls, hyper market and supermarkets. Requirements were divided into internal resources including (human resources, IT infrastructure and knowledge sharing) while the other part took into perspective the external resources (technological vigilance, competitiveness and market). Total of 150 individuals were exposed to a questionnaire as a tool of study. Results of the current study concluded that the current AIS tools and their techniques used in large retail stores in Jordan meet the needs of the modern business environment due to the ability of these tools to meet the needs of the modern business environment and be a response to it to achieve the goals of the organisation. Also, results of study indicated that both internal and external resources are extremely important but internal resources appeared to be more influential as main requirements for modern accounting operations in organisations. Study recommended that the organisations should use the talents of their existing and intangible organisational capabilities in developing their internal business environment in addition to developing their external tools and means in dealing with clients and competitors. © 2023 Inderscience Enterprises Ltd.

ABSTRACT: The adoption of Enterprise Resource Planning (ERP) systems is a critical aspect of managing business processes. However, Higher Education Institutions (HEIs) must exercise caution in implementing such systems to achieve optimal results. Past studies have demonstrated that ERP implementation projects can be arduous and may not deliver the intended benefits. Therefore, ERP providers should evaluate an organization's preparedness and customize their approach to ensure successful implementation. In the context of HEIs in Jordan, it is imperative to assess whether universities are ready and willing to embrace this technology. Consequently, this study seeks to appraise universities' readiness and suitability by conducting a questionnaire survey and categorizing them accordingly, enabling the identification of the most suitable and prepared universities for implementing an ERP system in Jordan. © 2023 IEEE.

ABSTRACT: This study aims to determine the impact of green marketing (green perceived value), green products (green buildings), and environmental concerns on Jordanian consumers' attitudes toward buying green buildings in Jordan. The research population includes all consumers in Amman, the capital of Jordan, who might be interested in buying such buildings. A convenience sample is used to collect data from the respondents by distributing the questionnaire among 400 consumers using Google Forms. 357 questionnaires were found valid for statistical analysis. The results of the multiple regression test showed that R equals 0.815, which indicated that green marketing and consumers' attitudes toward buying green buildings in Jordan are positively and highly correlated, with a percentage of 81.5%. R square equals 0.664, indicating that the variation in green marketing explains 66.4% of the variance in consumers' attitudes toward green buildings in Jordan. Moreover, the hierarchical multiple regression test showed that there is an increase in R and R² values in the existence of product awareness as a moderating variable between green marketing and consumers' attitudes toward buying green buildings in Jordan. © 2023 LLC CPC Business Perspectives. Speech Acts in the Discourse of Prophet Joseph Peace be Upon Him in the Holy Quran: A Deliberative Approach

(2023) Dirasat: Human and Social Sciences, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177852563&doi=10.35516%2fHUM.V50I5.209&partnerID=40&md5=739f26d04a91bc79f80f3abebe87b037)

[85177852563&doi=10.35516%2fHUM.V50I5.209&partnerID=40&md5=739f26d04a91bc79f80f3abebe87b037](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177852563&doi=10.35516%2fHUM.V50I5.209&partnerID=40&md5=739f26d04a91bc79f80f3abebe87b037)

AFFILIATIONS: Arabic Department, Faculty of Arts, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Objectives: The study aims to present a deliberative reading within the framework of the speech act theory to unveil the deliberative tendencies in the discourse of Joseph Peace be upon him as a boy, a youth, an accused man, a prisoner, a ruler, a son, a brother, etc. Furthermore, this study uncovers key stages in Joseph's life and examines speech acts in various contexts to achieve specific communicative goals. **Methods:** This research is descriptive and analytical; and conducted a deliberative reading of the discourse of Joseph Peace within the framework of the speech act theory. In addition, this research is twofold: A preliminary theoretical study which relies on the nature of speech acts, their types and meanings; and a practical demonstration of the speech acts in the discourse of Joseph. **Results:** According to the deliberative reading of the Holy Quranic discourse within the framework of the speech act theory, it comes to light that the discourse of Joseph peace be upon him in the Quran has more than one type, and carries more than one meaning. Such multiple meanings rely on the communicative context of this discourse as well as on its purpose and influences to ensure the continuity of the communicative process. **Conclusions:** This study recommends further studies pertaining to the discourse of the Quran within the framework of the deliberative speech act theory since this theory has changed the traditional view of speech by focusing on the various factors and elements of discourse. © 2023 DSR Publishers/ The University of Jordan.

ABSTRACT: Objectives: The study attempts to elucidate the status of creative writing in Jordanian Universities from the viewpoint of students and faculty members. **Methods:** The study is conducted on (385) male and female students and (255) faculty members from selected Jordanian universities using the stratified random sampling method. The sample members responded to two questionnaires; one is for faculty members and the other is for students. The study adopts the descriptive method approach which describes and analyzes the studied phenomenon under investigation and presents its results. **Results:** According to both students and faculty members, the study's findings indicate that university students' creative writing skills are on the medium level range. Additionally, it demonstrates that there are no statistically significant differences between students and faculty members based on their gender, but that there are significant statistical differences based on the academic year, in favor of fourth-year students, the type of university, in favor of public universities, and the rank of the faculty member, favoring associate professors. **Conclusions:** The study recommends the necessity of creating and adopting a clear and a well-organized approach as part of obligatory university courses in creative writing in public and private universities taught by specialized professors in this field. © 2023 DSR Publishers/ The University of Jordan.

Blockchain technology and sustainable performance: moderated-mediating model with management accounting system and digital transformation

(2023) Environment, Development and Sustainability, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177605584&doi=10.1007%2fs10668-023-04189-7&partnerID=40&md5=3868cda1cb28283b3c64967b2ed5ecc0>

AFFILIATIONS: School of Accounting, College of Business, University of Economics Ho Chi Minh City, Ho Chi Minh City, Viet Nam;

Department of Accounting, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study scrutinizes the effect of blockchain technology on sustainable performance in the circumstances of Vietnam, a developing country. In which, we consider management accounting system as a mediating factor. Additionally, digital transformation is employed as the moderating variable for links in the research model. It provides empirical evidence about this context from manufacturing businesses in Vietnam. Our paper has been carried out utilizing a quantitative technique. Our population is already represented by manufacturing companies in Vietnam. Survey questionnaires were distributed to potential participants via their email. After removing missing answers and outliers, our final sample consisted of 568 observations. By employing the partial least squares structural equation modeling, our findings explicate that blockchain technology has a substantial favorable impact on sustainable performance, and management accounting system positively mediates this effect. Moreover, digital transformation acts as favorable moderator role on the link between blockchain technology and management accounting system, and the link between management accounting system and sustainable performance, respectively. Therefore, this paper has been conducted to complement experiential verification on sustainable performance in the early digital circumstances in developing market, particularly Vietnam. Accordingly, this is a pioneering study in this area that integrates all the above factors in the same experimental model. This contributes to supporting a scientific perspective for policy formulation to both digitize and internationalize the Vietnamese economy. © 2023, The Author(s), under exclusive licence to Springer Nature B.V.

ABSTRACT: Objective: The current study aimed to examine the relationship between depressive symptoms and quality of life among Jordanian community-dwelling older adults. Methods: A cross-sectional, descriptive correlational design was used. A convenience sample (N = 602) was selected to recruit the participants in the Amman governorate during the period from August to November 2021. Results: Findings demonstrated that the mean (SD) age of older adults was 67.5 (7.0) years and 51.5% of participants were females. Also, 54.1% of the participants experienced moderate to severe depressive symptoms with a total mean (SD) score was 8.57 on a scale of 0 to 15, while the mean (SD) for the quality of life scale was 12.12 (3.85) on a scale of 4 to 20. Significant differences existed in quality of life and depressive symptoms based on marital status (p <.001), educational level (p <.001), working status (p <.01), income (p <.001), and chronic disease (p <.01). Quality of life and its domains were negatively associated with depressive symptoms (B= - 0.596, p <.001). Also, marital status, working, educational level, income, and chronic disease were associated with depressive symptoms. Conclusion: Strategies to improve quality of life should be promoted to minimize depressive symptoms among older adults and consider significant demographic factors. © 2023 Taylor & Francis Group, LLC.

ABSTRACT: Trichophagia, or eating one's own hair, commonly occurs in individuals with trichotillomania. Minimizing the symptoms of trichotillomania and trichophagia and maintaining remission can encourage them to have healthy lives. Conduct a scoping review to investigate the efficacy of using psychotherapy interventions to minimize symptoms of trichotillomania and

trichophagia among individuals with trichotillomania. Using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews guidelines to screen 19,552 studies published between 2010 and 2022. A total of 19 studies that fulfill the eligibility criteria reported that psychotherapy interventions had been effective and applicable approaches to minimizing the symptoms of trichotillomania and trichophagia. Psychotherapy interventions are a promising treatment that is regarded as a credible treatment approach to ensure long-term positive outcomes among individuals with trichotillomania. This scoping review verifies the formalization and incorporation of psychotherapy interventions into standard practice and highlights the importance of mental health practitioners using them to ensure long-term positive outcomes for individuals with trichotillomania. Moreover, practitioners need further specialized training on a variety of psychotherapy interventions because not all of them are familiar with these interventions. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

Navigating the capital investment through national governance in BRICS economies: the role of cash holdings

(2023) Asian Review of Accounting, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177186102&doi=10.1108%2fARA-02-2023-0043&partnerID=40&md5=bcd745bfcc282c78898c98f7e4c95952>

AFFILIATIONS: School of Economics and Finance, Xi'an Jiaotong University, Xi'an, China; Department of Finance and Banking Sciences, Applied Science Private University, Amman, Jordan; Quaid-i-Azam School of Management Sciences, Quaid-I-Azam University, Islamabad, Pakistan; Department of Accounting, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Purpose: The current analysis aims to explore the role of cash holdings in the nexus of national governance and capital investment (CIN). Design/methodology/approach: To achieve this aim, the authors sample the nonfinancial enterprises from 5 Brazil, Russia, India, China, South Africa (BRICS) economies and employ system generalized method of moments(GMM) models as an estimation technique. Findings: The empirical analysis infers that national governance has a positive relationship with CIN and a negative relationship with cash holdings. The cash holdings negatively determine CIN. However, the cash holdings show a positive relationship with CIN in the presence of the national governance index (NGI). Research limitations/implications: The important policy layout of the current analysis is that corporate managers should reduce cash holdings during better governance situations. Alternatively, corporate managers can disentangle the negative impact of bad country governance conditions on CIN by holding more cash. Originality/value: The study is innovative as it explores mediating impact of cash holdings in the NGI-CIN nexus. © 2023, Emerald Publishing Limited.

ABSTRACT: This study explores the effectiveness of online flipped learning for outstanding students in Jordan. It examines the factors influencing students' acceptance and use of technology, such as performance expectancy, effort expectancy, social influence, and facilitating conditions. The findings show a positive relationship between these factors and students' intention to utilize e-flipped learning, highlighting the efficacy of this approach for outstanding students in Jordan. The proposed model can guide the development of online flipped learning systems tailored to the needs of outstanding students. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: In her Harry Potter series, J. K. Rowling created a complicated society in which wizards

are judged by the purity of their blood. This paper posits that J. K. Rowling was inspired by real-world events when writing the Harry Potter series, especially the Salem witchcraft trials of Puritan New England. Though the main theme of this series rests in the battle between good and evil, racism and prejudice are strongly demonstrated in Rowling's books. The current study examines the connection between the Wizarding society created by Rowling and the Puritan society in Salem. Even though it is a fictional magical society, the way the author presents the conflict between different races in her Wizarding World mirrors real-life events in the Puritan society. This article aims to connect the Wizarding World with Puritan society in relation to racism, gender, and classism. It also aims to demonstrate that this magical place is not so fictional in any case. © 2023 Common Ground Research Networks. All rights reserved.

Hayajneh, A.M., Aldalahmeh, S.A., Alasali, F., Al-Obiedollah, H., Zaidi, S.A., McLernon, D. Tiny machine learning on the edge: A framework for transfer learning empowered unmanned aerial vehicle assisted smart farming (2023) IET Smart Cities, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85176919544&doi=10.1049%2fsmc.2.12072&partnerID=40&md5=b520be4f50c9a3de1bb313534538f1a9

School of Electronic and Electrical Engineering, University of Leeds, Leeds, United Kingdom

ABSTRACT: Emerging technologies are continually redefining the paradigms of smart farming and opening up avenues for more precise and informed farming practices. A tiny machine learning (TinyML)-based framework is proposed for unmanned aerial vehicle (UAV)-assisted smart farming applications. The practical deployment of such a framework on the UAV and bespoke internet of things (IoT) sensors which measure soil moisture and ambient environmental conditions is demonstrated. The key objective of this framework is to harness TinyML for implementing transfer learning (TL) using deep neural networks (DNNs) and long short-term memory (LSTM) ML models. As a case study, this framework is employed to predict soil moisture content for smart agriculture applications, guiding optimal water utilisation for crops through time-series forecasting models. To the best of authors' knowledge, a framework which leverages UAV-assisted TL for the edge internet of things using TinyML has not been investigated previously. The TL-based framework employs a pre-trained data model on different but similar applications and data domains. Not only do the authors demonstrate the practical deployment of the proposed framework but they also quantify its performance through real-world deployment. This is accomplished by designing a custom sensor board for soil and environmental sensing which uses an ESP32 microcontroller unit. The inference metrics (i.e. inference time and accuracy) are measured for different ML model architectures on edge devices as well as other performance metrics (i.e. mean square error and coefficient of determination [R²]), while emphasising the need for balancing accuracy and processing complexity. In summary, the results show the practical feasibility of using drones to deliver TL for DNN and LSTM models to ultra-low performance edge IoT devices for soil humidity prediction. But in general, this work also lays the foundation for further research into other applications of TinyML usage in many different aspects of smart farming. © 2023 The Authors. IET Smart Cities published by John Wiley & Sons Ltd on behalf of The Institution of Engineering and Technology.

Faculty of Computer Studies, Arab Open University, Riyadh, Saudi Arabia

ABSTRACT: Solar photovoltaics have been widely used as solar energy harvesting systems for many years throughout the world. Lately, bi-facial modules have been gaining a lot of popularity due to utilizing solar irradiance on both sides of the module. Therefore, the presence of partial static shading on such modules may lead to some ambiguity regarding their output powers and efficiencies. In this work, a shading anomaly detection framework comprised three stages: An autoencoder-convolutional neural networks CNN model, a mean absolute error MAE threshold, and data filters. The framework was developed to detect the occurrence and location of partial shading on bi-facial modules. Several experiments were carried out using two bi-facial modules under different shading settings. The modules were connected to solar chargers and batteries to analyze their performances. The experimental results showed the modules' generated current and the batteries' state of charge SOC in

all shading settings. The results also showed that anomalies or shading can be detected with an accuracy of more than 99% merely from the second stage of the framework. However, the location of shading can be classified and predicted with an accuracy of 91% by utilizing all three stages of the framework. © 2023 Taylor & Francis Group, LLC.

School of Social Sciences, Humanities and Law, Department of Psychology, Teesside University, Middlesbrough, TS1 3BX, United Kingdom

ABSTRACT: Purpose: Asthma is a major chronic disease of all ages, globally. Exacerbations are a significant problem for asthmatic patients. Despite advances in asthma management and efforts to identify asthma triggers, viral infections of the respiratory tract remain the most frequent triggers of asthma exacerbations. This study explored knowledge, attitudes, and practices (KAP) of asthmatic patients towards receiving the influenza vaccine. Patients and Methods: This cross-sectional study enrolled 397 adult asthmatic patients visiting the outpatient respiratory clinics of three Jordanian medical facilities. Results: The research included 66.4% females, with a median age of 32 years. The results showed that 42.4% of enrolled asthmatics had never received the flu vaccine and only 51.1% reported that they intended to take the vaccine in the current year. Most of those who had been vaccinated at least once in their lifetime reported that the side effects were mild (61.8%).

Variables that decreased refusal/hesitancy towards receiving the flu vaccine in the current year included having well-controlled asthma (RRR = 0.193, 95% CI (0.053-0.698), $p = 0.012$), and high knowledge about asthma and flu (RRR= 0.916, 95% CI (0.847-0.990), $p = 0.028$, respectively).

Conclusion: A small number of the participants adhered to vaccinating against the flu which is due to lack of knowledge about the asthma, flu, and the vaccine. To address this challenge, we propose targeted health education campaigns, collaboration with healthcare providers, and utilization of digital platforms. © 2023 Al-Qerem et al.

Faculty of Science, Al-Zaytoonah University of Jordan, Amman, 11733, Jordan;

Faculty of Medicine, Universiti Malaya, Kuala Lumpur, 50603, Malaysia

ABSTRACT: This study examines the influence of sustainability accounting, specifically its environmental, economic, and social dimensions, on the quality of financial reports in the pharmaceutical and chemical firms listed on the ASE. The research aims to address the gap in understanding the relationship between sustainability accounting and financial reporting quality in these industries. Using a sample of 27 firms selected from a population of 53, the financial reports and statements from 2016 to 2021 are analyzed as the primary research data source. Statistical methods, including simple and multiple regression models, are employed to test hypotheses and derive results. The findings demonstrate a significant positive impact of sustainability accounting activities on the financial reporting quality of the studied firms. Increasing the reporting of sustainability dimensions enhances the quality of financial reports. The practical implications suggest supporting ASE-listed firms in adopting sustainability accounting initiatives, such as the Fourth-Generation reporting, and revising the listing and disclosure instructions on the ASE to include sustainability accounting as a requirement for disclosure and listing, following the Global Reporting Initiative (GRIG4) guidelines. This study contributes to theory and practice by supplying empirical evidence of the positive relationship between sustainability accounting and financial

reporting quality in the pharmaceutical and chemical sectors, emphasizing the importance of integrating sustainability dimensions into reporting practices. © 2023, Success Culture Press. All rights reserved.

ABSTRACT: Background: The entry of the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) into the host cell is carried out by specific receptors and enzymes, including human angiotensin-converting enzyme 2 receptor (ACE2), transmembrane serine protease 2 (TMPRSS2), and cathepsin-L (CTSL). COVID-19 patients with comorbidities, such as diabetes mellitus (DM), are more prone to severe symptoms and have a higher risk of mortality. Aims: The present study aimed to investigate the impact of controlled and uncontrolled type 1 DM (T1DM) on the gene expression of mouse *Ace2*, *Tmprss2*, and *Ctsl* and correlate it with the pathological alterations in the lungs and the heart of DM mice. Methods: Balb/c mice were administered a single dose of 240 mg/kg streptozocin to induce T1DM. The blood glucose level was measured to confirm the induction of DM. Normalization of blood glucose levels in T1DM mice was achieved using 0.1 mL/kg Mixtard® insulin therapy. The mice's lungs and hearts were harvested, and the mRNA was extracted and converted to cDNA. The gene expression of *Ace2*, *Tmprss2*, *Ctsl*, *Cyp4a11*, and *Adrb1* genes, which play a role in the homeostasis of lungs and hearts, were measured using quantitative real-time polymerase chain reaction (RT-PCR). The pathological alterations in the hearts and lungs induced by T1DM were evaluated using the relative heart and lung weights, in addition to the pathohistological examination. Results: After inducing T1DM for 14 days, we observed a significant reduction in the total weight of uncontrolled DM (UDM) mice ($P < 0.05$). Pathohistological examination of UDM lung tissues revealed thickening of the alveolar walls with narrowing of the surface of the alveolar sacs. Additionally, we found that UDM mice exhibited downregulation of *Ace2* gene expression ($P < 0.05$) in their lungs, while both UDM and control DM (CDM) mice showed upregulation of *Ctsl* gene expression in their hearts ($P < 0.05$). Notably, *Cyp4a12* gene expression was significantly downregulated ($P < 0.05$) in UDM mice but returned to normal levels in CDM mice. Conclusions: We conclude from this study that T1DM downregulates *Ace2* receptor and *Cyp4a12* gene expression, which is correlated with the thickening of alveolar walls and narrowing of the surface of alveolar sacs in the lungs. Insulin administration for controlling T1DM ameliorated these pathological alterations. These results can help increase our understanding of the impact of controlled and uncontrolled T1DM on the lungs and may explain, at least in part, why DM patients with COVID-19 experience exacerbation of symptoms. © 2023 Société Française de Pharmacologie et de Thérapeutique. ABSTRACT: The e-entrepreneurship field is a relatively novel one, suffering from a lack of theories and models, as researchers are deriving theories from other disciplines, such as economics, psychology, etc. To consolidate as a discipline, e-entrepreneurship studies need a systematic classification of previous and current contributions that can support the development of theories and research. The purpose of this study is to run a systematic literature review (SLR) to categorise the theories and models found from a total of 105 e-entrepreneurship publications over the period from

2008 to September 2020. A citation analysis has also been performed to identify 25 influential works that may be seen as foundational milestones in this field. The results revealed some critical research gaps and the need to develop new theoretical frameworks able to combine and extend the classical models of innovation, entrepreneurship, and technology to specifically tackle the e-entrepreneurship field of research. ABSTRACT: In this paper, we study new classes of differential equations of fractional order. The first considered problem involves the derivative of Caputo, while the second one involves conformable Khalil derivative. For the first class, we prove an existence and uniqueness result, then, we discuss an example to show the applicability of the result. For the second one, we apply the exp-function method to find new traveling wave solutions for a generalised conformable fractional partial differential equation, then some examples on Ostrovsky and KdV equations are given to illustrate the efficiency and accuracy of the method. Some graphs are plotted and discussed to show more the importance of the obtained results. © 2023 Sciendo. All rights reserved.

ABSTRACT: Landfills are currently one of the most effective ways to dispose of waste. Underground storage tanks (UGST) are also used to store hydrocarbon fluids that include different types of fuels. The bottom part of the landfills and UGST is critical. This liner material and its composition prevent heavy metals and leachate from infiltrating the groundwater table. Failure of this layer presumably causes most landfill failures. Bentonite clay is used to build such liner because of its properties including high cation exchange capacity and swelling index. The swelling of bentonite is sensitive to the type of liquid and load. It swells under low loads when submerged with water and to a lesser extent for ethanol. However, it undergoes consolidation when penetrated by biofuel. Test results indicate that bentonite undergoes swelling in water under high load (40 kPa) and consolidates for both alternative fuels (biofuel and ethanol). Under very high loads (100 kPa) bentonite consolidates for all kinds of liquids including water. © 2023, Association of American Publishers. All rights reserved.

ABSTRACT: Soil stabilization is a technique that is used in most construction projects to enhance the geotechnical and engineering properties of soil. There is a wide range of research studies related to soil stabilization techniques and agents, these studies discussed the effects of the different types of soil stabilization on soil, the most suitable agent type regarding soil classification, and the

challenges that were founded during the application of these processes. Stabilization agents include traditional and non-traditional additives with their different categories were reviewed and discussed in this paper by presenting the results of the recent studies concerned with various types of soil stabilization agents in different laboratories and project tests with highlights on the enhancement of soil properties. In addition to increasing the compressive and shear strength parameters, Maximum Dry Density (MDD), and California Bearing Ratio (CBR) of the soil, the soil stabilization agents play a great role in decreasing the soil plasticity index, swelling, compressibility, porosity, permeability, and Optimum Moisture Content (OMC). © 2023, Association of American Publishers. ABSTRACT: Landfills are one of the most effective ways utilized to dispose the wastes and usable up today, most of their failures were suspected due to the failure of their protecting natural liners. Landfill liners failure is one of the most problematic issues that face engineers and expose governments, societies, and the environment to high costs. Protection of groundwater requires that natural landfill liner structure be able to reserve its properties in harsh conditions and over a long period. However, the composition of disposed of residuals might change in the following contemporary trends and it could contain alternative fuels and their impact on natural liners requires further investigations. This paper focuses on the changes in sand-bentonite liner due to the interaction and infiltration of hydrocarbon liquids (alternative fuels); biofuel and ethanol-fuel. In this investigation, an experimental program was carried out to examine the influence of chemical properties of alternative fuels on the hydraulic conductivity, erodibility, swelling potential and shrinkage behaviour of natural liners. Series of laboratory tests were conducted in 20 cm-high PVC columns to investigate the hydraulic conductivity of the liners, swelling behaviour of bentonite when subjected to water, biofuel or ethanol-fuel was assessed by oedometer tests, and shrinking behaviour and cracking patterns of samples taken from the PVC columns were examined employing digital photo analysis. The results can be useful in designing liners, barriers as well in assessing the behaviour of clayey soil in case of accidental spills or intentional discharges. © 2023, Association of American Publishers. ABSTRACT: Big data (BD) is one of the major technological trends of today and finds application in numerous domains and contexts. However, while there are huge potential benefits, there are also considerable challenges. One of these is the difficulty to make sure the respective applications have the necessary quality. For this purpose, the application of test driven development (TDD) to the domain was proposed. In general, the approach already has a rather long history and, thereby, the corresponding challenges are also known. However, since the BD domain has several demanding particularities, this also needs to be accounted for when applying TDD. Yet, to our knowledge, this specific aspect has not been discussed by now. The publication at hand bridges this gap by examining the challenges of applying TDD to the engineering of BD applications. In doing so, it facilitates the approach's use by practitioners and researchers while also constituting a foundation for further discourse regarding the quality assurance in the BD realm and the TDD approach in general. © 2023 ICSBT International Conference on Smart Business Technologies. ABSTRACT: This investigation explores two numerical approaches: the optimal auxiliary function method (OAFM) and the new iterative method (NIM). These techniques address the physical fractional-order Klein-Gordon equations (FOKGEs), a class of partial differential equations (PDEs) that model various physical phenomena in engineering and diverse plasma models. The OAFM is a recently introduced method capable of efficiently solving several nonlinear differential equations (DEs), whereas the NIM is a well-established method specifically designed for solving fractional DEs. Both approaches are utilized to analyze different variations in FOKGE. By conducting numerous numerical experiments on the FOKGE, we compare the accuracy, efficiency, and convergence of these two proposed methods. This study is expected to yield significant findings that will help researchers study various nonlinear phenomena in fluids and plasma physics. © 2023 the author(s), published by De Gruyter.

ABSTRACT: Bullying among nurses and other health care professionals with low health quality has become a major global concern. Nurses were also recognised as people who are close to patients and can play an important role to manage work bullying through providing effective training and education programs. This systematic review was developed and aimed to identify and clarify concepts and provide an overview of the available evidence on workplace bullying (WPB) among nurses as part of health care delivery system. Systematic review of all types of studies involving nurses published between 2009 and 2020 and approached health-related databases Cumulative Index to Nursing and Allied Health Literature (CINAHL), Psychology and Behavioural Sciences (PsychINFO), MEDLINE, and Education Resource Information Centre (ERIC). The review used focused keywords: WPB, health care quality, safety, interpersonal conflict, work productivity and nursing. Forty-three studies met the review criteria and five main themes were discovered including the prevalence of WPB among nurses worldwide, prevalence of WPB among nurses in the Arab region, perpetrators of WPB, influence of bullying on productivity, and individual-organisational characteristics and bullying. Growing evidence provided a negative relationship between WPB, safety and productivity suggesting further research on how bullying is prevalent and what solutions would manage this problem, particularly in Jordan. © 2023 SAGE Publications.

ABSTRACT: Purpose: This study aims to investigate the direct nexus between board characteristics, corporate social responsibility (CSR) disclosure and the cost of equity capital (CEQ). This is done by using agency theory, stakeholder theory and signalling theory, followed by an investigation into the indirect mediation impact of CSR disclosure in the board characteristics-CEQ nexus. It intends to present new experimental evidence from Jordan's developing economy. Design/methodology/approach: The study's target population was services companies registered on the Amman Stock Exchange (ASE) between 2012 and 2020. As a result, the population and sampling of this study are represented by all services companies for whom complete data are available over the period, with a total of 43 services companies yielding 387 company-year observations. Data for our study were obtained from their annual disclosures and the ASE's database. Findings: The main findings demonstrated that board size, board gender variety and the number of board sessions positively affect CSR disclosure significantly. In addition, three board characteristics (i.e. board size, board independence and board gender variety) significantly negatively affect CEQ. Besides, CSR disclosure significantly negatively affects CEQ and it fully mediates the relationship between two board characteristics (i.e. board size and board gender variety) and CEQ, whereas it partially mediates the nexus between board independence, CEO/Chairman duality and the number of board sessions of board characteristics and CEQ.

Originality/value: This study varies from earlier studies, in that it builds a new research model by looking at the mediating role of CSR disclosure in the nexus among board characteristics and the CEQ.

ABSTRACT: In this study, the effect of rolling angle orientation namely; 0o, 45o, and 90o degrees, and three rolling passes on the mechanical behavior of Al-Cu after vanadium addition were investigated. Al-4%Cu and Al-4%Cu-0.1%V sheets were produced and rolled from 4 mm to 3 mm followed by 3 to 2 mm, and finally from 2 mm to 1.3 mm. After each pass, the tensile test was performed in three directions from which the maximum tensile force, deformation energy, microhardness, and average surface roughness (Ra) were determined. A pronounce finding is that the addition of both additions of 0.1% vanadium to Al-4%Cu alloy and multi-rolling passes resulted in reducing the deformation energy by 85.4, and the maximum tensile forces reduced by 56.6%, this resulted in reduction of production cost of AlCuV alloys, furthermore, it resulted in reducing the anisotropy of AlCuV alloy.

Additionally, the average microhardness was enhanced for Al-Cu and AlCuV alloy, whereas the Ra was in maximum enhanced for AlCuV alloy of about 64.9%. © 2023, Politechnika Lubelska. All rights reserved.

ABSTRACT: The purpose of this paper is to assess the interactional impact of military expenditure on economic growth, taking into consideration the levels of political instability in the Middle East, North Africa and Turkey region (MENAT), namely Egypt, Iran, Jordan, Morocco, Saudi Arabia, Tunisia, and Turkey, over the period 1996-2019. In this regard, this study considers the effects of military

spending on economic growth in a panel cointegration framework using panel dynamic ordinary least squares (OLS), focusing on the implications of political instability. Our analysis indicates that after controlling for cross-sectional dependence, the typical relationship between military spending and output does not hold in the long run. This relationship, however, is re-established and becomes stronger once we account for political instability in the countries in the region. It is clearly found that political stability indices are more important for developing countries. In the long run, the results of dynamic OLS reveal that military spending has a more elastic relationship with the economic growth rate in the presence of political instability in the MENAT region with a negative effect, while there is a negative relationship between political stability level measured by government effectiveness and economic growth. © 2023 The Authors.

ABSTRACT: Introduction: There is a variation in drug response among patients who practice intermittent fasting. Alteration in the expression of drug-metabolizing enzymes (DMEs) can affect the pharmacokinetics and drug response. Aims: This research aimed to determine the effect of intermittent fasting on the mRNA expression of major drug-metabolizing cyp450s in the liver of diabetic mice.

Methods: Thirty-two male Balb/c mice were divided into four groups; control, nonfasting diabetic, non-diabetic fasting, and diabetic fasting mice. Insulin-dependent diabetes was induced in mice by a single high-dose (250 mg/kg) streptozocin. Mice of non-diabetic and diabetic fasting groups were subjected to 10-day intermittent fasting for 17 hours daily. Then, the mRNA expression of mouse phase I DMEs cyp1a1, cyp2c29, cyp2d9, and cyp3a11 was analyzed using real-time polymerase chain reaction.

In addition, the liver of mice in all groups was examined for pathohistological alterations. Results: Diabetes downregulated the mRNA expression of hepatic drug-metabolizing cyp450s in diabetic mice, while intermittent fasting significantly ($P < 0.05$) increased it. Also, cyp2d9 and cyp3a11 were upregulated in the liver of diabetic fasting mice. These alterations in the gene expression were correlated with the pathohistological alterations, where livers of diabetic mice showed dilatation in the blood sinusoids and inflammatory cells leukocyte infiltrations. Whereas livers of diabetic fasting mice showed almost comparable histological findings to control mice. Conclusions:

Intermittent fasting can protect the liver against diabetes-induced hepatotoxicity and the down-regulation of DME genes in the diabetic liver. These results can explain, at least partly, the inter-individual variation in the drug response during practicing fasting. © 2023 The Author(s). ABSTRACT: Within the field concerning innovative performance (IP), which is extensive in its research, a wealth of research has zoned in on the encouragement of IP within a given workplace via total quality management (TQM), a concept that allows individuals to foster cooperation and ability to enhance IP (alongside knowledge-sharing [KS]). In mind of the above, 213 employees at Jordanian ISO 9000-certified SMEs participated in this study, with structural equation modelling (SEM) employed to analyse the ways in which IP was influenced by KS. The results show that the relation between TQM

and IP is partly controlled through KS, such that it is necessary to recognise TQM as a multi-factorial problem, rather than selectively choosing individual factors, and that in order to facilitate more innovative performance, KS needs to further complement total quality (TQ). © 2023 Inderscience Enterprises Ltd.

ABSTRACT: This study examines the determinants of social commerce adoption among women during crises, focusing on the potential impact of hedonic and utilitarian motivations, self-efficacy, and social support. It also examines the impact of social commerce adoption on women's empowerment and innovation. To achieve these aims, an online questionnaire was used to gather data from women who use social media platforms to produce and/or sell goods, services, and information to make a profit. Smart PLS, version 3, was used to estimate the research model and test hypotheses. The results confirmed that women's hedonic motivations, utilitarian motivations, self-efficacy, and social support significantly impact social commerce adoption among women. The findings also reveal that social commerce business has a significant role in women's empowerment and innovation during crises. This study provides novel contributions to the literature on social commerce, women's empowerment, and women's innovation in a crisis setting. Furthermore, it enhances the knowledge of policymakers and women business sponsoring organizations, and other organizations support women about the role of social commerce in women's empowerment and innovation. © 2023, Small Business Institute. ABSTRACT: Background: COVID-19 vaccines continue to save people's lives around the world; however, some vaccine adverse events have been a major concern which slowed down vaccination campaigns.

Anecdotal evidence pointed to the vaccine effect on menstruation but evidence from the adverse event reporting systems and the biomedical literature was lacking. This study aimed to investigate the physiological changes in women during menstruation amid the COVID-19 vaccination. Methods: A cross-sectional online survey was distributed to COVID-19 vaccinated women from Nov 2021 to Jan 2022. The results were analyzed using the SPSS software. Results: Among the 564 vaccinated women, 52% experienced significant menstrual irregularities post-vaccination compared to before regardless of the vaccine type. The kind of menstrual irregularity varied among the vaccinated women, for example, 33% had earlier menstruation, while 35% reported delayed menstruation. About 31% experienced heavier menstruation, whereas 24% had lighter menstrual flow. About 29% had menstruation last longer, but 13% had it shorter than usual. Noteworthy, the menstrual irregularities were more frequent after the second vaccine shot, and they disappeared within 3 months on average. Interestingly, 24% of the vaccinated women reported these irregularities to their gynecologist. Conclusion: The COVID-19 vaccine may cause physiological disturbances during menstruation. Luckily, these irregularities were short-termed and should not be a reason for vaccine hesitancy in women. Further studies are encouraged to unravel the COVID-19 vaccine adverse effect on women's health. Copyright © 2023 Almomani, Hajjo, Qablan, Sabbah and Al-Momany.

ABSTRACT: Up-to-date, no country in the world has enough donated organs. This study aimed to assess the levels and predictors of knowledge, attitudes, beliefs, and intentions of critical care unit patients' families regarding organ donation. This is a cross-sectional study that used a questionnaire to collect data from 250 families having patients hospitalized in critical care units from three medical sectors in Jordan. Results revealed that 97.6% of the participants had heard about organ donation. Knowledge, attitudes, beliefs (3 types), and intentions levels were 67%, 49.6%, (14.9%, 77.1%, -12.9%), and 81.8%, respectively. Participants who were educated, employed, health insured, with higher income, and lived in urban areas had higher levels of knowledge. Participants who live in urban areas have favorable attitudes toward organ donation. Higher-educated females reported higher behavioral beliefs. Policymakers can design ways to deal with obstacles facing organ donation by taking into account these variables. Improving these factors will provide a huge social service to community health by increasing organ transplantation rates and improving the quality of life of chronic illnesses patients. Future interventional studies are needed in the world that focuses on improving community knowledge, attitudes, beliefs, and intentions toward organs donation. © 2023 Taylor & Francis Group, LLC.

Faculty of Business, Amman Arab University, Amman, Jordan;

Faculty of Science, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study investigated impact of financial technology on customer behavior in Jordanian commercial banks. The descriptive technique was employed based on the study of the research topic. The study population consisted of all administrative workers in Jordanian commercial banks. The data was collected through a random sample of administrative workers in Jordanian commercial banks, estimated at 300 male and female employees. The statistical package for the social sciences program was used to examine the data after obtaining it using the questionnaire (SPSS). The results showed that there is a statistically significant positive effect of financial technology (credit service, payment services, investment management services, financial market support services) on customer behavior in Jordanian banks, which indicates that (financial technology) explained an amount (84.1%) of the change in customer behavior in Jordanian banks. Banking will unquestionably concentrate on delivering financial services through data in the future, limiting the ability to react. By enhancing the promise of value, financial institutions that have been able to quickly adapt to financial innovations boost client loyalty and happiness. The study recommends that Jordanian banks, in light of global competitiveness and the global trend towards digital transformation, follow the financial technology approach and make the most of the opportunities and advantages offered by digitization to banks in order to preserve their customers and compete. The study also recommended researchers and those interested in banking studies expand their research on financial technology due to the relative lack of studies covering the subject. © 2023, World Scientific and Engineering Academy and Society. ABSTRACT: Window views are key factors that affect buildings' occupants psychological and physiological comfort and wellbeing. Window design should consider the holistic impacts on building energy, lighting performance, and the connection to the outdoors provided by the view which is

usually overlooked. In this study, view perception, stress recovery, physiological, and psychological affect were evaluated in virtual environments of five different conditions varying the physical dimensions of a window located in the same office space with an urban view. This allowed three window-to-wall ratios (i.e. 10%, 20%, and 30%) and two different window layouts (i.e. narrow and wide) to be compared. Twenty-five participants were recruited. Subjective self-assessments on view perception (e.g. content and complexity), self-assessment and physiological measures (e.g. skin conductance and heart rate variability) stress recovery besides psychological affect were measured. Participants performed a Stroop-test to induce stress that was immediately followed by a period of recovery facilitated by exposure to one of the five window conditions. Results showed that increased window size advocated higher view perception assessments, increased stress recovery, and positive psychological affect. Measurements of skin conductance and heart rate variability also corroborated these findings. Differences in window layout were also revealed, but only for 10% WWRs. Therefore, WWR is not a reliable indicator for view perception for small window sizes, indicating that layout preference is dependent on window size. This study highlights the importance of considering view perception for occupant health and wellbeing when sizing window openings, since these may not necessarily align with other design criteria. © 2023 Illuminating Engineering Society.

ABSTRACT: The exothermic hydration of cement generates heat, which increases the temperature in the core of the concrete members. This causes a temperature gradient, leading to thermal stresses, and sometimes cracks due to the expansion of the core and contraction of the surface, which reduces massive concrete durability. The goal of this study is to assess the impact of concrete precooling technologies on the quality of massive concrete constructions, such as dams constructed in desert climate. The impact on the strength of concrete and its hydration time under various operating circumstances have been investigated. In massive concrete structures, cooling can be accomplished by reducing the temperature of aggregates using ventilated cold air from an air conditioning system or by using chilled water. In order to determine the initial and the final settings of concrete, the Vicat test has been used. The use of chilled water in the preparation of mortar can increase the cement solidification time. According to experimental laboratory tests, concrete cubes prepared with chilled water have higher compressive strength than those prepared with cooled aggregates. The compressive strength of the concrete mixed with chilled water has increased by 35%, while a 10% increase in compressive strength in the concrete mix has been reached by using precooled aggregates. Results of compressive strength tests on mortar cubes prepared with chilled water have showed a 29% increase after 28 days of curing. © 2023 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: Introduction: Clinical training allows nursing students to acquire and strengthen their psychomotor abilities, which is an important component of nursing education. The clinical components of nursing training programs were much more demanding than the academic ones. Purposes: The purpose of this study was to examine sources of stress-related and coping behaviors during first clinical training among nursing students in the Arab American University. Methods: The study was cross-sectional and conducted with a convenience sample of 266 participants of nursing students. Data collection was performed by "Perceived Stress Scale and the Coping Behavior Inventory." The data were analyzed by using the descriptive, that is, frequency and percentage, mean, and standard deviation.

Results: The results revealed that the perceived stress mean was 41.2 (SD = 19.5). The main stressors were taking care of the patients (M = 11.4 ± 0.85) and teachers and nursing staff (M = 8.32 ± 5.3). Coping behaviors mean was (M = 29.0 ± 15.2). The main coping behavior was problem-solving (M = 9.5 ± 5.6). Conclusion: The study confirmed that students perceived moderate levels of stress in their first clinical training, and the most common sources of stress were taking care of the patients and teachers and nursing staff. However, the main coping behavior was problem-solving. © The Author(s) 2023.

ABSTRACT: Background: There is a little knowledge on the extent to which healthcare providers understand and accept the professional recommendations and appropriate dosing strategy regarding metformin XR. Objectives: To evaluate UAE community pharmacists' knowledge, attitude, and practices (KAP) concerning metformin XR. Methods: This is a cross-sectional research study conducted amongst licensed community pharmacists. The survey took place via a questionnaire and physical interviews were held. The survey used in this study included questions on demographics and questions on the participants' attitudes, knowledge and practices concerning metformin XR. The factors influencing KAP regarding metformin XR were examined via simple logistic regression analysis. Results: Threehundred fifty-three (n = 353) participants were recruited in the study. Independent pharmacies constituted 57.5% of this study sample and 42.5% were chain pharmacies. The average knowledge score about metformin XR tablets was 42.5% with a confidence interval (CI) of 95% [37.3%, 47.4]. Better knowledge scores on metformin XR tablets was observed in respondents aged ≥40 years (OR 2.97, 95% CI 1.63-5.4), having greater than 10 years in terms of experience (OR 2.28; 95% CI 1.25-4.16) and pharmacist graduated from Regional or international universities (OR 2.08; 95% CI 1.34-3.24). About 78% (n = 275) of the participants believed that metformin XR tablets have better efficacy and 63.2% (n = 233) indicated that metformin IR was associated with greater adverse effects. Conclusion: This study demonstrated a distinct gap in knowledge, attitude and practice pertaining to metformin XR among community pharmacists in the UAE. The community pharmacists need to enhance their practice by receiving accurate and reliable data to support their decision-making on the prescribing of metformin XR. The implementation of novel guidelines and evidence dissemination strategies may help bridge this gap. © The Author(s) 2023.

ABSTRACT: In this paper, we introduce and develop a new definitions for Katugampola derivative and Katugampola integral. In particular, we defined a (left) fractional derivative starting from a of a function f of order $\alpha \in (m - 1, m]$ and a (right) fractional derivative terminating at b, where $m \in \mathbb{N}$. Then, we give some proprieties in relation to these operators such as linearity, product rule, quotient rule, power rule, chain rule, and vanishing derivatives for constant functions. © 2023 the author(s).

ABSTRACT: Water-pipeline leakage is one of the most common problems that depletes water supplies. Countries like Jordan, which are really experiencing a water deficit, are particularly concerned about this issue. The lack of monitoring tools makes the underground water-pipeline leakage a challenge since the pipelines are invisible. Besides, reducing the amount of time needed to precisely detect and locate the leak is another challenge. If not reduced, the aforementioned element has an effect on cost. A small broken water distribution line costs \$64,000 per year. In Jordan, water leakage costs \$1.7 million. This expense can be significantly decreased using an effective early water leak detection system. In this paper, we proposed an efficient internet of things system for detecting water-pipeline leakage based on a shielded pipeline, a NodeMCU, a soil moisture sensor, and the Firebase database. We created a baseline system, and then we tested and evaluated the proposed system when various types of soil are used. Furthermore, this paper compared several strategies offered for detecting water-pipeline leaking including the proposed system. The results showed that the proposed system reduced the time required for detecting water-pipeline leakage by 70% and the system hardware cost by 83% compared with the earlier work. It was difficult to compare the total cost of the proposed system with the total cost of previous works since the total cost is not calculated in their systems. Besides, in this paper, we proposed an IoT system for securing the underground water pipelines from adversaries. © 2023, IICM. All rights reserved.

ABSTRACT: This narrative review explores the transformative impact of Artificial Intelligence (AI) on mental health nursing, particularly in enhancing psychiatric patient care. AI technologies present new strategies for early detection, risk assessment, and improving treatment adherence in mental health. They also facilitate remote patient monitoring, bridge geographical gaps, and support clinical decision-making. The evolution of virtual mental health assistants and AI-enhanced therapeutic interventions are also discussed. These technological advancements reshape the nurse-patient interactions while ensuring personalized, efficient, and high-quality care. The review also addresses AI's ethical and responsible use in mental health nursing, emphasizing patient privacy, data security, and the balance between human interaction and AI tools. As AI applications in mental health care continue to evolve, this review encourages continued innovation while advocating for responsible implementation, thereby optimally leveraging the potential of AI in mental health nursing. © 2023 Taylor & Francis Group, LLC.

ABSTRACT: This study strives to describe how the nexus between capital structure (CAS) and firm performance (FIP) changes with and without earnings management (EAM), which previous studies have not fully addressed. For this purpose, we divide the FIP into discretionary performance (DIP) and non-discretionary performance (NDIP). Subsequently, we examine the effect of CAS on both with each studied separately to recognize the conceptual drivers in the nexus between CAS and FIP. We use the dataset of firms listed on Ho Chi Minh Stock Exchange (HOSE) during the period from 2018 to 2022. Our findings reveal that there is a negative and noteworthy impact of CAS proxied by leverage on both DIP and NDIP, which is in line with trade-off theory (TOT) and pecking-order theory (POT). Because non-discretionary accruals (NDA) play an important role in EAM, firm action is consistent with TOT or POT and, thus, this study suggests dividing EAM into discretionary accruals (DA) and NDA to test CAS theories. Additionally, Vietnamese firms use EAM to lessen the negative effect of CAS and firm size. Finally, besides the theoretical contributions, the findings of this study have important empirical implications for managers, shareholders and other stakeholders. © 2023 International Management Institute, New Delhi.

ABSTRACT: The purpose of this study is to demonstrate the impact of big data analytics techniques on predicting stock prices in industrial companies listed on the Amman Stock Exchange (ASE) from the perspective of employees in Jordanian financial intermediation firms. To achieve the goal of this research, two approaches were used. The first approach is an analytical descriptive approach that collects primary data through a survey that measures the elements of the independent variable related to big data analytics techniques (Volume, Velocity, Variety, and Veracity). A second approach is an applied approach that measures the dependent variable of stock price prediction using financial statements from industrial companies listed on the ASE from 2015 to 2021. Multiple regression tests were used to test the hypotheses and extract the results, which demonstrated that big data technologies play an important role in providing appropriate and reliable information to predict the prices of stock exchange traded shares. The variable "veracity" ranked first in the power of influence in predicting share prices, while the variable "volume" ranked last. These findings suggest that ASE dealers prioritize the credibility of data received from companies over the rest of the information resulting from big data analyses to predict stock prices traded on the stock exchange. © 2023, Success Culture Press. ABSTRACT: Purpose: This study aims to empirically examine the impact of perceived risks, optimism and financial literacy on trust and the perceived value of cryptocurrencies. It will also examine the impact of trust on the perceived value of cryptocurrencies. Design/methodology/approach: A quantitative approach is followed. A questionnaire was designed to collect data from 308 respondents in Jordan. The Structural Equation Modeling - Partial Least Squares (SEM-PLS) method was used to evaluate the research model and test hypotheses. Findings: The results of PLS algorithm analysis showed that perceived risks negatively impact the optimism and trust in cryptocurrencies. This study revealed that while financial literacy minimizes the perceived risks, it serves to enhance optimism and improve the perception of the value of cryptocurrencies. Furthermore, the findings of this study show that optimism plays a significant role in trust and perceived value. Originality/value: This study provides new insights into the literature on cryptocurrencies adoption, blockchain theory, the theory of trust in financial systems, the role of the optimism factor and the perception of the value of cryptocurrencies. It also provides important practical implications for different stakeholders. © 2023, Emerald Publishing Limited.

ABSTRACT: The coefficient of performance (COP) for a gas refrigeration cycle was estimated using Matlab/Simulink and fuzzy logic. A Matlab/Simulink model of the gas refrigeration cycle was developed, and the output was compared to theoretical data. Additionally, fuzzy logic was used to estimate the COP for arbitrary low- and high-pressure levels. Simulation results were used to develop a multi-input-multi-output (MIMO) fuzzy Takagi-Sugeno-Kang (TSK)-based model. Both the Matlab/Simulink and the MIMO fuzzy model were found to be very well correlated with theoretical results, with an error of less than 2 %. These results demonstrate the effectiveness of using fuzzy logic to analyse gas refrigeration cycles and suggest that this approach can be extended to analyse other thermodynamic cycles. © 2023 Assoc. of Mechanical Eng. and Technicians of Slovenia. ABSTRACT: Purpose: Based on the technology acceptance model theory, this study aims to explore whether perceived usefulness (PU), perceived ease of use (PE) and the availability to embrace technology (AET) influence the intention to accept an enterprise resource planning (ERP) system in Jordanian companies. It also analyses the influence of the intention to accept ERP system on ERP system adoption. More crucially, the current research fills a gap in earlier investigations by exploring the influence of adopting an ERP system on accounting information quality moderated by a company size. Design/methodology/approach: This research seeks to provide evidence about the study context from Jordanian companies, as the research population and sample consist of all companies listed on the Amman Stock Exchange in 2022 (totally 170 companies). This signifies that the research method is a complete survey of the study population. The core data were collected using an online survey via Google Forms. It was emailed to the selected companies' chief financial officers. Because each company received one online survey questionnaire, this unit of analysis is a company. Finally, 141 questionnaires were returned, reflecting an 82.94% response rate. Findings: Empirically, the findings reveal that PU, PE and AET influence the intention to accept an ERP system, and that there is a positive relation between the intention to accept an ERP system and ERP system adoption. Furthermore, ERP system adoption positively influences relevance and faithful representation of accounting information moderated by company size. Originality/value: This research adds to the accounting information quality literature by investigating the direct influence of ERP system adoption. Furthermore, the findings show the effectiveness of ERP system adoption and its regulatory roles in companies. Finally, this research was conducted to provide empirical knowledge on ERP system adoption in developing countries, notably Jordan. © 2023, Emerald Publishing Limited.

Irbid University College, Al-Balqa Applied University, Jordan

ABSTRACT: Background: The wide spread of the pandemic prevented new graduate nurses caring for patients with COVID-19, although they were required to care for them. The use of simulation could present an acceptable alternative when training is limited for nurses. Aims: This study aimed to measure the impact of attending a hybrid clinical course on knowledge and skills about COVID-19 in new graduate nurses assigned to care for patients with COVID-19 in Jordanian hospitals. It also aimed

to measure the change in nurses' self-efficacy and decision to care for critically ill patients with COVID-19. Methods: A pretest-posttest study that involved the conduction of a clinical training course. Participants (n = 234) were nurses. Results: Nurses showed significant improvement in their knowledge, skills, and self-efficacy in the posttest scores. However, these improvements did not reflect a significant increase in nurses' willingness to care for critically ill patients with COVID-19, instead, they preferred caring for more stable patients with this condition. Conclusions and implications to practice: Simulation is acceptable to support and improve clinical training outcomes. The use of clinical training courses for new nurses caring for patients with COVID-19 is required to improve knowledge, skills, and safety. Training nurses on how to care safely for a patient with COVID-19 increases nurses' safety and improves the quality of care provided to those patients. This study emphasized the need for nursing curricula to include training on how to care for patients during pandemics, like COVID-19. © 2023

ABSTRACT: The Internet of Things (IoT) has the potential to revolutionize the education sector by creating smart learning environments that enable personalized learning experiences, improved teacher-student interactions, and enhanced collaboration. The traditional education system has been based on a one-size-fits-all approach, which may not be the most effective for all students. IoT-based education can provide personalized learning experiences that are tailored to individual students' needs and abilities. IoT-enabled devices can collect data on students' learning habits, preferences, and progress, which can be used to create customized learning paths that meet the specific needs of each student. Moreover, IoT in education can enhance collaboration among students and between students and teachers. However, its adoption and integration into the traditional education system pose significant challenges, including privacy concerns, cybersecurity risks, and the need for technical expertise to manage and maintain the IoT-enabled devices. This paper provides a comprehensive review of the literature on IoT in education, with a focus on its potential benefits, challenges, and implications. The paper also discusses the current state of IoT in education, and provides recommendations for future research on IoT in education. Overall, this paper highlights the potential of IoT to transform education, but also emphasizes the need for careful consideration of the challenges and implications associated with its adoption. © 2023, Al-Zaytoonah University of Jordan. ABSTRACT: Sentiment analysis has gained attention in computational linguistics, where algorithms are dedicated to recognizing sentiments to take better decisions in each context. However, this is difficult to achieve in social networks due to linguistic features. A text classification model of combined lexical-based and machine-learning techniques is presented in this paper; it uses discourse structure including its relations to improve sentiment analysis. The model aims at extracting information about opinion polarity posted by users; then modelling users' usual polarity to detect significant polarity. The model extracts posted texts on Facebook, then it classifies them according to their polarity, which shows the detection of polarity. It provides interesting results using Ukraine crisis argued by Jordanian news followers. Obtained results show a high accuracy (94.68%). It is useful to have information about users' sentiments. It may serve feedback for politicians and

jurists, where direct contact with war victims is extremely difficult. © 2023, Al-Zaytoonah University of Jordan. All rights reserved.

ABSTRACT: In recent years, there have been many Security vulnerabilities that threaten user security, these threats have led to the finding of user files, so the use of the Internet has become unlimited, and the number of digital network devices has increased, Therefore, maintaining the confidentiality and integrity of information has become an urgent necessity to preserve user information, due to the increase in hackers and intruders, and the innovation of modern methods of penetration every day. Data cryptography has proven to be a secure way to protect a user's data. Many current cryptography algorithms are considered weak regarding data transmission over the Internet, so newly updated algorithms are in high demand. In this paper, we proposed to develop the ancient rotor machine depending on the base64 coding technique, in which we replaced the alphabets of the ancient rotor machine with the alphabets of base64 that contain 64 characters. Furthermore, we proposed a key exchange based on One-time password OTP code via SMS, OTP is mechanism for logging on to a network using unique password that can only be used once, to overcome the static password method that is least secure, and used it to generate the subkeys for rotor machines based on hash and random permutation techniques. MD5 algorithm function is used to authenticate the original message, Finally, we experimented with these techniques of secure sending e-mails by encrypting the contents of them with the proposed technique. However, the proposed security technique got promising results. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Requirement engineering is a crucial step in software engineering as it forms the foundation for all subsequent stages and significantly affects whether software development is successful or unsuccessful. The same software requirement document generally includes both functional and non-functional requirements are essential. However, expressing these requirements in natural language necessitates considerable human effort to classify them. Manual classification can be laborious, time-consuming, expensive, and prone to inaccuracies. Inaccurate classification can result in misunderstandings or ambiguities in requirements, leading to incomplete products that fail to meet customer demands. While many studies have proposed English language requirements classification techniques, there is an absence of research in Arabic requirements classification. Moreover, there aren't many Arabic datasets that are openly accessible in this sector. In this paper, we offer a method for gathering Arabic data sets for needs and utilizing machine learning techniques to automatically categorize software requirements written in Arabic into functional and non-functional requirements. This study intends to assist software developers in time savings, lower the cost and effort associated with the manual classification process, and improve the effectiveness of the requirements engineering phase. Further gives scholars in this subject a new topic to explore. © 2023 IEEE.

ABSTRACT: Building heating and cooling power consumption optimization is an important field to reduce and optimize power consumption and to reach green building. To optimize the loads, the building can be constructed utilizing simulation software with its real materials, diminutions, glazing and orientation. Subsequently, the cooling and heating consumptions can be calculated. This method is a complex process. To reduce its complexity, machine learning (ML) has emerged to predict the cooling and heating loads of buildings. However, these algorithms require datasets to train, validate and to be tested. In this work, we attempted to work with a building dataset to predict its heating and cooling loads. Five different supervised machine learning regression algorithms are leveraged. In addition, a new hybrid multi-layer machine learning algorithm (HMLM) is proposed. The dataset utilized is a dataset constructed from simulation software. Our main purpose in this work is to show that simulation datasets may mislead the ML algorithms since their data has been extracted utilizing different assumptions and different preconfigured values. Moreover, simulation datasets should be verified with any real datasets before utilizing them. We have reduced the features in the dataset to only the building height. Our results show that with only this variable an acceptable model with accuracy exceeds 91% can be trained. This is misleading information obtained from the model. © 2023 IEEE.

ABSTRACT: Deepfake content is artificially created or altered using artificial intelligence (AI) methods to appear real. Synthesis can include audio, video, images, and text. Deepfakes may now produce content that looks normal, making it more difficult to identify. Significant progress has been made in identifying video deep fakes in recent years; However, most of the investigations into voice deep fake detection have used the ASVspoof-2019 dataset and several machine learning and deep learning algorithms. This research uses machine-based and deep-learning approaches to identify fake audio. Melted frequency cepstral coefficients (MFCCs) are used to extract the most useful information from the sound. We choose the 2019 ASVspoof dataset, which is the latest reference dataset. Experimental results show that Convolutional Neural Networks (CNN): (CNN-LSTM) outperformed other machine learning (ML) models in terms of accuracy, achieving an accuracy of up to 88%. © 2023 IEEE.

ABSTRACT: sometimes the available data and its nature determine us in choosing what biometric to rely on for identifying people. From here, we thought outside the box in a mechanism for building the biometric that we can rely on in order to overcome the challenges that arise in human identification. So, in this research paper we find a way to link between foot geometry with the way of sitting in prayer and adopting it to distinguish between persons. We used a Convolutional Neural Network (CNN)

algorithm on 900 images of different persons while sitting to perform the prayer; the collected images were preprocessed using different sharpening filters then making segmentation to highlight fine details and enhance edges, then divided into two groups: training set and testing set to be inserted into an algorithm to extract unique characteristics from them and train the CNN on them, store as a template to be compared in testing cases. We obtained a result that the prayer sitting is biometric with an accuracy of 91.2% based on the data set that was used. © 2023 IEEE.

ABSTRACT: Ambiguity is a crucial problem in Software Requirements Specification (SRS) documents since most SRS documents are written in natural language, which is generally ambiguous. A variety of strategies have been employed to detect ambiguity in SRS papers. This paper will present techniques to classify Arabic language requirements through machine learning techniques. The proposed framework could help streamline the classification process for software development in Arabic-speaking countries by automating tasks and reducing the time taken. © 2023 IEEE.

ABSTRACT: The aim of this work is to design a sound logger system for environmental monitoring using wireless sensors network WSN. The proposed solution is to place nodes in a fixed location in the city center of Annaba. These devices collect noise levels, process the information then transmit a code containing node position, sound level, and other data concerning the environment. A central unit will process the collected information from different nodes again then a GUI program will represent the data on a map concerning the selected area of Annaba city. The improvement is done on the choice of quality/price sensors; on designing an easy-to-understand and monitor GUI. © 2023 IEEE.

ABSTRACT: Automatic speech recognition (ASR) aims to convert human speech signal into text, where the quality of the speech signal is essential to assure correct recognition. However, some people suffer speech disorders (SD) of various kinds such as distortion and substitution, which may degrade the recognition of the speech signal in ASR domain. Based on our literature investigation, most of the

available ASR systems handle normal/regular speech with no consideration for SD and disabilities. This paper provides a comprehensive review on Arabic ASR for speakers suffering SD. In this paper, classifications of SD are provided. In addition, research attempts on Arabic ASR for speakers suffering SD are also highlighted in order to identify the benchmark datasets, tools, algorithms, and research gaps. To the best of our knowledge, all previous research attempts on Arabic ASR for speakers suffering SD focused on the Arabic letter /r/ in limited isolated words mode. This shows that there is a need to consider other types of SD in ASR domain for Arabic language, and consider continuous speech mode. In addition, Arabic speech datasets are very limited for SD research, which can be treated as an important research gap to be considered. © 2023 IEEE.

ABSTRACT: In this paper, we will consider the problem of estimating the parameters of the Log-normal distribution using Lindley's approximation method where Lindley's approximation is considered when no closed-form Bayes estimators exist. Only Squared Error loss function will be considered. Applies Lindley's approximation to the proposed Bayesian treatment of the Lognormal distribution when both location and scale parameters have prior distributions. Introduces the simulation results of this Bayesian treatment. And By using Mathematica12, a simulation study to illustrate several numerical examples, estimators' performance is demonstrated. © 2023 IEEE.

ABSTRACT: The widespread use of Android mobile phones in recent years has increased the risk of vulnerabilities that attackers can exploit, potentially leading to malware downloads and system damage. This paper presents an effective solution utilizing Machine Learning (ML), a subset of artificial intelligence, to detect Wannalocker ransomware specifically targeting Android devices. To achieve this objective, we employed the CICAndMal2017 dataset with several modifications to make it suitable for ML analysis. These modifications included data normalization, label encoding, attribute name resolution, and addressing data imbalance through the Synthetic Minority Over-sampling Technique (SMOTE). Furthermore, we performed feature selection using three distinct methods and applied a voting principle to select the most frequently occurring attributes. The resulting dataset was then subjected to various classifiers, yielding exceptional classification accuracy compared to previous studies. Notably, the BayesNet classifier achieved an accuracy of 99.1%. These findings demonstrate the efficacy of the proposed ML-based approach in bol-stering Android device security against Wannalocker ransomware, providing a valuable contribution to the field of mobile device security © 2023 IEEE.

ABSTRACT: Agile and DevOps methodologies are becoming increasingly popular in software development, as they offer many benefits to software development teams and the organizations they work for. Agile

methods depend on speed in development, repetition, and an increase in focus on the main characteristics and functions of the system. The DevOps approach aims at continuous integration, continuous delivery, continuous improvement, and faster feedback. Security is a critical component of Agile and DevOps methodologies. Integrating security into the development process from the outset can help to reduce the risk of security vulnerabilities, improve collaboration between development and security teams, enable rapid response to security incidents, increase automation, and ensure compliance with regulatory requirements. In conclusion, security has challenges in agile and DevOps approaches, so this paper discusses the most important challenges of combining ensuring security and continuous development. © 2023 IEEE.

ABSTRACT: As cities continue to grow and evolve, the need for sustainable smart cities becomes increasingly important. Sustainable smart cities aim to improve the quality of life for citizens in these cities by leveraging technology and innovation. This paper provides an overview of sustainable smart cities around the world, focusing on key features, challenges, and examples. Sustainable smart cities integrate smart technology, citizen engagement, environmental sustainability, inclusivity, and equity. The challenges facing sustainable smart cities include governance, data privacy, the digital divide, and collaboration. The paper highlights examples of sustainable smart cities, such as Amsterdam, Singapore, and Stockholm. The conclusion emphasizes the importance of prioritizing sustainability and collaboration to create a more livable and equitable urban future. © 2023 IEEE.

ABSTRACT: Diagnosing and treating colorectal cancer (CRC) at its earlier stages is considered a significant public health issue since it is the second and third most commonly diagnosed cancer in both genders. However, early identification and screening of CRC can increase the survival rate to more than 90%. Employing machine learning to study individual predictors (socio-demographics, level of knowledge, and health beliefs) can affect the willingness to screen for CRC and enhance screening rates. This paper presents the application of five machine learning classifiers for predicting the patient's willingness for CRC screening. The classifiers are tested on a dataset obtained from Jordan University Hospital (JUH) and Albasheer Hospital in Amman, Jordan. The dataset is used to train and test the machine learning models with attributes related to socio-demographics, level of knowledge, and health beliefs. By applying 10-fold cross-validation, 90.9% is the best-obtained accuracy using Random Forest (RF) classifier compared to the accuracies achieved by Multi-layer Perceptron (MLP) Neural Network, Logistic Regression (LR), Random Forest (RF), J48 with Decorate algorithm, and multi-objective evolutionary fuzzy classifier. Additionally, this paper presents the importance of the attributes obtained by the RF. The results show that the level of knowledge and health beliefs impact the prediction accuracy almost as well as the socio-demographic attributes, where omitting them decreases the accuracy. © 2023 IEEE.

ABSTRACT: In this study, we presented a feature extraction approach that addresses the difficulties arising from high dimensionality and large datasets in classification tasks. Our method combined differential evolution algorithm with Support Vector Machines (SVM). The experimental results demonstrated that SVM struggled when applied to large datasets. The proposed approach aimed to identify the most relevant features from the dataset, ultimately improving the accuracy of classification tasks. By reducing the data's dimensionality, we achieved storage efficiency and enhanced the classification process. This research provides valuable insights into the effectiveness of DE algorithm in overcoming challenges related to high-dimensional and large datasets, making a significant contribution to the field of feature selection and classification. Future research can explore the application of these approaches to other datasets and explore ways to further improve the efficiency and effectiveness of classification tasks. © 2023 IEEE.

ABSTRACT: The metaverse, a virtual space that combines elements of the physical and virtual worlds, has gained significant attention in recent years. Its potential to transform education is considerable, with extended reality (XR) technologies, such as virtual and augmented reality, and the Internet of Everything (IoE) enabling the creation of immersive, interactive learning experiences that can enhance learning outcomes and promote educational accessibility. However, implementing a metaverse in education also poses challenges, including the need for standardized XR content, the expense of hardware and software, and concerns regarding privacy and security. This paper aims to investigate the opportunities and challenges associated with using XR and IoE to facilitate a metaverse in education. Moreover, this study offers a comparative analysis of different approaches to implementing a metaverse in education. Our findings suggest that the benefits of a metaverse in education are substantial and that careful planning, research, and collaboration can help overcome the challenges and realize the potential of this technology in education. © 2023 IEEE.

ABSTRACT: this paper proposes a conceptual model for assessing user satisfaction in metaverse-based learning, a novel field that utilizes virtual reality technology to create an immersive and interactive learning experience. Despite the growing popularity of metaverse-based learning, there is a lack of research on how to evaluate user satisfaction in this type of learning environment. The proposed model includes four factors: Perceived Trialability, Perceived Observability, User Compatibility, and Perceived Complexity, each of which can be measured using statistical methods. The study aims to address the research gap in evaluating user satisfaction in metaverse-based learning and provides a model for educators and researchers to assess and improve user satisfaction in this innovative learning environment. The findings of this study contribute to the growing body of literature on metaverse-based learning and provide insights into the unique challenges associated with implementing this technology in educational settings. © 2023 IEEE.

ABSTRACT: Three-dimensional object encryption involves converting a 3D object into a secure and encrypted format to restrict access to authorized individuals. The primary objective is to protect the confidentiality, authenticity, and integrity of 3D objects, particularly in the face of rising cyber-attacks during storage, transmission, and processing. The choice of encryption technique depends on the required level of security and the specific application. This literature review provides an overview of existing algorithms and previous research on 3D object encryption which published in highly-cited peer-reviewed journals. It summarizes achievements, techniques, datasets of these algorithms while highlighting research gaps and issues in these literature review articles. © 2023 IEEE.

ABSTRACT: The emergence of affordable virtual reality technology has opened up new possibilities for immersive and engaging education and training. In the past, technical challenges and high costs have hindered the progress of virtual reality in education, but now educational institutions and industries are quickly adopting it as a key training tool. Virtual learning environments have proven to be successful in various domains due to their ability to create a powerful sense of presence and effective immersion. This study examined a virtual reality application that offers safe and controlled on-site training experiences that can revolutionize education and training by providing learners with interactive, engaging, and effective learning experiences. The study involved analyzing the benefits and limitations of using this application, as well as providing recommendations for how it could be improved or used more effectively in educational settings. The goal of the study is to determine whether virtual reality has the potential to revolutionize education and training by providing learners with interactive, engaging, and effective learning experiences that are tailored to their individual needs. © 2023 IEEE.

ABSTRACT: Integrating Internet of Things (IoT) technology in health monitoring systems enables healthcare professionals to remotely track patients' vital signs and other health-related data through internet-connected sensors and devices. These systems possess the potential to significantly enhance patient care and management, particularly for those with chronic conditions. Continuous monitoring of vital signs can be achieved through the utilization of wireless implantable sensors. Automation of data analysis can be achieved through various approaches, including time series models. The development and application of IoT healthcare solutions necessitate the consideration of semantic data and the imperative need to safeguard patients' personal and health-related data. In addition, realtime integration platforms for telemetry systems, like the E-AMBULANCE system, can be employed to improve patient care and communication during transport to healthcare facilities. This work explores the different applications in IoT Healthcare. © 2023 IEEE.

ABSTRACT: Smart technologies play a very vital and useful role in solving power consumption issues and encouraging sustainable practices in businesses and households for a sustainable future. A smart approach is needed to promote knowledge sharing to solve the major problems of modern societies.

These days, reducing the effects of greenhouse gases and ensuring balanced economic growth are the major challenges. All engineers and experts should collaborate closely to achieve interdisciplinary synergies to bridge the challenging tasks of engineering. It is important to direct intense research efforts to balance resource usage, energy-efficient technologies, the integration of green energy solutions, and the effective integration of approaches for the circular economy. This study is based on relevant data collected from recent studies conducted by engineers and research scholars for knowledge integration and to know the efforts made for developing smart and sustainable technologies. The strategic aim of the study is to help solve major issues of modern times, especially those associated with the smart utilization and sustainability of valuable and limited resources. This study discusses new ideas, current issues, and challenges for a sustainable future on the basis of smart technologies. © 2023 IEEE.

ABSTRACT: The elicitation of software requirements is an essential phase in building commercial software. Business rules can be an important source of software requirements specifications. Business rules are the description of the business process. Categorization and classification of these business rules can enhance the process of software requirements elicitation. We proposed an approach to categorize and classify business rules based on Witt's approach, which classifies business rules into four main categories. The proposed approach showed good accuracy, recall, and F1-scores values compared to the state-of-art approach. © 2023 IEEE.

ABSTRACT: The cosmetics industry has witnessed significant growth over the years, driven by changing beauty ideals, economic factors, and the rise of natural and organic beauty products. Artificial intelligence (AI) has played a crucial role in revolutionizing the cosmetics and personal care sector. This paper presents a virtual cosmetics recommender system that leverages AI and machine learning techniques to provide personalized cosmetic recommendations based on user images. The system utilizes a dataset comprising various well-known cosmetic brands, and the recommendation process involves image feature extraction, similarity analysis, and brand mapping. The proposed system aims to enhance decision-making and provide an interactive user interface for cosmetic brand classification. The experimental results demonstrate the effectiveness of the system in generating accurate cosmetic recommendations. © 2023 IEEE.

ABSTRACT: The aim of this study is to evaluate the use of information and communication technology by faculty members at Al-Zaytoonah University in Jordan. Data were obtained from 42 faculty members from the faculties of information technology. A standardized questionnaire was used to obtain data from the research participants. Descriptive statistics, confidence interval, one-sample t-test, two-sample t-test, and one-way ANOVA were used to analyze the obtained data. This made it easier to assess the differences in usage by the different departments and faculties of the university. The result of the

study was that there were no differences in the use of information and communication technology with regard to the educational status of the participants, ages, gender, and marital status. However, a difference was found in the academic degree and there were no differences in the number of hours and academic rank. © 2023 IEEE.

ABSTRACT: Background: N-acetyltransferase 2 (NAT2) enzyme is a Phase II drug-metabolizing enzyme that metabolizes different compounds. Genetic variations in NAT2 can influence the enzyme's activity and potentially lead to the development of certain diseases. Aim: This study aimed to investigate the association of NAT2 variants with the risk of Type II diabetes mellitus (T2DM) and the lipid profile among Jordanian patients. Methods: We sequenced the whole protein-coding region in NAT2 using Sanger's method among a sample of 45 Jordanian T2DM patients and 50 control subjects. Moreover, we analyzed the lipid profiles of the patients and examined any potential associations with NAT2 variants. Results: This study revealed that the heterozygous NAT2*13 C/T genotype is significantly ($P = 0.03$) more common among T2DM (44%) than non-T2DM subjects (23.5%). Furthermore, the frequency of homozygous NAT2*13 T/T genotype was found to be significantly higher ($P = 0.03$) among T2DM patients (26.7%) compared to that of non-T2DM subjects (11%). The heterozygous NAT2*7 G/A genotype was exclusively observed in T2DM patients (11.1%) and absent in the control non-T2DM group. Moreover, among T2DM patients, those with a homozygous NAT2*11 T/T genotype exhibited significantly higher levels of triglycerides (381.50 ± 9.19 ng/dL) with a P value of 0.01 compared to those with heterozygous NAT2*11 C/T (136.23 ± 51.12 ng/dL) or wild-type NAT2*11 C/C (193.65 ± 109.89 ng/dL) genotypes. T2DM patients with homozygous NAT2*12 G/G genotype had a significantly ($P = 0.04$) higher triglyceride levels (275.67 ± 183.42 ng/dL) than the heterozygous NAT2*12 A/G (140.02 ± 49.53 ng/dL) and the wild NAT2*12 A/A (193.65 ± 109.89 ng/dL). Conclusion: The finding in this study suggests that the NAT2 gene is a potential biomarker for the development of T2DM and changes in triglyceride levels among Jordanians. However, it is important to note that our sample size was limited; therefore, further clinical studies with a larger cohort are necessary to validate these findings. © 2023 Jarrar et al. ABSTRACT: The current study identifies the degree of employing distance learning technology by faculty members and its role in students' acquisition of self-learning skills. The descriptive survey approach was used. To collect data, two questionnaires were distributed to (240) faculty members at Jordanian universities: the first 13-item questionnaire measures the faculty members' use of distance learning technology, while the second 10-item questionnaire measures students' acquisition of self-learning skills. The findings indicate the degree of employing distance learning technology by faculty members is medium. The results also show that students' acquisition of self-learning skills is high. Given the results, the study recommends preparing and training faculty members on how to use distance learning technology to improve its impact on students and to increase their acquisition of self-learning skills. © 2023 IEEE.

ABSTRACT: This paper calculates the exact quantiles of the MLE of Shannon entropy of the Nakagami distributions and approximate quantiles of the asymptotic distribution of this statistic. In addition, the paper proposes a new version of that statistic and shows that, even for small samples, through the quantiles of the chi-square distribution, it offers formula for quantiles of the precise distribution of statistic and derives some characteristics from the MLE Shannon entropy of the Nakagami distributions. Tables and graphs were created using Wolfram Mathematica 12. © 2023 IEEE.

ABSTRACT: This research aims to generate the properties of a conformable fractional Maxwell-Boltzmann probability distribution. The Maxwell-Boltzmann distribution is a probability distribution with applications in physics and chemistry. The most common application is in the field of statistical mechanics. Fractional calculus (FC) has become an essential computational method for describing appropriate kinetic energy problems. Fractional derivatives have mathematically interpreted many physical models of kinetic energy. This study investigates conformable fractional analogs of some basic concepts related to probability distributions of random variables, namely density, cumulative distribution, survival, and hazard functions. Moreover, we used comfortable fractional analogs for expected values, moments, central moments, mean, variance, skewness, and kurtosis. In addition, it introduces conformable fractional analogs to some entropy measures, namely, Shannon and Renyi entropy measures, together with Awad sup- entropy counter parts of these three measures. All these concepts have been applied to the fractional Maxwell probability distribution, which is very useful in a wide range of disciplines that are used for describing the speeds of various particles within a stationary container at a specific temperature © 2023 IEEE.

Examining the Validity of Inference Rules: Utilizing Truth Tables and Contrapositive Analysis

(2023) 2023 International Conference on Information Technology: Cybersecurity Challenges for Sustainable Cities, ICIT 2023 - Proceeding, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171778920&doi=10.1109%2FICIT58056.2023.10226089&partnerID=40&md5=a7f4aef06cbc620ca1f27d3995cf7d67>

AFFILIATIONS: Alzaytoonah University of Jordan, Department of Computer Science, Amman, Jordan

ABSTRACT: In mathematical discrete logic, rules of inference play a fundamental role in reasoning and drawing valid conclusions. This paper focuses on proving the common rules of inference using truth tables for the contrapositive. The contrapositive is a powerful tool that allows for the examination of the logical relationships between conditional statements. By constructing truth tables for the contrapositive of each rule of inference, we can systematically evaluate the validity of the rules. The analysis involves assigning truth values to the premises and determining the truth values of the conclusions based on the contrapositive truth tables. The results demonstrate the consistency and soundness of the rules of inference, providing a rigorous foundation for logical reasoning in mathematical discrete logic. This approach showcases the applicability of truth tables and the

contrapositive in establishing the validity of the rules of inference, thereby enhancing our understanding and utilization of logical principles in mathematical discrete logic. © 2023 IEEE.

ABSTRACT: Smart grid technology is a critical application of the Internet of Things, and it is gaining popularity in the science and technology arena. However, it is also highly vulnerable to cyber attacks and threats. To address this issue, we conducted a survey to identify various studies that propose solutions for enhancing cyber security in smart grids based on the Internet of Things. We created a questionnaire that compared the studies in terms of their problem statements, proposed solutions, research methodology, and results. The objective of this paper is to emphasize the significance of cyber security for smart grids and to identify appropriate solutions to safeguard them from potential attacks and threats. © 2023 IEEE.

ABSTRACT: In this paper, we consider bi-variate Logarithmic functions over two dimensional box. We convert the bi-variate differentiable logarithmic functions to Lagrange's polynomials of two variables and finite degree. Subsequently, we expand the Lagrange polynomial onto Bernstein form over the same domain. Furthermore, we prove that the Lagrange polynomial is optimized by the Bernstein enclosure with error bound. If the error is not bounded, we optimize the alternative discrete Logarithmic functions by the enclosure bound at the corresponding values of the given nodes. Eventually, we extend Bernstein properties to the Bernstein-Lagrange Form. © 2023 IEEE.

ABSTRACT: The paper investigates the degree of implementing e-learning technology in the learning-teaching process in the education system post-COVID-19 world. The challenges and possibilities to utilize e-learning technologies are always on the rise among researchers and scholars. A discussion related to the most used e-learning platforms is also tailored in this paper. An analysis of the nature, pros, and cons of the most used e-learning platforms is identified, as well. Given the related findings, the challenges relating to the future successful adoption and use of e-learning technologies are properly set. © 2023 IEEE.

ABSTRACT: This paper provides a brief overview of the exponential distribution and its properties, we will define the Shannon statistic and discuss its properties and derive the exact distribution of a standardized version of MLE of Shannon entropy from exponential distribution and finally we compare its exact quantiles with those of quantiles of asymptotic distribution of this statistic. Moreover it suggests modified version of that statistic and shows that this modified one is much closer to

normality even for small samples. © 2023 IEEE.

ABSTRACT: In spite of the adverse effects of the COVID-19 pandemic on the global economy, it has had a positive impact on the environment. To combat the spread of the virus, many countries, including Jordan, imposed lockdown measures that involved the suspension of economic activities such as manufacturing operations, transportation, and construction (with some exceptions for essential services). Consequently, the levels of certain atmospheric pollutants, such as NO₂ and CO, decreased by an average of 54% and 7%, respectively, during the lockdown period in Jordan. By conducting a systematic review of the lockdown measures and applying spatiotemporal analysis, this study established a methodology to analyze the influence of pandemic mitigation measures on regional air quality. The findings revealed a significant improvement in air quality throughout the study area during the lockdown period. © 2023 IEEE.

ABSTRACT: This paper examines the impact of the operational characteristics of the firms represented by firm size, financial leverage level, operating cash flow, and profitability on the total risks of the ASE-listed industrial public shareholding firms. The research population consists of (53) industrial firms listed on the Amman Stock Exchange (ASE), while the study sample comprises (26) firms between (2017) and (2021). Given the statistical analysis, the results show that the operational characteristics of the ASE-listed industrial public shareholding firms represented by firm size, financial leverage level, operating cash flow, and profitability affect the total risks. The findings also indicate that these four independent variables separately affect the total risks to varying degrees. The variable of the financial leverage level is ranked first in the strength of influence, while the variable of firm size is ranked last. This result can be expounded by the fact that the indebtedness in the industrial firms has a large size and thus has a greater impact on achieving the total risks of these firms. In light of these results, the officials in these firms whose shares are listed on the Amman Stock Exchange (ASE) must develop methods and tools to assess the relationship between the operational characteristics of the firms and the total risks by analyzing the ability of the firms to operate resources in operations that achieve actual cash flows exceeding the value of the cost of capital represented in stock returns and payments due for short- and long-term liabilities. © 2023 IEEE.

ABSTRACT: Big data applications have gained widespread usage across various fields, including healthcare, business, and education. The effectiveness and accuracy of these applications heavily rely on the availability of a large volume of data. However, the collected and generated data for these applications often suffer from incompleteness, inaccuracy, and lack of structure. Consequently, significant efforts are required to clean and process the vast amount of data collected. In this research, we conduct a comprehensive review of existing data quality models that address data and big data quality in general. Building upon this review, we propose a data collection quality model that

incorporates a wide range of quality factors. Our model aims to produce clear and accurate data that can be readily utilized, thereby enhancing the value of data and supporting the performance of big data systems. Additionally, the proposed model contributes to reducing storage space requirements and processing time for data. To validate the effectiveness of the model, a case study is conducted using a predefined dataset. The results indicate that the model significantly streamlines the process of obtaining clean and accurate data. Nonetheless, further investigation is necessary to address additional aspects such as legal and privacy considerations pertaining to the collected data. Overall, this research presents a robust data collection quality model that addresses existing challenges and provides a foundation for improved utilization of big data in various domains. © 2023 IEEE.

ABSTRACT: Low Power Networks are spreading worldwide, seeking to enable small devices to join wireless networks. This requires a routing mechanism that makes it possible and seamless. This research aims to create a Low Power and Lossy Networks (RPL) routing protocol that balances power usage and node dependability. The main emphasis of the algorithm presented here is the choice made by network nodes (Zigbees) regarding which path to deliver the message along. Results for this routing technique seem promising. Utilizing it increased packet transfer reliability while enforcing power conservation. Furthermore, a 10% reduction in the network's overall power consumption was made. © 2023 IEEE.

ABSTRACT: In this paper, with no closed-form Bayes estimators available, Lindley's approximation is taken into consideration when trying to estimate the parameters of the inverse Gaussian distribution. We shall only take into account the squared error loss function. When both the location and scale parameters have different prior distributions, this applies Lindley's approximation to the suggested Bayesian treatment of the inverse Gaussian distribution. Introduces the Bayesian treatment's simulated results. And A simulation study using Mathematica 12 is used to explain numerous numerical situations and show how well estimators function. © 2023 IEEE.

ABSTRACT: The purpose of the study was to identify the role of disclosure governance in the operational risk management (ORM) in the commercial banks of Jordan. A questionnaire has been

designed for this purpose, consisting (28) paragraphs to measure the independent and the dependent variable. It has been distributed to the community members of the study, consisting of a sample of the commercial banks of Jordan. (175) Questionnaires had been collected of (130) distributed. These were statistically processes using descriptive statistics and correlation coefficients. The results of the study showed a statistically significant role among disclosure governance, and the operational risk management in the commercial banks of Jordan. In light of these findings the study recommended the need to disclose all relative important information, in addition to those established by the law or international standards, on time to ensure timely reception of information to all stakeholders. © 2023 IEEE.

ABSTRACT: Big data analytics have claimed an important role in today's society. Consequently, ways of improving the design and development of the corresponding applications are highly sought after. One rather current proposition is the application of test driven development (TDD) in the big data domain. The idea behind it is to increase the quality and the flexibility of the developed solutions. However, the application of TDD is often seen as a rather challenging task. Therefore, to increase the accessibility and facilitate its use, it is necessary to provide information that give orientation for interested developers. Hence, the publication at hand focuses on the question which considerations, information, and resources need to be provided to facilitate the widespread utilization of TDD in the big data domain. In doing so, it can be used as the foundation for an inventory of the current state of the related literature but also as a call for action to fill remaining gaps by conducting corresponding research endeavours. © 2023 IEEE.

ABSTRACT: Feature selection is a vital preprocessing step before utilizing any machine learning algorithm. It aims at reducing the number of features in the dataset by removing irrelevant, noisy, and redundant features. The feature selection problem can be viewed as an optimization problem where the goal is to maximize or minimize an evaluation measure for the machine learning tasks, mainly classification tasks. Metaheuristic algorithms are optimization algorithms that can be applied to feature selection. In this research, a comparison between the wrapper feature selection model based on the Differential Evolution (DE) and filter methods like Chi2 and ReliefF is conducted to evaluate both approaches. Three classification algorithms k-Nearest Neighbors (KNN), Support Vector Machines (SVM), and Decision Trees (DT) are used to evaluate the utilized feature selection algorithms. The proposed model is tested on a recent malware dataset obtained from the UCI repository. The results show that DT achieves the highest accuracy and consistently performs well in both wrapper and filter feature selection techniques. Thus, DT can be considered the most effective algorithm for the given dataset. However, SVM and KNN also offer viable alternatives depending on specific requirements or preferences. © 2023 IEEE.

ABSTRACT: Intelligent agents have become increasingly significant in numerous fields including autonomous systems, robotics, and smart environments. Neural fuzzy logic, an amalgamation of fuzzy logic and neural networks, offers a propitious solution to incumbent-addressed roadblocks to sub-optimal decision-making and limited adaptability. This paper presents a methodology for integrating

neural fuzzy logic into intelligent agent systems, with a focus on a case study involving a robotic vacuum cleaner, constructing a smart cleaning device that continues to learn and optimize its cleaning performance based on experiences. The proposed approach leverages the power of neural fuzzy logic and robotics to create an intelligent and adaptive cleaning device. The iterative nature of the proposed approach allows the robot vacuum cleaner to continuously adapt its behavior based on real-time feedback and learning capabilities, enhancing the intelligence and autonomy of the agent. © 2023 IEEE.

ABSTRACT: Nowadays cybersecurity became more important for a world that is moving exponentially towards Internet of Things (IoT), automation, and online services, Thus protecting information and data about people, industrial secrets, government assets and much more information sources became even more important. And to understand cybersecurity we have to break it into segments related to technology, people, procedures and policies, and physical security, this will insure clear definition for the process of risk assessment of factors and the way they interact with the remaining elements according to MITRE ATT&CK framework [1]. By doing that experts found that the human factor is considered the weakest and hardest to include in the cybersecurity framework of any establishment, this is because the complex nature of people and the easiness of falling victims to Social Engineering (SE) attacks due to the exploitation of psychology, financial factors, environmental factors, social factors and even educational or lack of education and awareness. © 2023 IEEE.

ABSTRACT: In Wireless Sensor Network (WSN), sensor nodes are densely and arbitrarily deployed in monitoring areas and most of them generate redundant data due to sense same events in the overlapping area. Thus, they spent more of energy from their limited batteries that reduce the chance of its survival and continuity. This paper integrates two mathematical models namely Boolean Sensing Model and Event Radius Model in the cluster WSN. The proposed model analyses an event coverage area to compute minimum number of active source nodes required to transmit data events to CH node rather than all nodes within cluster. OMNeT++ simulation tool has been using to performs experimental study and obtain the result. The simulation result shows that 4 source nodes are become active and transmit their data to CH node whereby 12 source nodes turn off and become sleep in the cluster. In addition, the proposed model reduces the source nodes energy consumption about 80 % comparing with LEACH scheme. © 2023 IEEE.

ABSTRACT: Artificial Intelligence Augmented Software Development Life Cycle is a process for developing software that incorporates AI techniques and technologies. One aspect of AIASDL is knowledge vaporization, which refers to the process of extracting and encapsulating knowledge from the AI model during development and making it available for use in other parts of the software development life cycle. The advantages of AIASDL include; improved performance, increased efficiency, better decision-making, better user experience, better scalability, better security and compliance, and knowledge vaporization. Requirement engineering is the process of gathering, analyzing, and specifying the requirements for a software system. The context boundary, domain knowledge, application domain, and system boundary are all important concepts in requirement engineering that help define the scope and constraints of the system being developed. Understanding the context boundary is important because it helps identify the external factors that will affect the requirements of the system. Domain knowledge is the understanding and expertise in a specific field or area that is necessary for effective requirement engineering. The application domain is the specific area or field where the system will be used, and it is important to understand the application domain to gather and document the correct requirements for the system © 2023 IEEE.

ABSTRACT: In this paper, we present a new concept of generalized cyclic (ρ, θ) - ψ contraction via the extended MF-simulation function and establish the existence of such a contraction in a rectangular b-metric space. Our proposed contraction generalizes and extends several existing works in the literature. Moreover, we provide an illustrative example to validate and support the effectiveness of our proposed concept. © 2023 IEEE.

ABSTRACT: Business Process Modeling Notation (BPMN) offers a dynamic graphical language that simplifies the creation of business process diagrams for organizations. This standardized visual representation allows for effortless understanding, analysis, and optimization of processes. By integrating Natural Language Processing (NLP), an artificial intelligence branch that enables computers to comprehend and process human language, BPMN diagrams can now be generated from natural language descriptions of processes. Utilizing NLP to convert process descriptions into structured forms streamlines the creation and maintenance of BPMN diagrams, saving both time and effort. This fusion of BPMN and NLP results in a potent tool for analyzing and enhancing business processes. This paper introduces a BPMN diagramming method using NLP while addressing previous studies' shortcomings. The proposed technique manages natural language with multiple meanings by applying Probabilistic Latent Semantic Analysis (PLSA) in the pre-processing stage. © 2023 IEEE.

ABSTRACT: The rise of social media has brought about new cybersecurity threats that can affect individuals and organizations. To ensure safe social media usage, there is a need for effective cybersecurity applications that can mitigate these threats. Cyberbullying is a serious issue that affects many individuals, particularly young people, and can have long-lasting effects on mental health and well-being. Natural language processing (NLP) techniques can be used to detect cyberbullying in online content. This study utilized the cyberbullying-tweets.csv dataset from Kaggle and implemented two classifiers, Logistic Regression and Decision Tree, to detect cyberbullying in tweets. The results showed that Logistic Regression achieved an accuracy of 91%, while Decision Tree achieved an accuracy of 89%. These findings highlight the potential of NLP techniques to accurately detect cyberbullying and help prevent this harmful behavior on social media platforms. © 2023 IEEE.

ABSTRACT: Air pollution is one of the most common problems that the world is facing today. In fact, there are numerous causes of air pollution, including the large number of industries and automobiles that emit carbon dioxide (CO2) and carbon monoxide. Pollution is increasing on a daily basis, making air quality monitoring and management a major challenge for governments in both developed and developing countries. Air pollution affects human health as well as the atmosphere, causing climate change. One of the techniques used for monitoring air pollution is the Internet of Things (IoT). In this paper, we demonstrate various techniques for monitoring air quality using IoT and make a comparison based on various factors elicited from the previous work. © 2023 IEEE.

ABSTRACT: It is of no doubt that the advent of social media has brought several important benefits. However, there have been also attempts of abusing social media in several ways, one of which is by distributing fake news. Fake news is able to change public opinion, and it is necessary to detect such attempts. Despite its importance, there is a lack of research work that has been done in this topic on Arabic posts. The few works that studied this topic in Arabic language did not give much attention to optimizing the feature selection process, which can play an important role in further improving the detection accuracy. This work further improves fake news detection performance by optimizing the feature selection phase. Experimental work has shown that such optimizing improved the detection accuracy for traditional machine learning methods. © 2023 IEEE.

ABSTRACT: Internet of Things (IoT) is one of the most growing technologies that embedded in most application systems in our life. IoT aimed to solve real world problems in different environmental fields such as industry, education, healthcare, intelligent systems and many other areas. IoT embedded rapidly in most daily devices and technologies with new efficient and creative needs of functional and nonfunctional requirements that are complicated compared with traditional requirements engineering (RE) systems. In addition, remotely smart systems present new challenges and lacks in RE process that needs a solution. IoT systems open a new research issues in (RE) such as elicitation, analysis, specification and management of IoT RE. To solve this lack of RE new smart techniques based on AI must be applied in elicitation RE process. In this paper we present a new smart dynamic approach in RE elicitation phase to build dynamic functional requirements based on AI models. The new stakeholder expectation needs from the smart IOT system are collected and stored in requirements dataset. These new requirements are analyzed and classified into new requirement features using Support Vector Machine (SVM) classifier to classify the new requirement and/or duplicated requirement. These classified functional requirements compared to the IoT system, the positive training requirements are added to the smart functional requirement presented in the IoT system. In addition, the proposed work presents the most used functional requirements to appear first to the system Stakeholder as the most functionality used in IoT system. © 2023 IEEE.

ABSTRACT: Internet of Things (IoT) is one of the most growing technologies that embedded in most application systems in our life. IoT aimed to solve real world problems in different environmental fields such as industry, education, healthcare, intelligent systems and many other areas. IoT embedded rapidly in most daily devices and technologies with new efficient and creative needs of functional and nonfunctional requirements that are complicated compared with traditional requirements engineering (RE) systems. In addition, remotely smart systems present new challenges and lacks in RE process that needs a solution. IoT systems open a new research issues in (RE) such as elicitation, analysis, specification and management of IoT RE. To solve this lack of RE new smart techniques based on AI must be applied in elicitation RE process. In this paper we present a new smart dynamic approach in RE elicitation phase to build dynamic functional requirements based on AI models. The new stakeholder expectation needs from the smart IOT system are collected and stored in requirements dataset. These new requirements are analyzed and classified into new requirement features using Support Vector Machine (SVM) classifier to classify the new requirement and/or duplicated requirement. These classified functional requirements compared to the IoT system, the positive training requirements are added to the smart functional requirement presented in the IoT system. In addition, the proposed work presents the most used functional requirements to appear first to the system Stakeholder as the most functionality used in IoT system. © 2023 IEEE.

ABSTRACT: Threat hunting is an essential practice in protecting operational technology (OT) systems from cyber threats. The convergence of information technology (IT) and OT systems has increased the attack surface and complexity of security threats in OT environments. As a result, proactive threat hunting has become critical in identifying and mitigating potential security breaches. Threat hunting in OT systems involves the continuous monitoring and analysis of network traffic and system logs to identify and isolate threats before they can cause significant damage. This approach allows security teams to identify malicious activity that traditional security measures may not detect, such as advanced persistent threats (APTs) and zero-day exploits. Effective threat hunting requires specialized skills and expertise to navigate the unique challenges of OT environments, including limited resources, outdated technology, and a lack of standardization. It also involves collaboration between IT and OT teams to ensure comprehensive coverage of the attack surface. Threat hunting in OT systems is an ongoing process that requires a proactive approach to security. This paper presents a survey of threat hunting practices and methodologies in operational technology (OT) systems, this involves implementing continuous monitoring, conducting regular security assessments, and leveraging the latest threat intelligence to identify and mitigate emerging threats. By adopting a proactive and collaborative approach to threat hunting, organizations can protect their critical infrastructure systems and ensure the continuity of essential services. © 2023 IEEE.

ABSTRACT: Enhancing sales strategies and developing targeted marketing approaches that effectively resonate with customers are crucial for achieving success in today's highly competitive marketplace. To accomplish this, sales organizations can invest in their teams and equip them with analytical tools to examine customer personality and behavior. By employing unsupervised learning algorithms such as K-Means clustering, customer data can be efficiently analyzed, facilitating the grouping of customers into clusters based on shared characteristics. This enables the identification of patterns in customer behavior, allowing companies to create tailored marketing strategies. This study provides practical recommendations for companies to enhance their sales and marketing strategies based on the analysis of a benchmark dataset from Kaggle, revealing three primary customer clusters: new customers with lower income and spending, old customers with average income and behavior, and old customers with higher income and spending. These insights empower companies to align their efforts with customer preferences and improve. © 2023 IEEE.

ABSTRACT: Infrastructure as a Service (IaaS) is a service provided by cloud computing systems vendors. IaaS provides virtual computing resources to the users such as hardware, servers, data center space and storage, and network components all over the internet. Just like any other growing technology, cloud computing and specifically IaaS faces some challenges that affect the quality of

service and must be conquered to achieve users' satisfaction and the most reliable service. Therefore, the service must be dependable to satisfy the business. In this study, a quality model will be proposed from the users' perspective to help the IaaS vendor to understand the IaaS users' nonfunctional requirements. © 2023 IEEE.

ABSTRACT: This paper examines the Acceptance of Adoption Metaverse (AAM) in eLearning by utilizing the Technology Acceptance Model (TAM) framework. The TAM model is a widely recognized theoretical framework that is used to understand the factors that influence users' acceptance of technology. In this study, we explore the relationship between AAM and eLearning adoption by investigating the key factors that influence users' behavioral intention towards AAM. The Metaverse is a virtual world that simulates the real-world environment and offers learners an interactive, immersive, and collaborative learning experience. It posits that perceived usefulness and perceived ease of use are the key factors that influence users' behavioral intention to use technology. The study employs a quantitative research approach to collect data from students through a survey questionnaire. The data collected will be analyzed using both multiple linear regression model and simple linear regression model to examine the relationship between Model variables for the acceptance of AAM in eLearning. © 2023 IEEE.

ABSTRACT: The Internet of Things has led to the deployment of billions of interconnected devices in critical infrastructures such as health, transportation, environmental control, and home automation. IoT offers convenience and dependability, but it also presents new risks for hackers and hurdles for digital forensics. Digital forensic investigations are made more difficult by the enormous range of IoT devices, non-standard file formats, and cloud infrastructure. End-to-end encryption puts forensic investigation success and privacy at risk. In particular, all legal, privacy, and cloud security issues will be addressed in this article along with other key issues that arise during the complex investigation process involving IoT. Also, this study offers a summary of the previous and present theoretical frameworks in the field of digital forensics © 2023 IEEE.

ABSTRACT: Non-Functional Requirements (NFR) are a set of quality attributes that software must have, such as security, reliability, and performance. Extracting NFR from software requirement specifications can help developers deliver quality software that meets users' expectations. However, since functional and non-functional requirements are mixed in the same SRS, it requires a lot of human effort to distinguish them. While many studies have proposed English language requirements extracting techniques, there is a lack of research in Arabic requirements extracting, as well as a lack of publicly available Arabic datasets in this field. In this study, we propose an automatic NFR extraction method for quality software development by combining machine learning and feature extraction techniques. Also, we will collect an Arabic dataset for requirements. This study aims to help software engineers save time, reduce costs and effort in the manual extraction process, and make the requirements engineering phase more efficient. Additionally, it provides new research areas in this field. © 2023 IEEE.

ABSTRACT: This research paper investigates the role of Artificial Intelligence (AI) and Machine Learning (ML) in Cybersecurity Threat Detection. With the increasing frequency and complexity of cyber-attacks, cybersecurity has become a major concern for individuals and organizations alike. AI and ML offer promising solutions to this problem by providing advanced analytics, automation, and decision-making capabilities to improve cybersecurity threat detection. In this paper, we examine various AI and ML techniques for threat detection, vulnerability management, password cracking, drones and robots, text, and Natural Language Processing (NLP). Furthermore, we present a case study on fake news prediction, using a dataset consisting of fake and real news, and propose a classifier model based on different ML algorithms, namely Multinomial Naive Bayes, Bernoulli Naive Bayes, Gaussian Naive Bayes, and Logistic Regression. The study shows that the proposed model can effectively predict fake news, achieving an accuracy of 0.99 %. Overall, this research sheds light on the potential of AI and ML in cybersecurity and demonstrates how these technologies can be used to detect cyber threats and enhance cybersecurity. © 2023 IEEE.

ABSTRACT: The paper investigates the significance of interactive lesson design skills on the effectiveness of Nearpod in developing the online interactive lesson design skills of mathematics and computer teachers. Achieving the study objectives necessitates adopting the semi-experimental approach through one experimental group and two pre- and post-measurements. The study sample consisted of (50) male and female teachers from the Directorate of Naour District. The study sample consisted of (50) male and female teachers from the Directorate of Education for Naour District in Amman. The note card is used as the study instrument. The findings indicate apparent differences in the means and standard deviations of the responses of the study sample in the pre- and post-measurements of the practical performance note card of 'Nearpod' and its use in designing and producing digital interactive lessons. © 2023 IEEE.

ABSTRACT: In this article, we focus on quadric surfaces from two sides. On one side, we study quadric surfaces of the first kind whose position vector r satisfies a relation of the form $\Delta I r = A r$, where A is a square matrix of order 3 and Δ is the second Laplace operator. On the other side, we study quadric surfaces of the second kind with the same property. © 2023 IEEE.

ABSTRACT: Many users are nowadays interested in keeping pace with the development of smart technology and its invention. Such technology is factual with the assistance of smart technology and science. Hoverboard can be alike to a skateboard but the unconventionality is that it depends on super-strong electromagnetic levitation and magnets to remain aloft. The term levitation means a technology class, which makes use of electromagnetic levitation to propel vehicles, including electromagnets instead of wheel axles, and bearings. Hoverboards represent a resolution for the future demands of the globe. This paper provides a notion regarding self-levitating boards and how these boards function effectively. © 2023 IEEE.

ABSTRACT: This research paper proposes a new quality model for social media websites based on an extensive literature review and analysis of previous studies. The study identifies seven key quality factors that are essential for evaluating social networking websites: user friendliness, community-drivenness, website appearance, entertainment, security and privacy, efficiency, and navigability. These factors were selected based on their prominence in previous research and their relevance to user satisfaction in the context of social media platforms. The paper explores each quality factor, providing definitions and highlighting their significance in shaping users' perceptions of website quality and satisfaction. The research aims to contribute to a deeper understanding of the factors that influence user experiences and satisfaction with social media websites, providing valuable insight to website designers and developers to enhance user engagement and overall website quality. © 2023 IEEE.

ABSTRACT: The paper introduces conformable fractional analogs of some basic concepts related to

probability distributions of random variables, namely density, cumulative distribution, survival and hazard functions. Moreover, it introduces conformable fractional analogs to expected values, r th moments, r th central moments, mean, variance, skewness and kurtosis. In addition, it introduces conformable fractional analogs to some entropy measures, namely, Shannon, Renyi and Tsallis entropy measures. All these concepts had been applied to the conformable fractional half-normal distribution. © 2023 IEEE.

ABSTRACT: We consider helicoidal surfaces in the 3-dimensional Euclidean space of coordinate finite type with respect to the third fundamental form III, i.e., their position vector x satisfies the relation $\Delta IIIr = Ar$, where A is a square matrix of order 3. We show that helicoid is the only helicoidal surface satisfying $\Delta IIIr = Ar$. © 2023 IEEE.

ABSTRACT: The diameter of a tree is a measure of the longest path between any two nodes in the tree where this path is defined in terms of the number of edges. A Diameter-Constrained Minimum Spanning Tree (DCMST) is a minimum-weight spanning tree with a diameter less than a given integer. Finding a DCMST is an NP-complete problem, and it may require searching through all possible spanning trees with acceptable diameters and finding the minimum. There have been a number of algorithms proposed for finding a DCMST efficiently. These algorithms can be broadly classified into two categories: exact algorithms and approximate algorithms. Exact algorithms are able to find the exact DCMST but generally have a higher time complexity and they are not suitable for very large trees. Approximate algorithms, on the other hand, are able to find an approximate DCMST, but may not be as accurate as the exact algorithms. In this survey, we review various algorithms that have been proposed for solving the DCMST problem and compare their performance in terms of time complexity, accuracy, and other relevant factors. Over-all, the problem of finding the DCMST is an active area of research, and there is still room for further improvement in the efficiency and accuracy of the existing algorithms. © 2023 IEEE.

ABSTRACT: In this paper, we propose a new algorithm to encrypt color and grayscale images by creating a strong private key and using XOR, flipping, expansion permutation, and variable circular shifting. The implementation results of the proposed algorithm showed that it is resistant to statistical, differential, and brute force attacks, as verified through the measures of entropy, histograms, correlation, key Sensitivity, key space, PSNR, MSE, SSIM, NPCR, and UACI. The overall results demonstrated the efficacy and robustness of the new algorithm. © 2023 IEEE.

ABSTRACT: Colorectal cancer (CRC) 1 screening tests help in early detection of CRC and improve disease prognosis. This study aimed to assess knowledge, attitude, and barriers to CRC screening and the associated factors among the general population in Jordan. A validated self-administered online survey was distributed on 1542 individuals in Jordan. The participants (n = 1542) reported several barriers and demonstrated insufficient knowledge but positive attitude towards CRC screening. Older age (OR = 1.021, 95% CI = 1.010–1.032, P < 0.001), working in medical field (OR = 3.198, 95% CI = 2.499–4.092, P < 0.001), family history of cancer (OR = 1.248, 95% CI = 1.002–1.555, P < 0.05), and knowing someone with CRC (OR = 1.601, 95% CI = 1.186–2.161, P < 0.01) were significantly associated with higher knowledge. Personal history of CRC (OR = 3.157, 95% CI = 1.188–8.387, P < 0.05), and high knowledge of CRC (OR = 2.795, 95% CI = 2.242–3.484, P < 0.001) were significantly associated with the positive attitude. Future healthcare programs should devise effective techniques to improve public understanding and perception of CRC screening and overcome the identified barriers. © 2023 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: This work attempts to develop a universal model for predicting micro-and macro-level accident frequency. The study implies that the number of accidents may vary depending on the type of roadway and the characteristics of its small segments, both at the group and individual levels. A multilevel model has been designed to address the nested link between individual road segments and multiple road classifications. The multilevel analysis allows one to investigate the hierarchical nature of road accident parameters at the micro and macro levels to comprehend the risk of specific road segments within distinct roadway categories. To accomplish this, a case study of fifty-seven roads has been selected, covering five main categories: motorway, expressway, primary arterial, secondary main roads, and minor roads. In addition, each roadway has been subdivided into several flexible-length segments, each of which is identified by its traffic and geometrical characteristics. The outcome confirms that the accident frequency per road segment is more likely to vary between roads with distinct categories. Moreover, road types with low design requirements are more hazardous than well-designed roads, even with lower speed restrictions and traffic numbers. © 2023 WITPress. All rights reserved.

ABSTRACT: Background: Despite the availability of effective pharmacotherapy for the management of

rheumatoid arthritis (RA), health outcomes are suboptimal due to poor adherence to the prescribed treatment. Limited research has been conducted to investigate medication non-adherence and its associated factors among patients with RA. Objective: This study aimed to assess medication adherence and to explore the factors associated with medication non-adherence among outpatients with RA in Jordan. Methods: The current cross-sectional study was conducted at outpatient rheumatology clinics at two teaching hospitals in Jordan. Variables including socio-demographics and biomedical variables, in addition to disease and medication characteristics, were collected using medical records and custom-designed questionnaire. Medication adherence was assessed using the validated 5-item Compliance Questionnaire for Rheumatology. Stepwise Logistic Regression analysis was performed to identify the factors that are independently and significantly associated with medication non-adherence. Results: A total of 261 patients participated in the study, from which, 43.3% were found non-adherent. Binary regression analysis results revealed that low monthly income (OR= 0.239, CI= 0.130-0.440, $P<0.01$), the presence of chronic respiratory disease (OR= 2.727, CI= 1.059-7.022, $P<0.05$), lower medication necessity scores (OR= 1.177, CI= 1.10-1.259, $P<0.01$) and higher concerns about RA medications (OR= 0.917, CI= 0.860-0.978, $P<0.01$) were significant and independent predictors of medication non-adherence in patients with RA. Conclusion: Future pharmaceutical care and clinical pharmacy service programs should emphasize medications benefits and minimizing medication-related concerns by selecting safe medications and providing guidance on mitigating side effects, particularly for RA patients who have low income and those who suffer from other comorbid diseases. © the Authors.

ABSTRACT: This research aims to learn more about the nature and scope of the speech disorder problem among first graders informed the perspective of both classroom teachers' and students' experiences with available interventions. The descriptive approach was relied on to achieve the study's objectives with its quantitative and qualitative methods. The study consisted of two instruments: the first tool was a questionnaire prepared by researchers. It consisted of 40 paragraphs divided into four areas. It was distributed to a sample of 47 primary school teachers in Nablus and Amman. They were selected most feasibly. Concerning second tool, it was an interview that consisted of 4 questions through which methods of treating speech problems were reached. It was found that there are no statistically significant differences at the level of significance ($\alpha \leq 0.05$) between the responses of the study sample members about the prevalence of pronunciation problems among the first primary stage students in the point of view of their teachers due to each of the variables (gender, years of experience). The most important methods of treating pronunciation problems were to practice pronouncing some words and sounds and continuing to repeat them and evaluation by teachers and parents. We hope that the valuable results presented by this study will be used to treat pronunciation problems depending on their type of problem. © 2023, Auricle Global Society of Education and Research. ABSTRACT: Green synthesis of zinc oxide (ZnO) nanoparticles (NPs) using various plant extracts as reducing and capping agents has gained attention in recent research. The green synthesis of ZnO NPs offers several advantages such as being simple, eco-friendly, safe, cost-effective, and reproducible approach with high stability. Hence, this article provides an overview of zinc metal and ZnO compounds, and traditional chemical and physical synthesis of ZnO NPs with primary focuses on the green synthesis of ZnO NPs. This study discusses various plant extracts used and the proposed

mechanisms in the green synthesis of ZnO NPs. Additionally, it explores the cytotoxic mechanisms of the green-synthesized ZnO NPs and addresses the various biomedical applications of ZnO NPs, including antibacterial, anticancer, antidiabetic, antioxidant, antifungal, antiviral, antiparasitic, anti-inflammatory, and wound healing. Moreover, the review critically discusses the toxicity of ZnO NPs and emphasizes the need for more toxicological studies to ensure the safety and facilitate the risk assessments and risk management of ZnO NPs. Furthermore, this review underlines the challenges associated with the translation process of ZnO NPs from bench to market, including the complex and time-consuming regulatory approval process for ZnO NPs, which requires a multidisciplinary approach involving scientists, regulators, and manufacturers. © 2023 the author(s), published by De Gruyter.

ABSTRACT: This research aims to improve the process of finding alternative drugs by utilizing artificial intelligence algorithms. It is not an easy task for human beings to classify the drugs manually, as this requires much longer time and more effort than doing it using classifiers. The study focuses on predicting high-quality medical drug data by considering ingredients, dosage forms, and strengths as features. Two datasets were generated from the original drug dataset, and four machine learning classifiers were applied to these datasets: Random Forest, Support Vector Machine, Naive Bayes, and Decision Tree. The classification performance was evaluated under three different scenarios, which varied the ratio of the training and test data for both datasets, as follows: (i) 80% (training) and 20% (test dataset), (ii) 70% (training) and 30% (test dataset), and (iii) 50% (training) and 50% (test dataset). The results indicated that the Decision Tree, Naive Bayes, and Random Forest classifiers showed superior performance in terms of classification accuracy, with over 90% accuracy achieved in all scenarios. The results also showed that there was no significant difference between the results of the two datasets. The findings of this study have implications for streamlining the process of identifying alternative drugs. © (2023), (Science and Information Organization). All Rights Reserved.

ABSTRACT: The study aims to examine the corporate social responsibility disclosure (CSR) levels for industrial firms listed on Amman Stock Exchange (ASE), and to explore the impact of firm size on these levels. The methods of collecting data were the narrative parts of annual reports published by firms in 2021 using content analysis, as well as a short descriptive questionnaire circulated to the CEO to assess the obstacles. The findings indicated that SRD categories were not distributed equally; the average disclosure of the employee category (EM), the environmental category (EN), and the community-related information category (CU) was 52.03%, 36.96%, and 51.60% respectively; the combined average disclosure for all dimensions was 46.7%. The study concludes that lack of top management support, followed by insufficient financial resources of the industrial sector are the main obstacle to deter the decision to disclose less information. However, there is a positively significant effect of firm size on the three CSR dimensions (EM, EN, and CU). The study inferred that large firms obtained higher percentages of EM, EN, and CU. The obstacles companies might encounter obtained an average score of (3.39) or (72%). The study concludes that firms' strategies should give more attention on disclosing EM, EN, and CU-related information in their reports. Future studies are recommended to encourage other sectors to do CSR between developing and developed countries. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

PMT and Mobile Payment Continuance Intention: The Moderating Influence of Digitalization Anxiety
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169844119&doi=10.1007%2f978-3-031-42455-7_32&partnerID=40&md5=a5753560a06b82eed1b3756e1bd7a7fa

AFFILIATIONS: Department of Business Administration, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan;

Department of Management, Faculty of Business Administration, Liwa College of Technology, Abu Dhabi, United Arab Emirates

ABSTRACT: This study aims to investigate the potential effects of the protection motive theory (PMT) and digitalization anxiety on consumers' continuance intentions (CI) toward mobile payment (M-pay) usage. This cross-sectional, exploratory study makes use of a quantitative research methodology. Jordanians who used any M-Pay application in the past two years were the target population for this investigation. The online questionnaire was distributed via social media (mainly via Facebook). Analysis was done on 202 valid surveys in total. The role of PMT and digitalization anxiety as CI factors were examined through the moderation evaluation. To conduct the analysis, the PLS-SEM method was used. The results support the role of PMT in raising CI. It was discovered that digitalization anxiety has a negative impact on CI and decreases the PMT's preferred role in developing CI to use M-pay. This research helps M-pay service providers who want to increase client loyalty by improving M-pay services. The behavioral intention analysis will reveal important details about consumers' CI and point out potential improvement areas. By integrating a PMT with digitalization anxiety, this research investigates customers' CI to use M-pay services from a human psychology perspective, making a novel contribution to the body of literature on M-pay services. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Impact of Digital Advertising via Social Media Tools on the Buying Behavior of Fast Food Consumers. A Case of Jordan

(2023) Studies in Systems, Decision and Control, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169836976&doi=10.1007%2f978-3-031-39158-3_44&partnerID=40&md5=f70a494a8ba89a9ea1548f1a8999cc43

AFFILIATIONS: Marketing Department, Zarqa University, Zarqa, Jordan;

Marketing Department, Al Zaytoonah University of Jordan, Amman, Jordan;

Department of Marketing, University of Business and Technology, Jeddah, Saudi Arabia

ABSTRACT: The study aims to find out the impact of digital advertising through social media on buying behavior and targeted fast-food consumers in Jordan. The study consisted of one independent variable, which were measured through six dimensions: characteristics of digital advertising, stimuli of digital advertising, the content of the digital advertising message interaction with digital advertising, and ease of access to digital advertising, the credibility of digital advertising through social media, and one dependent variable represents buying behavior. The study followed the descriptive-analytical method, using suitable statistical analysis program to analyze the data. (465) questionnaire were distributed to the study sample, and a total of (416) questionnaire were retrieved with a response rate of (89%). The study reached several results, the most important of which are: The digital advertisement has a significant statistical impact on buying behavior, and this effect is considered positive as it helps in improving the buying behavior of fast-food consumers in Jordan, which motivates them to buy and make the purchasing decision, and that the electronic advertisement has an explanatory ability to achieve buying behavior by a percentage of (75%). Digital advertising incentives have the strongest positive impact on the buying behavior of fast food consumers with an interpretive capacity of 68%, while the digital advertising credibility variable has the lowest impact on buying behavior among fast food consumers by 36%. The study recommended that fast-food restaurants owners must enhance the credibility of fast-food restaurants advertisements through punctuality and promises and choosing specialized experts in designing promotional campaigns to ensure high-quality advertising content that contains different stimuli. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Effect of Waste Ceramic Powder on the Properties of Asphalt Binder and Asphalt Concrete Mixtures (2023) International Journal of Pavement Research and Technology, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169833062&doi=10.1007%2fs42947-023-00375-y&partnerID=40&md5=51526bcfecc429dd8b82ec20ad6457fd>

AFFILIATIONS: Civil Engineering Department, Jordan University of Science and Technology, Irbid, Jordan;

Department of Civil and Infrastructure Engineering, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: In the past decades, there has been an increase in traffic volumes and loads on pavement roads. Thus, there has been a need to enhance the properties of road pavements using certain additives in hot mix asphalt (HMA). In this research waste ceramic powder (WCP) was used as a filler replacing the conventionally used limestone filler by different percentages (0, 25, 50, 75 and 100%) by weight of mineral filler in the HMA specimens and their respective asphalt mastic. The research

aimed to study the practicality of using WCP in asphalt mixes and its effect on their properties, specifically using the dynamic creep and indirect tensile tests which have not been conducted on WCP-HMA prior to this research. The rotational viscosity (RV) test results showed that increasing the WCP% increased the dynamic viscosity of the mastic. The dynamic shear rheometer (DSR) test results showed that increasing the WCP percentage slightly enhanced the rutting resistance, but results of the PAV-aged mastics showed that increasing the WCP percentage slightly decreased the fatigue cracking resistance. The bending beam rheometer (BBR) test results showed that increasing the WCP percentage in the mastic slightly decreased the low-temperature cracking resistance. Overall, the WCP replacement increase in the asphalt mastics was not very effective. The HMA testing results showed that the WCP significantly increased the Marshall stability of the asphalt mixes. As for the dynamic creep test, the results showed that the highest resilient modulus and creep modulus values were mostly at 100% WCP. The indirect tensile modulus test results showed that at 5 and 25 °C 25% WCP was the optimum percentage, and at 40 °C 50%WCP was the optimum percentage. © 2023, The Author(s), under exclusive licence to Chinese Society of Pavement Engineering.

Consumer Adoption of e-Payment Services Using the Theory of Planned Behavior

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169832821&doi=10.1007%2f978-3-031-42455-7_35&partnerID=40&md5=ea6b2372497939e529748ce2e86b8185

AFFILIATIONS: Faculty of Business, Alzaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study aims to evaluate estimated factors influencing consumer adoption of e-payment services. A theoretical framework has been proposed based on the Theory of Planned Behavior. The study used the convenience sampling method targeting users of electronic payment services. A total of usable 384 questionnaires were retrieved from respondents. Empirical results pointed out the strong relationship between attitude, subject norm, perceived behavioral control, culture and both customer intention and actual use e-payment services. In addition, the results demonstrated the significant influence of the consumer's attitude toward e-payment services and culture as two essential influencing factors that explaining about 60% of consumer intention for adopting e-payment services. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Consumers' Adoption of E-Wallet Services in Jordan: Mediating Effect of Perceived Usefulness

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169831383&doi=10.1007%2f978-3-031-42455-7_29&partnerID=40&md5=5b36518d861532bac4aa6d9948cd6970

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The current research examines the environmental drivers of consumers' adoption of e-wallet services. It investigates how environmental factors, such as social influence, technology readiness, and government support affect the consumers' intention to use e-wallet services. In addition, the research assesses the mediating role of perceived usefulness in this relationship. Data was collected through a questionnaire with a sample size of 324 respondents. Structural equation modeling was employed to analyze the collected data. The results showed that all hypotheses were accepted, indicating that the environmental drivers significantly impact users' intention to use e-wallet services. Also, perceived usefulness positively mediates the relationship between environmental drivers and the intention to use e-wallet services. Further, the results showed that digital wallets are quickly becoming a popular online payment method. Customers are quickly adopting digital wallets due to their convenience and ease of use. Customers are becoming tech-savvy and they are increasingly looking for creative solutions. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Mediating Role of Green Supply Chain Management in the Relationship Between Green Human Resource Management Practices and Entrepreneurial Performance

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169823365&doi=10.1007%2f978-3-031-42455-7_28&partnerID=40&md5=182f5bbe477a7280edf0d7a8b381f6cd

AFFILIATIONS: AL- Zaytoonh University of Jordan, Amman, Jordan

ABSTRACT: Environmental issues and climate change have prompted business organizations to refocus their operations on environmental sustainability. Organizations are aware that integrating greening into their practices of managing their human resources may help to address environmental issues. The purpose of the current research is to examine the relationship between green human resource management (GHRM) practices and entrepreneurial performance (EP). It is assumed that using eco-friendly human resource practices facilitates the development of entrepreneurial performance which aids the organization gain a strategic competitive advantage. Furthermore, it focuses on exploring

the mediated effects of green supply chain management (GSCM) on entrepreneurial performance, that is to address the spread, and extent, of the link between green human resource management practices and entrepreneurial performance that has not been covered in the empirical literature. A quantitative exploratory research method was used in the investigation. The sample consisted of 285 managers from five-star hotels in Jordan. PLS structural equation modeling was used to test the hypotheses. The findings of this study revealed that green human resource management practices positively impacted entrepreneurial performance. It is also found that green supply chain management is positively affecting entrepreneurial performance. In addition, green supply chain management partially mediated the relationship between green human resource management practices and entrepreneurial performance. The research findings may inspire human resource managers to implement green human resource management practices to foster entrepreneurial performance. Overall, by supporting the empirical relationship between green human resource management, entrepreneurial performance, and green supply chain management, which until now has mostly been limited, this study has contributed to the literature on the sustainability of the environment. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Graphic Design Department, Al-Zaytoonah University, Amman, Jordan

ABSTRACT: The study explores the effects of artificial intelligence (AI) and predictive analytics on digital marketing strategy and return on investment (ROI). It reviews relevant literature on the use of AI and predictive analytics in digital marketing, focusing on email marketing, customization, social media marketing optimization, and consumer segmentation. The research methodology is described, including data collection and analysis procedures. The findings highlight the significant impact of predictive analytics and AI on digital marketing strategy and ROI, with businesses that effectively utilize these technologies reporting higher engagement, conversions, and revenue growth. The study acknowledges limitations and proposes future research directions of successful AI and predictive analytics integration in digital marketing campaigns. It concludes with recommendations for businesses to invest in predictive analytics and AI to remain competitive in the dynamic digital landscape. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Department of HRM, University of Business and Technology, Jeddah, Saudi Arabia

ABSTRACT: This paper attempts to identify the effect of service quality on Customer Comfort and the effect of customer comfort as a mediating variable on customer satisfaction of services in Jordan. For this purpose, a set of related independent variables to service quality which are (Reliability, Responsiveness, Assurance, Failure recovery), one mediating variable (Customer Comfort) and one dependent variable (Customer Satisfaction) which are adopted in the study model. A questionnaire is designed as a research instrument and distributed to 480 respondents who deals with services organizations in Jordan, (89%) were valid for analysis. Thus (409) respondents are assured to be the sample size of the present study. The study concluded that there is statistical significant effect of service quality (Reliability, Responsiveness, Assurance, Failure Recovery) on customer comfort and there is a strong direct relationship between customer comfort and customer satisfaction. The study recommended that services companies should create a systematic procedures that help to develop failure recovery mechanism, and it should offer training courses for its employees to enhance responsiveness. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: In probability and other applied sciences, distributions are used extensively. We employ fractional differential equations in this study (FDE). The work offers conformable fractional analogs of density, cumulative distribution, survival and hazard functions, four fundamental ideas in probability distributions of random variables. Additionally, it introduces r th moments, r th central moments, variance, skewness, and kurtosis as well as conformable fractional analogs to anticipated values. Additionally, it introduces conformable fractional analogs of Shannon and other entropy metrics. To the conformable fractional Kumaraswamy distribution, all notions had been applied. © 2023 ITMA.

ABSTRACT: The Internet of Things and artificial intelligence made their development in healthcare possible by ensuring quality, providing services, and monitoring and analyzing outcomes. AI improves the delivery and efficacy of healthcare. Combining AI and machine learning with existing neural interfaces enabled the development of intelligent and small devices for treating neurological disorders. This article employs a case study approach to examine the recently introduced technology by Elon Musk to assist patients with neurological disorders. The introduction of a brain microchip would have a profound effect on the neurotechnology industry. With the advent of neurochips, there is growing optimism that AI and neurology can collaborate. Modern technology can help individuals with cerebral palsy feel emotionally better and prevent physical deterioration. The thought of using this technology to manipulate is terrifying. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Legal Problems of the Intervention of Artificial Intelligence in the Medical Field: Obligations and Challenges

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169801579&doi=10.1007%2f978-3-031-42455-7_34&partnerID=40&md5=eea660b5d6ce147ed8c7b63c8b087edb

AFFILIATIONS: Faculty of Law, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Artificial intelligence became a fact that cannot be denied in all aspects of economic, industrial and educational life and the medical one, too, because of the advantages provided by those robots included superior ability to think, elicit make decision, accuracy, velocity and others, especially to develop themselves automatically without human intervention. However, no matter how accurate they are in medical work, there is no doubt they that they sometimes derail which makes malpractice these smart robots make malpractice that requires punishment and legal liability; this issue addresses the following question: who is the legally responsible party for those medical malpractice when automatic robots committed them? Are the manufacturers, the programmers of these devices or those who use them? The current study seeks to show the legal obligations that led to use of artificial intelligence in the medical field in terms of their obligations, what they are, advantages, disadvantages and applications, then explain the legal challenges in facing medical malpractice resulted from using them. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: This study aimed to explore the drivers of social commerce adoption and women empowerment during covid-19 pandemic. Data were collected from a sample of 223 participants, using Structural equation modeling through the Amos program for analysis and testing the research model and hypotheses. Empirical results showed that hedonic motivations, utilitarian motivations, and social support positively affected social commerce adoption among women during the COVID-19 crisis. The results also revealed that social commerce adoption positively affected women's empowerment during the crisis This study made a theoretical and managerial contribution to the social commerce adoption and women empowerment literature. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The world is experiencing a demographic shift, with an increasing number of elderly individuals who require regular health monitoring. In this context, the development of e-health monitoring systems has become increasingly important in improving the quality of life for elderly individuals. Wearable devices have emerged as a popular choice for remote health monitoring, owing to their convenience and ease of use. However, the cost of such devices can be prohibitive, especially for elderly individuals who may have limited financial resources. This paper introduces a low-cost design for an IoT embedded system that monitors the physiological signals of elderly individuals in their homes or smart cities. The Internet of Things (IoT) aims to extend the network and data exchange to physical objects in everyday life. The proposed system is an embedded stand-alone design that utilizes off-the-shelf components to capture various physiological signals such as heart rate, temperature, body moisture, respiration rate, and patient motion. The system processes the signals and verifies the value of the collected data before transmitting it via RF-transmitters to the treating physician in the form of a file or SMS message. The data is processed via a server and can be recorded in a patient file. The system's main sensors, including heart rate, respiration, and motion, were tested, and the results were positive. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Circular Economy Practices in Higher Education Institutions: Towards Sustainable Development
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169697833&doi=10.1007%2f978-3-031-42463-2_27&partnerID=40&md5=fbda443089a0e9ec985d6e0621efc4ed

AFFILIATIONS: Al-Zaytoonah University of Jordan, 130, Amman, 11733, Jordan

ABSTRACT: There is a growing global interest in shifting from linear to Circular Economy (CE), which is closely linked to the implementation of sustainable development. Higher Education Institutions (HEIs) can play a major role in the dissemination of CE practices, skills and knowledge. This study provides a review of current practices of CE in HEIs. For this purpose, a number of recent articles have been reviewed and analyzed. This study provides a framework for CE application in HEIs. A case study shows how a university has applied CE practices and how its UI GreenMetric® evaluation can be used to assess the level of universities' engagement in the CE. The results showed that CE practices in HEIs could be categorized into six groups. Furthermore, the case study reflects an example of CE practices in HEIs and a high correlation of UI GreenMetric® with the degree of CE application. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Influence of Artificial Intelligence on Quality of AIS Outcomes: Moderating Role of Accountants' Experience
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169697786&doi=10.1007%2f978-3-031-42455-7_24&partnerID=40&md5=1efd0d89bfc0a81a9a086208b9a459ca

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan;
School of Management, University Sains Malaysia, Gelugor, Malaysia;
Business School, Middlesex University, London, United Kingdom

ABSTRACT: This study is aimed at exploring the moderating role of accountants' experience in the relationship between artificial intelligence (AI) and the quality of accounting information system AIS. A quantitative approach was adopted, and the questionnaires were distributed to 237 managers of finance and accounts departments in small and medium organizations (SMEs) in Jordan. SPSS was employed to screen and analyze gathered data. The results of the study suggest the acceptance of study's hypothesis that "accountants' experience moderates the relationship between Artificial Intelligence characteristics and quality of AIS outcomes" The evidence also suggests that the influence of AI characteristics on the quality of AI outcomes may vary depending on the level of experience of the accountant using the AI system. Experienced accountants may be better equipped to leverage the strengths of AI systems and produce high-quality outcomes, while inexperienced accountants may be more likely to produce inaccurate or biased outcomes. The study recommends that AI systems should be employed in accounting as an approach to detecting and preventing fraud and

irregular entries in AIS applications. Further recommendations are presented in the paper. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Impact of Sustainable Supply Chain Management on the Environmental Performance of Jordan's Construction Organizations

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169692151&doi=10.1007%2f978-3-031-42455-7_21&partnerID=40&md5=94bfcc19274a876a86dde6d11fab424d

AFFILIATIONS: Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This research aims to investigate the impact of sustainable supply chain management on the environmental performance of Jordanian construction organizations. This research dealt with a set of supply chain practices in organizations which included: design, packaging, purchasing, storage, transportation, and their relationship with environmental performance. In order to achieve the objectives of the research, literature related to sustainable supply chain management was reviewed, regarding environmental performance elements in construction organizations. The study population consisted of 13 construction companies, and the study sample included a set of job titles (director, branch manager, department head). The study sample was (346). The questionnaire method was used to collect data, and (SPSS) was used to analyse the data and extract the results. Results and conclusions of the study illustrated the impact of sustainable supply chain management on environmental performance. One of the most notable findings of the study is the presence of a clear and statistically significant impact of sustainable supply chain management on the environmental performance of Jordanian construction organizations. The main recommendations of the study are as follows: Business organizations should adopt and apply economic, societal and environmental supply chain practices in order to achieve sustainable development. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The objective of this research is to investigate how intellectual capital affects sustainable competitive advantage in the Jordanian telecommunication industry, with a focus on the mediating effect of marketing knowledge management. An online questionnaire was randomly distributed to 300 participants from various managerial levels. The proposed conceptual model and associated hypothesis were tested using SEM-PLS. The findings indicated that only Human Capital exerted a direct significant impact on sustainable competitive advantage. Marketing knowledge management fully mediated the relationship between relational capital, structural capital, and sustainable competitive advantage. The research highlights the importance of how the telecommunication sector management uses intellectual capital and marketing knowledge management in determining the sustainable competitive advantage of their business. Furthermore, it fills the gap and aids telecommunication sector management in focusing on the critical role of marketing knowledge management in achieving sustainable competitive advantage. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Nexus of Intellectual Capital and Firm Performance: Evidence from Jordanian Pharmaceutical Companies

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169688207&doi=10.1007%2f978-3-031-42455-7_16&partnerID=40&md5=dc405f361af815b99aef3db61568a4ff

AFFILIATIONS: Hittien College, Amman, Jordan;

Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This paper examines the relationship between intellectual capital (IC) and the financial performance of Jordanian pharmaceutical companies (JPCs). We used secondary data collected from six JPCs, listed on the Amman Stock Exchange (ASE) over the period 2012-2016 to measure the Value-added intellectual coefficient (VAIC™) model, which is used to measure IC and its components, including an additional element, namely Relational Capital Efficiency (RCE). Earning per Share (EPS) and Asset Turnover Ratio (ATR) were used to measure financial performance. The results indicated no significant

relationship between IC and the financial performance of Jordanian Pharmaceutical Companies. Further regression analysis on the individual components of IC showed that only Human Capital Efficiency (HCE) had a significant positive relationship with financial performance indicators, EPS, and ATR. The main limitation of this study is that it was conducted during the Arab Spring, which negatively affected the Jordanian economy. The findings imply that JPCs have utilized their human capital resources efficiently, and this component is vital for their competitive advantage. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169688018&doi=10.1007%2f978-3-031-42463-2_16&partnerID=40&md5=fa978e20aa1038da55049841f110e8a8

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study aimed at surveying the beliefs of academics about the benefits and challenges of using Power BI as a sample of business intelligence tools in accounting education. A survey of 60 faculty members in the faculty of business et al.-Zaytoonah university of Jordan revealed that developing the data interpretive ability, data gathering skills, and problem-solving skills are the most important benefits that could be gained from using Power BI in accounting education. The main challenges that could face the dissemination of Power BI tool in accounting education include resisting the change learning type, poor experience in the BI tools for faculty members. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Impact of Cash Liquidity on Sustainable Financial Growth: A Study on ASE-Listed Industrial Companies
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169686830&doi=10.1007%2f978-3-031-42463-2_19&partnerID=40&md5=dc39615371b082528322033a11dd8865

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, 11733, Jordan; Department of Marketing, Setif University, Setif, Algeria;

Faculty of Business, The World Islamic Science and Education University, Amman, Jordan

ABSTRACT: This study examines the impact of cash liquidity on the financial sustainability of industrial public shareholding companies listed on the Amman Stock Exchange (ASE) between 2015 and 2021. A purposeful sample of 28 companies was selected from the population of 53 listed companies based on the availability of complete financial data. Statistical methods using SPSS were employed to analyze the data. The study found that cash flow, as measured by net cash flow from all activities to total assets, net cash flow from all activities to total equity, net cash flow from all activities to total profit, and net operating cash flow to total assets, significantly affects the sustainability of profit growth, sales, and assets of these companies. However, the net cash flow from all activities to total equity does not impact sales growth. The study recommends that companies pay more attention to the cash flow statement and utilize the data therein to make investment and financing decisions. Additionally, companies should focus on improving cash liquidity management and determining the appropriate combination of equity and debt sources to reduce the cost of capital and maximize sustainable financial growth, leading to more profitable investment opportunities. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Hijazi, R.
Perceived Service Quality of Mobile Banking and Co-creation Intention: The Mediating Role of Epistemic Value and the Moderating Influence of Digitalization Anxiety
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169685318&doi=10.1007%2f978-3-031-42463-2_30&partnerID=40&md5=475cd0d89834aaad50a93a46c975285c

AFFILIATIONS: Department of Business Administration, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: In this paper, the Service-Dominant Logic (SDL) and the Electronic Service Quality Model (E-S-QUAL) are combined to assess customer value co-creation intention (CCI). To achieve this, participants among mobile banking users in Jordan were administered questionnaires. To evaluate the importance of mobile banking service quality (MBSQ), epistemic value, and digitalization anxiety in determining CCI, the SPSS, and Smart PLS software were used to perform mediation and moderation analyses. The findings confirm the assumption that MBSQ, epistemic value, and digitalization anxiety all impact CCI. Bank managers can use this research to help them allocate resources whilst developing m-banking platforms. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Maximizing Financial Performance and Sustainability Through Innovative Dividend Policies: Evidence from Emerging Market
(2023) Studies in Big Data, .
https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169682915&doi=10.1007%2f978-3-031-42455-7_12&partnerID=40&md5=49d6fa097091169b95766d4b1dfd58b7

AFFILIATIONS: Accounting Department, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study aims to investigate the impact of dividend policy on financial performance in the context of Jordanian commercial banks and explores how innovative dividend policies can contribute to both financial performance and sustainability. Specifically, the study analyzes the relationship between dividend per share (DPS), earnings per share (EPS), and price-earnings ratio (P/E ratio) with financial performance, represented by return on assets (ROA) and return on equity (ROE), for 13 Jordanian commercial banks from 2012 to 2021. Data was collected from the financial statements of the sample banks and analyzed using descriptive statistics, correlation analysis, and multiple linear regression analysis. The study found that EPS, DPS, and P/E ratio positively impact financial performance and that increasing EPS and DPS while maintaining a lower P/E ratio could be key to achieving financial performance in the context of Jordanian commercial banks. The study concluded that innovative dividend policies have the potential to enhance both financial performance and sustainability in Jordanian commercial banks. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Influence of Data-Driven Digital Marketing Strategies on Organizational Marketing Performance: Mediating Role of IT Infrastructure
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169682106&doi=10.1007%2f978-3-031-42463-2_31&partnerID=40&md5=935fff91131ccb7836593b859b462ad6

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The purpose of this research was to investigate the function that IT infrastructure played as a mediator between data-driven digital marketing strategies and the marketing performance of organizations. Dimensions of data-drive digital marketing strategies adopted included (Data collection, Data analysis, Segmentation, Targeting, Personalization, Automation and Optimization). The quantitative method was used to successfully complete the study's objectives, a questionnaire was distributed on a sample of (84) marketing managers and leaders within delivery services companies which are licensed and operating in Jordan. Results of study indicated that IT infrastructure mediates the relationship between Data-driven digital marketing strategies and marketing performance. Study recommended before implementing any data-driven marketing strategy, it is important to have clear business goals and metrics in place. Further recommendations were presented in the study. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Department of Accounting, Finance and Economics, Griffith Business School, Griffith University, Brisbane, QLD, Australia;

Department of Accounting, Seneca College of Applied Arts and Technology, Toronto, Canada

ABSTRACT: The purpose of this study is to examine how Big Data and Big Data Analytics (BDA) affect sustainability accounting and reporting. It provides qualitative evidence from financial managers perspective working in Canadian public firms listed on the Toronto Stock Exchange in the year 2023. This research evidence suggests BDA impact the proficiency and expertise of financial administrators when conducting engagement practices in public firms. Furthermore, the use of Big Data enables a more streamlined and precise reportage, increases profitability, enhances risk management techniques, and discovers potential for reducing costs. Finally, as with any technology, the comprehensive utilization of big data will incur certain adverse outcomes, some of which can be predicted, and a few, conversely remain completely unpredictable. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Artificial Intelligence and Digital Marketing in Jordan: Opportunities and Challenges
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169680044&doi=10.1007%2f978-3-031-42455-7_26&partnerID=40&md5=9efc2c487855f2319bda29b85bfa05d4

AFFILIATIONS: Faculty of Business, Alzaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This research explores the opportunities and challenges of artificial intelligence (AI) to improve technologies used in digital marketing. It aims to understand the impact of AI tools on digital marketing performance in Jordan. For this reason, we revised the literature published in previous empirical studies in Jordan. Those studies focused on local marketing agencies; Xotox Branding Agency, Bidaya Marketing Communications, FOCUS Marketing & Advertising and Brandsberry, that uses AI tools to improve their digital marketing capabilities. This returned several key areas: customer acceptance, ROI, and data security, which identified the main problems preventing businesses from getting the most out of their AI investments. Additionally, it provided some solutions and best practices for companies to consider when adapting AI technologies for digital marketing strategies. Furthermore, this research has yielded important insights into the potential for AI to revolutionise digital marketing in terms of automation, optimisation, personalisation, and cost and time savings within the Jordanian market. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Impact of Dynamic Capabilities and Organizational Agility on the Competitive Performance: The Mediating Role of Organizational Learning

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169677951&doi=10.1007%2f978-3-031-42463-2_11&partnerID=40&md5=c4d4d62a38b9ca0c13834be45ab7408c

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This research attempts to ascertain the mediating role of organizational learning between dynamic capabilities, organizational agility and competitive performance in the Jordanian commercial banks. Findings from partial least square structural equation modeling revealed that dynamic capabilities and organizational agility have a significant impact on competitive performance. Furthermore, the finding that organizational learning partially mediates the effects of dynamic capabilities, organizational agility and competitive performance suggests that the ability to learn is a crucial component of the bank's competitiveness. The current research provides new insight on how banks can develop and leverage their dynamic capabilities, agility and learning to enhance competitive performance. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Bagging vs Boosting Ensemble Classifiers in Predicting Companies' Financial Status

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169675909&doi=10.1007%2f978-3-031-42463-2_11&partnerID=40&md5=838d1df4f05c9421f8b453e742598997

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Nowadays, predicting companies' financial status became an essential part of the researchers' interest, given its importance and impact on several parities (i.e., stockholders, banks and workers). In this work, we propose ensemble bagging and boosting algorithms for predicting companies' financial status. In addition, real vastly imbalanced Polish companies' dataset considered to train and test the classifiers. SMOTE and SMOTE ENN balancing techniques used to solve the data imbalanced distribution problem. Accordingly, the ensemble boosting classifiers outperform the bagging classifiers in predicting companies' financial status. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Department of Accounting, Faculty of Administrative and Financial Sciences, Philadelphia University, Amman, Jordan

ABSTRACT: This study investigates the nexus among digital corporate social responsibility (CSR) practices and corporate sustainability as well as the moderating impact of perceived technological

environmental uncertainty in this context. It provides empirical evidence from the Jordanian market. To achieve the study's purpose, 170 e-survey questionnaires were emailed to all Jordanian corporations listed on the Amman Stock Exchange. In the research letter, we invited the respondent to be the chief executive officer (CEO). Using a partial least squares structural equation modeling (PLS-SEM), the results show that corporate sustainability is positively affected by digital CSR practices and that the relationship between digital CSR practices and corporate sustainability is positively moderated by perceived technological environmental uncertainty. Finally, this study has immediate impact for a wide range of managers, decision-makers, consultants, and policymakers. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Cultural and Social Impact of Artificial Intelligence on Islamic Law Standard: A Fundamental Purposeful Study

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169672864&doi=10.1007%2f978-3-031-42455-7_18&partnerID=40&md5=121c023135ffd7e2383a6c60cefb7b50

AFFILIATIONS: College of Law, Al-Zaytoonah University, Amman, Jordan

ABSTRACT: The study tackled the cultural and social impact of artificial intelligence on the Islamic law traits - a fundamental purposeful study. It also discussed the advantages and disadvantages of dealing with this sophisticated technology - Artificial Intelligence - in light of Islamic law. The paper attempted to establish the legal perspective in using this technology. One of the foremost important results the study came up with is that discovering the goals of those working in this technology with regard to development and promotion. One of the most important recommendations the study also came up with, is Islamic legal authorities need to serve Sharia's goals and to be independent from others. "And pursue not that of which thou hast no knowledge; for surely the hearing, the sight, the heart all of those shall be questioned of." Sustainable Business Excellence Through Digitalisation: From an Educational and Businesses Point of View

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169669502&doi=10.1007%2f978-3-031-42455-7_20&partnerID=40&md5=8d691a772d016ecf701c2578ab9bf5ba

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan;

Alliance University, Bengaluru, India

ABSTRACT: Businesses, social organizations, including academic and educational institutions as well, even the types of government in place today will all undergo fundamental shifts due to the advent of digital technology. In this sense, we will approach the company's digitalization from the viewpoint of the three pillars, namely social, economic, and environmental, to conclude the degree to which this new and last revolution corresponds to the principles of sustainable development. Through the use of econometric analysis, this research aims to investigate the economic connections between the digitalization of business and sustainable development. The findings of the econometric study will be used to assess the degree to which the occurrence of this phenomenon will impact the characteristics that define sustainable development. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Bitcoin Market and Post Covid-19: Empirical Evidence from Asian Countries

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169669366&doi=10.1007%2f978-3-031-42455-7_11&partnerID=40&md5=8bb6c45599e8158c8c8847821aa4692e

AFFILIATIONS: Accounting Department, Tien Giang University, Tien Giang Province, My Tho, Viet Nam; Accounting Department, Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Our paper aims to scrutinize the COVID-19 indicators and blockchain (BC) features on the returns of Bitcoin. This paper focus on the most owned and used cryptocurrencies in Asian countries. The ARDL panel is used for hypothesis testing. Random effects modeling (REM) and Generalized Moment Method (GMM) were utilized to scan the robustness of the results. Two newly discovered results have divulged; firstly, Vaccine Confidence Index (VCI) boosts economic recuperation and increases Bitcoin returns. Secondly, disclosed block chain size is required for Bitcoin. Despite the uncertain post-Covid-19 conditions and the unregulated crypto market, the government plays an important role, significantly driving the economic recovery. This benefits policymakers and investors. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Impact of Sustainability Principles on Organizational Commitments and the Mediating Effect of Digital Transformation Process

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169668862&doi=10.1007%2f978-3-031-42455-7_25&partnerID=40&md5=9d52aaedca6eb3988af98d7b7ec71ea5

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study seeks to determine the impact of the five principles of sustainability (pollution reduction, recycling, renewable resources, green innovation, and ethical sustainability) on the types of organizational commitment (affective, continuance, and normative). It also seeks to explore the mediating effect of digital transformation on the relationship between sustainability principles and organizational commitment. A random sample of 202 respondents was taken from 4 Jordanian pharmaceutical companies. The results confirmed that there is positive effect of two principles (renewable resources, green innovation) on the three types of organizational commitment (affective, continuance, and normative). The results also showed that there was no significant effect of other three principles (pollution reduction, recycling, and ethical sustainability) on the three types of organizational commitment. The results of the study proved that the digital transformation had a significant positive impact on the relationship between the principles of sustainability and types of organizational commitment. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

An Empirical Study of the Effect of Enterprise Resource Planning System on Tobin's Q

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169666028&doi=10.1007%2f978-3-031-42463-2_6&partnerID=40&md5=7b54b1e20b9fbf587d54a9ae1ef6e3b0

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: The purpose of this article is to investigate the nexus between Enterprise Resource Planning (ERP) system and company market performance measured by Tobin's Q in Jordan. This research employs a matched-pair design and the robust standard errors for random-effects regression model to draw conclusions. The study sample is based on 58 non-financial firms listed on Amman Stock Exchange (ASE) from 2020 to 2022. The results show that ERP implementation is positively and significantly related to company market performance, indicating that cutting-edge technologies (i.e. ERP system) can be crucial in improving the firm market performance and an important measure for the sustainability of Jordanian businesses. This article provides novel evidence detailing the effect of ERP adoption towards market performance in an emerging market following the limited amount of research on the topic. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

The Impact of E-Government and Size on Corruption: An Empirical Study on Jordan

(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169663790&doi=10.1007%2f978-3-031-42455-7_10&partnerID=40&md5=2b6b759dec6e6e748ea6fc5b996b3cd6

AFFILIATIONS: AlZaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study examines the effect of e-government and the size of government on corruption using Jordan as a case study during the period 2001-2020 by employing the Vector Error Correction Model (VECM). It is unique as it is the first of its kind that tackles the issue of corruption in Jordan. It provides empirical evidence that the implementation of e-government (GI) reduced corruption and rising government size (GER) along with economic freedom (EF), and democracy index (DI or lowering democracy) positively affect the corruption perception index CI (i.e. lowering corruption). The positive correlation between GER and CI is obtained in association with improved economic freedom and the implementation of e-government. It is surprising that when the DI increases (i.e. lowering democracy level) CI also increases (i.e. lowering corruption). This be avoided through improved political freedom and participation, minimized income inequality, so as to widen middle income class, in the presence of improved and strengthened Judiciary system and the rule of law. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Accounting Department, Al-Zaytoonah University, Airport Road, Amman, Jordan;
Agribusiness Department, Universitas Medan Area, Medan, Indonesia

ABSTRACT: This study aims to determine whether executive compensation intends to spur managers to pursue Financial Performance (FP) issues as assessed by sustainability Performance (SP) disclosures, in connection to Jordanian banks from 2018 to 2020, influenced by ROA and Tobin-Q, as FP indicators. Based on stakeholder theory, this study also provides discussion of the mediating function of green accounting indicators (GI). Results showed only a relationship in terms of SP on ROA, according to the regression association between SP and FP. The GI findings indicate that there is no correlation between SP and Tobin-Q as a performance measure, but that there is a mediating role for green accounting indicators within the relationship between SP and FP directed by ROA. This suggests that Jordanian banks may be more inclined to pursue sustainability disclosure indicators in the future and emerging-market exporters' adoption of more green techniques as an incentive; ultimately, that influences a firm's financial performance. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Cutting-Edge Technology and Blockchain: A Bibliometric Analysis (2017-2022)
(2023) Studies in Big Data, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169662180&doi=10.1007%2f978-3-031-42455-7_15&partnerID=40&md5=515d86233834c87a5d7b7f06a8f0fa40

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan;
Isra University (Jordan), Amman, Jordan

ABSTRACT: This paper aims to analyze the Scopus-indexed English-language literature and apply the bibliometric methodology to show the reality of blockchain and cutting-edge technology intellectual structure and emerging trends from a large quantity of data between (2017) and (2022). The bibliometric analysis, therefore, is applied to describe this domain's evolution and structure, including co-authorship, bibliographical coupling, and co-citation. The findings demonstrate that China is the most relevant country, the Hua Zhong University of Science and Technology is the most pertinent institution, and the ACM international conference proceeding series is the most applicable source. This paper mainly contributes to the existing literature by identifying the benchmark authors, locations of blockchain and cutting-edge technology, and journals, summarizing the most cited papers, and classifying the research classes of research streams in cutting-edge technology and blockchain, namely: blockchain, cutting-edge technology, and artificial intelligence, demonstrating the future upcoming trends. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The solvability of the semilinear parabolic problem with integral overdetermination condition for an inverse problem is investigated in this work. Accordingly, we solve the generated direct problem by using the so-called "energy inequality" method and then the inverse problem is handled with the use of the fixed point technique. © 2023 InforMath Publishing Group.

Preparation and Characterization of Capsaicin Encapsulated Polymeric Micelles and Studies of Synergism with Nicotinic Acids as Potential Anticancer Nanomedicines
(2023) Journal of Pharmacy and Bioallied Sciences, .

https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169511286&doi=10.4103%2fjpbs.jpbs_311_22&partnerID=40&md5=9e948e9156df98eddb51151c507371a8

Physics Department, Yarmouk University, Irbid, Jordan

ABSTRACT: Background/Objective/Methods: Capsaicin micelles were prepared by the direct dissolution using the amphiphilic copolymer Pluronic P123 and advanced for substantially novel submicro-nanocytotoxicity. Results: Superior cytotoxicity of capsaicin loaded nanomicelles vs. both the raw capsaicin and reference cisplatin in pancreatic PANC1, breast MCF7, colorectal resistant CACO2, skin

A375, lung A549 and prostate PC3 cancer cell lines were delineated. Nicotinic acid (NA) derivative 39 (2-Amino IsoNA) had antiinflammatory potential but consistently lacked antiproliferation in MCF7, PANC1 and CACO2. Besides NA derivatives 8 (5-MethylNA) and 44 (6-AminoNA) exhibited lack of antiinflammation but had comparable antitumorigenesis potency to cisplatin in PANC1 cells. Though capsaicin loaded nanomicelles exerted pronounced antiinflammation (with IC 50 value of 510 nM vs. Indomethacin's) in lipopolysacchride-induced inflammation of RAW247.6 macrophages; they lacked DPPH scavenging propensities. Free capsaicin proved more efficacious vs. its loaded nanocarriers to chemosensitize cytotoxicity of combinations with NAs 1(6-Hexyloxy Nicotinic Acid), 5(6-OctyloxyNA), 8(5-MethylNA), 12(6-Thien-2yl-NA), 13(5,6-DichloroNA) and 44(6-AminoNA) in CACO2, PANC1 and prostate PC3. Conclusion: Capsaicin loaded nanomicelles proved more efficacious vs. free capsaicin to chemosensitize antiproliferation of cotreatments with NA derivatives, 1, 5, 8, 12, 13 and 44 (in skin A375), 1, 5, 8 and 12 (in breast MCF7), and 1, 5, 12 and 44 (in lung A549). © 2023 Journal of Pharmacy and Bioallied Sciences.

ABSTRACT: This research investigates the impact of virtual laboratories (VLabs) based on artificial intelligence (AI) on developing students' motivation toward learning mathematics. A semiexperimental approach is used to achieve the research objectives. The research sample, consisting of 80 students from the seventh grade, is selected by the purposeful sampling approach. The research sample is randomly distributed into three groups: two experimental groups and one control group. The first group of 26 students is taught using the AI-based VLabs, while the second group of 27 students is taught using a VLab based on 3D visual imaging, and the third group, a control group consisting of 27 students, is taught using the traditional approach. The research instrument, a questionnaire for learning motivation, was designed after ensuring its validity and reliability. The findings of the motivation questionnaire indicate that students in the first experimental group have more motivation to learn mathematics than students in the second experimental group and the control group. The results also show that the students in the second experimental group have more motivation to learn mathematics than the students in the control group. Given the said findings, the research recommends using virtual laboratories based on artificial intelligence and all its applications in the learning process due to their impact on students' mathematics learning. © 2023 by the authors of this article. ABSTRACT: This study purposed to determine the levels of nursing informatics competency and self-efficacy in clinical practice and influencing factors on self-efficacy among Palestinian nurses in hospitals. A descriptive-correlational design was adopted. The nurses who worked in the North West Bank of Palestine (N = 331) were recruited. The data were collected using the Self-Assessment of Nursing Informatics Competencies Scale (SANICS) which consists of 30 items rated on a 5-point Likert scale, ranging from 1(not competent) to 5 (expert), and scored by calculating the mean as follows: novice/low (1.00-2.59), beginner/moderate (2.60-3.39), and competent/high (3.40-5.00); and the New General Self-Efficacy Scale (NGSE) that consists of eight items rated on a 5-point Likert scale, ranging from 1(strongly disagree) to 5(strongly agree) and scored according to the average of the scale, whereas the average of > 3 indicated high self-efficacy, and ≤ 3 reflected low self-efficacy. The data were collected during the period from September to November 2020. Findings showed that the total mean score for the nursing informatics competency scale was 2.9 (SD = 0.7), which indicated that the nurses had a moderate level of nursing informatics competency. The average score for the self-efficacy scale was 3.5 (SD = 0.8), which reflected that nurses had high self-efficacy. Self-

efficacy in clinical practice increased with age and with nursing informatics competency. Thus, it is necessary to enhance nurses' informatics competency by developing continuous educational programs about this technology for nurses and engaging nurses in such programs to enhance their competencies in this system. © 2023 Taylor & Francis Group, LLC.

ABSTRACT: Adapting historical city buildings into modern facilities is a basic problem in architecture today. In many large cities, historical centers preserve cultural heritage, including spiritual, cultural, economic, and social capital of irreplaceable value. Because of their importance, these centers must consider the unique characteristics of their surroundings, including harmony of size, spatial composition, architectural environment, facades, and the facilities in general. Disharmony in the architectural design of these centers is evident in the non-compliance of new objects, particularly in historical areas of the city. The restoration, reconstruction, and repair of these historical sites require special knowledge. Experts with this special knowledge can implement modern methods, strategic and operational modes of architecture, and public programs to preserve the historical and cultural values of these sites, thus pre-serving them for the future, which follows the sustainable development concept. The main conclusion of the re-search is that unique modern buildings, including novel architectural and constructive elements, can coexist with historical ones by using right policies and methods. © 2023, Politechnika Lubelska. ABSTRACT: Purpose – For 5G wireless communication at frequencies below 6 GHz, this research describes an electromagnetic bandgap (EBG) structure based on an electrically coupled split-ring resonator (ECSRR). To create the EBG, the ECSRR is embedded within a structure similar to an interdigital capacitor. Design/methodology/approach – The proposed EBG design is composed of an electrically coupled structure that resembles an interdigital capacitor and a structure built of split-ring resonators. The proposed EBG structure was printed on a FR4 substrate that had a 4.4, 1.6 millimeters thickness, and a $\tan \delta = 0.025$. An interdigital capacitor-like structure is connected to the inner split-rings, and the top layer consists of two sets of split-ring resonators that are electrically connected. A wire-like structure is printed on the substrate's bottom layer. Findings – The suggested ECSRR EBG structure has a reflection phase bandwidth of 2.65 GHz between 3.5 and 6.15 GHz, and also a bandgap property bandwidth of 2.9 GHz between 3.3 and 6.2 GHz. Without an EBG structure, the CPW-fed microstrip quarter wave monopole antenna has a gain(maximum) of 2.574 dBi at 4.15 GHz and a bandwidth of 4.6 GHz between 3.4 and 8 GHz. Gain(maximum)of 8.785 dBi is achieved at 4.15 GHz when the ECSRR EBG structure is combined with a CPW-fed microstrip quarter wave monopole antenna . Originality– The suggested ECSRR EBG structure is merged with a two-element ECSRR bowtie antenna to verify its bandgap property. By inserting the ECSRR EBG structure's 2x4 array in between the two elements of the bow-tie antenna, we can decrease their mutual coupling. Maximum isolation is achieved at 4.9 GHz, with mutual coupling below -32 dB over the whole operational frequency range. Decision science enables antenna designers to analyze, optimize, and track the performance of the antenna characteristics. The following are some of the potential benefits of the proposed study: It is argued that statistical and regression properties can be used to create a powerful tool for feature extraction. To better understand how antenna design choices affect antenna performance, we compare different regression models. To accurately calculate the S parameters from the relevant UWB antenna dimensions, a random

forest classifier that has been optimized for this task has been developed. © 2023 Hindawi Limited. All rights reserved.

ABSTRACT: Background/Objective: Alzheimer's disease (AD) is mainly characterized by amnesia that affects millions of people worldwide. This study aims to explore the effectiveness capacities of bee venom (BV) for the enhancement of the memory process in a rat model with amnesia-like AD. Methods: The study protocol contains two successive phases, nootropic and therapeutic, in which two BV doses (D1; 0.25 and D2: 0.5 mg/kg i.p.) were used. In the nootropic phase, treatment groups were compared statistically with a normal group. Meanwhile, in the therapeutic phase, BV was administered to scopolamine (1mg/kg) to induce amnesia-like AD in a rat model in which therapeutic groups were compared with a positive group (donepezil; 1mg/kg i.p.). Behavioral analysis was performed after each phase by Working Memory (WM) and Long-Term Memory (LTM) assessments using radial arm maze (RAM) and passive avoidance tests (PAT). Neurogenic factors; Brain-derived neurotrophic factor (BDNF), and Doublecortin (DCX) were measured in plasma using ELISA and Immunohistochemistry analysis of hippocampal tissues, respectively. Results: During the nootropic phase, treatment groups demonstrated a significant ($P < 0.05$) reduction in RAM latency times, spatial WM errors, and spatial reference errors compared with the normal group. In addition, the PA test revealed a significant ($P < 0.05$) enhancement of LTM after 72 hours in both treatment groups; D1 and D2. In the therapeutic phase, treatment groups reflected a significant ($P < 0.05$) potent enhancement in the memory process compared with the positive group; less spatial WM errors, spatial reference errors, and latency time during the RAM test, and more latency time after 72 hours in the light room. Moreover, results presented a marked increase in the plasma level of BDNF, as well as increased hippocampal DCX-positive data in the sub-granular zone within the D1 and D2 groups compared with the negative group ($P < 0.05$) in a dose-dependent manner. Conclusion: This study revealed that injecting BV enhances and increases the performance of both WM and LTM. Conclusively, BV has a potential nootropic and therapeutic activity that enhances hippocampal growth and plasticity, which in turn improves WM and LTM. Given that this research was conducted using scopolamine-induced amnesia-like AD in rats, it suggests that BV has a potential therapeutic activity for the enhancement of memory in AD patients in a dose-dependent manner but further investigations are needed. © 2023 Bentham Science Publishers.

ABSTRACT: The synthesis of novel 5-(2-((1(E/Z),2E)-1,3-disubstitutedallylidene)hydrazinyl)-1,3-dimethyl-4-nitro-1H-pyrazole (4a-k) was attempted via reaction involves a nucleophilic attack which takes place at the carbonyl group of the α,β -unsaturated carbonyls. The transformation proceeds via an effective addition-elimination reaction in the presence of catalytic amount of concentrated H₂SO₄.

The cytotoxicity of synthesized compounds was evaluated against two tumor cell lines, MCF-7 and MDA-MB-231, via MTT assay. The compounds 4a-d showed better toxicity than tamoxifen on MCF-7 cells, ranging from 26.28 to 12.96 μM with 4b having the lowest IC50 among the compounds tested. On the other hand, the compounds have moderate toxicity on MDA-MB-231 with 4c showing the lowest IC50. The docking study suggests that these Schiff bases chalcone scaffolds might facilitate the further development of investigated compounds as anticancer agents. © 2023 Taylor & Francis Group, LLC.

ABSTRACT: Introduction: A midwife needs to know how to assess fetal heart rates, recognize and interpret fetal heart patterns, report any substandard patterns, and initiate supportive measures as necessary. Objective: This study aims to assess the knowledge and attitudes of midwives concerning the interpretation and use of cardiotocographs. Materials and Methods: This cross-sectional study involves 183 midwives working in maternity units across all Jordanian regions. An online survey was used to collect data, including 6 demographic questions, 10 questions about knowledge, and 25 questions about attitude. The data were analyzed using descriptive statistics (Mean \pm SD, No. [%]), ANOVA, and the Pearson correlation tests. The significance level was set to be <0.05 . Results: Most participants were 21 to 30 years old, and most midwives (59.6%) had no more than six years of experience. The result showed that the total scores for the knowledge and attitude regarding cardiotocographs (CTGs) interpretation and usage were 68.7% and 73.0%, respectively. There is a significant relationship between the knowledge about the interpretation and use of CTGs and the years of experience ($P=0.003$), with higher knowledge scores among midwives with fewer than 6 years of experience. Furthermore, there is a significant relationship between the knowledge of CTGs and level of education ($P=0.002$), indicating higher knowledge scores among midwives with a degree. The knowledge about classifying the CTG traces was significantly correlated with the region of work ($P=0.018$), with higher scores among midwives from the southern region. Finally, there was a positive correlation between knowledge and attitude ($r=0.007$, $P<0.05$). Conclusion: Based on the study result, the participant's knowledge and attitudes are not satisfactory; thus, comprehensive education and training should be prioritized to improve midwives' knowledge and attitudes toward using cardiotocograph. © 2023, Journal of Holistic Nursing and Midwifery. ABSTRACT: Introduction: The prevalence of obesity is increasing worldwide, especially among pregnant women. Maternal obesity is a serious risk factor during pregnancy associated with pregnancy-related complications for the mother and her child. Objective: This study aimed to estimate the prevalence of Jordanian pregnant women who are overweight or obese. The relationship between high body mass index and selected obstetrical conditions was also investigated. Materials and Methods: A descriptive, correlational, cross-sectional design was used on a purposive convenience sample of 411 pregnant women in Jordan. Results were obtained through structured interviews, antenatal routine lab tests, physical measurements (height and weight), body mass index (BMI), thyroid function tests (free thyroxine [FT4] and 2e [TSH]), and Edinburgh postnatal depression scale. Descriptive statistics, including means, standard deviation, and inferential statistics, such as Pearson correlation, t-test, and ANOVA, were used to describe and examine the relationship among the study variables. Results: Based on the results, 58.4% of the participants had one to four pregnancies, and 54.5% had at least one abortion. Based on their weight before pregnancy, there was a high frequency of overweight (29.7%) and obesity (25%) among pregnant women. High maternal BMI for the mother is correlated

significantly with pregnancy complications and offspring neurocognitive impairments. Additionally, maternal obesity is a risk factor for hypothyroidism. BMI was correlated with hypothyroidism ($r=0.141$, $P=0.004$), fetal distress ($r=0.217$, $P=0.0001$), postnatal depression ($r=0.161$, $P=0.0001$), and preterm labor ($r=0.115$, $P=0.020$). The thyroid function tests and thyroid stimulating hormone levels were correlated with maternal and fetal conditions, such as infertility, fetal death, hemorrhage, and cerebral palsy among children. Conclusion: High BMI associated with old age is a critical factor related to many maternal and infant health conditions. Repeated pregnancy failures, fetal health conditions, and maternal complications, including hypothyroidism, can be associated with maternal obesity. Healthcare providers should raise awareness among mothers and care providers on the serious conditions associated with obesity. © 2023, Journal of Holistic Nursing and Midwifery. ABSTRACT: Several studies were conducted in the past for evaluating the benefits and shortcomings of virtual tours in various sites including university campuses. The previous studies addressed numerous issues such as providing initial perceptions, guiding visitors, etc. Most of these issues can be related, up to some extent, to Jordanian universities in general. However, there are issues specific to Jordan that need to be addressed such as the availability of fast internet connection and suitable data caps. Furthermore, new demands rose recently such as the need for social distancing under COVID-19 restrictions, thus limiting the sizes of physical tour groups. This paper reviews previous studies on virtual tours and evaluates their applicability to Jordanian university and their present practicality. Then, the paper outlines the motivations and limitations of virtual campus tours in Jordan. © 2023 IEEE.

ABSTRACT: In this paper, estimating real and reactive power measurements provided in smart grids through wireless sensor networks is considered. The communication channel is assumed to suffer from additive white Gaussian noise (AWGN). k-means clustering is used to learn the underlying structure of the collected power measurements. Then, nearest-neighbour method is used to estimate the power measurements from the noisy received measurements. Two clustering approaches are proposed. First, clustering the real and reactive power measurements individually. Second, combining the power measurements and clustering jointly. Simulation results show very small estimation errors for both methods even if a small number of clusters is small, where, the individual clustering performs better. On the other hand, the joint clustering method performs better if the number of clusters increases. © 2023 IEEE.

ABSTRACT: The rise in bulk email phishing attempts has emerged as a serious cyber-risk for businesses given the pervasive usage of email as a primary form of communication. Despite the existence of manual and technical countermeasures, phishing emails still pose a risk of deceiving employees.

Machine learning has played a vital role in improving the detection of many types of cyberattacks, including email phishing. In this paper, the utilization of a machine learning-based IDS model to detect phishing emails before they reach inboxes is proposed. A review of phishing email detection techniques and algorithms is presented, and a publicly available dataset of ham and phishing emails is discussed and used. Multiple machine learning classifiers were deployed (RF, SVM, Adaboost, Logistic Regression, and KNN), and their evaluation scores were generated and analysed. Using recursive feature elimination and multi-feature analysis, Random Forest outperformed the other classifiers with an accuracy of 98.6%, closely followed by Adaboost with 98.1%. © 2023 IEEE.

ABSTRACT: Cancer is a complex and diverse group of diseases characterized by the uncontrolled growth and spread of abnormal cells in the body. Tumors, which are commonly associated with cancer, refer to abnormal masses of tissue that can develop in various organs or tissues. Cancer can arise from almost any cell type in the body and can affect different organs and systems. The disease occurs when the normal processes of cell division and growth go awry, leading to the formation of malignant tumors. These tumors have the potential to invade nearby tissues and spread to distant parts of the body through a process known as metastasis. In this paper, we aim to present a numerical solution for a recent fractional-order model related to Immune-Chemotherapeutic Treatment for Breast Cancer (ICT) using a novel numerical scheme called the Modified Fractional Euler Method (MFEM). We will also compare our proposed scheme with the traditional numerical scheme, Fractional Euler Method (FEM), through numerical simulations. © 2023 the author(s).

ABSTRACT: Purpose: This paper aims to investigate the relationship between voluntary disclosure and the cost of capital as a direct relationship and as an indirect relationship mediated by information asymmetry. It provides evidence from Jordan as a developing economy. Design/methodology/approach: The sample was selected from the companies listed in the first market of the Amman Stock Exchange during the period 2010-2019. Four exclusion criteria were used in selecting the companies for analysis. Findings: The findings show that the cost of capital and information asymmetry are negatively affected by voluntary disclosure, as well as that the cost of capital is positively affected by information asymmetry. In addition, information asymmetry does not mediate the relationship between voluntary disclosure and the cost of capital. Originality/value: This research looks at the mediating effect of information asymmetry in the relationship between voluntary disclosure and the cost of capital; thus, it provides new explanations about it using empirical evidence from a developing economy. As a necessary consequence, this research has the potential to significantly contribute to the existing body of knowledge and literature in this field. © 2023, Emerald Publishing Limited.

ABSTRACT: During the COVID-19 pandemic, social media played an important role in disseminating information and procedures for dealing with this pandemic, however, there is a lack of studies investigating the perceptions of social media users concerning the regulations and measures issued by authorities to encounter and cope with the COVID-19 pandemic, which was exceptional at that time. Therefore, this study purposed to explore the perceptions of social media users about the regulations and instructions of the authorities' measures in times of the COVID-19 pandemic in Jordan. A qualitative method including thematic analysis and content analysis was adopted to evaluate social media posts, which involved the text and images found in these posts during the period from March 2020 to June 2020. Three social media websites were included in the study, namely Facebook, Snapchat, and Twitter. Five themes were extracted from 317 posts, including COVID-19 is a bubble economy, COVID-19 is a political game, health-related information about COVID-19 and safety precautions, COVID-19 regulations influenced personal restrictions and freedom confiscation, and COVID-19 is a financial burden. Thus, this study may provide recommendations for policy-makers to develop campaigns and activities based on people's perspectives and design the appropriate health and economic promotions and interventions. © 2023 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Sentiment analysis has been studied widely in the literature. Despite these many works, there is a lack of works that concentrates on finding the basic emotions behind these sentiments. This problem becomes more challenging in under-resourced languages, such as Arabic. Furthermore, to our knowl-edge, no works have studied this problem from the reader's versus the writer's perspectives. In this work, we study sentiment analysis and basic emotions extraction from the writer's perspec-tive, which is the person who wrote the text, to complement an earlier work of ours focusing on the reader perceptive. Using a dataset of Arabic tweets, we compare the two perspectives. Since each tweet may contain multiple emotions, we use Multi-Label Classification (MLC) techniques. Three classifiers are compared: Decision Trees (DT), Random Forest (RF), and K-Nearest Neighbor (KNN). Prior results showed that the top performing classifier in the case of the reader dataset was RF. For this work focusing on the writer dataset, RF is not a clear winner for all performance

metrics under consideration as DT produces competitive results. © 2023 IEEE.

ABSTRACT: Earthquakes are natural disasters that can cause severe damage to human life and infrastructure. Therefore, accurate earthquake prediction is crucial for disaster prepared-ness and risk reduction. Recently, machine learning techniques have shown promise in earthquake prediction. In this paper, we present a comprehensive study on the application of machine learning techniques for earthquake prediction. We first review the existing literature on earthquake prediction using machine learning techniques, including neural networks. We then propose a machine learning approach for earthquake prediction, based on analyzing seismic data. The proposed approach uses a convolutional neural network to extract relevant features from the seismic data, and a long short-term memory network to predict the probability of an earthquake. We evaluate the performance of the proposed approach on earthquake datasets from different regions and demonstrate its high accuracy in earthquake prediction. Our study provides a new perspective on earthquake prediction using machine learning techniques and highlights the potential of deep learning approaches for improving earthquake prediction. The proposed approach can be used in conjunction with existing earthquake prediction methods to provide more accurate and reliable predictions, which can help mitigate the potential impact of earthquakes on human life and infrastructure. © 2023 IEEE.

ABSTRACT: In this article, we are devoted to study the problem of the existence, uniqueness and positivity of the global solutions of the 3×3 reaction-diffusion systems with the total mass of the components with time. We also suppose that the nonlinear reaction term has a critical growth with respect to the gradient. The technique that we used to prove the global existence is the method of the compact semigroup. © 2023 KSCAM.

ABSTRACT: Gradable Epistemic Modals (GEMs) such as certain or likely have been analyzed to have the semantics of gradable adjectives, which constrain their epistemic modality. This squib analyzes the modal use of the sentential particle qad in Standard Arabic which has the following puzzling behavior: particle qad gives rise to the certainty/likelihood modality meaning only when it is composed with the tense expression of its propositional complement. Modal qad then manifests itself as an extreme, non-gradable modal with no lexically encoded but grammatically derived scale meaning. A probabilistic semantics is proposed to derive the truth conditions of the epistemic modal meaning of qad based on a monotonic, probabilistic time-world branching model. The analysis assigns maximum degree of likelihood to qad in the past tense which triggers certainty. It also assigns a minimum degree of likelihoods to qad in the present tense which triggers possibility. © 2023 The Author(s). Published by Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: This study seeks to explore the impact of project management ethics on the corporate reputation. Project management ethics included five dimensions: the first four dimensions (responsibility, respect for commitments, fairness, and honesty) were taken from the project management ethics code issued by the American project management institute, with a fifth dimension being ethical citizenship proposed by the researchers. The study also sought to determine the impact of employee satisfaction as a mediating variable on the relationship between project management ethics and company reputation. The study was carried out on the Greater Amman Municipality (the capital of Jordan), which is characterised by a number of projects implemented in many sites by its engineering units. The number of respondents participating in the study sample was 112 respondents, including engineers, technicians, and administrative employees. The results of the study confirmed that all dimensions of project management ethics had a positive impact on the company's reputation, with the exception of ethical citizenship, which had no significant impact on the corporate reputation. In addition, employee satisfaction as a mediating variable had a significant impact on the relationship between ethics and the corporate reputation. Copyright © 2023 Inderscience Enterprises Ltd.

ABSTRACT: This paper provides a detailed bibliometric analysis of the Libyan State's scientific publications (Libya). The study is based on data from the well-known Scopus database. The study spans the years 1948 to 2022. The study examines the growth of annual publications and citations. It has been demonstrated that over the last five years, 36% of total publications and 66% of total citations have been achieved. Science mapping activities such as co-occurrence and co-citation networks were used to reveal thematic clustering and research topic trends. The top source title with the most articles is the 2021 1ST MI-STA conference, which has 142 articles. The LANCET journal is the most frequently cited locally, with 1181 articles citing it, and the most prolific author is Dr. ElHadi from the University of Tripoli with 76 articles. © 2023 IEEE.

ABSTRACT: Recent years have witnessed significant and rapid developments in technological trends of teaching in educational institutions worldwide. We have seen online learning methods offering sufficient and effective solutions during 2020 and 2021. Although online learning had many merits, it did not offer a classroom-like environment. Blended learning has re-appeared as a good alternative that combines between the advantages of online and face-to-face (F2F) learning using learning management systems (LMS) like Moodle. In this paper, a series of Moodle reports were utilized to evaluate students' performance and engagement in two blended engineering courses throughout four consecutive semesters. Results showed that the online part of the courses had about 110 views and 9 posts per student in all four semesters. This paper also presents findings on two formats of blended learning: (67% F2F and 33% online) and (50% F2F and 50% online). Results showed that there was a change in students' engagement and studying behaviour between the two formats. Finally, students' views and posts in the courses are compared against the timings at which midterm and final exams occurred. © 2023 IEEE.

ABSTRACT: Salinity is becoming more expanded globally. Soil salinity imposes a great challenge for vegetable-crops production in arid and semiarid regions. Cucumber (*Cucumis sativus* L.) is the fourth most important vegetable crop worldwide. In this review, we discuss the complex network of effects, and the ways cucumber responds to salinity. Salt stress inhibits almost all growth phases and yield components of cucumber. Accumulation of Na⁺ and/or Cl⁻ ions in cucumber tissues disturbs the absorption of other ions causing ionic imbalance which affect stomatal opening. Nevertheless, high levels of NaCl in soil inhibit water uptake in the root medium exposing cucumber to osmotic stress. Osmotic stress broadly interrupts metabolic pathways by altering enzymatic activity. Both, ionic and osmotic stresses induce ROS amassing in cucumber tissues. ROS directly constrain photosynthesis by decreasing levels of total chlorophyll and degrading PSII as well as corrupting thylakoid membranes. Ultimately, NaCl-induced stress inhibits cucumber seed germination, roots and shoots growth and development, fruit quality and yield production. © 2023, Australian Journal of Crop Science. ABSTRACT: Introduction: Psychological aspects are common in patients with heart failure (HF). Psychological aspects have negative consequences in patients with HF. Objective: This study was conducted to gain a deeper understanding of the consequences of psychological aspects in Jordanian patients with HF. Methods: This study is a qualitative study conducted with the participation of 24 patients with HF. Data were collected using semi-structured interviews. Results: The main theme of the findings can be expressed as "Consequences of psychological aspects of HF." The following four sub-themes emerged from the data: social isolation, disturbance of feelings, being non-compliant, and growing burden on the health care system. Conclusion: The findings revealed the need for informing healthcare providers about the negative consequences of psychological aspects and develop clinical guidelines to evaluate psychological aspects to support these patients. © The Author(s) 2023.

ABSTRACT: In this paper, carbon nanotubes (CNT) are synthesized using the microwave oven method, which offers several advantages, including a simple, quick, inexpensive, and solvent-free growing method. To produce CNT, a mixture of graphite and ferrocene catalysts had to be flattened inside a microwave oven for five seconds at room temperature. CNT was produced using various ratios of graphite and ferrocene, and analyses indicated that a 70:30 graphite/ferrocene ratio produced better nanocrystalline CNT. To optimize CNT properties, five processes of purification were used to dispose of impurities like metal particles and support material from the as-produced carbon nanotubes. Raman spectroscopy, field emission scanning electron microscopy (FESEM), energy dispersive X-ray spectroscopy (EDX), X-ray diffraction (XRD), and Fourier transform infrared spectroscopy (FTIR) was used to characterize the CNTs both after and before purification. After acid treatment and centrifugation, the amount of amorphous carbon and iron particles significantly decreased. Additionally, following the purification process, the ID/IG decreased by 0.14 and the I2D/ID increased by 0.55 for the purified CNTs. Furthermore, the FTIR spectra of the untreated and functionalized CNTs confirm the presence of carboxyl groups on pure CNTs and -OH moieties in sorbed water. © 2023, World Scientific and Engineering Academy and Society. ABSTRACT: Purpose: The digital transformation revolution has brought outstanding changes to business organizations, especially in the digital accounting transformation domain. Consequently, the purpose of this study is to explore the important role of digital accounting transformation in improving business performance in the context of the banking industry. Design/methodology/approach: Data were collected through a questionnaire from the Jordanian bank sector with a sample of 190 respondents. Partial least squares structural equation modeling (PLS-SEM) was used to analyze the collected data and test the hypotheses. Findings: The results have shown that the adoption of digital accounting, adoption of FinTech innovation and technological competition are the major drivers for improving business performance. All direct paths leading to improving business performance were found to be significant in the hypothesized directions, while technological savvy was found to indirectly affect the relationship between (the adoption of digital accounting and FinTech innovation) and improving business performance. Originality/value: The current study is differentiated from other studies by developing a theoretical research model to incorporate the adoption of digital accounting, adoption of FinTech innovation, technological competition, technological savvy and business performance in the Jordanian context under the digital transformation revolution. For practitioners, the findings provide policymakers with meaningful insight for organizations looking to adopt these digital technologies for improved business performance. © 2023, Emerald Publishing Limited.

ABSTRACT: In this work, we are concerned by the problem of identification of noisy terms which arise in singular problem as for remote sensing problems, and which are modeled by a linear singular parabolic equation. For the reason of missing some data that could be arisen when using the traditional sentinel method, the later will be changed by a new sentinel method for attaining the same purpose. Such new method is a particular least square-like method which permits one to

distinguish between the missing terms and the pollution terms. In particular, a sentinel method will be given here in its more realistic setting for singular parabolic problems, where in this case, the observation and the control have their support in different open sets. The problem of finding a new sentinel is equivalent to finding singular optimality system of the least square control for the parabolic equation that we solve. © 2023 KSCAM.

ABSTRACT: This study aims to see how well three different types of Artificial Neural Networks (ANNs) can predict the concentrations of four air pollutants (CO, NO₂, PM₁₀, and SO₂) before, during, and after the COVID-19 pandemic. MATLAB software was used to construct and test the suggested networks. The World Air Quality Project website included the metrological data and data on air pollutant concentrations. The data were utilized to approximate and estimate the actual performance of proposed models during the development phase. The ANN findings were validated using the results generated during the training phase. Statistics on the three metrology variables were used to compare the performance of the three models (R, RMSE, and MBE). The Elman model was the best and most accurate coefficient of correlation (R) and provided the more precise correlation between meteorological factors and air pollution concentrations in Amman, Jordan. © 2023 Praise Worthy Prize S.r.l.-All rights reserved.

ABSTRACT: Introduction: Little is known about the status and the future potential of biosimilars in the Middle East and North Africa (MENA) region. Areas covered: This perspective provides insights into the current regulatory landscape of some MENA countries, currently available biosimilars, the potential of biosimilars in the next decade, and challenges to overcome. Expert opinion: Given the economic and demographic heterogeneity across the MENA countries, biosimilars could reduce significant economic unmet needs in these countries. In the next decade, biosimilars may witness higher approval rates and market share over their originators in the MENA countries. We argue that the regulatory bodies in the MENA countries should adopt the new policies of the FDA, the EMA, and the WHO, that aim to ease the biosimilar approval process. These policies are to adopt technology in the process of approval; engage health technology assessment bodies in price assessment; provide educational materials to increase awareness among providers, patients, and payers. Further, MENA countries should upgrade the external-reference pricing systems to more sophisticated ones that consider the heterogeneity in economics and needs. © 2023 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Purpose: The purpose of this paper is to investigate the determinants of users' intention to continue to invest in cryptocurrencies. The paper also aims to examine the impact of hedonic motivation and the legal environment on perceived value in cryptocurrencies.

Design/methodology/approach: A questionnaire was designed to obtain data from 258 respondents in UAE. The Structural Equation Modeling - Partial Least Squares (SEM-PLS) was used to evaluate the research model and test the hypotheses. **Findings:** The results of smart PLS path analysis showed that perceived value, hedonic motivation, gambling attitude, and price volatility were significant determinants of the continued intention to invest in cryptocurrency. This study also revealed that hedonic motivation enhances perceived value and improves the perception of cryptocurrencies value from user's perspective. **Originality/value:** This study provides new insights into the literature on cryptocurrencies adoption, and delivers advanced understanding about the determinants of user's intention to continue investing in cryptocurrencies. In addition, the study provides important practical implications for cryptocurrencies companies to promote this financial technology to users by enhancing the knowledge of policy makers about how investors think and get motivated towards a continued investment of cryptocurrencies. © 2023, Emerald Publishing Limited.

ABSTRACT: In this work, a novel technique is considered for analyzing the fractional-order Jaulent-Miodek system. The suggested approach is based on the use of the residual power series technique in conjunction with the Laplace transform and Caputo operator to solve the system of equations. The Caputo derivative is applied to express the fractional operator, which is more suitable for modeling real-world phenomena with memory effects. As a real example, the proposed technique is implemented for analyzing the Jaulent-Miodek equation under suitable initial conditions. Additionally, the proposed technique's validity (accuracy and effectiveness) is examined by studying some numerical examples. The obtained solutions show that the suggested technique can provide a reliable solution for the fractional-order Jaulent-Miodek system, making it a helpful tool for researchers in different areas, including engineering, physics, and mathematics. We also analyze the absolute error between the derived approximations and the analytical solutions to check the validation and accuracy of the obtained approximations. Many researchers can benefit from both the obtained approximations and the suggested method in analyzing many complicated nonlinear systems in plasma physics and nonlinear optics, and many others. Faculty of Nursing, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Purpose: The purpose of this paper is to assess the level of nurses' competencies while providing care to COVID-19 patients. **Design/methodology/approach:** A descriptive, correlational design was used to collect data from nurses who were providing care to COVID-19 patients at four public hospitals. **Findings:** A total of 377 nurses (64.5% females) aged 23-50 consented to participate and completed the survey. The mean score of nurses' competencies in providing care to COVID-19 patients

was 2.5 (SD = 0.81). The results of correlation coefficient tests disclosed a significant positive correlation between reported competence level and sex $rpb(377) = 0.18, p < 0.01$; working area $rpb(377) = 0.2, p < 0.01$; disaster experience $rpb(377) = 0.16, p < 0.01$; disaster education $rpb(377) = 0.25, p < 0.01$; and disaster training $rpb(377) = 0.31, p < 0.01$. Research limitations/implications: The COVID-19 pandemic response heavily relied on nurses. However, they had a gap in clinical competencies that indicates an urgent need to incorporate disaster management courses in basic nursing education and to update training in hospitals based on nurses' needs to improve their capabilities in dealing with COVID-19 pandemic. Originality/value: To the best of the authors' knowledge, this is the first study that investigated the perceived level of Jordanian nurses' competencies in providing care to COVID-19. © 2023, Emerald Publishing Limited.

ABSTRACT: One way to cut down the consumption of diesel fuel in domestic heating in Jordan is to blend it with shale oil, which may be extracted from oil shale. This leads to a cut down in the national fuel bill in Jordan. Unfortunately, shale oil contains significant amounts of sulfur as impurities and upon burning sulfur oxides are emitted causing a negative environmental impact, and hence desulfurization of such fuel blends is essential. This may be achieved by adding activated carbon to the fluids. The process of removing sulfur from shale oil is crucial for safeguarding the environment, human well-being, and equipment, as well as meeting regulatory requirements and creating superior-quality goods. In this study, a domestic boiler was utilized to evaluate the degree of desulfurization process of blends of diesel and shale oil fuels upon their burning in a domestic boiler, to achieve this, blends of both fuels were prepared with varying amounts of shale oil (10%, 20%, 30%, and 40%) and various amounts of activated carbon were added to the prepared mixtures of diesel fuel and shale oil. The assessment of performance included examining the environmental impact, specifically by analyzing exhaust gases to measure the concentration of Sulfur Oxide (SO₂). It was found that an increase in the concentration of shale oil in the mixture led to an increase in the concentration of SO₂. However, adding more activated carbon to the mixture from the fuels resulted in a decrease in the SO₂ concentration. The lowest SO₂ concentration was observed when 1g of activated carbon was added per liter of the fuel mixture at a 20% concentration of shale oil, and 0.6g of activated carbon per liter of the fuel mixture at a 40% concentration of oil shale. © (2023), All Rights Reserved.

ABSTRACT: Objectives: The study aims to introduce the challenges faced by the reality of designing animated illustrations in advertising for tourism promotion in the Arab world. It explores the interest in designing animated illustrations in the Arab world and the challenges it faces, while seeking positive solutions capable of advancing the design and development of animated illustrations in the region. Methods: This study utilizes a descriptive analytical approach, chosen for its suitability in achieving the study's objectives. Results: The motion graphic industry is complex, requiring careful planning and decision-making on both the economic and technical fronts. It emphasizes the significance of graphic design and its role in motion graphic design, showcasing

destinations in a captivating manner that sparks the tourists' desire to experience them in person. The study identifies the various steps involved in motion graphic design, including script writing, storyboarding, graphics, animation, and the creation of scenes for designing animated illustrations in tourism advertising. Furthermore, it focuses on processing these illustrations and presenting them in their final form. Conclusions: The study highlights the necessity for designers to be proficient in all design programs, stay updated with their advancements, and be familiar with their utilization to accurately accomplish their work and enhance the quality of motion graphics design.. © 2023 DSR Publishers/ The University of Jordan.

ABSTRACT: Objectives: The present study aimed to present and analyze a collection of caricature artworks reflecting the artist's standpoint on introducing and addressing terrorism. It also sought to provide insights and recommendations on the potential use of caricature art in countering terrorism in contemporary society. Methods: Researchers employed a descriptive analytical design, which is the most appropriate scientific method for studying the sample. The methods used were as follows: Survey Method - Gathering, studying, and describing a collection of notable cartoonists' works addressing terrorism. Content Analysis Method - Examining and analyzing caricature works from the study sample. Results: The study yielded several findings, with the most important being that in most countries worldwide, the majority of cartoonists have committed themselves to countering the widespread terrorism in contemporary societies. However, their efforts are insufficient in light of the growing phenomenon. Conclusions: Caricature art plays a prominent role in countering the causes of terrorism, even before its emergence. This is achieved through the significant influence of caricature art in shaping the cultural and emotional perspectives of society members. Moreover, caricature art is free from negative beliefs and attitudes that can serve as a foundation for extremism and terrorist activities. © 2023 DSR Publishers/ The University of Jordan.

ABSTRACT: This paper aims to handle some types of fractional differential equations with a fractional-order values $\beta > 1$. In particular, we propose a novel analytical solution called an atomic solution for certain fractional linear type differential equations as well as for some other types of partial differential equations with fractional-order values exceeding one. Some examples are provided to validate our findings. © 2023 the author(s).

ABSTRACT: This cross-sectional study aimed to evaluate public perception, satisfaction, expectations, and barriers to utilize the community pharmacy services. A validated self-reported online survey was distributed on 681 individuals in different regions across Jordan. The mean age of the participants was 29 (± 10) years. The most reported reason for choosing a particular community pharmacy was its closure to home or workplace (79.1%), while the main reason for visiting a community pharmacy was to obtain over the counter medications (66.2%). The participants showed good perception, satisfaction, and expectations of community pharmacy services. However, several barriers were identified, including higher participants' trust in physicians when compared to pharmacists (63.1%), and lack of privacy in the pharmacy (45.7%). Community pharmacists should participate in successful education and training programs in order to raise the quality of the provided services, meet patient requirements, and re-establish consumer confidence in community pharmacists. © 2023 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: This paper aims to present a numerical solution to the fractional stochastic differential equation by using modified three-point fractional formula. Such a formula, which can be derived from the generalized Taylor theorem, is used to approximate Riemann-Liouville fractional integral operator. To show the effectiveness of the numerical method, the approximate solution is compared with the exact solution coupled with the approximate solution generated from the Euler-Maruyama method. Finally, the results of numerical experiments are supported with graphs for completeness. © 2023 IEEE.

ABSTRACT: Fractional-order discrete-time neural networks are kind of discrete-time models described by fractional-order difference operators. Despite the fact that the stability of such networks is required for their effective implementations, extremely low publications on the subject have been published. In this article, finite-time stability of fractional difference neural networks with discrete Mittag-Leffler kernels is investigated. First, with the use of a new generalization of the Gronwall inequality by means of the Atangana-Baleanu fractional difference sum operator, we generate some finite-time stability conditions of the discrete-time neural networks in their fractional-order cases with discrete Mittag-Leffler kernel. Then, the finite time stability coupled with the modified Gronwall inequality requirements are used to establish an adequate condition, which can provide these networks with a finite-time synchronization on the basis of a specific state feedback control approach. In addition, we develop a type of variable fractional-order discrete-time neural networks as well as we establish a new theorem that can be used to guarantee the finite-time stability of these networks. Finally, with the use of some performed numerical solutions, the discrete-time fractional-order neural networks are investigated to validate the gained findings. © 2023 IEEE.

 ABSTRACT: In this paper, a three dimensional discrete time Hopfield neural network with commensurate
 fractional variable order is presented based on the Caputo like difference operator. The dynamics of
 the proposed system is investigated by means of chaotic attractors, bifurcation diagram and maximum
 Lyapunov exponents, It is shown that the discrete time Hopfield neural network has complex behaviour
 for several fractional variable orders and different system parameter values. Moreover, the
 approximate entropy and the C0 complexity algorithms of the system are performed to prove the
 existence of chaos. Finally, the corresponding simulations are carried out on Matlab to illustrate
 the theoretical results. © 2023 IEEE.

ABSTRACT: In more recent times, many monkeypox disease cases have steadily increased and the range of
 the projected outbreaks in human populations has grown constantly. In the light of these aspects,
 this work proposes a new fractional-order version for one of the Susceptible-Exposed-Infectious-
 Recovered models (or simply SEIR models). This model, which is formulated in the sense of Caputo
 fractional differentiator, is first analyzed in terms of finding some theoretical results related to
 the stability analysis and the basic reproduction number. Then, with the help of using a novel recent
 version of the fractional Euler method, called Fractional Modified Euler Method (FMEM), the proposed
 model is solved numerically. Several numerical simulations are presented afterward for completeness.

ABSTRACT: The mathematical study of the growth of a cancer tumor gives us great progress in knowing
 the behavior of the cancer tumor as well as taking appropriate therapeutic measures. In this article,
 we endeavor to investigate a mathematical model of a cancer tumor and study its stabilization. In
 particular, we first discretize the continuous model connected with the dynamics of cancer tumor to
 get the discrete model. Then we perform several numerical simulations that will show that the
 proposed discrete model can behave chaotically. As a result, we study the unique fixed point
 stability that has a physical meaning, and finally we controlled the proposed system to stabilize
 its dynamics at such a point. © 2023 IEEE.

ABSTRACT: This manuscript analyzes the dynamical properties of the incommensurate variable fractional
discrete Tinkerbell system. Through time evolution of the states, phase portraits, lyapunov exponents
and bifurcation diagrams, it is indicated that the two dimensional incommensurate fractional
variable-order Tinkerbell map with discrete time exhibits chaotic and periodic behaviour. The
approximation entropy is also used to estimate the complexity of the incommensurate variable
fractional-order Tinkerbell system with discrete time. Finally, the 0-1 test plots of the presented
discrete Tinkerbell map with incommensurate variable fractional-order validate the findings from the
largest lyapunov exponents, bifurcation diagrams and approximate entropy. Numerical results are
provided out to simulate the effectiveness of the approach described herein. © 2023 IEEE.

ABSTRACT: Electronic payment options have mostly superseded traditional cash payment methods. The
growth of digital wallets, e-commerce, mobile payments, and other unusual payment methods has moved
the global economy one step closer to a cashless society. Therefore, this study aims to understand
how mobile-wallet service quality dimensions affect customer satisfaction and loyalty, as well as to
explore users' experiences with these wallets. The dimensions of the mobile wallet adopted were
service quality, ease of use, usefulness, cost, and security. A quantitative approach was used, and a
questionnaire was utilized and distributed based on a convenience sample of 557 respondents who were
located in Jordan. The statistical techniques of AMOS and SPSS have been applied. The analysis
results supported all the main hypotheses, arguing that mobile-wallet service quality leads to
customer satisfaction and loyalty. Additionally, mobile wallet service dimensions have an impact on
customer loyalty through customer satisfaction. Furthermore, it found that the perceived ease of use,
perceived usefulness, and perceived security dimensions have no impact on customer satisfaction.
Moreover, perceived ease of use and perceived security dimensions have no impact on customer loyalty.
The study recommended the need for m-wallet providers to support m-wallets and other electronic
services to enhance the possibility of good control over their technological tools to improve service
quality, reduce costs, improve security, develop the relationship between the organization and its
customers, and learn more about their desires and aspirations. © 2023 The Author(s). Published by

ABSTRACT: Aim: To assess the cost-efficiency and expanded access of three rituximab biosimilars versus the reference rituximab from the perspective of the Jordanian national health payer. Methods: A 1-year cost-efficiency and expanded access model of conversion from reference rituximab (Mabthera) to the approved biosimilars (Truxima, Rixathon, and Tromax) to assess five metrics: total annual cost to treat a hypothetical patient; head-to-head cost comparison; changes in patients' access to rituximab; number-needed-to-convert (NNC) to provide an additional 10 patients access to a rituximab treatment; and relative amount of Jordanian Dinar (JOD) spent on rituximab options. The model included rituximab doses at 100 mg/10 ml and 500 mg/50 ml and considered both cost-saving and cost-wastage scenarios. Costs of treatments were based on the fiscal year 2022 tender prices received by the Joint Procurement Department (JPD). Results: Rixathon was associated with the lowest average annual cost per patient (JOD2,860) across all six indications among all rituximab comparators, followed by Truxima (JOD4,240), Tromax (JOD4,365) and reference Mabthera (JOD11,431). The highest percentage of patient access to rituximab treatment (321%) was achieved when switching patients from Mabthera to Rixathon in the RA and PV indications. At four patients, Rixathon was associated with the lowest NNC to provide an additional 10 patients access to rituximab treatment. For each JOD1 spent on Rixathon, an additional JOD3.21 must be spent on Mabthera, an additional JOD0.55 on Tromax, and an additional JOD0.53 on Truxima. Conclusion: Rituximab biosimilars were associated with cost savings in all approved indications in Jordan compared to reference rituximab. Rixathon was associated with the lowest annual cost, the highest percentage of expanded patient access for all six indications, and the lowest NNC providing 10 additional patients with access. © 2023 The Author(s). ABSTRACT: In this work, the dynamic response of Euler-Bernoulli beams of four different boundary conditions with fractional order internal damping under a traversing moving load is investigated. The load is assumed to be moving with different values of constant velocity. A proposed approach to obtain the closed-form solution of the problem based on Green's functions combined with a decomposition technique in the Laplace transform domain is introduced. Several cases are studied and compared to the literature; for instance, if simply supported beam is considered, the following three cases are to be explored: the case of elastic (or undamped) beam, the damped (or viscously damped) beam, and finally the fractionally damped beam modeled by the fractional Kelvin-Voigt model. The effects to the beam dynamic response induced by magnitude of moving load velocity, damping ratio, and fractional damping order are explored. The results expressed sufficient agreement with similar problems found in literature and evidenced that the dynamic response of beams is significantly affected by varying the fractional order of beam damping as well as the moving load velocity. Accordingly, using fractionally damped materials exhibits better realistic behavior of beams and intermediate between elastic and viscous beam behaviors. © 2023 Raed AlSaleh et al.

ABSTRACT: **OBJECTIVE:** Inadequate glycemic control among patients with type 2 diabetes is growing worldwide. Earlier research studies investigated the predictors of poor glycemic control among patients with diabetes, but not among hypertensive patients who have type 2 diabetes as a comorbid disease. The aim of this study was to explore the factors associated with poor glycemic control in patients with type 2 diabetes and hypertension. **PATIENTS AND METHODS:** In the present retrospective

study, the medical records of two major hospitals were used to collect sociodemographic, biomedical, disease and medication-related information about patients with hypertension and type 2 diabetes. Binary regression analysis was conducted to find the predictors of the study outcome. RESULTS: The data from 522 patients were collected. High physical activity (OR=2.232; 95% CI: 1.368-3.640; $p < 0.01$), receiving insulin (OR=5.094; 95% CI: 3.213-8.076; $p < 0.01$) or GLP1 receptor agonist (OR=2.057; 95% CI: 1.309-3.231; $p < 0.01$) increased the odds of having controlled blood glucose. Increased age (OR=1.041; 95% CI: 1.013-1.070; $p < 0.01$), elevated high-density lipoprotein (HDL) levels (OR=3.727; 95% CI: 1.959-7.092; $p < 0.01$), and lower triglycerides (TGs) levels (OR=0.918; 95% CI: 0.874-0.965; $p < 0.01$) were also associated with improved glycemic control among the study participants. CONCLUSIONS: Most of the current study participants showed uncontrolled type 2 diabetes. Low physical activity, not receiving insulin or GLP1 receptor agonist, younger age, low HDL and high TG levels were independently associated with poor glycemic control. Future interventions should place a strong emphasis on the value of consistent physical activity and a stable lipid profile in enhancing glycemic control, particularly in younger patients and those who are not receiving insulin or GLP1 receptor agonist therapy. © 2023 Verduci Editore s.r.l. ABSTRACT: The global stability of solutions for a discrete-time globally dispersed reaction-diffusion SEI epidemic model with individual immigration is investigated in this work. The global stability is addressed using the Lyapunov functional after giving a discrete form of the reaction-diffusion SEI epidemic model. As in the continuous case, the unique steady-state is proven to be globally stable in the presence of diffusion. To validate the findings of this study, some numerical simulations are provided. © 2023, The Author(s), under exclusive license to Springer Nature Singapore Pte Ltd.

ABSTRACT: The paper introduces conformable fractional analogs of some basic concepts related to probability distributions of random variables, namely density, cumulative distribution, survival, and hazard functions. Moreover, it introduces conformable fractional analogs to expected values, r th moments, r th central moments, mean, variance, skewness, and kurtosis. In addition, it introduces conformable fractional analogs to some entropy measures, namely, Shannon, Renyi, and Tsallis entropy. All these concepts had been applied to the conformable fractional Nakagami probability distribution (Abu Hammad et al (2020) J Math Comput Sci 1239-1250; Gaeddert and Annamalai (2005) IEEE 9:22-24). © 2023, The Author(s), under exclusive license to Springer Nature Singapore Pte Ltd.

ABSTRACT: One of the most critical features of the Internet of Things (IoT) is that it allows a massive number of devices to communicate with each other at the same time, for example (cars, smoke alarms, watches, glasses, web cameras, etc.). Given that they can connect to the Internet, the huge demand to convert systems into smart systems that can be controlled remotely increases the chances of cyber-attacks that threaten security and availability becoming more frequent, severe, and in a different form. Distributed Denial of Service (DDoS) attacks have become the most common threats in IoT. These attacks make IoT systems unreliable because complex DDoS attacks cannot be detected by traditional security countermeasures such as firewalls and intrusion detection systems (IDS). In this research, we proposed a model dedicated to work on prediction and detection of DDoS attacks on networks IoT, where we run this model on a NF-BoT-IoT-v2 dataset, which contains 37,763,497 records divided into five categories (Benign, Reconnaissance, DDoS, DoS, and Theft), and then we process our dataset to be more business friendly so it only has two categories (100,000 records broken down into 23,906 benign attacks and 76,094 DDoS attacks). This study used WEKA and MATLAB tools to perform the classification efficiently and find the most important features through feature selection. We used a decision tree (J48) machine learning classifier, a Naive Bayes (NB) classifier, and a random forest (RF) classifier. However, the results were as expected and improved accuracy and efficiency. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

Nonlinear Dynamics Research Center (NDRC), Ajman University, Ajman, United Arab Emirates

ABSTRACT: In this paper a novel definition of the fractional-order derivative operator will be introduced. This operator will be called "pro rata" due to its ratio form as well as its geometric behavior that it is proportional to the fractional-order value. Some properties and theorems will be investigated. As an inverse of the fractional-order derivative operator, the integral of fractional order will be introduced. Some illustrative examples will be given. © 2023, The Author(s), under exclusive license to Springer Nature Singapore Pte Ltd.

AFFILIATIONS: Department of Mathematics, Al Zaytoonah University of Jordan, Queen Alia Airport St. 594, Amman, 11733, Jordan

ABSTRACT: So far, our attention was focused on finite groups in which the commutator is in the center and it's called by the class of CC-groups. Since the center of any group is an abelian group, and the fundamental theorem of finitely generated abelian groups asserts that every abelian group is

isomorphic to the direct product of cyclic groups. Then it is reasonable to consider those groups for which the derived subgroup is cyclic. It should be remarked that several authors have investigated particular classes of groups with similar restrictions. For instance, in [1] a bound is obtained for the order of G/G' when G is a p -group, $p \neq 2$, with a cyclic commutator subgroup. In this paper, we prove that every finite group which has a cyclic commutator must be supersolvable. Our result makes it possible to apply all properties of supersolvable groups to the so-called D_c -groups. © 2023, The Author(s), under exclusive license to Springer Nature Singapore Pte Ltd.

ABSTRACT: Social media and the Internet of Things (IoT) have revolutionized the way we communicate and access information. However, the integration of these technologies also poses significant cybersecurity risks. This paper explores the challenges of using social media data in IoT applications and proposes strategies to ensure the protection of sensitive information. The aim is to strike a balance between leveraging the benefits of social media data and ensuring that adequate measures are taken to secure this information. The authors outline the importance of using secure data-sharing protocols, implementing data privacy policies, and conducting regular security audits to minimize the risk of cyberattacks. In this study, we compared the performance of four popular classifier models: Multinomial Naive Bayes, Bernoulli Naive Bayes, Gaussian Naive Bayes, and Logistic Regression, on a dataset of news articles. Our results showed that the best model for fake news prediction was Logistic Regression, achieving an accuracy of 0.99%. This research provides a promising solution for the automated detection of fake news, which could potentially be used in real-world applications to combat the spread of misinformation. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The objective of this study is to develop an automatic cleaning system for Photovoltaic (PV) solar panels using machine learning algorithms. The experiment includes two phases. Phase one is to perform testing and reading of the sensor in 4 different classes which include no-dust, little dust, dusty, and very dusty during day and night time. The reading was taken using a visual inspection of the solar panel and the sensor reading using a multimeter. Phase two uses supervised learning to test and calibrate the sensor using the KNN algorithm. The classification was done using the data gathered from the sensor with one of the main classes identified. A total of 800 readings were taken. The results show the sensor reading taken during the night was more stable and accurate due to the sensor's sensitivity to noise which includes: heat and light during the daytime. Secondly, using machine learning (KNN algorithm) we get a 95% (with K=5) correct classification for the four main classes which determines the level of cleaning needed for the solar panel. © 2023, World Scientific and Engineering Academy and Society. ABSTRACT: In the field of Artificial Intelligence (AI), Smart Enterprise Management Systems (Smart EMS) and big data analytics are the most prominent computing technologies. A key component of the Smart EMS system is E-commerce, especially Session-based Recommender systems (SRS), which are typically utilized to enhance the user experience by providing recommendations analyzing user behavior encoded in browser sessions. Also the work of the recommender is to predict users' next actions (click on an item) using the sequence of actions in the current session. Current developments in session-based recommendation have primarily focused on mining more information accessible within the current session. On the other hand, those approaches ignored sessions with identical context for the current session that includes a wealth of collaborative data. Therefore this paper proposed Context-aware and Click session-based graph pattern mining with recommendations for Smart EMS through AI. It employs a novel Triple Attentive Neural Network (TANN) for SRS. Specifically, TANN contains three main components, i.e., Enhanced Sqrt-Cosine Similarity based Neighborhood Sessions Discovery (NSD), Frequent Subgraph Mining (FSM) using Neighborhood Click session-based graph pattern mining and Top-K possible Next-clicked Items Discovery (TNID). The NSD module uses a session-level attention mechanism to find m most similar sessions of the query session, and the FSM module also extracts the frequent subgraphs from the already discovered m most similar sessions of the query session via item-level attention. Then, TNID module is used to discover the top-K possible next-clicked items using the NSD and FSM module via a target-level attention. Finally, we perform comprehensive experiments on one big dataset, DIGINETICA, to verify the effectiveness of the TANN model, and the results of this experiment clearly illustrate the performance of TANN. © 2013 IEEE.

ABSTRACT: -Forest fires are one of the most devastating natural disasters that can have a significant impact on the environment, economy, and human lives. Early detection and prompt response are crucial to minimize the damage caused by forest fires. In recent years, Wireless Sensor Networks (WSN) and Internet of Things (IoT) technologies have emerged as promising solutions for forest fire detection due to their low-cost and efficient monitoring capabilities. This paper proposes a low-cost forest fire detection system based on WSN and IoT. The system uses a network of sensor nodes that are strategically placed in the forest to monitor environmental conditions such as temperature, humidity, and smoke. The sensor data is transmitted to a central server, where advanced algorithms are used to detect and predict the occurrence of forest fires. The system provides real-time alerts to forest

authorities and users using a mobile application that shows the fire maps and the current updates. The proposed system has been evaluated using based on experiments, and the results show that it can effectively detect forest fires with high accuracy, low false alarms, and low cost. This system has the potential to provide an efficient and cost-effective solution for forest fire detection and can play a vital role in protecting the environment and saving lives. © 2023, World Scientific and Engineering Academy and Society. AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Lycopene, a potential bioactive agent, is a non-pro-vitamin A carotenoid recognized as a potent antioxidant. It is extracted from plants like tomatoes, watermelons, red carrots and papayas and has remarkable health benefits. A significant amount of research has been assisted to date to establish the anticancer activity of lycopene. Our review enhances information about the promising anticancer potential of this compound. The biological activity of lycopene has been described in several studies in regard to pancreatic, breast, prostate, liver, gastric, ovarian, kidney, skin, intestine, brain and spinal cord cancers. Lycopene resists cancer by inhibition of apoptosis, induction of cell proliferation, cell invasion, cell cycle development, metastasis and angiogenesis. The mechanisms of anticancer action of lycopene are attributed to the management of certain signal transduction pathways, such as modulation of insulin-like growth factors system, PI3K/Akt pathway, modification of important gene expression, inhibit the activity of sex steroid hormones, and the conversation of mitochondrial behavior. Hence, this review focuses on current knowledge of sources, extraction techniques, and chemistry of lycopene, as well as the prospective mechanisms of action related with its anticancer activity. Also, it summariz-es the background information about lycopene and the most current research with consideration to its aspect in treating several types of cancer together with future directions. © 2023 Bentham Science Publishers.

Influence of smart mobile banking services on senior banks' clients intention to use: moderating role of digital accounting

(2023) Global Knowledge, Memory and Communication, .

[https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162217304&doi=10.1108%2fGKMC-01-2023-](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162217304&doi=10.1108%2fGKMC-01-2023-0018&partnerID=40&md5=5f2343684e5d9f75bfec955e3ef2c1e3)

[0018&partnerID=40&md5=5f2343684e5d9f75bfec955e3ef2c1e3](https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162217304&doi=10.1108%2fGKMC-01-2023-0018&partnerID=40&md5=5f2343684e5d9f75bfec955e3ef2c1e3)

AFFILIATIONS: Faculty of Business, Al-Zaytoonah University of Jordan, Amman, Jordan;

Faculty of Business, Isra University, Amman, Jordan

ABSTRACT: Purpose: The current study aims to examine the influence of smart mobile banking services (SMBS) on senior clients' intention to use banking applications through the moderating role of digital accounting. For that sake, features of SMBS were adopted and included (convenience, security, trust and ease of use). Design/methodology/approach: Quantitative approach was used through adopting a questionnaire as a tool of study. The questionnaire was built by researcher through the aid of previous studies; the questionnaire was distributed on a convenient sample of senior bank clients who were above 60 years old as according to UNCEF. After application process, researcher retrieved (306) properly filled questionnaires and SPSS was used to screen and analyze gathered primary data. It is worth mentioning that Cronbach's alpha scored higher than 0.70 which guaranteed the reliability and consistency of study tool. Findings: Results of the study indicated that SMBS influence senior clients' intention to use these applications and this influence is moderated by ramifications of digital accounting. It appeared that features of SMBS were mainly ease of use and trust, which can effect on how senior clients are convinced to use SMBS. Digital accounting appeared in the sense of guaranteeing a high level of stability and accountability to use SMBS through security, easy access, continuous update and valid presentation of application contents. Results of hypothesis testing accepted the main hypothesis which argued that there was a statistically significant influence of SMBS on senior clients' intention to use, with a value of ($R^2 = 0.73$, $p = 0.5$). Based on such results, the study recommended that bank managers should focus on providing reliability and privacy by introducing digital accounting practices in a deeper way to ensure efficiency, reliability and compatibility in the banking services provided. Practical implications: Limitations of current study were presented through the application on senior clients who were above 60 years old according to UNICEF. As for the practical implications of study revealed that understanding the factors that influence senior clients' intention to use SMBS can help banks develop strategies to improve their experience with the banking service. For example, if digital accounting is found to be a significant moderating factor, banks can invest in digital accounting solutions to provide a more user-friendly interface for senior clients. As for theoretical implications, the study can extend the technology

acceptance model by examining the moderating role of digital accounting in the relationship between SMBS and senior clients' intention to use. This can contribute to a better understanding of the factors that influence technology adoption among senior clients. Originality/value: The originality of current study is that it focuses on the use of SMBS, which is a relatively new technology that has gained significant popularity in recent years due to its convenience and accessibility. Also, the study examines senior clients, who are an important demographic for the banking industry, as they represent a large portion of the population that is more likely to face challenges in adopting new technologies. © 2023, Emerald Publishing Limited.

ABSTRACT: There are four different types of fuzzy implications in fuzzy logic, referred to as (S, N)Implications, R-Implications, QL-Implications, and D-Implications. Only one research work on the implications of two functional equations for the Hyers-Ulam stability for (S, N) has been published recently. The Hyers-Ulam stability of two functional equations for QL-Implication is being examined in this study. © 2023 Authors. All rights reserved.

ABSTRACT: A framework to determine the key factors impacting the economic sustainability post COVID-19 crisis recovery is proposed in this study for SMEs. The study was supported by resource-based-view (RBV) theory. Questionnaires were distributed to the study sample comprising of SME financial managers and heads of accounting departments, in which 190 returned copies were valid for analysis. The impact of human capital, social capital, and relational capital on the economic sustainability in SMEs appeared strong, positive and significant. A significant positive relationship was demonstrated between cost leadership strategy and economic sustainability, and between differentiation strategy and economic sustainability. SMEs could benefit from the study framework as it can guide SMEs in identifying early survival strategies in COVID-19 crisis recovery. For regulators, the framework could assist them in dealing with SMEs post COVID-19. Copyright © 2023 Inderscience Enterprises Ltd.

ABSTRACT: Aim/Purpose This study identifies the scale types and measurement units used in the measurement of enterprise architecture (EA) and analyzes the admissibility of the mathematical operations used. Background The majority of measurement solutions proposed in the EA literature are based on researchers' opinions and many with limited empirical validation and weak metrological properties. This means that the results generated by these solutions may not be reliable, trustworthy, or comparable, and may even lead to wrong investment decisions. While the literature proposes a number of EA measurement solutions, the designs of the mathematical operations used to measure EA have not yet been independently analyzed. It is imperative that the EA community works towards developing robust, reliable, and widely accepted measurement solutions. Only then can senior management make informed decisions about the allocation of resources for EA initiatives and ensure that their investment yields optimal results. Methodology In previous research, we identified,

through a systematic literature review, the EA measurement solutions proposed in the literature and classified them by EA entity types. In a subsequent study, we evaluated their metrology coverage from both a theoretical and empirical perspective. The metrology coverage was designed using a combination of the evaluation theory, best practices from the software measurement literature including the measurement context model, and representational theory of measurement to evaluate whether EA measurement solutions satisfy the metrology criteria. The research study reported here presents a more in-depth analysis of the mathematical operations within the proposed EA measurement solutions, and for each EA entity type, each mathematical operation used to measure EA was examined in terms of the scale types and measurement units of the inputs, their transformations through mathematical operations, the impact in terms of scale types, and measurement units of the proposed outputs.

Contribution This study adds to the body of knowledge on EA measurement by offering a metrology-based approach to analyze and design better EA measurement solutions that satisfy the validity of scale type transformations in mathematical operations and the use of explicit measurement units to allow measurement consistency for their usage in decision-making models. Findings The findings from this study reveal that some important metrology and quantification issues have been overlooked in the design of EA measurement solutions proposed in the literature: a number of proposed EA mathematical operations produce numbers with unknown units and scale types, often the result of an aggregation of undetermined assumptions rather than explicit quantitative knowledge. The significance of such aggregation is uncertain, leading to numbers that have suffered information loss and lack clear meaning. It is also unclear if it is appropriate to add or multiply these numbers together. Such EA numbers are deemed to have low metrological quality and could potentially lead to incorrect decisions with serious and costly consequences. Recommendations The results of the study provide valuable insights for professionals in the field for Practitioners of EA. Identifying the metrology limitations and weaknesses of existing EA measurement solutions may indicate, for instance, that practitioners should wait before using them until their design has been strengthened. In addition, practitioners can make informed choices and select solutions with a more robust metrology design. This, in turn, will benefit enterprise architects, software engineers, and other EA professionals in decision making, by enabling them to take into consideration factors more adequately such as cost, quality, risk, and value when assessing EA features. The study's findings thus contribute to the development of more reliable and effective EA measurement solutions. Recommendations Researchers can use with greater confidence the EA measurement solutions for Researchers with admissible mathematical operations and measurement units to develop new decision-making models. Other researchers can carry on research to address the weaknesses identified in this study and propose improved ones. Impact on Society Developers, architects, and managers may be making inappropriate decisions based on seriously flawed EA measurement solutions proposed in the literature and providing undue confidence and a waste of resources when based on bad measurement design. Better quantitative tools will ultimately lead to better decision making in the EA domain, as in domains with a long history of rigor in the design of the measurement tools. Such advancements will benefit enterprise architects, software engineers, and other practitioners, by providing them with more meaningful measurements for informed decision making. Future Research While the analysis described in this study has been explicitly applied to evaluating EA measurement solutions, researchers and practitioners in other domains can also examine measurement solutions proposed in their respective domains and design new ones. © 2023 Informing Science Institute. The determinants of continuance intention to use pandemic contact tracing apps: the case of COVID-19 (2023) International Journal of Intellectual Property Management, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161828310&doi=10.1504%2fIJIPM.2023.130488&partnerID=40&md5=76309bbeb0d864726e601a2dd306cdce>

AFFILIATIONS: Al-Zaytoonah University, Airport Rd., Amman, Jordan

ABSTRACT: This study examines the determinants of pandemic contact tracing apps adoption and explores their impact on the intention to continue use. Data were collected from a sample of 243 users from those who have downloaded and used the 'Aman' app, the Jordanian version of the contact tracing app, to combat the COVID-19. Smart-PLS structural equation modelling software was used to analyse data. The results reveal a significant role of performance expectancy, risk perception and social influence in the intention to continue using contact tracing apps in responding to coronavirus COVID-19. Furthermore, the results did not reveal a significant role of privacy concerns and facilitating conditions in the intention to continue using contact tracing apps. This study adds valuable insights to continued investigation on contact tracing apps adoption and use. The research model offers a practical paradigm that can be employed to develop effective contact tracing apps to combat global epidemic outbreaks. © 2023 Inderscience Enterprises Ltd.

ABSTRACT: Background: In Palestine, there is a lack of studies that examined self-care behaviors among patients with coronary artery disease in outpatient clinics. Objective: This study purposed to evaluate self-care behaviors, examine the relationship between self-care behaviors and selected sociodemographic and psychosocial factors (e.g. depression, anxiety, stress, and social support), and self-efficacy, and determine predictors of self-care behaviors among patients with coronary artery disease in outpatient clinics in the West Bank/Palestine. Design: A cross-sectional study was conducted. Methods: A total of 430 Palestinian adult patients suffering from coronary artery disease attended outpatient clinics were recruited. A self-reported questionnaire consisting of the following tools: Depression, Anxiety, Stress Scale 21, Sullivian's Self-efficacy scale, and Multidimensional Social Support Scale was used to collect data during the period from the beginning of April to the beginning of July 2022. Descriptive and inferential statistics (Pearson's and Point-biserial correlation tests and multiple linear regression) were used for analyzing data. Results: The patients reported low self-care behaviors levels and high self-efficacy levels. The psychosocial reactions endorsed by the patients were 86.3% for depression, 76.3% for anxiety, 43.3% for stress, and 98.6% had moderate and normal social support. A positive correlation was found between self-care behaviors and age ($r = 0.160$, $p < 0.01$), duration of disease ($r = 0.095$, $p < 0.05$), self-efficacy ($r = 0.443$, $p < 0.01$), and social support ($r = 0.266$, $p < 0.01$). Self-efficacy ($B = 0.401$, $p < 0.01$), social support ($B = 0.160$, $p < 0.01$), and age ($B = 0.109$, $p < 0.05$) were significant predictors of self-care behaviors in those patients. Conclusion: Low self-care behaviors were a significant issue among patients with coronary artery disease in outpatient clinics. This study may help healthcare professionals develop health promotion programs for patients with coronary artery disease to improve self-care behaviors. © 2023 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Purpose: This paper aims to understand in-depth the electronic entrepreneurial intentions (EEI) towards launching online start-ups in United Arab Emirates (UAE) by exploring the effect of perceived entrepreneurial culture and risk propensity on EEI amongst the youth in the country, additionally, exploring the differences (if existed) amongst intentions based on gender categories. Design/methodology/approach: This study developed a theoretical framework based on the theory of planned behaviour (TPB) to examine perceived entrepreneurial culture, risk propensity and the moderating role of gender. The researchers followed the partial least squares in structural equation modelling (PLS-SEM) method. The collected responses of 250 online surveys were analysed using the SmartPLS 3.3 software. Findings: The results showed a significant positive influence of risk propensity and perceived entrepreneurial culture on EEI in the UAE. Interestingly, despite that many prior studies showing a significant impact of gender e-EI, the analysis showed no differences between male and female responses regarding EEI. More results are demonstrated in the study. Originality/value: To the best of the authors' knowledge, this study is considered the first in the UAE which investigates empirically the factors that influence youth intentions to launch online start-ups and entrepreneurial ventures in the country. In addition, the results of this study contribute to the relevant literature by adding rich insights into the moderating role of gender in the relationship between perceived entrepreneurial culture and the three constructs of TPB, namely attitude, subjective norm and perceived behavioural control, in order to start an e-entrepreneurial business. Furthermore, this study genuinely addresses the role of risk propensity in impacting the youth intentions in e-entrepreneurial ventures mediated by perceived behavioural control. Therefore, this research study provides original and rich insights into youth attitudes towards and behaviours of launching online start-ups and significantly contributes to the body of the e-entrepreneurship literature. © 2023, Emerald Publishing Limited.

ABSTRACT: Purpose: This study aimed to investigate the medication administration error perceptions among Jordanian critical care nurses. Methods: A cross-sectional, descriptive design was used among Jordanian critical care nurses. The total number of completed questionnaires submitted for analysis was 340. Data were collected between July and August 2022 in two health sectors (governmental hospitals and educational hospital) in the middle and north region in Jordan through a self-administered questionnaire on medication administration errors which includes 65 items with three parts. Results: Nurses showed negative perceptions toward medication administration errors. The majority of participants agreed that "The packaging of many medications is similar" (76.7%), followed by "different medications look alike" (76.2%), as the main reasons for medication error occurrence. Two thirds of participants agreed that "when med errors occur, nursing administration focuses on the individual rather than looking at the systems as a potential cause of the error" (74.1%). Similarly, 73.5% of them believed nurses were blamed if something happens to the patient as a result of the medication error was the main reason for underreporting of MAEs. The highest reported levels of medication errors were in a range between 41% and 70%, for both types intravenous (IV) medication errors and non-intravenous (non-IV) medication errors. Conclusion: Implement interventions centered on MAEs in particular among critical care nurses, owing to the proven significance of it in foretelling their crucial role in delivering safe care to patients, which will lead to quantifiable returns on both patient outcomes and nurse health, as well as the overall efficiency and image of the organization. © 2023 Alzoubi et al.

ABSTRACT: In this paper, we study a linear system of homogeneous commensurate /incommensurate fractional-order differential equations by developing a new semi-analytical scheme. In particular, by decoupling the system into two fractional-order differential equations, so that the first equation of order $(\delta + \gamma)$, while the second equation depends on the solution for the first equation, we have solved the under consideration system, where $0 < \delta, \gamma \leq 1$. With the help of using the Adomian decomposition method (ADM), we obtain the general solution. The efficiency of this method is verified by solving several numerical examples. © 2023 Kyungnam University Press

ABSTRACT: This work purposes to establish a novel analytical method to obtain the atomic solutions of partial differential equations. This will be carried out by employing the tensor product theory in Banach spaces coupled with some properties of atoms operators. Some illustrative examples will be provided to validate our findings. © 2023 Iqbal M. Batiha, et al.

ABSTRACT: Digitalization in a number of financial sectors has forced the financial system to adapt to new standards of technological change. The current regulatory structure also made the financial system reevaluate its business strategies and its interactions with the market. These factors led to the creation of a new type of ecosystem-wide competition in the banking industry that had never been witnessed before. There is a lack of a comprehensive framework for the new ecosystem of banks and financial institutions, which would clarify strategic decisions and organizational structures within the new ecosystems as well as highlight the development lines of open innovation in the banking industry. The objective of this research was to evaluate the open banking strategy and fintech impacts on digital transformation. Empirical evidences collected from banking sector located in Dubai UAE. 102 bank branches were approached to collect data using a descriptive research. A valid sample of 201 employees used for data analysis. SmartPLS 4 software used to measure the hypothesized model. Significant relationships between the variables were found in the results. Additionally, this research is regarded as a fantastic resource for financial knowledge for experts, bankers, professionals, and academics interested in this sector. © 2023 IEEE.

ABSTRACT: In an economic recession, cloud computer infrastructure will play an important role in public organizations and the private sector, as it reduces, in addition to providing many other advantages, the expense of accessing information technology (IT) software. In public sector organizations, cloud computing is currently not widely used, particularly for Jordan for several reasons and factors. The objective of this analysis is to recognize and understand these variables that could influence the adoption of cloud computing in the Jordan government industry, to understand the theoretical context of this issue through the proposal of a conceptual model, and to assist and direct Jordanian government organizations in implementing cloud computing in practice. This study employed a hybrid methodology approach consisting of two steps of data collection and analysis. The first phase of the online survey was based on the literature survey and technically performed. Descriptive and one direction frequency statistics, inferential analysis and regression analysis have been used for the quantitative analyses of the results. 19 theories have been tested. The quantitative data were analyzed to detect factors which can influence the adoption and the importance of cloud computing. To engage in this study four Jordanian organizations have been selected. Thematic interpretation of the results was used to analyses them. The considerations studied were divided into three major categories: the organizational and technical background, environmental and external constraint and the advantages perceived. In addition to this, the study found a theoretical model that does not address the influences and challenges of the adoption of cloud data and proposes a new concept model to improve understanding of these facets by conducting a comprehensive literature survey which would lead to the identification of possible factors that could influence the introduction of cloud computing. © 2023 IEEE.

ABSTRACT: The Fintech industry has grown in importance globally for staying current with advancements and advances in the financial industry. The need of technology in financial institution captured higher attention that signifies Fintech uses specialized software and algorithms. This research is aimed to empirically investigate the impact of cryptocurrency regulations and fintech on growth of innovation in banking sector Dubai UAE. A total of 209 valid respondents collected from managerial departments in the banks using convenient sampling technique. Screened data considered for testing and analysis using SmartPLS 4. A PLS-SEM test run for model evaluation, hypothesis testing, and construct correlation. The findings support the significant association between fintech and innovation growth as well as cryptocurrency regulation is positively associated with innovation growth. The financial sector can benefit from this research's findings, and the researchers' goal is to learn more about financial technology. © 2023 IEEE.

ABSTRACT: This article aims to pinpoint the impact of implementing the mind mapping technology as one of the active learning models on raising the achievement of the curriculum processing unit in the Teaching Methodologies & Styles Course on classroom teacher department taught to students in the first semester at the faculty of Arts at the Al-Zaytoonah University of Jordan. To achieve the study objectives, the semi-experimental approach is used. The study sample consists of two groups selected by the purposeful method, where the experimental group taught using mind mapping, while the control group taught using the traditional method. The internal validity of the participants of the two groups is determined, and a pre-test is conducted to ensure that the two groups are equal in the study achievement. After implementing the study and ensuring the validity and reliability of the study instrument, the achievement test is conducted at the end of the first semester of the academic year 2021/2022. The findings indicate that there is a statistically significant difference at the level of statistical significance ($\alpha = 0.05$) between the means of the scores of the students of the experimental and control groups in the post-application in the achievement test in favor of the experimental group. The findings also demonstrate a statistically significant difference at the level of statistical significance ($\alpha = 0.05$) between the means of the scores of the experimental group students in the pre and post-application in the achievement test in favor of the post-application. In light of these results, the study recommends using mind mapping in university teaching. © 2023 IEEE.

ABSTRACT: Family relationships are some of the most prominent motifs in drama because the family unit is a microcosm of society and is among its essential pillars. Several American dramatists use real-life events of American families in their works. They intend their plays to be a useful corrective force to afford people a closer look into themselves and consequently elicit positive change. The study is an analytical historical investigation of the theme of family disintegration in Eugene O'Neill's "Long Day's Journey into Night." It approaches the American family motif from different perspectives. Specifically, it deals with how the Tyrone family is represented, the reasons behind its disintegration, the role of parents in its breakup, the effect of the external surrounding conditions on the family, and the influence of the playwright's personal life and background on his play. © 2023 Common Ground Research Networks, Asad Al-Ghalith, Alaa Al-Hadidi,

ABSTRACT: Introduction: Workplace violence (WPV) is a growing concern that constitutes a major threat to occupational health and safety, thereby comprising a priority issue for policymakers. Given the increasing prevalence of chronic diseases and comorbidities among the Lebanese population, nurses working in critical care settings encounter intense workloads and high-risk interactions, potentially increasing the risk of WPV. Objectives: This study aimed to investigate the traumatic and psychological reactions of Lebanese critical nurses who have been exposed to WPV, and the risk factors for depression and anxiety. Methods: The study utilized a cross-sectional descriptive correlational design; 112 critical care nurses from diverse departments took part in this study during the period of June to July 2021. Results: A positive, significant correlation between WPV exposure and self-reported anxiety was observed, $p = .03$ with high levels of WPV, especially among patients and their families. Although verbal abuse was found to be more prevalent among critical care nurses in Lebanon compared to physical and sexual violence, the severity of the situation and its impact on the nurses' mental health and well-being cannot be ignored. Conclusions: WPV for critical care nurses is a serious issue that needs to be considered. Policy-makers should develop the politics of regulating the nursing profession, especially for critical care nurses in Lebanon. © The Author(s) 2023.

ABSTRACT: Background: Poor adherence to heart failure (HF) medications represents a major barrier to achieve the desired health outcomes in those patients. Objective: To assess medication adherence and to explore the factors associated with medication non-adherence among patient with HF in Jordan. Methods: The current cross-sectional study was conducted at the outpatient cardiology clinics at two main hospitals in Jordan from August 2021 through April 2022. Variables including socio-demographics, biomedical variables, in addition to disease and medication characteristics were collected using medical records and custom-designed questionnaire. Medication adherence was assessed using the 4-item Morisky Medication Adherence Scale. Multinomial logistic regression analysis was performed to identify the factors that are significantly and independently associated with medication non-adherence. Results: Of the 427 participating patients, 92.5% had low to moderate medication adherence. Results of the regression analysis revealed that that patients who had higher education level (OR=3.36; 95% CI 1.08–10.43; $P=0.04$) and were not suffering from medication-related side effects (OR=4.7; 95% CI 1.91–11.5; $P=0.001$) had significantly higher odds of being in the moderate adherence group. Patients who were taking statins (OR=16.59; 95% CI 1.79–153.98; $P=0.01$) or ACEIs/ ARBs (OR=3.95; 95% CI 1.01–15.41; $P=0.04$) had significantly higher odds of being in the high

adherence group. Furthermore, Patients who were not taking anticoagulants had higher odds of being in the moderate (OR=2.77; 95% CI 1.2-6.46; P=0.02) and high (OR=4.11; 95% CI 1.27- 13.36; P=0.02) adherence groups when compared to patients who were taking anticoagulants. Conclusion: The poor medication adherence in the present study sheds the light on the importance of implementing intervention programs which focus on improving patients' perception about the prescribed medications particularly for patients who have low educational levels, receive an anticoagulant, and do not receive a statin or an ACEI/ ARB. © 2023 Jarab et al.

ABSTRACT: Big data analytics (BDA), as a new innovation tool, played an important role in helping businesses to survive and thrive during great crises and mega disruptions like COVID-19 by transitioning to and scaling e-commerce. Accordingly, the main purpose of the current research was to have a meaningful comprehensive overview of BDA and innovation in e-commerce research published in journals indexed by the Scopus database. In order to describe, explore, and analyze the evolution of publication (co-citation, co-authorship, bibliographical coupling, etc.), the bibliometric method has been utilized to analyze 541 documents from the international Scopus database by using different programs such as VOSviewer and Rstudio. The results of this paper show that many researchers in the e-commerce area focused on and applied data analytical solutions to fight the COVID-19 disease and establish preventive actions against it in various innovative manners. In addition, BDA and innovation in e-commerce is an interdisciplinary research field that could be explored from different perspectives and approaches, such as technology, business, commerce, finance, sociology, and economics. Moreover, the research findings are considered an invitation to those data analysts and innovators to contribute more to the body of the literature through high-impact industry-oriented research which can improve the adoption process of big data analytics and innovation in organizations. Finally, this study proposes future research agenda and guidelines suggested to be explored further. © 2023, The Author(s), under exclusive licence to Springer Nature Limited.

ABSTRACT: Introduction: Characterization of the tumour immune infiltrate (notably CD8+ T-cells) has strong predictive survival value for cancer patients. Quantification of CD8 T-cells alone cannot determine antigenic experience, as not all infiltrating T-cells recognize tumour antigens. Activated tumour-specific tissue resident memory CD8 T-cells (TRM) can be defined by the co-express of CD103, CD39 and CD8. We investigated the hypothesis that the abundance and localization of TRM provides a

higher-resolution route to patient stratification. Methods: A comprehensive series of 1000 colorectal cancer (CRC) were arrayed on a tissue microarray, with representative cores from three tumour locations and the adjacent normal mucosa. Using multiplex immunohistochemistry we quantified and determined the localization of TRM. Results: Across all patients, activated TRM were an independent predictor of survival, and superior to CD8 alone. Patients with the best survival had immune-hot tumours heavily infiltrated throughout with activated TRM. Interestingly, differences between right- and left-sided tumours were apparent. In left-sided CRC, only the presence of activated TRM (and not CD8 alone) was prognostically significant. Patients with low numbers of activated TRM cells had a poor prognosis even with high CD8 T-cell infiltration. In contrast, in right-sided CRC, high CD8 T-cell infiltration with low numbers of activated TRM was a good prognosis. Conclusion: The presence of high intra-tumoural CD8 T-cells alone is not a predictor of survival in left-sided CRC and potentially risks under treatment of patients. Measuring both high tumour-associated TRM and total CD8 T-cells in left-sided disease has the potential to minimize current under-treatment of patients. The challenge will be to design immunotherapies, for left-sided CRC patients with high CD8 T-cells and low activate TRM, that result in effective immune responses and thereby improve patient survival. ABSTRACT: Background: Dyslipidemia is common among patients with heart failure, and it negatively impacts clinical outcomes. Limited data regarding the factors associated with poor lipid control in patients with HF patients. Therefore, this study aimed to evaluate lipid control and to explore the factors associated with poor lipid control in patients with HF. Methods: The current cross-sectional study was conducted at outpatient cardiology clinics at two major hospitals in Jordan. Variables including socio-demographics, biomedical variables, in addition to disease and medication characteristics were collected using medical records and custom-designed questionnaire. Medication adherence was assessed using the validated 4-item Medication Adherence Scale. Binary logistic regression analysis was conducted to explore significant and independent predictors of poor lipid control among the study participants. Results: A total of 428 HF patients participated in the study. Results showed that 78% of the participants had poor lipid control. The predictors that were associated with poor lipid control included uncontrolled BP (OR = 0.552; 95% CI: 0.330-0.923; P < 0.05), higher Hb levels (OR = 1.178; 95% CI: 1.013-1.369; P < 0.05), and higher WBC (OR = 1.133; 95% CI: 1.031-1.246; P < 0.05). Conclusions: This study revealed poor lipid control among patients with HF. Future intervention programs should focus on blood pressure control in order to improve health outcomes among HF patients with dyslipidemia. 2023 Jarab, Al-Qerem, Hamam, Abu Heshmeh, Mukattash and Alefishat.

ABSTRACT: Background: Needle stick injuries constitute the greatest threat to nursing students during clinical practice because of accidental exposure to body fluids and infected blood. The purpose of this study was to (1) determine the prevalence of needle stick injuries and (2) measure the level of knowledge, attitude and practice among nursing students about needle stick injuries. Methods: Three

hundred participants undergraduate nursing students at a private college in Saudi Arabia were included, of whom 281 participated, for an effective response rate of 82%. Results: The participants showed good knowledge scores with a mean score of 6.4 (SD = 1.4), and results showed that students had positive attitudes (Mean = 27.1, SD = 4.12). Students reported a low level of needle stick practice (Mean = 14.1, SD = 2.0). The total prevalence of needle stick injuries in the sample was 14.1%. The majority, 65.1%, reported one incidence in the last year, while (24.4%) 15 students reported two incident of needle stick injuries. Recapping was the most prevalent (74.1%), followed by during injection (22.3%). Most students did not write a report (77.4%), and being worried and afraid were the main reasons for non-reports (91.2%). The results showed that female students and seniors scored higher level in all needle stick injuries domains (knowledge, attitude and practice) than male students and juniors. Students who had needle stick injuries more than three times last year reported a lower level of all needle stick injury domains than other groups (Mean = 1.5, SD =1.1; Mean = 19.5, SD =1.1; Mean = 9.5, SD =1.1, respectively). Conclusion: Although the student's showed good knowledge and positive attitudes in NSI, the students reported a low level of needle stick practice. Raising awareness among nursing students and conducting continuing education related to sharp devices and safety and how to write an incident reporting is highly recommended. ABSTRACT: This research paper aims to investigate the impact of financial leverage on a company's capital structure. The study focuses on 54 Jordanian industrial companies listed on the Amman Stock Exchange market for the year 2021. The primary objective of the research is to determine whether financial leverage has a significant effect on a company's capital structure, debt, and equity. The study utilizes a purposive sampling technique, and the data is collected from the annual reports of the selected companies. The social statistical tool SPSS is used to analyze the data and test the hypotheses. The study's findings indicate that financial leverage has a considerable impact on the capital structure of the organization. The results suggest that the higher the financial leverage, the higher the proportion of debt in the capital structure. Furthermore, the study also discovered that financial leverage has a large impact on a company's debt and equity, which suggests that financial leverage plays a significant role in determining a company's financing decisions. The study's relevance lies in its contribution to the existing literature on corporate finance, particularly in the context of Jordanian industrial companies. © 2023, Virtus Interpress. ABSTRACT: Every day, we engage in a variety of activities such as shopping, reading, swimming, and so on. Many people in our community, however, are unable to participate in such activities, due to a variety of eye problems. Directing a blind person to the optimal position (the center of a spot where there is enough space in all directions such that a blind person avoids various obstacles) is a challenge. This paper proposes wireless bracelets that are able to guide a blind person to the optimal position. The proposed system employs ultrasonic sensors in order to detect various obstacles in an indoor environment. It also makes use of the Firebase database and NodeMCU WiFi module to enable real-time communication with a blind individual. Furthermore, the suggested system includes a novel fall-detection mechanism. The proposed Internet of Things (IoT) system is evaluated in an indoor environment. Experiment results showed that the proposed system could efficiently direct a blind person to the optimal position. In comparison to the current state of the art, the proposed system is simpler, less expensive, and more efficient in determining the optimal position to which a blind person must navigate. © 2023 CCIS.

ABSTRACT: A surface M^2 with position vector $r = r(s, t)$ is called a Hasimoto surface if the relation $r_t = r_s \wedge r_{ss}$ holds. In this paper, we first define the Beltrami-Laplace operator according to the three fundamental forms of the surface, then we classify the J-harmonic Hasimoto surfaces and their Gauss map in E^3 , for $J = II$ and III . © 2023 the Author(s), licensee AIMS Press.

ABSTRACT: Cellular concrete (known as foamed concrete) is a lightweight building material with low densities ranging from 900 kg/m³ to 1900 kg/m³, which can have potential applications in civil engineering practices. However, it is very weak in withstanding tensile loads which leads to cracks during shrinkage in the drying stage. Therefore, six different groups of cellular concrete are prepared for a possible application in grouting underneath the foundations to achieve a minimum compressive strength of 2000 psi (13.79 MPa) as per ASTM C476, and for soil nail grout with a minimum compressive strength of 3000 psi (20.86 MPa) as per ASTM C109 at 28 days. Furthermore, these mixtures are undergoing laboratory testing for pushout (using steel cylinders with varied diameters and thicknesses) and pullout tests as the subsequent part of this project. All groups contain 0.34 water-to-cement ratio, same size and amounts of sands and superplasticizer (SP). The first group included four control mixes without bentonite and polypropylene fiber (PPF) additives with varied foam content (C1-F1, F2, F3, F4). The remaining groups consist of 17 different mixes blended with either one or both additives. The content effect of foam agent, bentonite clay, and PPF as additives on the density and compressive and flexural strengths of cellular concrete are investigated in this study. The results revealed that the introduction of bentonite and/or PPF in cellular concrete mixtures increased the density and strength. The results revealed that low dry densities (less than 1900 kg/m³) of blended cellular concrete mixtures can reach high compressive strength of 24.37 MPa with 4.74 MPa flexural strength that make them feasible for geotechnical and structural engineering applications. © 2023 Trans Tech Publications Ltd, Switzerland.

ABSTRACT: *P. aeruginosa* is an opportunistic pathogen that is commonly found in nosocomial infections. The purpose of this study was to investigate the effects of seven antibiotics on *P. aeruginosa* planktonic growth, biofilm formation, and the expression of virulence factors. These antibiotics included Ciprofloxacin (CP), Amikacin (AMK), Vancomycin (VAN), Tetracycline (TET), Gentamicin (GEN), Erythromycin (Ery), and Clindamycin (CLI). Antibiotic susceptibility testing, Minimum Bactericidal Concentration (MBC), Minimum Inhibitory Concentration (MIC), growth curve, time-kill curve, biofilm inhibition and reduction assay, and RT-qPCR were used to assess the effects of these antibiotics on *P. aeruginosa* planktonic and biofilm. The clear zones of inhibition against *P. aeruginosa* for the CP, AMK, VAN, TET, GEN, Ery, and CLI were 26 mm, 20 mm, 21 mm, 22 mm, 20 mm, 25 mm and 23 mm,

respectively. The MIC values for CP, AMK, VAN, TET, GEN, Ery and CLI against *P. aeruginosa* ranged from 0.25 to 1 µg/mL while the MBC values ranged from 1 and 0.5 to 2 µg/mL respectively. The growth, total viable counts (TVCs), bacterial adhesion and biofilm formation of *P. aeruginosa* were reduced after exposure to all the tested antibiotics in a dose-dependent manner. The RT-qPCR analysis showed that all the tested antibiotics share a similar overall pattern of gene expression, with a trend toward reduced expression of the virulence genes of interest (*lasR*, *lasI*, *fleN*, *fleQ* and *fleR*, *oprB* and *oprC*) in *P. aeruginosa*. The results indicate that all of the tested antibiotics possess antimicrobial and anti-biofilm activities, and that they may be multiple inhibitors and moderators of *P. aeruginosa* virulence via a variety of molecular targets. This deduction requires to be investigated in vivo. © 2023 the Author(s), licensee AIMS Press.

ABSTRACT: In this paper, the installation of energy storage systems (EES) and their role in grid peak load shaving in two echelons, their distribution and generation are investigated. First, the optimal placement and capacity of the energy storage is taken into consideration, then, the charge-discharge strategy for this equipment is determined. Here, Genetic Algorithm (GA) and Particle Swarm Optimization (PSO) are used to calculate the minimum and maximum load in the network with the presence of energy storage systems. The energy storage systems were utilized in a distribution system with the aid of a peak load shaving approach. Ultimately, the battery charge-discharge is managed at any time during the day, considering the load consumption at each hour. The results depict that the load curve reached a constant state by managing charge-discharge with no significant changes. This shows the significance of such matters in terms of economy and technicality. © 2023 Tech Science Press. All rights reserved.

ABSTRACT: In this paper, we examine a nonlinear hyperbolic equation with a nonlinear integral condition. In particular, we prove the existence and the uniqueness of the linear problem by the Fadeo Galerkin method, and by applying an iterative process to some significant results obtained for the linear problem, the existence and the uniqueness of the weak solution for the nonlinear problem are additionally examined. © 2023 the author(s).

ABSTRACT: Data cleansing approaches aim at revealing and reducing different types of outsourced errors. Such errors introduce a major issue as data cleansing often involves costly computations and

time consumption. Data cleansing is complicated as most of the errors within the obtained data emerge in different forms, such as typos, duplicates, noncompliance with business rules, outdated data, and missing values. In this paper, the Supervised Dataset Cleaning Model (SDCM) is proposed in order to detect and reduce different types of outsourced errors that are stored in the data repository according to the supervised cleaning rules that are practiced from the previous cleaning processes. The findings indicates that the cleaning execution time can be reduced with this supervised model and the accuracy of the model is also increased when it covers the entire training rules and classified error types derived from the data warehouse. There are some expected future directions, which include: implementing full scale of SDCM and comparing the results obtained with different current methods. By comparing different data cleaning algorithms with SDCM, a knowledge gap is likely to arise in the search for further future improvements. © 2023 IEEE.

ABSTRACT: With the increasing cost of external financing in Jordan, excess cash holdings are a dominant feature of industrial companies listed on the Amman Stock Exchange (ASE). This study provides empirical evidence of an information asymmetry problem by examining the impact of earnings quality on excess cash holdings. The results aim to help investors and creditors to evaluate the transparency of and confidence in financial reporting to enhance decision making and minimise the risk of default. The study employed three different models for earnings quality and two different models for excess cash holdings. Through examination of panel data, the study found that firms with poor earnings quality tend to accumulate excess cash holdings in order to isolate themselves from an information asymmetry problem. ABSTRACT: This study examines the role of absorptive capacity on corporate social innovation, e-business proactiveness, and SMEs' survival. It also investigates the impact of corporate social innovation and e-business proactiveness, and SMEs' survival. Data were collected from 384 managers and owners of 62 SMEs in Jordan. Smart PLS, version 3, was employed to test hypotheses. The findings reveal that absorptive capacity significantly impacts e-business proactiveness and social innovation. They also show that absorptive capacity, e-business proactiveness, and social innovation significantly impact SMEs' survival. This study enriches the literature on renewable dynamic capabilities, exploring how e-business entrepreneurial orientation and social innovation contribute to SMEs' resilience and survival during global crises. © Vilnius University, 2002-2023.

ABSTRACT: Purpose: The present study aims to examine the relationships between digital business transformation, organizational learning, frugal innovation and Small and Medium Enterprises (SMEs) resilience in emerging markets. Design/methodology/approach: Empirical data collection has been implemented using a questionnaire method from 214 owners and managers of SMEs. The partial least squares structural equation modeling (PLS-SEM) approach was used to examine the measurement model and test hypotheses. Findings: The results show that digital business transformation significantly

impacts frugal innovation and SMEs' resilience in emerging markets. They also confirm the significant impact of frugal innovation on SMEs' resilience. Furthermore, the results revealed that organizational learning significantly impacts digital business transformation, frugal innovation and SMEs' resilience. Originality/value: This study provides novel insights into the existing theories and literature regarding the determinants of SMEs' resilience in emerging markets. It also provides practical contributions, confirming the SMEs' need to develop their dynamic capabilities, including digital transformation, frugal innovation and organizational learning to maintain their resilience. © 2023, Emerald Publishing Limited.

ABSTRACT: The development of easily administered targeted delivery for vaginal candidiasis is an area of active research. Challenges emerge from the specific conditions that may not permit enough time for the dosage form to reside on the infected area. Herein, we propose to develop films based on cellulose derivatives for the treatment of vaginal candidiasis. Gels of sodium carboxymethyl cellulose (Na-CMC) (F1), equal combination of Na-CMC and hydroxyethyl cellulose (HEC) (F2) and hydroxyethyl cellulose (HEC) (F3) were prepared and loaded with nystatin (NYS). The resultant gels were dried using solvent casting and characterized to detect glass transition temperature (T_g), mechanical properties, mucoadhesion, inhibition of candida growth toxicity on human embryonic kidney 293 cells (HEK) cells and drug release. T_g was affected by the polymer type and was found to be highest in F2, where equal ratios of HEC and Na-CMC were used. Mucoadhesion was highest in F1 (Na-CMC) films. The films showed moderate toxicity. The zone of inhibition was observed for the three formulations. Drug release was affected by the polymer type and was complete after 8 h in F2. The findings allowed concluding that the cellulose derivative based films were successfully prepared and were efficient in allowing the drug to elute and minimizing the growth of candida. © 2023, Publishing House of the Romanian Academy. ABSTRACT: We study rotational surfaces in the 3-dimensional Euclidean space E^3 . Furthermore, We classify non-degenerate rotational surfaces in E^3 in terms of its finite Chen type Gauss map. We show that the only rotational surfaces in E^3 whose Gauss map is of coordinate finite type are those of constant mean curvature. © 2023 Asia Pacific Journal of Mathematics.

ABSTRACT: Purpose: This study examines the impact of digital corporate social responsibility (CSR) on social entrepreneurship, organizational resilience and competitive intelligence during the coronavirus disease 2019 (COVID-19) crisis. It also examines the impact of competitive intelligence on social entrepreneurship and organizational resilience. Design/methodology/approach: Data were collected from telecommunication companies in Jordan with a sample of 223 managers, using Smart-PLS for analysis and testing the research model and hypotheses. Findings: The results reveal a significant impact of digital CSR on social entrepreneurship. They show that digital CSR significantly impacts organizational resilience. The findings also indicate a significant role of digital CSR in competitive intelligence. This study shows that social entrepreneurship significantly impacts organizational resilience. The results also confirm the impact of competitive intelligence on

social entrepreneurship. Finally, the results confirm that competitive intelligence significantly impacts organizational resilience. Originality/value: This study provides valuable academic and practical insights into digital CSR practices, social entrepreneurship and how to support organizational resilience during crises. © 2023, Emerald Publishing Limited.

ABSTRACT: The paper presents an experimentally validated 3D finite element modelling impacts of viscoelastic and natural materials. It considers, in particular, the material set of ash wood and rubber in the context of the impact between the bat (the "hurley" made of ash wood) and the ball (the "sliotar" made of polyurethane-cork composite) in the Irish game of hurling. The hurley is highly anisotropic in its mechanical properties and this impact system therefore presents a unique modelling challenge. The FE models do not rely on either the assumption of linear materials models or on calibrated materials models. The FE models are able to take all three geometric, status and material nonlinearities into account yielding a close correlation with real-world impact scenario. The reported FE results were validated against experimental measurements showing an excellent correlation of more than 91% in term of maximum ball deformation. © 2022 Published by Shahid Chamran University of Ahvaz

ABSTRACT: Background: Diabetes mellitus is a long-term disorder with high prevalence globally. It can be classified into two types: Type 1 diabetes and Type 2 diabetes mellitus. Diabetes mellitus is considered a multifactorial disorder in which genetic factors such as cytokines play a major role. Cytokines play a role in immune modulation and are associated with the development of diabetes mellitus. Single nucleotide polymorphisms in cytokines were studied extensively in different populations to determine their association with a predisposition to diabetes mellitus. Objective: The aim of this study was to estimate the frequency of single nucleotide polymorphisms in the cytokine genes TNF- α , TGF- β , IL-6, IL-10, and IFN- γ in 102 Jordanian diabetes mellitus patients in comparison to 50 controls and their association to diabetes mellitus susceptibility. Methods: Analysis was performed using the highly specific polymerase chain reaction-sequence specific primers methodology. Results: Our findings showed that the IL-10-1082 G/G genotype ($P = 0.02$) and the TGF- β 1 codon 25*G allele ($P < 0.01$) may be considered risk factors for type 2 diabetes mellitus. In addition, the IFN- γ -874*A allele ($P = 0.04$) seems to increase the predisposition to type 1 diabetes. Conclusion: Our study showed that the IL-10-1082 G/G genotype and TGF- β 1 codon 25*G allele are associated with type 2 diabetes mellitus while the IFN- γ -874*A allele is associated with type 1 diabetes. Our findings may help in the early detection of diabetes mellitus, which would in turn help in undergoing the needed preventative measures to delay the onset of diabetes mellitus. © 2023 Bentham Science Publishers.

ABSTRACT: Communication with the hearing impaired is a great challenge in the society today. Sign language is a significant communication method between deaf persons and their societies. However deaf and dumb people have an issue in this field as sign language may cause a lot of misunderstanding.

Today, many new technologies are becoming more applicable and cheaper. The intelligent algorithms and techniques are improved and becomes more accurate. Gesture recognition is one of the key technologies that facilitate many people life. Translating signs language into text and speech is an attractive field for researchers from past few years. However, it did not receive adequate interest in Sultanate of Oman. The proposed recognition system utilizes the Convolution neural network (CNN) method. It aims to convert the dynamic deaf signs from live video to text and speech using raspberry pi device and normal camera. The dataset for this project was created by the researchers. It contains 62000 (64x64 pixel) images of the 30 letter of Alphabets and 1 Word. Each pattern has 2000 images that are divided into 1750 images for training and 250 images for testing. The proposed system achieved 99.8 % accuracy. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: As a result of the effects of the COVID_19 pandemic, which has greatly affected the global economy, individuals have resorted to using financial technology and modern applications for financial transactions, which help reduce gatherings, given the centralization of the virus and the emergence of new, advanced pests. This paper aims to determine the impact of the COVID_19 pandemic on financial technology in the Jordanian banking sector. However, the quantitative approach was adopted, through electronic survey questionnaires being distributed to 2450 respondents from the population, which are all customers of Jordanian banks who use electronic banking services in the presence of the COVID_19 pandemic. As a result of analyzing 1930 resolution, it was found that the perception of the COVID_19 pandemic has a significant positive impact on Fintech in the Jordanian banking sector and that the perception of the COVID_19 pandemic has a significant positive impact on the dimensions of Fintech in Jordan which are (ease of use, reliability, responsiveness, assurance, interface design, and privacy). This study contributed to determining the extent to which electronic banking services reduce customer visits to branches according to social distancing. The paper explains how the development of technical services should go hand in hand with the bank's development strategies aimed at acquiring and retaining more customers. This paper recommends the need to improve the application of electronic banking services in proportion to customer satisfaction as much as possible. Copyright © 2023. All Rights Reserved.

ABSTRACT: The study aimed at showing the impact of COBIT5 with its dimensions (planning and organization, ownership and implementation, support and deliver, follow-up and evaluation, guidance and control) on the effectiveness of governance tools in Jordanian commercial banks. In order to achieve the objectives of the study and answer its questions, the study adopted the descriptive-analytical approach, in order to trace the relationship between the study variables, and to identify their trends and their impact on the study problem. The study population included all the (13) Jordanian commercial banks listed on the Amman Stock Exchange. 350 questionnaires were distributed. 322 of them were recovered, but 32 of them were non-analyzable. Thus, 290 questionnaires could be analyzed. They were analyzed on the program SPSS. The results of testing the hypotheses branching from the main hypothesis showed that there is a statistically significant impact of COBIT5 on the effectiveness of applying governance tools in Jordanian commercial banks, when studying each of them individually. The study recommended the necessity of speed in providing the management of Jordanian commercial banks with all software and special techniques, which help them to respond to any variables that may occur in the work environment. It also recommended the importance of working on developing systems and technologies that are characterized by modernity and accuracy in the event of the emergence of what is new and advanced, thus to document, classify and protect data. © 2023, SRAC - Romanian Society for Quality. ABSTRACT: -The aim of this study was to elaborate a conceptual approach to the development of financial technologies under the impact of restrictions imposed by international economic sanctions. The development of this sector was analyzed based on empirical studies of available information on the state of the FinTech sector in 28 countries that are impacted by international economic sanctions, using the Global Sanctions Database presented by OFAC (Office of Foreign Assets Control). The research involved comprehensive research methods: situational analysis, system analysis, reproductive analysis, structural and functional analysis. The results of the study confirmed the main hypothesis: international economic sanctions do not block the development of financial technologies, as FinTech can ensure the development of the financial sphere of sanctioned countries because of its flexibility and mobility. The calculations proved that depending on the way of combining the internal perception of external restrictions imposed by the sanctions, which is unique for each country, international economic sanctions are a stimulator for some countries (China, Ukraine, Iran), while being a significant development blocker ($r=0.896$) for others (with a financial technology performance less than 1). This study will be useful not only to scholars who deal with the theoretical and methodological framework of the development of the financial sector of countries subject to sanctions. © 2023, World Scientific and Engineering Academy and Society. ABSTRACT: The use of a wireless communication network has successfully enriched experiences of learning. In the service of mobile computing, education has now led to the implementation of mobile learning (m-learning). Not only to access educational resources quickly but m-learning also contributes to allowing a wide-ranging collaboration between users as learners. Supported by cloud technology, m-learning nowadays has shown its potential solution in making larger capacity and shorter processes. However, a cloud-based learning architecture would only enhance the power of data storing for the applications. The implementation with the growth of billions of various devices which still needs improvements due to computing performance and content delivery need to put the consideration of fog computing as an opportunity to create an effective and efficient educational service. This paper discusses the current implementation of fog technology including a comparative analysis regarding each type of learning situations in m-learning networked environments by using a comprehensive review and expert evaluation. Findings of this study also examine the benefits and future challenges to give a broader perspective for educational purposes. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: The systems of healthcare are being updated with modern capabilities, such as "Machine Learning (ML)", "Data Mining (DM)", and "Artificial Intelligence (AI)" in order to provide humans with more expert and intelligent services of healthcare. This paper provides a medical system of an intelligent prediction and classification for Parkinson's disease incorporating the "Density based Feature Selection (DFS)" with our optimization algorithm namely, "Sperm Swarm Optimization (SSO) algorithm". Prior to the SSO-based classifier construction, the proposed intelligent system (D-SSO) eradicates redundant or irrelevant features using DFS. Preprocessing, "Feature Selection (FS)", and classification are the three phases of the proposed D-SSO framework. Moreover, the D-SSO algorithm is tested using a benchmark of Parkinson's dataset, which the performance of D-SSO is examined using various evaluation factors. Mainly, the D-SSO algorithm is compared to existing approaches, which the proposed intelligent system outperforms the others, and gets an ideal recognition rate. © Al-Zaytoonah University of Jordan (ZUJ).

ABSTRACT: Background: Cardiovascular disease is one of the leading causes of death. Atherosclerosis causes arterial constriction or obstruction, resulting in acute cardiovascular illness. Cholesteryl ester transfer protein (CETP) facilitates reverse cholesterol transport. It supports the transfer of cholesteryl ester from HDL to LDL and VLDL. Inhibition of CETP by drugs limits cardiovascular disease by decreasing LDL and increasing HDL. Objectives: In this study, fourteen trifluoromethyl substituted benzene sulfonamides 6a-6g and 7a-7g were prepared. Methods: The synthesized molecules were characterized using ¹H-NMR, ¹³C-NMR, IR and HR-MS. They were in vitro tested to estimate their CETP inhibitory activity. Results: In vitro biological evaluation showed that compounds 7d-7f had the highest inhibitory activity with 100% inhibition, while the inhibition observed by compounds 6a-6g, 7a-7c and 7g ranged from 2%-72% at 10 μM concentration. It was found that the addition of a fourth aromatic ring significantly improved the activity, which may be due to the hydrophobic nature of CETP. Also, the presence of ortho-chloro, meta-chloro and para-methyl substituents results in high inhibitory activity. Conclusion: The induced fit docking studies revealed that hydrophobic interaction guided lig-and/CETP binding interaction in addition to H-bond formation with Q199, R201, and H232. Further-more, pharmacophore mapping demonstrated that this series satisfies the functionalities of the current CETP inhibitors. © 2023 Bentham Science Publishers.

ABSTRACT: Multiple linear regression and artificial neural network (ANN) models were utilized in this study to assess the type influence of nanomaterials on polluted water disinfection. This was accomplished by estimating E. coli (E.C) and the total coliform (TC) concentrations in contaminated water while nanoparticles were added at various concentrations as input variables, together with water temperature, PH, and turbidity. To achieve this objective, two approaches were implemented: data mining with two types of artificial neural networks (MLP and RBF), and multiple linear regression models (MLR). The simulation was conducted using SPSS software. Data mining was revealed after the estimated findings were checked against the measured data. It was found that MLP was the most promising model in the prediction of the TC and E.C concentration, s followed by the RBF and MLR models, respectively © 2023, Journal of Ecological Engineering. ABSTRACT: With the daily expansion of global energy consumption, developing the power grids is of uttermost importance. However, building a new transmission line is costly and time-consuming, so utilizing the same lines with possible higher transmission capacity is very cost-effective. In this regard, to increase the capacity of the transmission lines, the flexible alternating current transmission system (FACTS) has been widely used in power grids in recent years by industrialized countries. One of the essential topics in electrical power systems is the reactive power compensation, and the FACTS plays a significant role in controlling the reactive power current in the power grid and the system voltage oscillations and stability. When a static synchronous compensator (STATCOM) is embedded in a power system to increase the bus voltage, a supplementary damping controller can be designed to enhance the system oscillation damping. Given the expansion of the grids in the power system, the complexity of their optimization and the extraordinary ability of the imperialist competitive algorithm (ICA) for solving such problems, in this paper, the ICA has been used to determine the optimal position and size of the FACTS devices. © 2023, Tech Science Press. ABSTRACT: Aim and Objectives: The present study aims to provide an Arabic version scale that is valid and reliable to be used in Arabic countries to assess the level of competencies as it has become a prerequisite for nurses' high-quality performance. Background: Nursing is the profession that holds the health of individuals across life journey. Nurses' responsibilities are varied based on their specialties, but the main role is to support those who are in need for healthcare. Design: A methodological multi-countries study. Methods: the study is conducted on Iraqi and Jordanian hospitals from September, 6th, 2019 to September, 30th, 2021. Participants' Contribution: there is no patients or public contribution, there is only nurses, because the study is focused on their core competencies, not on patients or public persons. After the ethical consideration taken into consideration, nurses who completed the survey were 225; surveys with incomplete information were excluded and the total number left for the study were 217 nurses; male nurses were 132 and female nurses were 85. Results: The study results show that all the calculated values of the reliability parameters (Cronbach's Alpha=0.932, Correlation Between Forms=0.856, Spearman-Brown Coefficient=0.922, and Guttman Split-Half Coefficient=0.918) were within the higher reliability range. Additionally, the results indicate that the scale items can be collected in five domains according to its direction with a maximum determined variance. The scale domains are including the Human understanding and communication skills; Professional attitudes; Critical thinking and evaluation; General clinical performance; and Specific clinical performance. Conclusions: The ANCCS is a valid and reliable scale for measuring the nurses' core competencies in clinical practice, and it is easy to use by students, educators, administrators, and clinical personnel. It is highly recommended for nurses to use the ANCCS as a self-evaluation tool to maintain and improve their practice by identifying their strength and areas of improvement. Relevance to Clinical Practice Nurses' core competencies are a fundamental concept in nursing, it reflects the quality of nursing care. Furthermore, health care systems can integrate the core competencies of ANCCS in their quality

system to evaluate or to motivate nurses in specified and unified evidence-based items. As a conclusion; it has been determined that the ANCCS can be used for specifying nurse's competency level in Arabic population @ 2023, Journal for ReAttach Therapy and Developmental Diversities.All Rights Reserved.

ABSTRACT: Supply chain management processes and systems in different industries include multiple variables. This study examines the adoption of blockchain technology in supply chain in Malaysia. Data were collected through questionnaire designed as open ended question through 300 respondents while only 256 is used according to completed surveys, statistical analysis of the data obtained in this study was carried out by one sample t-test using the statistical software package (SPSS). we find that, perceived ease, Inter-Organizational Trust, Perceived Usefulness, Data transparency and confidentiality have significant impact on adoption Blockchain in supply chain, while Blockchain technology simplifies inventory financing. The paper use open ended questions so in future can use different kind of scale and different variables which can affect the adoption decisions. © The Author(s) 2023.

ABSTRACT: Aim: The aim of this potential repurposing study is to investigate the potential inhibitory activity of asenapine against central nervous system CaMKII isozymes using docking experiments and enzymatic assay. Background: The Ca²⁺/calmodulin-dependent protein kinase II (CaMKII) is a multifunctional protein kinase ubiquitously expressed throughout the brain. Emerging biological data have indicated that inhibiting central nervous system CaMKII isoforms, namely, CaMKII α and CaMKII β , may be a promising therapeutic strategy for the potential treatment of many neurological diseases including schizophrenia, depression, epilepsy, and learning deficit. Objective: 1-Study the possible attractive interactions of asenapine within the binding sites of the central CaMKII isozymes. 2-Evaluate the inhibitory activities of asenapine against central CaMKII isozymes. Methods: Docking experiments of asenapine and other known CaMKII inhibitors were performed. Docking settings were validated using ROC analysis. After that, the inhibitory activities of asenapine against central CaMKII alpha and beta were evaluated by enzymatic assay. Result: Docking and scoring experiments of asenapine showed several binding interactions anchoring asenapine within CaMKII α and CaMKII β catalytic sites while enzymatic assay results revealed that asenapine can inhibit CaMKII α and CaMKII β in the micromolar range. Conclusion: Our study provides evidence that asenapine can serve as a promising lead for the development of new CaMKII α and CaMKII β inhibitors. Moreover, this study reinforces how the investment in drug repurposing could boost the drug discovery process. © 2023 Daoud et al.

ABSTRACT: Purpose: This study aims to provide a better comprehension of the behavioural intentions that influence the adoption of Islamic financial technology (Fintech) in Malaysia for two kinds of Islamic lending Fintech services, which are crowdfunding and peer-to-peer (P2P) lending.

Design/methodology/approach: From May to July 2022 the primary data were collected by using a questionnaire distributed online to survey 437 Islamic Fintech clients in Malaysia. Structural equation modelling has been used to analyse the data based on using the partial least squares approach. **Findings:** The findings of this paper shows that planned behaviour, acceptance model and technology's use models are positively impacting factors that influence customers' opinions on adapting Islamic Fintech services in lending. The acceptance model was found to exert a negative impact on the intention to adopt Islamic lending P2P Fintech service. In addition, technology's use has a negative impact on the intention to adopt Islamic lending crowdfunding Fintech service.

Research limitations/implications: First, the study is limited to Islamic Fintech customers in Malaysia only, second, the study adopted an online survey but there is no guarantee that the geography area was fully covered. Another limitation is that the study covers only Islamic Fintech services in lending, thus the study did not attend to variables such as religiosity and the authors believe that this will provide useful insights for future research. **Originality/value:** Despite the importance of this topic, there has been a lack of empirical evidence until now. In this paper, the authors take stock of the empirical evidence in the literature through the importance of the adoption Fintech. This study provides a broad view of the market potentials for Fintech providers from the demand side on a wide range of Islamic Fintech services rather than focussing only on payment, transfer, etc. as presented in previous studies. © 2023, Emerald Publishing Limited.

ABSTRACT: Background: An imbalance in the levels of arachidonic acid (ARA) metabolites in cardiovascular disorders and drug-induced cardiotoxicity have been previously described. Aims: This study aimed to investigate the influence of cyclooxygenase-2 (COX-2) selective inhibitors on the gene expression of ARA-metabolizing genes and beta1 gene in the hearts and kidneys of experimental mice.

Methods: Thirty-five balb/c mice were divided into five groups with seven mice per group. The groups were then given two distinct types of COX-2 selective inhibitors, rofecoxib and celecoxib, in two different doses equivalent to those used in human treatment for 30 days. The mRNA expression of beta1, ace2, and ARA-metabolizing genes, coxs, lipoygenases (aloxs), and cytochrome p450 (cyp450s) in mice heart and kidneys were assessed. Genes were analyzed using real-time polymerase chain reaction analysis. In addition, rofecoxib-induced histological alterations were examined. **Results:** It was found that only the high dose of rofecoxib (5 mg/kg) caused toxicological alterations, a finding that was indicated by a significant increase ($P < 0.05$) in the relative weight of the mouse hearts and increase in the ventricle wall thickness as observed through pathohistological examination. This increase was associated with a significant increase in the mRNA expression level of the beta1 receptor in both the heart and kidneys of the mice (53-and 12-fold, respectively). The expression of both cox1 and 2 genes was increased 4-fold in the kidneys. In addition, the expression of the alox12 gene increased significantly (by 67-fold in the heart and by 21-fold in the kidney), while alox15 gene expression was upregulated in the heart by 8-fold and 5-fold in the kidney. The genes responsible for synthesizing 20-Hydroxyeicosatetraenoic acid (cyp4a12 and cyp1a1) were significantly upregulated ($P < 0.05$) in the hearts of high-dose rofecoxib-treated mice by 7-and 17-fold, respectively. In addition, the expression of epoxyeicosatrienoic acid-synthesizing genes, cyp2c29 and cyp2j5, was increased significantly ($P < 0.05$) in the hearts of high-dose rofecoxib-treated mice by 4-and 16-fold, respectively. **Conclusion:** Rofecoxib caused upregulation of the mRNA expression of the beta 1 gene in association with increased expression of ARA-metabolizing genes in mouse hearts and kidneys. These findings may help us understand the molecular cardiotoxic mechanism of rofecoxib. © 2023 Bentham Science Publishers.

Decoding Vehicle Motion Data on the Internal Network

(2023) Open Transportation Journal, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149143291&doi=10.2174%2f18744478-v17-e230111-2022-37&partnerID=40&md5=137cb4defa9f26fadfe6e109df8e8c20>

AFFILIATIONS: Department of Civil and Infrastructure Engineering, Faculty of Engineering and Technology, Al-Zaytoonah University of Jordan, St 594, Airport Rd, Amman, 11733, Jordan

ABSTRACT: Background: Encrypting functions of vehicle internal networks makes the lives of third parties more difficult since, in most cases, the meaning of messages carried by the CAN bus is not disclosed Objectives: This paper proposes a reverse engineering method to discover, to a large extent, the semantics of CAN messages in a vehicle internal network. Methods: A filtering mechanism has been applied that includes several statistical processes to interpret the codes of CAN messages. The speed change function of a vehicle has been chosen as an example to be followed in the development steps of this approach to predict the motion mechanism of the vehicle. The selected codes were verified by developing a multilevel model that relates the hierarchical relationship between the bytes and IDs and their impact on the speed factor. Results: The most influential IDs and bytes on vehicle speed functions were: ID 512, ID 520, ID 664, B2, B4, and B6, respectively. Conclusion: The selected codes used to model the observed speed do not mean they all share the speed function, but there is a good possibility that at least some fulfill this function. However, with some optimization, the same methodology can be applied to detect other semantic messages in the CAN network based on the expected data type. © 2023 Maen Qaseem Ghadi.

ABSTRACT: Background and Objectives: Honey is one of the oldest traditional remedies that has been widely utilized to cure a variety of human ailments. The objective of this research was to test and compare the antibacterial activity of Sidr honey (SH) and Tualang honey (TH) to that of Manuka honey (MH) against *Staphylococcus aureus*. Materials and Methods: The antibacterial activity of MH, SH and TH against *S. aureus* was investigated by agar well dif-fusion, Minimum Inhibitory Concentration (MIC), Minimum Bactericidal Concentration (MBC), time-kill curve, microtiter plate and RT-qPCR analysis. Results: Agar inhibition assay showed that MH possess highest total antibacterial activity against *S. aureus* with an inhibition zone 25.1 mm compared with that of SH (22.2 mm) and TH (21.3 mm). The findings showed that when compared to SH and TH (MIC: 25% and MBC: 50%), MH honey had the lowest MIC (12.5%) and MBC (25%). After *S. aureus* was exposed to MH, SH, and TH, there was a decrease in colony-forming unit as seen by the time-kill curve. The lowest concentration 20% of MH, SH and TH was significantly found to inhibit *S. aureus* biofilm. The RT-qPCR results revealed that all the selected genes in *S. aureus* were downregulated in gene expression following exposure to each of the tested honeys. Comparing the total antibacterial, antibiofilm, and antivirulence activities of all the tested honeys, MH demonstrated the greatest levels of these properties. Conclusion: According to this study, various types of each evaluated honey have the capacity to effectively suppress and

modify the virulence of *S. aureus* via a variety of molecular targets. © 2023 The Authors..

ABSTRACT: Shift-work leads to many negative health outcomes among nurses, including overweight/obesity, high stress level, and sleep disturbances. This study purposed to evaluate the influence of shift-work on perceived stress, sleep quality, and Body Mass Index (BMI) among emergency department (ED) nurses in Jordan. A descriptive correlational design was employed. A structured self-reported questionnaire was used to collect data from emergency nurses in government and private hospitals. A total of 450 emergency nurses responded to the questionnaire. Findings found that around 81.1% and 14.0% of the study participants endorsed moderate and high levels of stress, respectively. The majority of the participants (94.5%) had poor sleep quality; 35.3% had overweight and 18.7% had obesity. The study findings indicated that shift-work influenced on perceived stress ($\beta = 0.18$, $p < .001$) and BMI ($\beta = 0.15$, $p < .001$). The mixed shift-workers had lower perceived stress and higher BMI than their counterparts who were doing other shift-work categories. Hence, shift-work had a negative influence on the levels of perceived stress and BMI. Hence, this influence should be taken into consideration when planning interventions and strategies to minimize the negative effects of shift-work. © 2023 Taylor & Francis Group, LLC.

ABSTRACT: In this paper, we establish a novel fractional numerical modification of the 5-point classical central formula; called the modified 5-point fractional formula for approximating the first fractional-order derivative in the sense of the Caputo operator. Accordingly, we then introduce a new methodology for Richardson extrapolation depending on the fractional central formula in order to obtain a high accuracy for the gained approximations. We compare the efficiency of the proposed methods by using tables and figures to show their reliability. © 2023 the Author(s), licensee AIMS Press.

ABSTRACT: The main purpose of this paper is to examine the impact of business enablers and financial technology (Fintech) on the banking industry in order to determine whether it is an opportunity or a disruption. The applied research design is quantitative, and the hypotheses and the model were tested. To achieve the objectives, the study used a questionnaire to collect data. 150 managers in Saudi Arabia banks were surveyed. The participants provided 130 substantial and valid responses, and the PLS-SEM technique was used. Based on the analysis, it was concluded that the presence of business enablers facilitated Fintech progress, which led to the increase in bank performance, from the economic, social and environmental point of view. In addition, Fintech also plays a mediating role,

by increasing the positive impact of business enablers. Therefore, Fintech provides several opportunities, not a disruptive technology, for the banking industry. The research paper explains the importance of Fintech progress in Saudi Arabian banking. Many have viewed Fintech as a disruptive technology, but this study found that it presents various opportunities for the Saudi Arabian banking industry. © Ayman Abdalmajeed Alsmadi, Najed Alrawashdeh, Anwar Al-Gasaymeh, Heba Al-Malahmeh, Amer Moh'd Al_hazimeh, 2023.

ABSTRACT: Bortezomib (BTZ) is a first-in-class reversible and selective proteasome inhibitor. It inhibits the ubiquitin proteasome pathway that leads to the degradation of many intracellular proteins. Initially, BTZ was FDA approved for the treatment of refractory or relapsed multiple myeloma (MM) in 2003. Later, its usage was approved for patients with previously untreated MM. In 2006, BTZ was approved for the treatment of relapsed or refractory Mantle Cell Lymphoma (MCL) and, in 2014, for previously untreated MCL. BTZ has been extensively studied either alone or in combination with other drugs for the treatment of different liquid tumors especially in MM. However, limited data evaluated the efficacy and safety of using BTZ in patients with solid tumors. In this review, we will discuss the advanced and novel mechanisms of action of BTZ documented in MM, solid tumors and liquid tumors. Moreover, we will shed the light on the newly discovered pharmacological effects of BTZ in other prevalent diseases. © 2023, Leibniz Research Centre for Working Environment and Human Factors. ABSTRACT: Here, we describe the anticancer activity of our novel bis-triazoles MS47 and MS49, developed previously as G-quadruplex stabilizers, focusing specifically upon the human melanoma MDA-MB-435 cell line. At the National Cancer Institute (NCI), USA, bis-triazole MS47 (NCS 778438) was evaluated against a panel of sixty human cancer cell lines, and showed selective, distinct multi-log differential patterns of activity, with GI50 and LC50 values in the sub-micromolar range against human cancer cells. MS47 showed highly selective cytotoxicity towards human melanoma, ovarian, CNS and colon cancer cell lines; in contrast, the leukemia cell lines interestingly showed resistance to MS47 cytotoxic activity. Further studies revealed the potent cell growth inhibiting properties of MS47 and MS49 against the human melanoma MDA-MB-435 cell line, as verified by MTT assays; both ligands were more potent against cancer cells than MRC-5 fetal lung fibroblasts (SI > 9). Melanoma colony formation was significantly suppressed by MS47 and MS49, and time- and dose-dependent apoptosis induction was also observed. Furthermore, MS47 significantly arrested melanoma cells at the G0/G1 cell cycle phase. While the expression levels of Hsp90 protein in melanoma cells were

significantly decreased by MS49, corroborating its binding to the G4-DNA promoter of the Hsp90 gene. Both ligands failed to induce senescence in the human melanoma cells after 72 h of treatment, corroborating their weak stabilization of the telomeric G4-DNA. © 2022 by the authors.

ABSTRACT: Background and Objectives: There is consensus on the negative effects of obesity on the development of heart failure. However, several studies have suggested that obesity may have paradoxical survival benefits in heart failure patients. Therefore, the aim of this study is to investigate whether the obesity paradox exists in heart failure with reduced ejection fraction (HFrEF) patients in Jordan. Materials and Methods: In this retrospective cohort study, data were retrieved from electronic hospital records of heart failure patients admitted to King Abdullah University Hospital between January 2010 and January 2020. Patients were divided into five BMI (kg/m²) subgroups: (1) Less than 25.0, (2) Overweight 25.0–29.9, (3) Obese Class I 30.0–34.9, (4) Obese Class II 35.0–39.9, and (5) Obese Class III ≥40.0. Changes in patients' clinical and echocardiographic parameters over one year were analyzed. Results: Data of a total of 297 patients were analyzed to determine the effect of obesity on heart failure. The mean age was 64.6 ± 12.4 years, and most patients (65.7%) were male. Among several co-morbidities, diabetes mellitus and hypertension were the most common and were present in 81.8% and 81.1% of patients, respectively. Over all patients, there was no significant change in EF after 1 year compared to baseline. However, only patients in the Obese Class I group had a statistically significant improvement in EF of 38.0 ± 9.81% vs. 34.8 ± 6.35% (p = 0.004) after 1 year. Importantly, among non-diabetic individuals, only Obese Class I patients had a significant (p < 0.001) increase in EF after 1 year compared to other BMI subgroups, a feature that was not observed among patients with diabetes. On the other hand, only Obese Class I patients with hypertension had a significant improvement (p < 0.05) in EF after 1 year compared to other BMI subgroups, a feature that was not observed among patients without hypertension. Conclusions: Our study demonstrates an inverted U-shaped relationship between BMI and EF such that patients with mild obesity (i.e., Obese Class I) had significant improvement in EF compared to those having a lower and higher BMI. We, therefore, suggest the existence of the obesity paradox among HFrEF patients in Jordan. © 2022 by the authors.

ABSTRACT: In this note, we give an elementary proof of Hardy inequality in higher dimensions introduced by Christ and Grafakos. The advantage of our approach is that it uses the one-dimensional Hardy inequality to obtain higher dimensional versions. We go further and get some well-known weighted estimates using the same approach. © 2023 the author(s).

ABSTRACT: Antimicrobial resistance (AMR) is a growing global crisis with an increasing number of untreatable or exceedingly difficult-to-treat bacterial infections, due to their growing resistance to existing drugs. It is predicted that AMR will be the leading cause of death by 2050. In addition to ongoing efforts on preventive strategies and infection control, there is ongoing research towards the development of novel vaccines, antimicrobial agents, and optimised diagnostic practices to address AMR. However, developing new therapeutic agents and medicines can be a lengthy process. Therefore, there is a parallel ongoing worldwide effort to develop materials for optimised drug delivery to improve efficacy and minimise AMR. Examples of such materials include functionalisation of surfaces so that they can become self-disinfecting or non-fouling, and the development of nanoparticles with promising antimicrobial properties attributed to their ability to damage numerous essential components of pathogens. A relatively new class of materials, metal-organic frameworks (MOFs), is also being investigated for their ability to act as carriers of antimicrobial agents, because of their ultrahigh porosity and modular structures, which can be engineered to control the delivery mechanism of loaded drugs. Biodegradable polymers have also been found to show promising applications as antimicrobial carriers; and, recently, several studies have been reported on delivery of antimicrobial drugs using composites of MOF and biodegradable polymers. This review article reflects on MOFs and polymer-MOF composites, as carriers and delivery agents of antimicrobial drugs, that have been studied recently, and provides an overview of the state of the art in this highly topical area of research. © 2023 by the authors.

ABSTRACT: A web-based cross-sectional study was conducted to evaluate pharmacists' perception of information technology (IT) utilization and to explore the barriers for its implementation in hospital and community pharmacies. Three scores were calculated including tasks, frequency of use, and capability scores. The majority of the participants (n = 784) were community pharmacists (88.8%) and had less than 10 years of work experience (94.8%). Google was the most frequently used source for information (72.4%). No vision or strategic plan for IT was the most common barrier for IT utilization (41.5%). Pharmacists who had a Doctor of Pharmacy (Pharm. D) degree had a significantly higher mean in the three calculated scores, and females had a significantly higher tasks score mean. Quantile regression results showed that Pharm. D holders had significantly higher task scores (Coefficient = 1.09, p-value < 0.01) than those with Bachelor of Pharmacy (BPharm) degree, who had significantly lower frequency and capability scores (Coefficient = -6.68 and -1.80, p = 0.02 and <0.01, respectively). Efforts should be made by the different healthcare authorities to overcome the identified barriers and to improve pharmacists' utilization of IT in order to improve patient care and health outcomes. © 2023 Anan S. ABSTRACT: OBJECTIVE: Limitations and side effects associated with current anti-diabetic treatments have necessitated the search for new therapeutic alternatives. This study aimed to explore the combined use of resveratrol (RVT) and established anti-diabetic drug pioglitazone (PGZ) against

streptozotocin (STZ)-induced diabetes mellitus (DM). MATERIALS AND METHODS: STZ was supplemented daily to Sprague-Dawley rats to induce DM. The synergistic effect of the RVT (20 mg/kg) and PGZ (0.65 mg/kg) on DM complications was evaluated after 8 weeks of treatment. Biochemical analyses were performed to evaluate the effectiveness of our treatment on glucose level, insulin sensitivity, lipid disturbances, oxidative mediators and inflammatory markers. RESULTS: STZ induced DM onset that is accompanied with elevated diabetic markers, lipid disturbances, remarkable oxidative damage and hyper-inflammation. The PGZ+RVT combination has the best effect as illustrated by significant ($p < 0.05$) decreases in fasting blood glucose, insulin, HbA1c and HOMA-IR levels. This combination attenuated ($p < 0.05$) lipid disturbances and their associated elevated atherogenic biomarkers. At the same time, treatments with PGZ+RVT exhibited an anti-inflammatory effect as it attenuated the increase in inflammatory parameters (CRP, TNF- α , IL-6). Also, it restored total antioxidant capacity and peroxisome proliferator-activated receptor (PPAR γ) levels that decreased by STZ-DM induction. CONCLUSIONS: This study provides PGZ+RVT as promising DM therapeutic alternative. This synergistic combination alleviates most of DM-related complications and insulin resistance. © 2023 Verduci Editore s.r.l. All rights reserved.

ABSTRACT: The current study aimed at exploring the role of organizational culture in supporting better AIS outcomes from perspective of financial and accounting managers within SMEs in Jordan during the fiscal year 2021–2022. Independent variables of study (organizational culture) included (Involvement, Adaptability, Mission, Consistency), while dependent variable was AIS outcomes within the organization. Quantitative approach was adopted and (318) questionnaire was distributed on financial and accounting managers from different SMEs in the Jordanian capital Amman, during the fiscal year 2021/2022. SPSS was employed so as to reach numerical results that can lead to explaining the phenomenon under study, and it was indicated that the main hypothesis was accepted

“Organizational culture has a statistically positive influence on reaching better AIS outcomes within SMEs in Amman”. Among the sub-variables it was seen that involvement to be the most influential variable with an $R = 0.772$ followed directly by consistency scoring an $R = .608$, other variables were also seen to influential with lower degrees. Study Recommended carrying out a research that explores the influence of AIS outcomes and characteristics on organizational culture, in addition to the need from organizations to employ highly skilled and competent professionals and accountants to generate financial information and have appropriate academic qualifications. Further recommendations were presented later in the study. © 2023 The Author(s). This open access article is distributed under a Creative Commons Attribution (CC-BY) 4.0 license.

Department of Mechanical Engineering, Tafila Technical University, P. O. Box 179, Tafila, Jordan
ABSTRACT: There are increasing concerns for the promising future of atmospheric water harvesters (AWH). AWH have been analysed theoretically and experimentally using different technologies such as Vapour Compression (VC) Thermoelectric (TE), Sorption (absorption, adsorption) and shape-based techniques. These techniques are suffering from low water harvesting or high energy consumption. The ammonia vapour absorption system (VAS) (which can be operated using renewable energy sources) has not yet been analysed experimentally. In this study, the AWH based on ammonia VAS has been studied experimentally, the effect of air flow velocity and ambient conditions have been analysed. The comparison between the existing techniques and VAS was performed to explore the possibility of implementing biomass, geothermal and solar energy in generating water from atmosphere, thus reducing the cost of the m3 of water produced. © 2023, Journal of Ecological Engineering. ABSTRACT: In this paper, a new two-dimensional fractional-order discrete rational map with γ th-Caputo fractional difference operator is introduced. The study of the presence and stability of the fixed points shows that there are four types of these points; no fixed point, a line of fixed points, one fixed point and two fixed points. In addition, in the context of the commensurate and incommensurate instances, the nonlinear dynamics of the suggested fractional-order discrete map in different cases of fixed points are investigated through several numerical techniques including Lyapunov exponents, phase attractors and bifurcation diagrams. These dynamic behaviors suggest that the fractional-order discrete rational map has both hidden and self-excited attractors, which have rarely been described in the literature. Finally, to validate the presence of chaos, a complexity analysis is carried out using approximation entropy (ApEn) and the C_0 -measure. © 2022 IOP Publishing Ltd.

ABSTRACT: The primary objective of this paper is the data analysis of digital interactive art on Jordanian university students using information technology. The study also uses information technology because of the opportunities that technology provides for an interactive nature between the innovative process, productivity, and high flexibility. The data is collected using a questionnaire, and the majority of the study population is made up of Jordanian university students. According to the findings of this study, Digital Interactive Art has a substantial influence on Jordanian University Students' Information Technology. © 2023 by the authors; licensee Growing Science, Canada.

ABSTRACT: Background: Nurses working in emergency departments are overworked and exposed to frequent stressors over time, leading to compassion fatigue, burnout, and secondary traumatic stress. Aims: This study aimed to assess the levels of compassion fatigue and compassion satisfaction, and examine the relationship of these two variables with specific demographic, health-related, and work-related factors among emergency nurses in Jordan. Methods: This is a cross-sectional study. The Professional Quality of Life Scale Version 5 was used to collect data. Results: A convenience sampling method was used to recruit 203 registered nurses from emergency departments in Jordan. The mean compassion fatigue and satisfaction scores were moderate. There was a significant but negligible correlation between compassion satisfaction and educational levels ($r = 0.15$, $p < 0.05$) and between secondary traumatic stress and comorbid diseases ($r = -0.16$, $p < 0.05$). Conclusions: Although the levels of compassion fatigue and satisfaction were moderate, both may negatively affect nurses' care and patient outcomes. Conversely, compassion satisfaction should be improved in order to overcome the negative effects of compassion fatigue. © 2022 Elsevier Ltd

ABSTRACT: In this research, the new auxiliary equation method (NAEM) for higher order nonlinear fractional Huxley equation is being employed to extricate the novel soliton solutions using Beta and M-Truncated fractional derivatives. For waves of finite amplitude, the Huxley equation demonstrates a substantial transfer of spectrum energy. A comparison of the solutions of the model with both fractional derivatives is also included in this research. Various kinds of solitary traveling wave solutions, such as trigonometric, hyperbolic, exponential, rational functions, etc., are found. These types of solutions demonstrate the superiority of the novelty of the method. This method's key advantage over others is that it provides more broad solutions with certain flexible parameters. 3D and 2D graphs are used graphically to demonstrate the dynamical structures of the solutions. The results are presented in a way that demonstrate the usefulness and competence of the approach used to handle various nonlinear fractional partial differential equations. Lastly, we investigate the comparison of the gain spectra for modulation instability and the depiction of certain noteworthy outcomes by illustratively depicting the 2D figures produced by carefully considering the parameters © 2022 The Author(s)

ABSTRACT: Salak is one of the fruits plants in Southeast Asia; there are at least 30 cultivars of salak. The size, shape, skin color, sweetness or even flesh color will be different depending on the cultivar. Thus, classification of salak based on their cultivar become a daily job for the fruit farmers. There are many techniques that can be used for fruit classification using computer vision technology. Deep learning is the most promising algorithm compared to another Machine Learning (ML) algorithm. This paper presents an image classification method on 4 types of salak (salak pondoh, salak gading, salak sideempuan and salak affinis) using a Convolutional Neural Network (CNN), VGG16 and ResNet50. The dataset consists of 1000 images which having 250 of images for each type of salak. Pre-processing on the dataset is required to standardize the dataset by resizing the image into

224 * 224 pixels, convert into jpg format and augmentation. Based on the accuracy result from the model, the best model for the salak classification is ResNet50 which gave an accuracy of 84% followed by VGG16 that gave an accuracy of 77% and CNN which gave 31%. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The p-toluene sulfonic acid (p-TSA) catalyzed cascade ring closing transformation has been executed for the preparation of novel spiroquinazolinone compounds 4 and 5 by the reaction between anthranilamide and cyclohexanone followed by subsequent acylation. These molecules were then examined against the inhibitory activity of Acetylcholinesterase (AChE). The tested compounds revealed moderate anti-AChE activity of IC₅₀ values ranging from 46.675 to 14.256 μM). The described results lead toward the development of compounds 4b and 5c having promising anti-AChE activities with IC₅₀ values at the micromolar level. The docking study suggests that these hybrid spiroquinazolinone scaffold might facilitate the further development of investigated compounds as anti-Alzheimer agents. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: Objective: Asthma is one of the most prevalent chronic diseases with a substantial impact on the health status of affected patients. Further research is necessary to identify factors contributing to poor asthma control. The current study aimed to investigate the factors associated with poor asthma control among adult asthmatic patients. Methods: In this case-control study, the Asthma Control Test (ACT) was translated into Arabic and distributed to adults with asthma attending two hospitals in Jordan to evaluate the degree of asthma control. The following variables were collected for each patient: sociodemographic information, comorbidities, appropriate use of inhaler technique, spirometric measurements, and medications use. Binary regression was used to evaluate factors associated with asthma control. Results: A total of 314 participants with a mean age of 51.47 years (±16.37) completed the study. ACT score had a mean of 16.68 (±4.86). The majority of asthmatic patients had insufficiently controlled asthma (64.6%). Binary regression results showed that previous respiratory infection history (p = 0.014, OR = 0.473 (95%CI 0.261–0.857)), higher exposure to irritants (p = 0.010, OR = 0.747 (95%CI 0.598–0.933)) decreased the odds of being in the controlled asthma group. Patients receiving inhaled corticosteroids (ICS) had higher odds of being in the controlled asthma group (p = 0.039, OR = 2.372 (95%CI 1.043–5.392)). Conclusions: The majority of asthma patients had insufficiently managed disease. The main factors that contributed to poor asthma control were respiratory infection history, increased exposure to asthma symptoms triggers, and ICS nonuse. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: Views provided by windows are key factors that affect occupants' overall psychological and physiological comfort inside buildings. Despite their importance, there are no established approaches and regulations to guide designers and researchers in investigating view perception. This paper systemically reviews studies on view perception in terms of quality and quantity factors affecting view perception (i.e., content-related factors, design-related factors including window's shape and size, shading devices, mullions, and partitions, dynamic changes in views based on observer-related factors, and view size) and discuss views impact on other visual (i.e., glare) and non-visual (i.e., privacy and thermal comfort) perceptions. In addition, the notion of view quality and quantity is discussed. Furthermore, methods used to visually represent views from windows, and methods used to quantify view perception subjectively and objectively are critically reviewed. As a result, knowledge gaps were identified for future studies in relation to view quality assessment and experimental design; and an all-inclusive comprehensive approach to quantify view quality using subjective and objective assessments along with an adequate representation method is proposed. © 2022 The Authors

ABSTRACT: Internet-of-Things (IoT)-based cyber-physical systems are increasingly being adopted because of the recent technological advancements in sensor technology, edge computing, machine learning, and big data. Integrating machine learning into designing IoT-based cyber-physical systems is essential. However, it is considered a challenging problem. This stems from the fact that IoT devices generate extensive data that requires extensive processing to achieve adequate learning. Relying on local learning by each IoT device is not feasible in most cases due to its limited resources. On the contrary, relying on all cloud-based learning requires transmitting a large amount of data to the cloud to perform the learning process, which is inefficient in large-scale IoT deployments. Therefore, this paper proposes a novel edge-computing architecture that employs the concept of distributed multi-task learning over EC networks in large-scale IoT-based cyber-physical systems. The architecture develops multiple distributed learning algorithms, a data placement architecture, task allocation algorithms, and a network protocol. In addition, it considers the problem of learning model parameters from IoT data distributed over different edge nodes in a large geographical area without sending raw data to the cloud. The architecture supports several distributed machine models that are trained using a combination of machine learning algorithms and population-based search algorithms to optimize the learning process. Population-based search algorithms allow for maintaining a set of candidate solutions, with each solution corresponding to a unique point in the search space for an optimal solution. Having the dataset distributed over several edge nodes, with each node having its own unique set of candidate solutions, increases the chance of finding a solution that generalizes well for the overall dataset combined. Simulation experiments with real IoT datasets are conducted to evaluate the accuracy of the proposed learning models. Results show the ability to achieve high-accuracy results that are close to single-machine models but with significantly efficient edge computing resource utilization. © 2022 Elsevier B.V.

ABSTRACT: This study has the objective of examining how internal corporate governance mechanisms are related to earnings manipulation, measured by real-based earnings manipulation (REM) and accrual-based earnings manipulation (AEM). The internal corporate governance mechanisms discussed in this

study signify two main kinds of board characteristics (board size and board independence) and three main kinds of ownership structure (institutional ownership, foreign ownership and business group affiliation). The study models were examined from eight countries selected from the Middle East and North Africa (MENA) region. A total of 480 non-financial firms listed between 2012 and 2019 were examined. Based on panel data-based generalised methods of moments (GMM) estimation, the findings showed that institutional ownership in MENA nations limits the use of REM and AEM. Additionally, we found that larger boards are more likely to participate in REM practices. Board independence has a positive association with REM and AEM. The results also reveal that business group affiliation has a significant effect on both methods of earnings manipulation. Foreign ownership does not seem to significantly impact either of the two manipulation methods. Finally, these results help regulators and policymakers pursue reforms to enhance national governance quality in the MENA region. © 2022 The Author(s). ABSTRACT: The primary purpose of this paper is to explore and discuss the role of Fintech in the transformation of Malaysian banking services. The research design is qualitative and secondary source analysis is conducted. Secondary data is collected from relevant journal articles, research papers, editorials, websites and official documents. Based on the analysis, it is concluded that different key drivers played an influential role in the progress of the Fintech industry in Malaysia. Financial literacy programs and Malaysia Stack are some notable initiatives that support the Fintech progress in Malaysia. A range of Fintech businesses is operating in Malaysia that are transforming different banking services including payments solutions, lending personal loans, credit cards, personal finance management solutions and one-stop-shop online banking. Underserved populations, flexible regulatory environment and increased level of interest of state authorities are some of the critical aspects for the future progress of Fintech business in Malaysia. The research paper explains the role of Fintech businesses in the Malaysian banking industry. Many have viewed Fintech as a disruptive technology, however, this study highlighted that Malaysian banking services are transformed by Fintech business and there are still opportunities for the progress of the Fintech industry in Malaysia. © 2023 NSP Natural Sciences Publishing Cor.

ABSTRACT: The research looks at how a marketing intelligence system might help Jordanian businesses improve their marketing effectiveness in the wake of the COVID19 Pandemic. The study's sample size includes 234 Jordanian marketing managers. A stratified random sample of 146 Jordanian firms was chosen, and 118 valid questionnaires were obtained from marketing managers for statistical analysis, yielding an 80.8% response rate. According to the findings, the marketing intelligence system is crucial in influencing the company's marketing performance, and its simple and practical design increases the possibility of benefiting from it in improving the company's marketing performance. The researchers recommend allocating a separate department for marketing intelligence systems in order to maximize the system's benefit in terms of improving Jordanian corporations' marketing performance, as well as involving the department's director in various strategic decisions affecting the company. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: In light of the COVID-19 pandemic, many patients have suffered from Acute Respiratory Distress Syndrome (ARDS) in Intensive Care Units (ICUs) around the world. In the medical field, it is known that the so-called artificial ventilation device, which has become the mainstay of treatment of such syndrome, decreases mortality in critically ill COVID-19 patients. Due to the high reliability of this device, there is an emergency need to follow up the progress made on designing a robust controller for improving its performance. From this perspective, this work introduces different control design schemes for obtaining an optimal Fractional-order PID controller (or simply PIPD μ -controller) of the Artificial Ventilation (AV) system through two optimization algorithms: the Bacteria Foraging Optimization (BFO) and the Particle Swarm Optimization (PSO) algorithms. The realization of the controller is accomplished using four approximations: Oustaloup's approximation, the Continued Fractional Expansion (CFE) approximation and the 1st-and 2nd-order El-Khazali approximations. The validation of the controller design and the AV system behavior are verified via numerical simulation in order to demonstrate the effectiveness and the potency of all proposed schemes. © 2023 the Author(s), licensee AIMS Press.

ABSTRACT: Tobacco smoking is a preventable main cause of fatal diseases. Accurate measurements of the effects it has on neurotransmitters are essential in developing new strategies for smoking cessation. Moreover, measurements of neurotransmitter levels can aid in developing drugs that counteract the effects of smoking. The aim of this study is to develop and validate a fast, simultaneous and sensitive method for measuring the levels of neurotransmitters in rat brain after the exposure of tobacco cigarettes. The selected neurotransmitters include dopamine, GABA, serotonin, glutamine and glutamate. The method is based on high-performance liquid chromatography-tandem mass spectrometry. Chromatographic separation was achieved within 3 min using a Zorbax SB C18 column (3.0 × 100 mm, 1.8 μ m particle size). The mobile phase consisted of HPLC-grade water and acetonitrile each containing 0.3% heptafluorobutyric acid and 0.5% formic acid at gradient conditions. The linear range was 0.015–0.07, 825–7,218, 140–520, 63.42–160.75 and 38.25 × 10³ to 110.35 × 10³ ng/ml for dopamine, GABA, serotonin, glutamine and glutamate, respectively. Inter- and intra-run accuracy were in the range 97.82–103.37% with a precision (CV%) of \leq 0.90%. The results revealed that 4 weeks of cigarette exposure significantly increased neurotransmitter levels after exposure to tobacco cigarettes in various brain regions, including the hippocampus and the amygdala. This increase in neurotransmitters levels may in turn activate the nicotine dependence pathway. © 2022 John Wiley & Sons Ltd.

ABSTRACT: "Extremely High Frequency (EHF)" and "Very high frequency (VHF)" bands are mainly utilized with "Underwater Wireless Sensor Networks (UWSNs)" for communication purposes. However, due to the mobility of underwater sensors in water because of the water tide, the EHF/VHF signals may attenuate, lose or fade depending on the condition of the water. Therefore, it is a challenging stint of finding the optimal parameters of UWSN topology planning. In this paper, three "Multi-Objective Optimization Algorithms (MOOAs)" have been utilized to mitigate this problem, namely MOSFP, SPEA2 and NSGA-II. This work also intends to minimize path loss. On the other hand, it intends to maximize the power density of the network. Various network configurations, such as distance between sender and receiver, water conductivity and water permeability, are considered to evaluate the proposed objective models. Qualitative and quantitative tests have been conducted to analyze the results. From the analysis of the intersection point of Pareto-front of the objective functions, it is shown that all the algorithms find the optimal distance between transmitter and receiver, which balances the aforementioned maximization and minimization objective functions. This value is 36 m. © 2022 The Author(s). Published by Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Postpartum depression among first-time mothers is a sensitive issue and few studies were conducted related to this topic in developing countries including Jordan. Thus, this study purposed to assess postpartum depression levels and associated factors among Jordanian first-time mothers. A cross-sectional design was adopted, and 193 postpartum first-time mothers living in Amman governorate were recruited. A questionnaire consisting of two parts was used to record data, sociodemographic and maternal health, and Patient Health Questionnaire (PHQ-9). Findings showed that 34.1% of the women experienced postpartum depression. The employment, gravida, antenatal health problems, breastfeeding problems, newborn health problems, and availability of assistance during the postpartum period significantly correlated with postpartum depression. Thus, the understanding of postpartum depression and related factors would provide important empirical evidence for healthcare professionals and policy-makers when planning to develop strategies and measures to minimize postpartum depression among first-time mothers. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: The chemical spray pyrolysis technique was used to synthesis zinc sulfide (ZnS) thin films without annealing treatment. The thin films were grown on a glass substrate under various Zn:S ratios (1:1,1:2, 1:3). The spray solution was prepared by combining zinc acetate dihydrate and thiourea as precursor materials for Zn²⁺ and S²⁻ ions, with deionized water serving as the solvent. The results of the ZnS film on glass showed a well-characterized thin film acquired using Zn:S of (1:1,1:2,1:3) molar ratio, nozzle to substrate distance (NSD) of 30 cm and a substrate temperature of 300 °C. Strong peaks (111) were obtained for all samples via X-ray diffraction analysis. The photoluminescence spectrum showed three distinctive peaks at roughly 2.36, 2.98, and 3.6 eV and the energy gap of the synthesized thin film was 3.66 eV. The MSM photodetectors (PDs) made from the layers on glass substrate showed response to UV illumination (400 nm), exhibiting a photosensitivity of 665% at base voltage of 3 V. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: The purpose of this study is to analyze the relationship between profitability measures and earnings management in Jordanian commercial banks. The quantitative methodology was used to collect the research data from the financial statements of (35) Jordanian commercial banks from (2013 to 2019). The results of the study reveal that there is a negative and significant relationship between Return on Equity (ROE) and earnings management, and a positive and not significant relationship between Return on Deposits (ROD) and earnings management. It's also documented that there is a positive and significant association between each Return on Investment (ROI), Earnings Per Share (EPS), and earnings management. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: Self-awareness, empathy, and patient-centered care are essential components for nurses for improving nurse-patient relationship and providing high-quality care for the patients. There is limited research regarding these components among critical care nurses in Arab countries, including Jordan. Thus, this study purposed to evaluate the self-awareness, empathy, and patient-centered care among critical care nurses in Jordan. A cross-sectional, descriptive correlational design was applied. Data were collected from 140 registered nurses from six hospitals in different health sectors. Findings showed that the mean scores for self-awareness, empathy and patient-centered care were as follows: 1.92 (SD = 0.27), 4.87 (SD = 0.88), and 3.71 (SD = 0.80), respectively. These results indicate that nurses had a high level of self-awareness and empathy and a low level of patient-centered care. There was no relationship between self-awareness and socio-demographic variables, perceived stress, and social support. Also, there was a positive relationship between empathy and social support ($r = 0.310$, $p < 0.001$). Patient-centered care had a positive relationship with social support ($r = 0.202$, $p < 0.05$) and perceived stress ($r = 0.175$, $p < 0.05$), also, male nurses had higher patient-centered care than female encounters. Social support was a predictor of empathy, while social support and perceived stress were the main predictors for patient-centered care. The results of the study reflect the need for educational programs to promote self-awareness and empathy to enhance patient-centered care and achieve high-quality patient care. Additionally, correlating factors with PCC (social support and perceived stress) should be taken into consideration upon implementing any interventional programs. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Device to device (D2D) communication offers numerous benefits such as low latencies, high throughputs, spectral efficiency boosting, and base station energy reduction. However, lack of encryption and authentication during device discovery, link setup, and data transmission exposes the transmitted data to numerous security and privacy threats. To counter these security threats, a number of schemes have been developed based on public key infrastructure, bilinear pairing operations, batch verification, pre-computed lookup tables, symmetric cryptography, and elliptic curve cryptography (ECC) among others. However, these techniques experience very high communication and computation overheads or fail to address privacy and security challenges effectively. In this paper, a session key agreement protocol is proposed to address some of these issues. Simulation results showed that the proposed protocol exhibits the lowest communication costs and average computation costs. In addition, security analysis showed that our protocol is resilient against

message replays, masquerade, identity theft, message forgery, and cloning attacks. © 2023, The Author(s), under exclusive license to Springer Nature Switzerland AG.

ABSTRACT: The dramatic growth of the older population worldwide has resulted in a renewed need for mobile health applications (mHealth apps). The use of mHealth UI-designed-based culture can be useful in improving the quality of healthcare for elderly users. Therefore, there is a need for a comprehensive examination of the impact of mHealth UI design-based culture on older adult people's satisfaction. This study was conducted to promote older adults' satisfaction with mHealth UI design-based culture in a culturally specific context. We examined the influence of learning, screen, application capabilities, and terminology and application information on older adults' overall satisfaction with mHealth UI. Eighty-five older adults' users from general population in Jordan participated in this study. The results showed different correlation coefficients between these factors. This study paves the way for future research to consider culture in the design of mHealth UI. © 2022 Taylor & Francis Group, LLC.

ABSTRACT: The health-care system around the world has recognized the importance and usefulness of spirituality in the delivery of care. The goal of this study was to describe nurses' self-perceived ability in providing spiritual care to patients in Intensive Care Units, as well as to look into the relationship between demographic variables and their competencies. The researchers used a descriptive correlation design. There were 106 surveys distributed in total. Two large hospitals in Jouf, Saudi Arabia, had an 83.01% response rate. The self-reported questionnaire was completed by 88 nurses. The majority of nurses said they were capable of providing spiritual care to patients of the Islamic faith. Religions had statistically significant mean Spiritual Care Competency scores. It is critical to have a unified health strategy based on multidisciplinary collaborations to control spiritual care delivery, particularly in Intensive Care Units. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: Many missense mutations/SNPs of the TCN2 gene (which yield Transcobalamin (TC)) were reported in the literature but no study is available about their effect on binding to vitamin B12(B12) at the structural level experimentally nor computationally. Predict the effect of TC missense mutations/SNPs on binding affinity to B12 and characterize their contacts to B12 at the structural level. TC-B12 binding energy difference from the wildtype ($\Delta\Delta G_{mut}$) was calculated for 378 alanine scanning mutations and 76 ClinVar missense mutations, repeated on two distinct X-ray structures of holoTC namely 2BB5 and 4ZRP. Destabilizing mutations then went through 100 ns molecular dynamics simulation to study their effect on TC-B12 binding at the structural level employing 2BB5 structure. Out of the studied 454 mutations (378 alanine mutations + 76 ClinVar mutations), 19 were destabilizing representing 17 amino acid locations. Mutation energy results show a neutral effect on

B12 binding of several missense SNPs reported in the literature including I23V, G94S, R215W, P259R, S348F, L376S, and R399Q. Compared to the wildtype, all the destabilizing mutations have higher average RMSD-Ligand in the last 25% of the MD simulation trajectories and lower average hydrogen bond count while the other parameters vary. Previously reported TCN2 SNPs with an unknown effect on TC-B12 binding were found to have a neutral effect in the current study based on mutation energy calculations. Also, we reported 17 possible amino acids that destabilize TC-B12 binding upon mutation (four listed in ClinVar) and studied their structural effect computationally. © 2022 Informa UK Limited, trading as Taylor & Francis Group.

Lipid-based formulations of microemulsion-loaded oleogels for the oral delivery of carvedilol (2023) Journal of Dispersion Science and Technology, .
<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113742338&doi=10.1080%2f01932691.2021.1964987&partnerID=40&md5=e90d4191fe30fa888e20d4ce4dc408bf>
AFFILIATIONS: Department of Pharmacy, Faculty of Pharmacy, Al-Zaytoonah University of Jordan, Amman, Jordan;

Department of Pharmacy, School of Pharmacy, University of Jordan, Amman, Jordan
ABSTRACT: This work aimed to develop controlled-release lipid-based formulations of microemulsion-loaded oleogels for the oral delivery of the poorly soluble drug carvedilol (CARV). The microemulsion-loaded oleogels were prepared by the oleogelator Compritol® 888 (CP888). CARV was loaded into submicron-sized emulsions (CARV-MEs) of various ratios of surfactant and cosurfactant. The CARV-MEs were entrapped into CP888-based oleogels, forming CARV-ME oleogels. The rheological properties and dissolution studies of the CARV-ME oleogels were determined. MTT assay test was performed to ensure the safety of oleogel formulations. The optimized formulation of CARV-ME oleogel was subjected to stability studies. The results revealed that CARV-MEs were thermodynamically stable of spherical globules of average size 13.3–57.4 nm, polydispersity index (PDI) range of 0.24–0.52, and interfacial tension of 29.9 ± 0.2 mN/m. Oleogels exhibited viscoelastic properties with more elastic behavior. The drug release rate was found to be dependent on the surfactant/cosurfactant ratio. A negative correlation was found between surfactant concentration and IC50. The optimized CARV-MEs oleogel was stable for 3 months at various storage conditions. In conclusion, the entrapment of the CARV-MEs, with various surfactant to cosurfactant ratios, into oleogels influences the dissolution rate and mechanism of drug release and the safety of CARV-MEs oleogels. © 2021 Taylor & Francis Group, LLC.

Mental Health Nursing, Department of Nursing Science, Faculty of Medicine, University of Malaya, Kuala Lumpur, Malaysia

ABSTRACT: Objective: To investigate the prevalence of psychological symptoms (PS) among university students and the predictors associated with seeking counseling and psychological help among students. Participants: A total of 663 students from three Jordanian universities participated in this study. Methods: A cross-sectional, correlational design was applied. Participants reported on the Attitude toward Seeking Professional Help Scale and the Hopkins Symptoms Checklist-21. Results: Students reported higher mean scores on the symptom checklist and had a poor attitude toward seeking counseling with low confidence in the counseling services. PS predicted that less than 7% of students would seek counseling with no difference among all age groups, gender, or specializations. Conclusion: High prevalence and low confidence influenced students' behavior toward seeking counseling and psychological help. There is a need to incorporate topics explaining the importance of counseling into different university courses, while emphasizing that it is neither stigmatizing nor shameful to seek professional help. © 2021 Taylor & Francis Group, LLC.

ABSTRACT: It became necessary to integrate alternative teaching methods having excellent results in the nursing curriculum such as high-fidelity human patient simulation. High fidelity simulation improves nursing students' thinking, and emotional and decision-making capabilities. The pretest-posttest control group design was conducted to examine the effect of high-fidelity simulation (HFS) intervention on clinical decision-making for pediatric nursing students at the Arab American University in Palestine. One hundred fifty participants took part in the present study, where 50% (n = 75) were in each of the intervention and control groups. The intervention group received theory-based learning and high fidelity simulation, while the control group was provided with theory based learning and usual training in the nursing laboratory. Findings showed that after implementing the intervention, a significant change was noticed in means of clinical decision-making between the control and intervention groups. Therefore, high fidelity simulation intervention was effective, thus it could benefit the nursing students by enhancing clinical decision-making. The results support nursing educators and universities especially in developing countries to adopt such an intervention strategy for nursing students. © 2021 Informa UK Limited, trading as Taylor & Francis Group.

ABSTRACT: The main purpose of any vehicular climatic control in terms of heating and air conditioning (AC) systems is to achieve maximum thermal human comfort with energy efficient. Therefore, it is important to analyse the temperature distribution and air-flow field in the cabin compartment to achieve the highest and rapid human comfort. This paper adopted a Berkeley human comfort model to show the behaviour of a vehicular human sensation and comfort at different airflow velocity levels. A temporal history, local sensation (LS), and comfort (LC) were analysed for different body segments with the addition of the overall sensation (OS) and the overall comfort (OC) inside the passenger compartment under summer period weather conditions. This study revealed that: because of the air velocity plays crucial impacts on both convection and evaporation mechanisms which directly effects on the heat losses from the body and thermal human comfort, the controlling of air movement with the temperature helps the environmental cabin to achieve the comfort zone faster than the sole control of the temperature only. When activated the air conditioning systems, the vehicular environmental parameters will change dramatically and a rapid transient occurred especially in the first few minutes. © 2020 Engineers Australia.

ABSTRACT: Pesticide contamination is a global issue, affecting nearly 44% of the global farming population, and disproportionately affecting farmers and agricultural workers in developing countries. Despite this, global pesticide usage is on the rise, with the growing demand of global food production with increasing population. Different types of porous materials, such as carbon and zeolites, have been explored for the remediation of pesticides from the environment. However, there are some limitations with these materials, especially due to lack of functional groups and relatively modest surface areas. In this regard, metal-organic frameworks (MOFs) provide us with a better alternative to conventionally used porous materials due to their versatile and highly porous

structure. Recently, a number of MOFs have been studied for the extraction of pesticides from the environment as well as for targeted and controlled release of agrochemicals. Different types of pesticides and conditions have been investigated, and MOFs have proved their potential in agricultural applications. In this review, the latest studies on delivery and extraction of pesticides using MOFs are systematically reviewed, along with some recent studies on greener ways of pest control through the slow release of chemical compounds from MOF composites. Finally, we present our insights into the key issues concerning the development and translational applications of using MOFs for targeted delivery and pesticide control. © 2022 American Chemical Society.

ABSTRACT: Lysine-specific histone demethylase 1 (LSD-1) is an epigenetic enzyme that oxidatively cleaves methyl groups from monomethyl and dimethyl Lys4 of histone H3 and is highly overexpressed in different types of cancer. Therefore, it has been widely recognized as a promising therapeutic target for cancer therapy. Towards this end, we employed various Computer Aided Drug Design (CADD) approaches including pharmacophore modelling and machine learning. Pharmacophores generated by structure-based (SB) (either crystallographic-based or docking-based) and ligand-based (LB) (either supervised or unsupervised) modelling methods were allowed to compete within the context of genetic algorithm/machine learning and were assessed by Shapley additive explanation values (SHAP) to end up with three successful pharmacophores that were used to screen the National Cancer Institute (NCI) database. Seventy-five NCI hits were tested for their LSD-1 inhibitory properties against neuroblastoma SH-SY5Y cells, pancreatic carcinoma Panc-1 cells, glioblastoma U-87 MG cells and in vitro enzymatic assay, culminating in 3 nanomolar LSD-1 inhibitors of novel chemotypes. © 2022 The Royal Society of Chemistry.

ABSTRACT: Anti-diabetic therapies possess many side effects; thus, searching for alternative strategies with low cost, minimal side effects, and high therapeutic value is very important. The present study aimed to explore the combined use of selenium yeast (SY) and standard anti-diabetic drug pioglitazone (PGZ) for diabetes mellitus (DM) treatment in streptozotocin (STZ)-induced DM. STZ was injected daily intraperitoneally with a low dose (40 mg/kg) into Sprague-Dawley rats to induce DM. The synergistic effect of the SY (0.2 mg/kg) and PGZ (0.65 mg/kg) on DM complications was evaluated after 88 weeks of treatment. The impact of our medication on glucose levels, insulin sensitivity, lipid abnormalities, oxidative mediators, and inflammatory markers was assessed by biochemical techniques. STZ-induced diabetes has toxic effects, including toxic hepatic tissues, lipid disturbances, massive oxidative damage, and hyperinflammation. Experimental rats either treated with monotherapy alone or combined therapy resulted in a significant anti-diabetic effect. The PGZ+ SY combination has the best effect, as illustrated by significant ($P < 0.05$) decreases in fasting

blood glucose, (FBG) insulin, HbA1c, and HOMA-IR levels. This combination attenuated ($P < 0.05$) lipid disturbances and their associated elevated atherogenicity biomarkers. At the same time, treatments with PGZ+ SY exhibited an anti-inflammatory effect as they ameliorated the increase in inflammatory parameters (CRP, TNF- α , IL-6). Also, it restored the total antioxidant capacity and peroxisome proliferator-activated receptor (PPAR γ) levels that were decreased by STZ-DM induction. In conclusion, this study finds PGZ+ SY as a promising DM therapeutic alternative. This synergistic combination alleviates most DM-related complications and insulin resistance. © 2022 Zainab ZZ et al.

ABSTRACT: Purpose: The research identifies the predictors of Islamic mobile banking (IMB) smart services adoption and usage in Jordan. Design/methodology/approach: Based on the Unified Theory of the Acceptance and Use of Technology (UTAUT) and the Unified Theory of the Acceptance and Use of Technology 2 (UTAUT2), an extended and modified model that encompasses perceived trust was developed. The sample comprised 358 customers from Islamic banks (IBs) in Jordan, and structural equation modelling was applied to examine data drawn from the sample. Findings: The research framework presented 0.728% of the behavioural intention variance and 0.455% of the use behaviour. Results discovered that performance expectancy, perceived trust and hedonic motivation have significant relations with behavioural intention. The finding that effort expectancy has an insignificant effect and that social influence has a significant negative influence on behavioural intention was unexpected. Research limitations/implications: The research has successfully verified the effect of performance expectancy, perceived trust and hedonic motivation on the customer's intention to use IMB smart services. However, the research data findings are based on the cross-sectional design. Practical implications: The outcomes hold implications for marketing strategy makers who are responsible for promoting IMB smart services in IBs. Originality/value: This research presents a deeper insight into IMB adoption and use. The research employed UTAUT and UTAUT2 as the baseline model and incorporates perceived trust to estimate behavioural intention. To the best of the authors' knowledge, this could be the first inquiry that examines IMB smart services adoption and use in Jordan. © 2022, Saad G. Yaseen, Ihab Ali El Qirem and Dima Dajani.

ABSTRACT: This article demonstrates the "structure of feeling," Raymond Williams' much-debated concept as it appears in his autobiographical novel, *Border Country* (1960). By drawing upon the nuances of Williams' cultural theory, it is the purpose of this article to trace his attempt to articulate diverse dimensions of the "structure of feeling" in this novel. Furthermore, this article touches upon Williams' various epochal classifications of culture such as dominant, residual, emergent and pre-emergent cultural elements as well as the ramifications of the communal and individual realities of England and Wales within the two time frames of the 1920s and the 1950s. Consequently, this article illustrates the manner in which Williams cultivates his artistic talent to embrace both subjective and collective experiences to capture the multi-faceted generational emotional energies depicted in *Border Country*. © 2022 Shanghai Normal University. ABSTRACT: This study was conducted to investigate the effect of cobalt complexation on the spectral properties of anthocyanins (AC) extracted from black grape pomace (Black Magic) and the effect of complexation on the pH stability of AC during storage. Initially, cobalt acetate tetrahydrate aqueous solution was complexed with AC crude extract and diluted separately in buffer solutions with different pH (3.5, 4.5, 5.5, and 6.5). Afterward, spectral changes were determined spectrophotometrically. pH stability was investigated using the same buffer solutions and stored for 7 days in the dark at room temperature, and the absorbance of each solution was measured daily using a spectrophotometer. Results indicated that complexation caused similar hypsochromic and hyperchromic shifts in λ_{max} at all pH values. With regard to pH stability, the degradation of complexed AC followed first-order reaction kinetics causing half-lives to increase up to 80-fold as compared with noncomplexed AC, which was due to the sharp decrease in K (per day), indicating an improved pH stability as compared with noncomplexed AC. Therefore, Co(II) could be used in the stabilization of grape AC for the coloration of a wide range of foods and food products at near-neutral pH environments considering the health benefits of grape AC and the maximum nontoxic dose of Co(II) salt. © 2022 The Korean Society of Food Science and Nutrition.

ABSTRACT: Alzheimer's disease (AD) is a polygenic multifactorial neurodegenerative disease that, after decades of research and development, is still without a cure. There are some symptomatic treatments to manage the psychological symptoms but none of these drugs can halt disease progression. Additionally, over the last few years, many anti-AD drugs failed in late stages of clinical trials and many hypotheses surfaced to explain these failures, including the lack of clear understanding of disease pathways and processes. Recently, different epigenetic factors have been implicated in AD pathogenesis; thus, they could serve as promising AD diagnostic biomarkers. Additionally, network biology approaches have been suggested as effective tools to study AD on the systems level and discover multi-target-directed ligands as novel treatments for AD. Herein, we provide a comprehensive review on Alzheimer's disease pathophysiology to provide a better understanding of disease pathogenesis hypotheses and decipher the role of genetic and epigenetic factors in disease development and progression. We also provide an overview of disease biomarkers and drug targets and suggest network biology approaches as new tools for identifying novel biomarkers and drugs. We also posit that the application of machine learning and artificial intelligence to mining Alzheimer's disease multi-omics data will facilitate drug and biomarker discovery efforts and lead to effective individualized anti-Alzheimer treatments. © 2022 by the authors.

ABSTRACT: Sand is one of the most abundant, naturally occurring materials in many parts of the world, which is used in local rural areas in infrastructure projects such as in the construction of low volume paved and unpaved road layers due to their availability at low cost and scarcity of other suitable construction materials. Several geotechnical solutions for sand stabilization have been undertaken to improve their properties in order to overcome erosion, failure of pavements under traffic loading, embankments, cuts and excavations caused by failures of sand structure. In this

investigation, bentonite clay-water slurry was used due to its cohesive and eco-friendly nature to improve sand strength by the means of manual injection in the laboratory and pilot scales. Sand was stabilized using variation of bentonite clay contents, 0%, 1%, 2%, 3%, and 4% (by weight of dry sand), at different curing times: 0 days, 1 day, 2 days, and 3 days. Direct shear tests were conducted to determine shear strength parameters for sand before and after stabilization process. Furthermore, a transparent polypropylene box (60 cm × 40 cm × 30 cm) was used in this study as a larger scale for sand stabilization technique by applying manual grouting of bentonite clay-water slurry to the sand mass. A mechanical shaker was used at 100, 200, 300, and 400 rpm for 10 min at each stage to test the stability of sand in addition to using a Scanning Electron Microscope (SEM) to obtain images for stabilized sand and Ground Penetrating Radar (GPR) to scan soil mass before and after stabilization. The test results showed that a slurry composed of 3% of bentonite clay additive with 10.3% added water by weight of dry sand mass are the optimum amounts for the stabilization process, which provides a substantial resistance to shear forces. © 2022 by the authors.

ABSTRACT: In the past few years, the world has suffered from an untreated infectious epidemic disease (COVID-19), caused by the so-called coronavirus, which was regarded as one of the most dangerous and viral infections. From this point of view, the major objective of this intended paper is to propose a new mathematical model for the coronavirus pandemic (COVID-19) outbreak by operating the Caputo fractional-order derivative operator instead of the traditional operator. The behavior of the positive solution of COVID-19 with the initial condition will be investigated, and some new studies on the spread of infection from one individual to another will be discussed as well. This would surely deduce some important conclusions in preventing major outbreaks of such disease. The dynamics of the fractional-order COVID-19 mathematical model will be shown graphically using the fractional Euler Method. The results will be compared with some other concluded results obtained by exploring the conventional model and then shedding light on understanding its trends. The symmetrical aspects of the proposed dynamical model are analyzed, such as the disease-free equilibrium point and the endemic equilibrium point coupled with their stabilities. Through performing some numerical comparisons, it will be proved that the results generated from using the fractional-order model are significantly closer to some real data than those of the integer-order model. This would undoubtedly clarify the role of fractional calculus in facing epidemiological hazards. © 2022 by the authors.

ABSTRACT: Sex hormones have a large influence on the structure and function of vaginal microbiota. A delicate balance between the vaginal microbiota and the host is one of the most important health reasons for women. The purpose of this study was to see if there were any links between female sex hormone levels and vaginal microbial diversity. A total of 100 vaginal swabs were obtained from female patients between the ages of 20 and 60 years who were suspected of having symptomatic and asymptomatic vaginal infections at the General Hospital and outpatient gynecological clinics, Samarra city, Iraq. The findings revealed that 70% and 25% of 100 high vaginal swabs with 95% positive cultures were from infected and healthy women, respectively. The most common organisms isolated belonged to Gram-negative bacteria and were *Escherichia coli* at 16 (16.84%) and in infected women were 9 (9.47%) and 7 (7.36%) in healthy women. The second most common isolated microorganisms from women with vaginitis were *Proteus vulgaris* at 8 (8.42%), *Acinetobacter* at 7 (7.36%), *Proteus mirabilis* at 7 (7.36%), and *Citrobacter* at 6 (6.31%). The highest percent of the isolates belonged to Gram-positive bacteria and were *Staphylococcus saprophyticus* at 5 (5.26%) and *Staphylococcus aureus* at 4 (4.21%) followed by *Enterococcus faecalis* at 4 (4.21%), *Bacillus stearothermophilus* at 3 (3.15%), *Bacillus megaterium* at 3 (3.15%), *Enterococcus faecium* at 1 (1.05%) and *Leuconostoc pseudomesenteroides* at 1 (1.05%), and *Lactobacillus* at 6 (6.31%). The greatest proportion of infection discovered in the age group 30 years was 36 (37.89%), while the least infected age group was 60 and above (2.1%). All of the bacteria that were isolated were susceptible to levofloxacin but resistant to metronidazole and amoxicillin-clavulanic acid. The relationship between isolated bacteria and sex hormone levels (estrogen and progesterone) revealed that sex hormone levels vary depending on the bacterial type. *Burkholderia cepacia* and *Lactobacillus* had the highest estrogen levels, while *Pseudomonas fluorescens* and *Aeromonas* had the highest progesterone levels. © 2022 Khaled M. ABSTRACT: Systemic Lupus Erythematosus (SLE) is a prolonged inflammatory autoimmune disease, which is characterized by a high titer of serological autoantibodies. Interactions between environmental and genetic factors play a crucial role in the pathogenesis of SLE. Human Leukocyte Antigen (HLA) genes, namely HLA-class II genes, are one of the main candidate genes that increase susceptibility to SLE. The aim of this study was to investigate, for the first time, the association of HLA-DRB1 and HLA-DQB1 genes among Jordanian patients diagnosed with SLE and Lupus Nephritis (LN) using the Polymerase Chain Reaction-Sequence-Specific Primer (PCR-SSP) technique. This study showed that SLE is positively associated with DRB1*0301, DRB1*1101, DRB1*1102 and HLA-DQB1*0601. Furthermore, HLA-DRB1*0301, DRB1*1101, HLA-DRB1*1501 and HLA-DQB1*0601 were found to be linked to SLE patients with LN. In addition, haplotypes HLA-DRB1*0301/DQB1*0201 and HLA-DRB1*1501/DQB1*0601 were found to be linked to SLE and LN. Our findings may serve as possible predictive markers for early screening for LN risk in SLE patients. In light of these results, the role of HLA gene polymorphisms may help in understanding the clinical course, prognosis of the disease and developing better treatment strategies for SLE patients. In addition, it may help in early diagnosis, prevention, intervention and management of the disease. © 2022 by the authors.

ABSTRACT: Big data applications and analytics are vital in proposing ultimate strategic decisions. The existing literature emphasizes that big data applications and analytics can empower those who apply Big Data Analytics during the COVID-19 pandemic. This paper reviews the existing literature specializing in big data applications pre and peri-COVID-19. A comparison between Pre and Peri of the pandemic for using Big Data applications is presented. The comparison is expanded to four highly recognized industry fields: Healthcare, Education, Transportation, and Banking. A discussion on the effectiveness of the four major types of data analytics across the mentioned industries is highlighted. Hence, this paper provides an illustrative description of the importance of big data applications in the era of COVID-19, as well as aligning the applications to their relevant big data analytics models. This review paper concludes that applying the ultimate big data applications and their associated data analytics models can harness the significant limitations faced by organizations during one of the most fateful pandemics worldwide. Future work will conduct a systematic literature review and a comparative analysis of the existing Big Data Systems and models. Moreover, future work will investigate the critical challenges of Big Data Analytics and applications during the COVID-19 pandemic. © 2022 by the authors.

New approach for predicting the load-displacement curve of axially loaded piles in sand

(2022) Case Studies in Construction Materials, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

ABSTRACT: A relationship to predict the load-displacement curve for axially loaded piles in sandy soil is presented by using the tri-linear softening model to describe the shaft load-displacement relationships, as well as a bi-linear model is adopted to characterize the unit end resistance-displacement reaction in the region of the pile's tip soil. Subsequently, an analytical mathematical approach to a single pile-surrounding soil interaction relation is provided as a nonlinear analysis to obtain the load-displacement curves. The mechanical response of piles under compression loading was analysed, and thus, an analytical method is developed to establish a solution for the entire compression process of the piles. A combination of the prementioned models with the pile response under compression loading was employed to establish a fully analytical approach. Furthermore, additional analytical approaches and field-tested pile loading history cases were utilized to prove the degree of exactness of the suggested method by comparing the experimental load-displacement curves with the ones founded by the proposed theoretical method in this work. The results of this study illustrate that the proposed method could be considered as an analytical mathematical technique for utilizing both the tri-linear softening model and the bi-linear elastic-plastic model for the purpose of predicting the load-displacement curves of the axially loaded pile with a 98% degree of accuracy compared to field load tests results. © 2022 The Authors

ABSTRACT: With the fast-expanding number of vehicles in smart cities, the management of road intersections and traffic congestion has grown to be major problems. Drivers often express their opinion that putting traffic lights on while taking traffic flows into account will have a significant impact on how traffic moves. This paper presents a smart Road traffic Control management

system termed Urban Traffic Control (UTC) keeping real-time dynamic traffic flow in mind which helps in upgrading the level of road traffic network management. To provide an organized traffic arrangement, UTC presents methodologies such as vehicle counting, controlling process, and evaluation of lanes keeping status in mind, this whole procedure is implemented by taking the complete traffic network into an account instead of just considering intersections. The primary goal of our system is to lessen traffic jams by cutting down on the trip and waiting times vehicles spend at crossings and intersections. We need to assign a plan for traffic flow that has the least amount of traffic congestion and vehicle waiting time, for this purpose some indicators and models are introduced in this study. Lane weight, traffic jam indicator, and vehicle priority are among these models. As this work is an improvement on the current Road Network without much changing, we integrate our system on normal traffic lights which allow each lane a chance to move and we also considered the no-interference lane movement. To simulate our idea, we introduced a smart road traffic control system consisting of multi-agents, by using a NetLogo simulator. To compare the fixed cycle traffic light, several vehicles (150 in total) with random behaviour were generated and scattered over 25 different intersections for the time duration of 9 h. This setting was used to test our smart traffic control solution on both lane flow and no interference movement flow. According to the obtained results, there was a 25.98% reduction in total average waiting time over simulation period for all vehicles and a reduction of 34.16% for no interference movement flow. These observations clearly state that suggested method is better suited for today's complex traffic conditions where change in infrastructure is minimal. © 2022

ABSTRACT: Targeting the intrinsic metabolism of immune or tumor cells is a therapeutic strategy in autoimmunity, chronic inflammation or cancer. Metabolite repair enzymes may represent an alternative target class for selective metabolic inhibition, but pharmacological tools to test this concept are needed. Here, we demonstrate that phosphoglycolate phosphatase (PGP), a prototypical metabolite repair enzyme in glycolysis, is a pharmacologically actionable target. Using a combination of small molecule screening, protein crystallography, molecular dynamics simulations and NMR metabolomics, we discover and analyze a compound (CP1) that inhibits PGP with high selectivity and submicromolar potency. CP1 locks the phosphatase in a catalytically inactive conformation, dampens glycolytic flux, and phenocopies effects of cellular PGP-deficiency. This study provides key insights into effective and precise PGP targeting, at the same time validating an allosteric approach to control glycolysis that could advance discoveries of innovative therapeutic candidates. © 2022, The Author(s).

ABSTRACT: Providing course recommendations has proven its importance, especially with the outbreak of COVID-19 and the resulting difficulties in the learning process. Although several works have proposed algorithms in this regard, to our knowledge, these algorithms did not consider the aptitudes of the student. These works used the previous grades of the student along with other features without considering the inherent student aptitudes, which would play a vital role in the final student grade, and in the long run, shaping the student future. This work proposes a novel course recommender based

on student aptitudes. In order to provide recommendations, we propose a novel method to extract the inherent student aptitudes. These aptitudes are further enriched using a pre-trained deep learning model to include semantically correlated aptitudes. We adopt the use of nearest neighbor approach in the course recommender and consider the previously extracted student aptitudes. Experimental work proves the efficiency of the proposed methods in terms of accuracy. © 2022 ICIC International.

ABSTRACT: In this research, approaches to making e-learning accessible to students with impairments were studied based on the authors' experience at Jordan's Al-Zaytoonah University. The educational, organizational, and instructional concerns are underlined when analyzing the university's experience in giving access to online content. Furthermore, these difficulties must be addressed in order to create the necessary organizational change to effectively solve accessibility concerns. This study looked into the e-learning issues that 56 university students with disabilities had reported. Students reported issues with: accessibility to websites and learning course management systems; accessibility to digital audio and video; time management in completing online tasks; trouble handling data during lectures; and a lack of appropriate adaptive strategies in online questionnaires. Students also noted technical issues with using e-learning, instructors' communication with e-learning, and their treatment of all students equally, overlooking the necessity of considering the needs of students with impairments. In this study, we present the problems raised by students with disabilities and how the e-learning affects students' outcomes in the e-learning experience. We also make recommendations based on the students' realistic special-needs experience at Al-Zaytoonah University in Jordan during the COVID-19 pandemic to inspire decision-makers in educational institutions and those interested in this field. © 2022, Institute of Advanced Engineering and Science. ABSTRACT: Background: The incidence of skin cancer and actinic keratosis has increased worldwide. Measuring the public awareness, attitude, and knowledge about these diseases and the skin protection behaviors are highly important to undertake preventive measures. Methods: To investigate skin cancer and actinic keratosis-related knowledge, sun protection behaviors, and sunscreen usage among Jordanians, a questionnaire was developed. The questionnaire was provided as a google form to individuals via social media and the data were analyzed using SPSS® 23. Results: A total of 1277 individuals, aged 18-65 years filled the questionnaire. The median melanoma and actinic keratosis knowledge score were 7 (4-9) and 4 (0-9), respectively. The melanoma knowledge was higher among females, those with a medical background, a high level of education, and in the central region, whereas the AK knowledge was higher among those with a medical background. Overall, 75.9% of the participants used sunscreen at least often to prevent sunburn, uneven skin tone, or tanning, 72% were using sunscreen with an SPF of 30 at least. However, 45.3% and 49.2% of sunscreen users did not comply with application, and reapplication times, respectively. Moreover, 58.4% of participants applied less than the recommended amount of sunscreen. Conclusion: Our study revealed that public awareness of actinic keratosis is low among Jordanians. Although it was found that a high proportion

of Jordanians use sunscreens there are deficits in sunscreen practice indicating an urgent need to design effective interventions to increase awareness of actinic keratosis and correct use of sunscreen via health campaigns or healthcare professions. © 2022 Wiley Periodicals LLC.

ABSTRACT: Understanding the interaction between biological structures and nanoscale technologies, dubbed the nano-bio interface, is required for successful development of safe and efficient nanomedicine products. The lack of a universal reporting system and decentralized methodologies for nanomaterial characterization have resulted in a low degree of reliability and reproducibility in the nanomedicine literature. As such, there is a strong need to establish a characterization system to support the reproducibility of nanoscience data particularly for studies seeking clinical translation. Here, we discuss the existing key standards for addressing robust characterization of nanomaterials based on their intended use in medical devices or as pharmaceuticals. We also discuss the challenges surrounding implementation of such standard protocols and their implication for translation of nanotechnology into clinical practice. We, however, emphasize that practical implementation of standard protocols in experimental laboratories requires long-term planning through integration of stakeholders including institutions and funding agencies. Department of Nursing, School of Nursing, Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Background: Acute otitis media (AOM) is one of the most common infectious diseases that affects children. Breastfeeding has been linked to a lower risk of AOM in the first three years of childhood. The aim of this study was to identify the association between exclusive breastfeeding and the development of acute otitis media (AOM) and investigate the influence of breastfeeding duration on the presence of AOM. Methods: In a retrospective case-control study, a sample of 98 children (cases) who were diagnosed with AOM and 98 children (controls) who were not diagnosed with AOM and were younger than two years old were selected from the Jordan University Hospital. Medical records were used to identify children with AOM. For both the case and control groups, the children's mothers completed a self-administered questionnaire about factors linked to the incidence of AOM. The type of feeding and the duration of breastfeeding were assessed using a validated questionnaire. Results: The data indicated that among children who developed AOM, 23.5% were artificially fed, while 22.4% and 13.3% were exclusively breastfed for 3 months and 6 months, respectively. Approximately 70.7% of the children without AOM were exclusively breastfed for 6 months, compared with only 29.3% of the children without AOM who were exclusively breastfed for 3 months. Logistic regression revealed that nonexclusive breastfeeding, exclusive breastfeeding for 3 months, and exclusive breastfeeding for 6 months were protective factors against AOM (OR = 0.23, 0.18, and 0.25, respectively; $P < 0.05$). A short duration of exclusive breastfeeding was considered a risk factor for the development of AOM (OR = 1.7, $P < 0.05$). Conclusions: The escalation of AOM is tightly connected to the early introduction

of formula feeding in the first six months of life. Breastfeeding had a protective impact on the occurrence of AOM. Understanding factors that are associated with the occurrence of AOM in children may support the role of public health institutions and primary health care in the prevention and reduction of AOM episodes and the need for national health strategies to promote breastfeeding. © 2022, The Author(s).

ABSTRACT: Recently, phishing attacks have become one of the most prominent social engineering attacks faced by public internet users, governments, and businesses. In response to this threat, this paper proposes to give a complete vision to what Machine learning is, what phishers are using to trick gullible users with different types of phishing attacks techniques and based on our survey that phishing emails is the most effective on the targeted sectors and users which we are going to compare as well. Therefore, more effective phishing detection technology is needed to curb the threat of phishing emails that are growing at an alarming rate in recent years, thus will discuss the techniques of mitigation of phishing by Machine learning algorithms and technical solutions that have been proposed to mitigate the problem of phishing and valuable awareness knowledge users should be aware to detect and prevent from being duped by phishing scams. In this work, we proposed a detection model using machine learning techniques by splitting the dataset to train the detection model and validating the results using the test data , to capture inherent characteristics of the email text, and other features to be classified as phishing or non-phishing using three different data sets, After making a comparison between them, we obtained that the most number of features used the most accurate and efficient results achieved. the best ML algorithm accuracy were 0.88, 1.00, and 0.97 consecutively for boosted decision tree on the applied data sets. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

Assessment of the effectiveness of a course in major chemical incidents for front line health care providers: a pilot study from Saudi Arabia (2022) BMC Medical Education, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129508203&doi=10.1186%2fs12909-022-03427-2&partnerID=40&md5=c3432ee8fb5cb271425c54e40fb987dc>

ABSTRACT: Background: Mass chemical exposure emergencies are infrequent but can cause injury, illness, or loss of life for large numbers of victims. These emergencies can stretch and challenge the available resources of healthcare systems within the community. Political unrest in the Middle East, including chemical terrorist attacks against civilians in Syria and increasing chemical industry accidents, have highlighted the lack of hospital preparedness for chemical incidents in the region. This study aimed to evaluate the effectiveness of a course designed to empower frontline healthcare providers involved in mass casualty incidents with the basic knowledge and essential operational skills for mass chemical exposure incidents in Saudi Arabia. Methods: A mixed-methods approach was used to develop a blended learning, simulation enhanced, competency-based course for major chemical incidents for front line healthcare providers. The course was designed by experts from different disciplines (disaster medicine, poisoning / toxicology, and Hazard Material Threat - HAZMAT team) in four stages. The course was piloted over five days at the Officers Club of the Ministry of Interior (Riyadh, Saudi Arabia). The 41 participants were from different government health discipline sectors in the country. Pre- and post-tests were used to assess learner knowledge while debriefing sessions after the decontamination triage session and simulation-enhanced exercises were used for team performance assessment. Results: The overall knowledge scores were significantly higher in the post-test (69.47%) than the pre-test (46.3%). All four knowledge domains also had significant differences between pre- and post-test results. There were no differences in the pre and post-test scores for healthcare providers from the different health disciplines. A one-year post-event survey demonstrated that participants were satisfied with their knowledge retention. Interestingly, 38.3% had the opportunity to put this knowledge into practice in relation to mass chemical exposure

incidents. Conclusion: Delivering a foundation level competency-based blended learning course with enhanced simulation training in major chemical incidents for front line healthcare providers may improve their knowledge and skills in response to such incidents. This in turn can improve the level of national preparedness and staff availability and make a crucial difference in reducing the health impacts among victims. © 2022, The Author(s).

No association between LDL receptor and CETP genetic variants and atorvastatin response in Jordanian hyperlipidemic patients

(2022) Drug Metabolism and Personalized Therapy, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129327270&doi=10.1515%2fdmpt-2021-0177&partnerID=40&md5=15a3bb180389360377271a80f0db54d5>

ABSTRACT: Objectives: Atorvastatin is commonly used medication to achieve low levels of low-density lipoproteins (LDL). Cholesteryl ester transfer protein (CETP) and LDL receptor (LDLR) genetic variants can affect the cholesterol transport and hence may affect on atorvastatin response. This study aimed to investigate the influence of LDLR AvaII, CETP TaqIb, and Rs1532624 on the efficacy of 20 mg atorvastatin among Jordanian hyperlipidemic patients. Methods: One hundred and 50 blood samples were collected from hyperlipidemic patients in the University of Jordan Hospital. Polymerase chain reaction-restriction fragment length polymorphism was used for genotyping of LDLR AvaII and CETP TaqIb genetic variants. The genotyping of CETP Rs1532624 variant was done by Sanger DNA-Sequencing. Results: LDLR AvaII and CETP TaqIb and Rs1532624 variants showed a significant (p value < 0.05) association with the baseline of the LDL at the time of diagnoses. On the other hand, none of the tested genetic variants showed a significant (p value > 0.05) association with LDL reduction after atorvastatin therapy. Conclusions: Results demonstrated a significant association between the LDLR AvaII and CETP TaqIb, and Rs1532624 genetic variants with the LDL baseline level. However, the atorvastatin therapy among hyperlipidemic patients of Jordanian origin was not affected by any of the tested variants. © 2022 Walter de Gruyter GmbH, Berlin/Boston.

ABSTRACT: We present and analyze a pattern of modal superlative constructions in Levantine Arabic (LA)¹ with an asymmetrical behavior: while the modal construct state superlative construction is ambiguous between the regular modifier and modal superlative readings, the modal attributive superlative is unambiguous and the only reading it has is the regular modifier reading. We propose an explanation for the asymmetry in terms of the (in)applicability of Late Merger of the modal adjective which is, as shown, a necessary compositional stage in deriving the modal superlative reading. © 2022 JJMLL Publishers/Yarmouk University. ABSTRACT: Catheter-associated urinary tract infections (CAUTIs) are nosocomial infections causing more than one million hospital cases annually. The progress of CAUTIs leads to severe health complications. Infections result in blockage of the medical device due to biofilm formation, which necessitates the replacement of the device. The objective of this study is to improve urological biomaterials to minimize microbial growth and reduce the incidence of CAUTIs. Challenges from mixed biofilm are crucial and need to be addressed in the development of new coating materials. Herein, an investigation highlighted the reduction of mixed biofilm overgrowth and attachment tendency on poly-2-hydroxyethyl methacrylate (p-HEMA) surface by loading the hydrogel with rifampicin (RIF), cefixime

trihydrate (CFX), and combined ratios of RIF and CFX. Mixed biofilm-formation ability in (3:1) RIF: CFX-loading p-HEMA (F6) surface showed best tendency to resist form biofilm. Persistent antimicrobial activity increased in p-HEMA loaded with combined ratios of RIF and CFX surface compared to p-HEMA alone, antimicrobial activity lasted for 8 days. All fabricated films exhibited %cell viability higher than 75% on HEK 293 cells. The addition of RIF and CFX may improve the duration of urological device employment before replacement. © 2022, The Author(s).

ABSTRACT: The aim of this study is to produce durable self-compacting concrete (SCC) using different fractions of recycled steel slag aggregates (SSA) by replacing natural aggregate. For this purpose, a series of nine mixing proportions were designed with a constant water-to-cement ratio of 0.34 and a change of SSA ratio replacing natural coarse or fine aggregates by weight from 0 to 50% (increments of 12.5%). For freshly mixed SCC, the flowability, passing and filling abilities, segregation and viscosity were observed by slump flow, slump-flow time (T500), L-box and V-funnel empirical tests. Mechanical properties were tested for compressive and flexural strengths, while the durability characteristics were conducted for water absorption and permeability, sulfate attack and freeze-thaw action (F/T). Non-destructive measurement approaches (i.e. ultrasonic pulse velocity and resonance frequency) were involved in the F/T testing. The test results indicate that the incorporation of SSA in SCC is suitable and improves the mechanical strength and durability properties, and that enhancement is more pronounced at higher SSA increments, especially when replacing the coarse natural aggregate partially by coarse SSA. © 2020 ICE Publishing: All rights reserved.

ABSTRACT: Amphotericin B (AmB) is one of the first-line treatments for systemic fungal infections, yet it suffers from dose-limiting systemic toxicity and high cost of less toxic lipid-based formulations. Here, we report on a facile approach to synthesize an AmB-loaded nanomedicine by leveraging plant-inspired oxidative self-polymerization of the ubiquitous polyphenol quercetin (QCT). Polymerized QCT nanoparticles (pQCT NPs) were formed, loaded with AmB, and functionalized with poly(ethylene glycol) (PEG) to impart steric stability in a simple procedure that relied on mixing followed by dialysis. The AmB-loaded NPs (AmB@pQCT-PEG NPs) were characterized by a drug loading efficiency of more than 90%, a particle size of around 160 nm, a polydispersity index of 0.07, and a partially negative surface charge. AmB release from the NPs was sustained over several days and followed the Korsmeyer-Peppas model with a release exponent (n) value >0.85, denoting drug release by polymer relaxation and swelling. A hemolysis assay revealed the NPs to be highly biocompatible, with negligible hemolytic activity and 30-60% hemolysis after 1 and 24 h of incubation with erythrocytes, respectively, across a wide concentration range (6.25-100.00 µg/mL). Conversely, equivalent concentrations of free AmB caused 90-100% hemolysis within the same timeframe. Importantly, AmB@pQCT-PEG NPs outperformed free AmB in microbial susceptibility assays on *Candida albicans*, achieving a minimum inhibitory concentration of 62.5 ng/mL after 48 h of incubation, which was 2-fold lower than the free drug. Our results demonstrate that pQCT NPs may serve as a viable AmB delivery platform for the treatment of fungal infections and potentially other AmB-susceptible pathogens. © 2022 American Chemical Society. ABSTRACT: Purpose: The objective of this paper is to explore the possible impact of mobile banking

service quality (MBSQ) on customer value co-creation intention (CVCI). Design/methodology/approach: A questionnaire was administered to research participants from Jordan. A total of 562 valid questionnaires were analysed. Mediation and moderation evaluations were performed in order to examine the function performed by MBSQ, customer engagement (CE), and social presence as determinants of CVCI. Structural equation modeling of type covariance-SEM using AMOS software was employed for the analysis. Findings: The research results verify the proposition that MBSQ, CE, and social presence can all influence. In addition, the mediating role of customer engagement in respect of the relationship between MBSQ and CVCI is also confirmed in this research. Practical implications: This research is of use to bank managers who must allocate resources during the development of m-banking platforms, wherein value co-creation in banking can be promoted. Originality/value: This study comprises an original contribution to current scholarship in the field of m-banking through its examination of the impact of customer engagement with m-banking. Moreover, this research augments current literature pertaining to the function of MBSQ in relation to CVCI as tempered by customer engagement and social presence. © 2022, Emerald Publishing Limited.

ABSTRACT: In this research work we present the synthesis and characterization of asymmetrical [FeFe]-hydrogenase mimic, $[\text{Fe}_2(\text{CO})_5\text{P}(\text{OMe})_3\{\mu\text{-(SCH}_2)_2\text{SnPh}_2\}]$ (2), obtained from replacing one of the CO ligands of the parent hexacarbonyl complex $[\text{Fe}_2(\text{CO})_6\{\mu\text{-(SCH}_2)_2\text{SnPh}_2\}]$ (1) with the monodentate phosphite $\text{P}(\text{OMe})_3$. The molecular structure of complex 2 was confirmed by X-ray diffraction analysis. Moreover, the electrochemistry of complexes 1 and 2 was investigated to explore the influence of the steric bulk of the Ph-ring at the bridgehead Sn atom with the nearby $\text{P}(\text{OMe})_3$ ligand. In addition, both complexes show their potentials toward hydrogen formation in the presence of weak acid, such as acetic acid (AcOH), suggesting an ECEC (E=electron transfer, C=chemical process) mechanism for hydrogen production. © 2022 Wiley-VCH GmbH.

ABSTRACT: Several novel, innovative approaches for improving transdermal delivery of BCS class III drugs have been proposed. Despite their great aqueous solubility, BCS class III drugs have the drawback of limited permeability. The objective of the current work was to screen the suitability of niosomes as a nanocarrier in permeation enhancement of azithromycin (AZM) transdermal delivery. Niosomes were prepared by an ether injection method using a nonionic surfactant (Span 60) and cholesterol at different concentrations. The ζ potential (ZP), polydispersity index (PDI), and particle size (PS) of AZM-loaded niosomes were evaluated. The size of the niosomes was found to vary between 288 and 394 nm. The results revealed that the niosomes prepared in a ratio of 2:1 (Span 60: cholesterol) had larger vesicle sizes, but all of them were characterized by narrow size distributions (PDI < 0.95). Niosomal gel was successfully prepared using different polymers. The appearance, pH, viscosity, and ex vivo drug release of niosomal gel formulations were all examined. The flow curves showed that the niosomal gel displayed lower viscosity values than its corresponding conventional gels. Niosomal and conventional gels exhibited a domination of the elastic modulus (G') over the viscous modulus (G'') ($G' > G''$) in the investigated frequency range (0.1–100 rad/s), indicating stable gels with more solid-like properties. Ex vivo skin permeation studies for the niosomal gel show $90.83 \pm 3.19\%$ of drug release in 24 h as compared with the conventional gel showing significantly lower ($P < 0.001$) drug release in the same duration ($1.25 \pm 0.12\%$). Overall, these results indicate that niosomal gel could be an effective transdermal nanocarrier for enhancing the

permeability of AZM, a BCS class III drug. In conclusion, this study suggests that transdermal formulations of AZM in the niosomal gel were successfully developed and could be used as an alternative route of administration. © 2022 Authors. All rights reserved.

ABSTRACT: This research aims to provide a predictive model of essential factors influencing the behavioral intention to use sustainable cloud-based quality management systems among academics in Jordan. A comprehensive research model was developed based on the Unified Theory of Acceptance and Use of Technology (UTAUT2) and the Theory of Planned Behavior (TPB), which was tested using cross-sectional data. The research sample covers Jordanian higher education institutions (23 governmental and private universities), and the unit of analysis includes 500 academics. The research adapts and modifies the UTAUT2 model and TPB to explain behavioral intention to use sustainable cloud-based quality management systems in developing countries. The proposed model explained 0.478 percent of behavioral intention variance and 0.127 percent of the user behavior variance. Three constructs are found to be significant predictors: perceived behavioral control, performance expectancy, and facilitating conditions. The attitude toward the behavior and subjective norm are not significant predictors. The research contributes to the literature in several ways. First, it extends previous studies by examining predictors of the behavioral intention to use SCQMS in higher education institutions. Second, it provides rigorous empirical evidence that incorporating the UTAUT2 model with the TPB produced a substantial improvement in the variance explained in behavioral intention compared to the prior research conducted in developing contexts. Third, this research provides useful insight into university management. The research provides a better understanding of the essential factors influencing the behavior intention to use sustainable cloud-based quality management systems in Jordanian Universities. Thus, the research model provides better explanatory power than previous studies in business literature and developing markets. © 2022 by the authors.

ABSTRACT: This study aims to recognize the sustainability independence of the Jordanian Association of Certified Public Accountants (JACPA/JCPA) and its impact on the credibility gap of the accounting information of companies operating in Jordan. This study demonstrates the effects of the apparent and intellectual sustainability independence on the credibility gap of accounting information. A total of 93 online questionnaires were analyzed using multiple regressions. The results revealed an impact of the apparent independence of the JCPA on the quality of the information credibility gap related to service fees, and no statistically significant impact for both consulting and accounting service fees was found. This study also concludes research regarding the impact of intellectual independence of the JCPA on the information credibility gap regarding the code of professional ethics and the commitment of auditing offices to their customers. © 2022 by the authors.

ABSTRACT: Background and Aims: The decision to stay in nursing has been challenged by the recent coronavirus disease 2019 (COVID-19) pandemic. New nurses joined the workforce and provided care to patients with COVID-19 although they received limited training, which could have influenced their intention to stay in nursing. We aimed in this study to examine the impact of caring for patients with COVID-19 on career decisions, resilience, and perceived self-efficacy among newly hired nurses in Jordan. It also tested the predictors of intentions to stay among new nurses. Methods: This cross-sectional quantitative study was conducted using an online electronic questionnaire form. The sample included newly hired nurses (n = 300) working in public hospitals and providing care to patients with COVID-19 in different levels of acuity units. The perceived stress scale and Connor-Davidson resilience scale 25 were used to measure stress and resilience among nurses. Results: The majority chose nursing as their career, but they were not satisfied with the current work conditions or autonomy in decision-making. Many nurses reported having moderate to high work-related stress and low to moderate resilience. Among all variables in this study, financial income predicted mild intention to stay in nursing. Conclusions: Nurses expressed the presence of work-related stress and low to moderate levels of resilience. As new nurses, exposure to these stress levels might lead to burnout. Nursing managers should take necessary measures to promote better work conditions and improve resilience to avoid nurses leaving the profession at times when there is a shortage. © 2022 The Authors. ABSTRACT: Background and Aims: During the coronavirus pandemic (COVID-19), healthcare providers confronted risks of disease transmission to themselves and their family members, resulting in physical and psychological burdens. This might affect their decisions to leave their jobs temporarily or permanently, fearing infection and protecting their families. This study examined the factors related to the intention to leave a job among healthcare providers during the COVID-19 pandemic in Jordan. Methods: A cross-sectional correlational design was used to collect data using a convenience sample of 557 healthcare providers working in different sectors across Jordan. Data were collected using a self-administered questionnaire about the intention to leave jobs during the pandemic. Results: The sample included 368 females (63.8%) and 209 males (36.6%) participants. The mean age of participants was 30.8 years (SD = 6.65). Differences found in intention to leave job during COVID-19 in relation to age ($t = 2.60$, $p < 0.05$), gender ($X^2 = 4.25$, $p < 0.001$), and marital status ($X^2 = 18.2$, $p < 0.001$). Participants with a high risk of exposure to COVID-19 and who experienced higher workloads had higher scores of intention to leave their job during COVID-19, while being married had lower scores. Conclusions: Policy-makers need to pay attention to young and single healthcare providers during the COVID-19 pandemic to prevent them leave their job. Crucial guidelines for managing workload during the COVID-19 pandemic are needed. Policy-makers during pandemics have to protect healthcare providers who feel they are at high risk of infection. © 2022 The Authors. Health Science Reports published by Wiley Periodicals LLC.

ABSTRACT: The learning environment usually raises various types of anxiety based on the student's abilities to use technology and their abilities to overcome the negative feelings of an individual being watched all the time and criticized. Hence, learners still feel anxious while using computers and socializing in an e-learning environment. Learners who are faced with computer and AI tools are confused and frustrated. The uneasiness stems from anxiety or uneasiness, which is highly evident in daily interaction with computers and artificial intelligence tools or devices in e-learning contexts. The uneasiness stems from anxiety or uneasiness, which is highly evident in the daily interaction with computers and artificial intelligence tools or devices in e-learning contexts. To investigate this phenomenon empirically, a questionnaire was distributed among a group of undergraduate students who are studying different majors. This study aims to investigate the role of social anxiety and computer anxiety in an e-learning environment at the university level. Universities in the Gulf area are among those implementing e-learning systems. In spite of this, recent studies have shown that most students at Gulf universities are still resistant to using online systems; hence, it is necessary to determine the type of anxiety that creates such resistance and their relationship with other external variables such as motivation, satisfaction and self-efficacy. Students would be more likely to use e-learning tools and participate more effectively in their courses using the accessible electronic channels when the degree of anxiety is low. In this study, we have proposed a theoretical framework to investigate the role of social anxiety and computer anxiety in e-learning environments in the Gulf region. We examined how different variables such as satisfaction, motivation and self-efficacy can negatively or positively affect these two types of anxiety. © 2022 by the authors.

ABSTRACT: In this investigation, some analytical solutions to both conserved and non-conserved rotational pendulum systems are reported. The exact solution to the conserved oscillator (unforced, undamped rotational pendulum oscillator), is derived in the form of a Jacobi elliptical function. Moreover, an approximate solution for the conserved case is obtained in the form of a trigonometric function. A comparison between both exact and approximate solutions to the conserved oscillator is examined. Moreover, the analytical approximations to the non-conserved oscillators including the unforced, damped rotational pendulum oscillator and forced, damped rotational pendulum oscillator are obtained. Furthermore, all mentioned oscillators (conserved and non-conserved oscillators) are linearized, and their exact solutions are derived. In addition, all obtained approximations are compared with the four-order Runge-Kutta (RK4) numerical approximations and with the exact solutions to the linearized oscillators. The obtained results can help several authors for discussing and interpreting their results. © 2022 by the authors.

ABSTRACT: This study aimed to investigate the effect of freeze and thaw (FT) cycles on the

performance of asphalt concrete (AC) mixtures modified by partial replacement of mineral filler of the aggregate with natural bentonite clay (NBC) in order to reduce damage that occurs due to rapid FT cycles within the pavement structure. After exposure to FT cycles, AC mixture stability is reduced and becomes lower than minimum requirements, which leads to earlier damage of pavement. In order to enhance the AC mixture's abilities to sustain severe FT cycles, this study used NBC amounts as a substitute for mineral filler by weight of its portion of the total aggregate: 5%, 10%, 15%, and 20%. Marshall stability, flow, and FT cycles were tested, and interior damage degree was assessed by a nondestructive test called ultrasonic pulse velocity (UPV). The results revealed the viability of combining NBC with asphalt mixtures for the purpose of improving the mixtures' properties, particularly in environments where asphalt pavement is exposed to alternating FT cycles. The results also revealed that replacement of filler with NBC by 5% in AC mixtures reduced the damage caused over 8 continuous weeks of rapid FT cycles by 13%, which, in future applications, would reduce maintenance cost and prolong the pavement's service life. © 2022 by the authors.

ABSTRACT: In this investigation, two different models for two coupled asymmetrical oscillators, known as, coupled forced damped Duffing oscillators (FDDOs) are reported. The first model of coupled FDDOs consists of a nonlinear forced damped Duffing oscillator (FDDO) with a linear oscillator, while the second model is composed of two nonlinear FDDOs. The Krylov-Bogoliubov-Mitropolsky (KBM) method, is carried out for analyzing the coupled FDDOs for any model. To do that, the coupled FDDOs are reduced to a decoupled system of two individual FDDOs using a suitable linear transformation. After that, the KBM method is implemented to find some approximations for both unforced and forced damped Duffing oscillators (DDOs). Furthermore, the KBM analytical approximations are compared with the fourth-order Runge-Kutta (RK4) numerical approximations to check the accuracy of all obtained approximations. Moreover, the RK4 numerical approximations to both coupling and decoupling systems of FDDOs are compared with each other. © 2022 by the authors.

ABSTRACT: Type 1 diabetes (T1D) is an autoimmune disorder whose etiology includes genetic and environmental factors. The non-classical Major Histocompatibility Complex (MHC) class I chain-related gene A (MICA) gene has been associated with increased susceptibility to T1D as the interaction of MICA to the Natural Killer Group 2D (NK2GD) receptors found on the cell surface of natural killer (NK) cells and T cells is responsible for inducing immune responses. MICA polymorphisms were reported in association with T1D among different ethnic groups. However, data from different populations revealed conflicting results, so the association of MICA polymorphisms with predisposition to T1D remains uncertain. The aim of this sequencing-based study was to identify, for the first time, the possible MICA alleles and/or genotypes that could be associated with T1D susceptibility in the Jordanian population. Polymorphisms in exons 2-4 and the short tandem repeats (STR) in exon 5 of the highly polymorphic MICA gene were analyzed. No evidence for association between T1D and MICA alleles/genotypes was found in this study, except for the MICA*011 allele which was found to be negatively associated with T1D ($p = 0.023$, $OR = 0.125$). In conclusion, MICA polymorphisms seem not to be associated with increasing T1D susceptibility in Jordanian patients. © 2022 by the authors.

ABSTRACT: The current study is dedicated to furnish a class of bright soliton and dark soliton solutions for the (3 + 1)-dimensional hyperbolic nonlinear Schrödinger equation. In this direction we operate with a variety of schemes to derive a class of bright and dark optical soliton solutions. Moreover, we derive another class of solutions of distinct structures, that include periodic, complex, and exponential solutions. This analysis provides new findings with a variety of optical features. © 2022

ABSTRACT: Purpose: The importance of knowledge, skills, and practices of nurses makes abridge for a higher quality of care provided to patients. This study purposed to assess the levels of knowledge, skills, and practices of patient triage among emergency nurses in Jordan. Methods: A cross-sectional, descriptive correlational, observational design was utilized to assess the levels of knowledge, skills, and practices of patients' triage among emergency nurses working in triage at emergency departments in Jordan. A convenience sample of 125 registered nurses were recruited from triage units of three health sectors in the middle region of Jordan; government, educational, and private. Results: The findings revealed that 88.8% of nurses had sufficient knowledge of triage, 84.8% had moderate triage skills, and 88.8% demonstrated good triage practices. There was a statistically significant positive association between triage knowledge, emergency experience, and triage training course. A significant positive association was found between triage skills, emergency experience, triage experience, and triage training course. Also, triage practices had a significant positive association with triage experience and triage training course. Conclusions: It is necessary to develop nursing policies that consider triage as a baseline training program for all emergency nurses. Also, triage training programs should be conducted and take into consideration the associated factors to enhance emergency nurses' knowledge, skills, and practices of triage in order to improve quality of care and patients' outcomes. © 2022 Elsevier Ltd

ABSTRACT: Background: Incidence rates and prevalence of cancer are substantially high globally. New safe therapeutic drugs are endorsed to overcome the high toxicity and poor safety profile of clinical anticancer agents. Objective: As antineoplastic Vosaroxin is a commercial fluoroquinolone (FQ), we hypothesize that superlative antipro-liferation activity of lipophilic FQs/TFQs series correlates to their acidic groups and C8-C7 ethylene diamine Chelation Bridge along with bulky dual halogenations. Methods: We tested dual lipophilic-acidic chelating FQs with a genuine potential of antiproliferative propensities based on their dual DPPH-and NO-radicals scavenging biocapacities using cell based - and colorimetric assays vs. respective reference agents as their molecular action mechanism. Results: In this work, 9 lipophilic-acid chelating FQs and their cyclized TriazoloFQs (TFQs) designed to bear 7-

dihaloanilino substituents with a special focus on dichlorosubstitutions have been prepared, characterized and screened against breast T47D and MCF7, Pancreatic PANC1, colorectal HT29, cervical HELA, lung A375, skin A549, and Leukaemia K562 cancer cell lines using sulforhodamine B colorimetric bioassay. Parameters including potency, toxicity, and selectivity (potency/toxicity) have been reported along with DPPH-and NO-radicals' scavenging propensities-as their molecular action mechanism-in comparison to ascorbic acid and indomethacin, respectively. Using Griess assay in lipopolysaccharide (LPS) prompted RAW264.7 macrophages inflammation, IC50 values (μM) in the ascending order of new FQs' NO scavenging/antiinflammation capacity were 4a < 3a < 4c < indomethacin (23.8 < 33.4 < 36 vs. indomethacin's 124, respectively). Exceptionally unlike the rest, reduced FQ, 4b exhibited remarkably superior DPPH radical scavenging capacity to ascorbic acid (IC50 values (μM) 19.9 vs. 123.9, p < 0.001). In comparison to cisplatin; nitroFQs (3a, 3b and 3c), the reduced FQs (4a, 4b, and 4c) and the TFQs (5a, 5b and 5c) exerted substantial micromolar antiproliferation IC50 values < 50 μM in cervical Hela cancer cells but lacked comparable bioactivity in leukaemia K562. In both breast MCF7 and T47D cancer cell lines, FQs/TFQs 4a < 3a < 5b (respective IC50 values (μM) 0.52 < 22.7 < 24 vs. cisplatin's 41.8 and 0.03 < 4.8 < 27 vs. cisplatin's 509), and in both GI system colorectal HT29 and pancreatic PANC1 cancer cells FQs/TFQs 4a < 3a < 5b and 4a< 3a (respective IC50 values (μM) 0.12 < 3.5 < 15.9 vs. cisplatin's 148 and 1.5 < 10.4 vs. cisplatin's 25.5), exerted nanomolar-micromolar affinities of antiproliferation potencies < 50 μM . Besides in lung A375 cancer cells FQs/TFQs 4c < 4a < 3a and in skin A549 cancer cells 5c < 3c < 4a < 3a < 4c (respective IC50 values (μM) 0.07 < 3.2 < 10.3 vs. cisplatin's 390 and 0.5 < 2.3 < 3.8 < 8.8 < 17.3 vs. cisplatin's 107) exhibited nanomolar-micromolar antineoplastic capacities < 50 μM . Their spectrum of selectivity indices for safety in fibroblasts PDL-based 72h incubations was reported. Unequivocally 4b reduction of viability effectiveness linked with its DPPH radical scavenging effects (without a matching antiinflammation effect). Explicitly 4a, 3a and 4c exerted exquisite antiinflammation-selective cytotoxicity duality in vitro. Conclusion: Such a new potential chelation mechanism can explain the pronounced difference in antineoplastic activity of new FQs/TFQs. © 2022 Bentham Science Publishers.

ABSTRACT: Multivariate rational control functions $r(x)$ of high degree d can be expressed in the Bernstein form defined over k -dimensional simplices (triangles). The range of rational functions can be optimized by the enclosure bound (minimum and maximum) of Bernstein coefficients. In this paper, linear and quadratic rate of convergence for the maximum error bound between the enclosure and range bounds are investigated. Furthermore, minimization and numerical identities for certifying the positivity of any given rational function over simplices are given. In order to provide global and local positivity certificates for r , the degree of Bernstein functions and number of simplex subdivision steps are estimated. Subsequently, we establish a bound for the maximum degree of Bernstein polynomials. © 2022 Elsevier B.V.

ABSTRACT: Since the mid-sixties of the twentieth century, interest in simulation has increased as an appropriate and effective method in the education process, especially after the advent of computers; The simulation process of concepts, activities and experiments is done through the computer, and it has an important and prominent role in the educational process. In the past, the theoretical aspects of education were the core of the education process for students, and this is certainly not enough to raise the level of students. Furthermore, understanding the handling and investing of securities is a challenging subject that requires students to understand and apply financial theories and models. Hence, this study pursued the influence of the Amman Stock Exchange simulation room on the student level of the College of Business at the Al-Zaytoonah University of Jordan through the predictive approach. The results show that the simulation education system may encourage students and increase

their intellectual abilities, attracts the attention of the students as well as gives a great opportunity for students to acquire the skills of dealing with the financial market in a practical and applied manner by using a real trading system based on high technology performance which performed by Amman Stock Market. © 2022, North American Business Press. ABSTRACT: Background: Injuries and accidents are essential issues in public health, where the school teachers are considered the first caregivers in schools. Objective: The purpose of this study was to assess the effectiveness of an educational program on first aid (FA) knowledge, cardiopulmonary resuscitation (CPR) skills, and teacher self-confidence among school teachers. Methods: One-group pretest-posttest preexperimental design was conducted. Three schools were enrolled using simple random sampling, and 40 teachers were participated. The Wilcoxon signed-ranks test was performed to compare the pre- and posttests' mean scores. Results: The mean posttest scores of FA knowledge, CPR skills, and self-confidence were significantly higher than the mean pretest scores ($P < 0.01$).

Conclusion: The educational program was effective in improving FA knowledge, CPR skills, and teachers' self-confidence. © 2022 Wolters Kluwer Medknow Publications. All rights reserved.

ABSTRACT: This paper aims to analyzes the English-language literature related to Systemically Important Banks (SIBs) by applying the bibliometric methodology to present the current state of SIBs' intellectual structure and emerging trends from a large quantity of data for the period 2002 to first 2 months of 2022 from Scopus, which is which is considered the most widely used database. SIBs are large and powerful, their contribution to economic growth is significant but their failure is usually systematic and contagious. Regulators subsidize them with public money to avoid systematic financial crises. It is striking that smaller banks do not receive the same treatment, which places them under competitive disadvantage. The bibliometric methodology helps in focusing on this issue for being a rigorous way for exploring and evaluating large volumes of data, identifying gaps, deriving unique research ideas, and resulting in a significant research impact. Therefore, we apply the bibliometric analysis to describe the field's evolution and structure, including co-authorship, bibliographical coupling, and co-citation. The findings reveal that, the USA is the most relevant country, the University of Southeast is the most relevant institution, and the Journal of Banking and Finance is the most relevant journal. We contribute to the literature mainly by: (1) identifying the benchmark authors, locations of SIBs, and journals; (2) specifying the research streams and summarizing the most cited papers; and (3) identifying the research gaps and future directions. © The Author(s) 2022.

ABSTRACT: Kelulut and Yemeni Sidr honey has been documented to have various therapeutic properties. Investigations associated with the medicinal properties and physicochemical characteristics of Kelulut and Yemeni Sidr honey are growing broadly and receiving raised awareness. This study incorporated and analysed the findings on the biological and physico-chemical properties of Kelulut and Yemeni Sidr honey. Kelulut and Yemeni Sidr honey was found to have a wide variety of biological effects attributed to their physicochemical characteristics. Findings showed that Kelulut and Yemeni Sidr honey have anti-bacterial, anti-biofilm, anti-virulence, anti-oxidative, anti-cancer, anti-inflammatory, anti-diabetic, anti-obesity and wound-healing properties. The physicochemical

properties of Kelulut and Yemeni Sidr honey were compared and discussed and results revealed that they have high-quality contents and excellent antioxidant sources. © 2022 Bentham Science Publishers.

ABSTRACT: The efficiency of PV (photovoltaic) modules is highly dependent on the operating temperature. The objective of this work is to enhance the performance of PV by passive cooling using aluminum fins that have been nanocoated (like those on an automobile radiator). A rise in the cell temperature of the module PV leads to a decrease in its performance. As a result, an effective cooling mechanism is required. In this work, the performance of the PV module has been improved using natural convection, which was achieved by placing three similar PV modules next to each other in order to test them simultaneously. The first panel will be the base panel and will be used for comparison purposes. An automotive radiator (with aluminum fins) was firmly fixed onto the rear of the other two PV modules, and the fins of the third PV panel had titanium oxide (TiO₂) water-based nanofluid applied to them. The power produced by the PV modules, as well as their rear side temperatures, were recorded every 30 min over four months. A temperature reduction of 4.0 °C was attained when TiO₂ water-based nanofluid was sprayed onto the panel's finned rear side. This was followed by the scenario where the rear side was only finned, with a temperature drop of 1.0 °C. As a result of the temperature reduction, the percentage of power produced by the coated-finned PV and the finned PV increased by 5.8 and 1.5 percent, respectively. This caused an increase in PV efficiency of 1.1 percent for coated-finned panels and 0.4 percent for finned PV. © 2022 by the authors.

ABSTRACT: Levofloxacin is a widely used fluoroquinolone in several infectious diseases. The structure-activity relationship of levofloxacin has been studied. However, the effect of changing the carbonyl into thiocarbonyl of levofloxacin has not been investigated up to the date of this report. In this work, levofloxacin structure was slightly modified by making a thionated form (compound 3), which was investigated for its antibacterial activity, biocompatibility, and cytotoxicity, as well as spectroscopic properties. The antibacterial susceptibility testing against five different bacteria showed promising minimum inhibitory concentrations (MICs), particularly against *B. spizizenii* and *E. coli*, with an MIC value of 1.9 µM against both bacteria, and 7.8 µM against *P. mirabilis*. The molecular docking experiment showed similar binding interactions of both levofloxacin and compound 3 with the active site residues of topoisomerase IV. The biocompatibility and cytotoxicity results revealed that compound 3 was more biocompatible with normal cells and more cytotoxic against cancer cells, compared to levofloxacin. Interestingly, compound 3 also showed an excitation profile with a distinctive absorption peak at λ_{max} 404 nm. Overall, our results suggest that the thionation of quinolones may provide a successful approach toward a new generation with enhanced pharmacokinetic and safety profiles and overall activity as potential antibacterial agents. © 2022 by the authors.

ABSTRACT: A novel, sensitive, and low-cost HPLC method for the rapid determination of favipiravir (FVR) in rat plasma was developed and validated, and the effect of vitamin C on FVR pharmacokinetic parameters was investigated. FVR and oxcarbazepine (IS) were separated using a mobile phase of 50% acetonitrile and 50% water (with 0.25% trifluoroacetic acid) at 1.0 mL/min flow rate and detected at λ_{max} 289 nm. The intra- and interday values for FVR in plasma were less than 15%, with low, medium, and high QC levels for the relative recovery rate, according to ICH guidelines. C_{max} values in the control and experimental groups were 558 ± 124.42 and 979.13 ± 138.10 ng/mL, respectively; $t_{1/2}$ values were 7.15 ± 1.60 and 9.09 ± 1.14 h, AUC(0-t) values were 5697.70 ± 536.58 and 7381.62 ± 1577.58 ng.h/mL, and AUC(0- ∞) values were 5697.70 ± 536.58 and 8192.36 ± 1721.67 , respectively. According to the results, the experimental group's C_{max} of FVR was 75.17% higher than the control group's, the V_z/F was lower, and the $t_{1/2}$ was 1.86 h longer. The technique developed for determining FVR in plasma was useful for FVR pharmacokinetics and food-drug interaction investigations. © 2022 by the authors.

ABSTRACT: Background: Jordan is a country well-known for its diversity in wild plants, and for many decades, folk medicines have represented part of its cultural heritage. In the present study, investigations have been focused on the therapeutic potential of *Silybum marianum* and *Pergularia tomentosa* on type 2 diabetes mellitus. In type 2 diabetes, which is considered a global health problem, the body cannot respond to or produce insulin hormone, which raises the blood glucose level, resulting in mortality, morbidity, healthcare expenses, and reduced life quality. Dipeptidyl peptidase-IV (DPP-IV) enzyme, a serine protease, is responsible for deactivating incretin hormones that promote insulin secretion. Accordingly, the DPP-IV inhibitory activity of these plant extracts that prolong the hypoglycemic effect of incretins was evaluated. Methods: The aerial parts of *S. marianum* and *P. tomentosa* were dried, ground, and extracted with ethanol. The ethanol extract was dried under reduced pressure and was partitioned by methanol, butanol, and hexane according to a systematic procedure. The inhibition of the DPP-IV enzyme by the different extracts was studied (at 10.0 mg/mL concentration). Sitagliptin was used as the positive control. Results: Fortunately, most of the plant extracts have noticeable inhibitory activity against the DPP-IV enzyme. It was found that the tested methanol extract of *S. marianum* has an inhibitory activity of 75.6% and the butanol extract of *P. tomentosa* has an inhibitory activity of 73.6%, which are analogous to DPP-IV inhibition of sitagliptin (78.5%), the used positive inhibitor. A superior inhibition of 98.1% was displayed for the butanol extract of *S. marianum* at 10.0 mg/mL concentration. Conclusion: The revealed DPP-IV inhibitory activity of tested extracts advocates that their active constituents, particularly flavonoids, are capable of binding to the enzyme's active cleft. © 2022 Bentham Science Publishers.

ABSTRACT: Esomeprazole is used in various clinical settings where a decrease in gastric acid production is desired since it is a proton pump inhibitor. Apixaban, an anticoagulant, is used to reduce the risk of stroke in patients with certain cardiovascular diseases. This research aims to examine the effects of giving esomeprazole and apixaban to rats simultaneously, as well as to measure their pharmacokinetics and look for statistical differences or interactions. A method for the simultaneous determination of esomeprazole and apixaban in rat plasma was developed using HPLC/MS and validated by ICH guidelines. Five groups of Wistar rats were created, and the drugs were administered as follows: esomeprazole (5 mg/kg) intravenously, apixaban (125 mcg/Kg) intravenously, esomeprazole (5 mg/kg) orally, apixaban (250 mcg/kg) orally, and esomeprazole (5 mg/kg) and apixaban (250 mcg/kg) both orally. Both drugs' concentrations were measured in plasma samples collected on a predetermined schedule. The pharmacokinetics of both drugs were calculated and statistically analyzed using a 90% confidence interval and non-compartmental analysis. When the two drugs were combined, apixaban's Cmax and AUC increased while esomeprazole's Cmax and AUC decreased. On the other hand, Apixaban's Tmax decreased with an increase in esomeprazole's Tmax, indicating a possible interaction between the two drugs. When both drugs were taken together, their bioavailability was reduced, implying that less esomeprazole was absorbed over time. © 2022 The Author(s)

ABSTRACT: Chest and lung diseases are among the most serious chronic diseases in the world, and they occur as a result of factors such as smoking, air pollution, or bacterial infection, which would expose the respiratory system and chest to serious disorders. Chest diseases lead to a natural weakness in the respiratory system, which requires the patient to take care and attention to alleviate this problem. Countries are interested in encouraging medical research and monitoring the spread of communicable diseases. Therefore, they advised researchers to perform studies to curb the diseases' spread and urged researchers to devise methods for swiftly and readily detecting and distinguishing lung diseases. In this paper, we propose a hybrid architecture of contrast-limited adaptive histogram equalization (CLAHE) and deep convolutional network for the classification of lung diseases. We used X-ray images to create a convolutional neural network (CNN) for early identification and categorization of lung diseases. Initially, the proposed method implemented the support vector machine to classify the images with and without using CLAHE equalizer. The obtained results were compared with the CNN networks. Later, two different experiments were implemented with hybrid architecture of deep CNN networks and CLAHE as a preprocessing for image enhancement. The experimental results indicate that the suggested hybrid architecture outperforms traditional methods by roughly 20% in terms of accuracy. © 2022 by the authors.

ABSTRACT: Aim: The aim of this study is to assess the perceptions of patient safety culture among emergency room nurses in Jordan. Background: Patient safety culture is considered an international

priority for health care institutions. There is a lack of studies on patient safety culture among emergency room nurses in international and Arab countries including Jordan. Methods: A cross-sectional design was used to perform among emergency room nurses (N = 424) who are working in two health sectors (government and private) in Jordan. Results: Results showed that the total perception mean of patient safety culture was 70.6% (M = 3.87, SD = 0.64), which indicates that the perceptions of patient safety culture among emergency room nurses need potential for improvement. Three areas in patient safety culture were reported as strong, including teamwork within units (77.4%; M = 3.87, SD = 0.64), feedback and communication about the error (76.6%; M = 3.83, SD = 0.65) and organisational learning-continuous improvement (75.4%; M = 3.77, SD = 0.63). The lowest scores were for areas of frequency of events reported (63.6%; M = 3.18, SD = 0.99) and handoffs and transitions (64.4%; M = 3.22, SD = 0.78). Patient safety culture was correlated with income, educational level and principal of patient safety. Conclusion: Regular assessment for emergency rooms is required to provide essential information to hospital managers on the areas that need improvement to promote patient safety culture. © 2022 John Wiley & Sons Ltd.

ABSTRACT: Blood transfusion is a continuous demand, as it is widely required for many medical surgeries and critical operations. Therefore, there is a need to manage the whole process of supplying blood from blood donors to the hospitals and transfusion centers. Many researchers were recently interested in the operations and supply chain management of blood products, they considered the operations and supply chain management of blood products for the purpose of minimizing the blood wastage. As a result of the the inverse relationship between blood donations and blood products demand, more occasional blood shortages can be expected. This research proposes an intelligent system that entails the recruitment of donors that are available to donate blood products on a short notice. The proposed system optimizes the blood donation process by preventing blood shortages and minimizing the wastage of blood units with regards to expiration, and proves promising results. A set of optimization equations have been built for optimizing the process of blood donation to reduce the blood wastage and prevent blood shortage. It considers as well the new insights from the medical literature on the deterioration of stored blood products, as the use of older red blood cells is linked to poorer clinical outcomes. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Buildings are responsible for over 40% of total primary energy consumption in the US and EU and therefore improving building energy efficiency has significant potential for obtaining net-zero energy buildings reducing energy consumption. The concurrent demands of environmental comfort and the need to improve energy efficiency for both new and existing buildings have motivated research into finding solutions for the regulation of incoming solar radiation, as well as ensuring occupant thermal and visual comfort whilst generating energy onsite. Windows as building components offer the opportunity of addressing these issues in buildings. Building integration of photovoltaics permits building components such as semi-transparent façade, skylights and shading devices to be replaced with PV. Much progress has been made in photovoltaic material science, where smart window development has evolved in areas such as semi-transparent PV, electrochromic and thermochromic materials, luminescent solar concentrator and the integration of each of the latter technologies to buildings, specifically windows. This paper presents a review on intelligent window technologies that integrate renewable energy technologies with energy-saving strategies contributing potential solutions towards sustainable zero-energy buildings. This review is a comprehensive evaluation of intelligent windows focusing on state-of-the-art development in windows that can generate electricity and their electrical, thermal and optical characteristics. This review provides a summary of current work in intelligent window design for energy generation and gives recommendations for further research opportunities. © 2022, The Author(s).

ABSTRACT: Cities with no memories certainly miss the joy of presenting the past and, as a result, struggle to dream of building their future. The aim of this research stems from the importance of urban and architectural heritage in historic districts of cities in the present and future. This importance leads to sustainable development, which satisfies the needs of the present and protects future rights. Also, it highlights the importance of studying "urban conservation". Moreover, there is an increasing population growth which causes expansion in contemporary cities; the reason behind this is the rapid expansion of modern urban, commercial and residential land use towards the historical centre of cities. The findings of this research confirm that orientation, which is accentuated in the present, is necessary to link the conservation of the old and planning for the contemporary projects in a unified architectural and constructional policy. The comparative research methodology uses an analytical approach through many successful and unsuccessful experiments and attempts to answer several questions, such as: What is urban conservation? How do cities of historical depth deal with modern planning? What should we do as we face the rapid increase in modern needs in the present? What are the reasons behind the loss of urban heritage? Why does urban heritage decrease, particularly in Arab cities? Finally, the research reaches its conclusions and possible recommendations. This paper shows that preventing the new residential expansion or any other modern function in the historical centre is a must unless done to create a balance between the old and contemporary through rehabilitating and investing in the heritage. © 2022 WIT Press.

ABSTRACT: Increased levels of 17- β estradiol (E2) due to pregnancy in young women or to hormonal replacement therapy in postmenopausal women have long been associated with an increased risk of yeast infections. Nevertheless, the effect underlying the role of E2 in *Candida albicans* infections is not well understood. To address this issue, functional, transcriptomic, and metabolomic analyses were performed on *C. albicans* cells subjected to temperature and serum induction in the presence or absence of E2. Increased filament formation was observed in E2 treated cells. Surprisingly, cells treated with a combination of E2 and serum showed decreased filament formation. Furthermore, the transcriptomic analysis revealed that serum and E2 treatment is associated with downregulated expression of genes involved in filamentation, including HWP1, ECE1, IHD1, MEP1, SOD5, and ALS3, in comparison with cells treated with serum or estrogen alone. Moreover, glucose transporter genes HGT20 and GCV2 were downregulated in cells receiving both serum and E2. Functional pathway enrichment analysis of the differentially expressed genes (DEGs) suggested major involvement of E2 signaling in

several metabolic pathways and the biosynthesis of secondary metabolites. The metabolomic analysis determined differential secretion of 36 metabolites based on the different treatments' conditions, including structural carbohydrates and fatty acids important for hyphal cell wall formation such as arabinonic acid, organicsugar acids, oleic acid, octadecanoic acid, 2-keto-D-gluconic acid, palmitic acid, and steric acid with an intriguing negative correlation between D-turanose and ergosterol under E2 treatment. In conclusion, these findings suggest that E2 signaling impacts the expression of several genes and the secretion of several metabolites that help regulate *C. albicans* morphogenesis and virulence. ABSTRACT: The use of hydrophilic bentonite nanoclay to improve the geotechnical properties of expansive soils was studied. Sonic waves and manual mixing for two expansive soils (taken from two different locations in Jordan) were studied; thereafter, a comparison between the results obtained from both methods was carried out. Different percentages of nanoclay were added to the two soils: 0, 0.1, 0.3, 0.5, 0.8, 1, 1.5, and 2.5% by dry weight of soil. Their impacts on compaction, unconfined compression strength (UCS), and free swell index (FSI) were investigated. For both methods of mixing, adding nanoclay to the soils resulted in a significant enhancement in strength and a reduction in swell properties of the soils. The UCS results of sonicated samples treated with 0.5% of nanoclay addition showed an increase of 27%–57% and a reduction in FSI by 41%–46.5%. Nevertheless, the UCS of non-sonicated samples treated with 1% of nanoclay showed an increase of 19.3–28.5% and a reduction in FSI by 37.3–44.3%. ABSTRACT: Purpose: The purpose of this paper is to identify the effect of organisational culture by its two dimensions (innovative organisational culture and conservative organisational culture) on innovative performance and also investigate the moderating role of the job type on innovative performance in the relationship between innovative organisational culture and conservative organisational culture. Design/methodology/approach: For this study's purposes, 321 questionnaires from employees of Jordanian private universities were analysed. Convergent validity and discriminant validity tests were performed. Data reliability was confirmed. A bootstrapping technique was used to analyse the data. The multi-group analysis was performed to investigate the moderating role of job type. Findings: The results of this study indicate that the innovative organisational culture will improve innovative performance and that a conservative culture reduces innovation opportunities. Moreover, innovative organisational culture promotes innovative performance for all employees regardless of who holds administrative positions. Research limitations/implications: This cross-sectional study provides a snapshot at a given moment in time, a methodological limitation that affects the generalisation of its results. Moreover, this study adopted subjective measures and the results are limited to one country, Jordan. Practical implications: This paper contributes to drawing the attention of senior management to the importance of innovation culture in the performance of innovation at Jordanian private universities surveyed, in particular, and other organisations in general. Social implications: The social impact of this study is to respond to the challenge of building an innovation-based culture and to limit the effects of a conservative culture that limits the response to innovation. Originality/value: This study has important implications for leaders in general. It also highlights the need for organisations to develop an orientation towards innovative organisational culture instead of the classic approach based on the conservative culture of all its members (both administrative and non-administrative employees) and to invest in training that supports this trend, thus increasing their innovative performance, which contributes to raising their

capabilities to excel, compete and achieve high levels of performance. © 2020, Emerald Publishing Limited.

ABSTRACT: This study aims to assess and evaluate the knowledge, beliefs, behaviors, and practices about COVID-19 among different categories of Jordanian people including pregnant and breastfeeding mothers. A cross-sectional study is designed using an online survey questionnaire and a five-section questionnaire was devised to address perceptions and attitudes of the participants towards COVID-19. This study was found that more than 80% of the participants had a belief that COVID-19 can be transmitted through direct contact or spreading of air droplets from infected people to healthy ones. Around 15% of pregnant and breastfeeding women realized that the COVID-19 virus could transmit the virus to their babies. Third-fourth of the participants agreed that the elderly, pregnant, and immunocompromised people have a higher risk of being infected with COVID-19. In addition, 80% of the participants believed that using paracetamol is a good way of treating COVID-19 or reducing symptoms, while the remaining believed that they should use antibiotics as well as some vitamins to combat COVID-19. Around 70% of the participants have got their information about COVID-19 through social media while others got the information through the Jordanian Ministry of Health official website, other websites, television news, friends, relatives, and colleagues. Participants' practices to avoid transmission of COVID-19 were adequate in more than 80% of the participants who reported that they should protect themselves as well as their families as a priority. we believe that this study allow other governments worldwide to understand the views of public people in Jordan during pandemic disease outbreaks. © RJPT All right reserved.

ABSTRACT: Several real-world phenomena emerging in engineering and science fields can be described successfully by developing certain models using fractional-order partial differential equations. The exact, analytical, semi-analytical or even numerical solutions for these models should be examined and investigated by distinguishing between their solvabilities and non-solvabilities. In this paper, we aim to establish some sufficient conditions for exploring the existence and uniqueness of solution for a class of initial-boundary value problems with Dirichlet condition. The gained results from this research paper are established for the class of fractional-order partial differential equations by a method based on Lax Milgram theorem, which relies in its construction on properties of the symmetric part of the bilinear form. Lax Milgram theorem is deemed as a mathematical scheme that can be used to examine the existence and uniqueness of weak solutions for fractional-order partial differential equations. These equations are formulated here in view of the Caputo fractional-order derivative operator, which its inverse operator is the Riemann-Louville fractional-order integral one. The results of this paper will be supportive for mathematical analyzers and researchers when a fractional-order partial differential equation is handled in terms of finding its exact, analytical, semi-analytical or numerical solution. © 2022 by authors, all rights reserved.

ABSTRACT: Cancer is a significant public health concern both globally and in Jordan. Modern cancer therapies are associated with multidrug resistance, severe side effects, and high costs. There has recently been a lot of interest in screening for plants that can be used in cancer prevention and treatment. The current study is intended to assess the cytotoxic activity of methanolic extract of aerial parts of *Ajuga orientalis* L. on a human breast cancer cell line (MCF-7). The cytotoxic activity of the extract against human breast cancer cells (MCF-7) and normal fibroblast (MRC-5) was assessed using the (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay. The cells were treated with different concentrations of methanol extract of *Ajuga orientalis* (3.125-200 µg/mL) for 24, 48, and 72 hrs. The extract demonstrated inhibition in the proliferation of the MCF-7 cell line in a dose-dependent manner, without any toxic impact on normal fibroblast cells. Furthermore, the extract showed significant cytotoxic activity after 72 hrs of incubation (IC₅₀ 30.5±0.05 µg/mL). In conclusion, the methanol extract of *A. orientalis* showed a potent reduction in the proliferation of MCF-7 cells and could be considered a potential source of the anticancer compound. © 2022 the authors.

ABSTRACT: Background: The pandemic COVID-19 requires collaborative teamwork by all healthcare professionals including Pharmacists who could help in combating epidemic diseases by providing several pharmaceutical services. Nevertheless, public perception of pharmacist's role in providing health service is controversial. Methods: A cross-sectional web-based design validated survey of 25 items was used to explore patients' opinion about pharmacist's ability to provide different health services during COVID-19 pandemic. Exploratory factor analysis (EFA) was conducted to evaluate the best model for the questionnaire. The association between different demographic variables and awareness about pharmacist's role was evaluated using Pearson correlation, Mann-Whitney u test and Kruskal-Wallis one-way analysis of variance. Results: A total of 668 persons participated in the study. The mean (SD) of the respondent questionnaire scores was 97.1 (12.6) and the possible maximum score was 115 (12.9). Higher awareness score was associated with increased age, female gender, lower educational level, living out of Amman the capital, being college or university student or being employed in medical field. Conclusion: The positive public perception toward pharmacist role shown in the present study enlighten the need to expand pharmacist role to be more engaged in providing different health services during the disaster or normal conditions. © 2022 DSR Publishers/The University of Jordan. ABSTRACT: N-(2-fluorophenyl)-6-chloro-4-hydroxy-2-quinolone-3-carboxamide (R19) is a newly synthesized phosphatidylinositol 3-kinase alpha (PI3K α) inhibitor with promising activity against cancer cells. The purpose of this study was to develop a polymeric nanoparticle (NP) formulation for R19 to address its poor aqueous solubility and to facilitate its future administration in preclinical and clinical

settings. NPs were prepared by nanoprecipitation using two polymers: D- α -tocopheryl polyethylene glycol 1000 succinate (vitamin E TPGS) and the poloxamer Pluronic P123 in different ratios. Physicochemical characterization of the NPs revealed them to be around 100 nm in size with high monodispersity, a spherical morphology, and an almost neutral surface charge. The NPs achieved ~60% drug loading efficiency and sustained release of R19 for up to 96 h, with excellent colloidal stability in serum-containing cell culture media. NPs containing TPGS enhanced R19's potency against MCF-7 and MDA-MB-231 breast cancer cells in vitro, with half-maximal inhibitory concentrations (IC₅₀) ranging between 1.8 and 4.3 μ M compared to free R19, which had an IC₅₀ of 14.7–17.0 μ M. The NPs also demonstrated low cytotoxicity against human dermal fibroblasts and more significant induction of apoptosis compared to the free drug, which was correlated with their cellular uptake efficiency. Our findings present a biocompatible NP formulation for the delivery of a cancer-targeted PI3K α inhibitor, R19, which can further enhance its potency for the treatment of breast cancer and potentially other cancer types. © 2022 by the authors.

ABSTRACT: This study aimed to develop and evaluate thermoresponsive in situ microgels for the local ocular delivery of prednisolone (PRD) (PRD microgels) to improve drug bioavailability and prolong ocular drug residence time. Lipid nanosystems of PRD microemulsions (PRD-MEs) were prepared and evaluated at a drug concentration of 0.25–0.75%. PRD microgels were prepared by incorporating PRD-MEs into 10 and 12% Pluronic® F127 (F127) or combinations of 12% F127 and 1–10% Kolliphor®P188 (F68). PRD microgels were characterized for physicochemical, rheological, and mucoadhesive properties, eye irritation, and stability. Results showed that PRD-MEs were clear, miscible, thermodynamically stable, and spherical with droplet size (16.4 ± 2.2 nm), polydispersity index (0.24 ± 0.01), and zeta potential (-21.03 ± 1.24 mV). The PRD microgels were clear with pH (5.37–5.81), surface tension (30.96–38.90 mN/m), size, and zeta potential of mixed polymeric micelles (20.1–23.9 nm and -1.34 to -10.25 mV, respectively), phase transition temperature (25.3–36 °C), and gelation time (1.44–2.47 min). The FTIR spectra revealed chemical compatibility between PRD and microgel components. PRD microgels showed pseudoplastic flow, viscoelastic and mucoadhesive properties, absence of eye irritation, and drug content (99.3 to 106.3%) with a sustained drug release for 16–24 h. Microgels were physicochemically and rheologically stable for three to six months. Therefore, PRD microgels possess potential vehicles for local ocular delivery. © 2022 by the authors.

ABSTRACT: Emotional intelligence is the automatic detection of human emotions using various intelligent methods. Several studies have been conducted on emotional intelligence, and only a few have been adopted in education. Detecting student emotions can significantly increase productivity and improve the education process. This paper proposes a new deep learning method to detect student emotions. The main aim of this paper is to map the relationship between teaching practices and student learning based on emotional impact. Facial recognition algorithms extract helpful information

from online platforms as image classification techniques are applied to detect the emotions of student and/or teacher faces. As part of this work, two deep learning models are compared according to their performance. Promising results are achieved using both techniques, as presented in the Experimental Results Section. For validation of the proposed system, an online course with students is used; the findings suggest that this technique operates well. Based on emotional analysis, several deep learning techniques are applied to train and test the emotion classification process. Transfer learning for a pre-trained deep neural network is used as well to increase the accuracy of the emotion classification stage. The obtained results show that the performance of the proposed method is promising using both techniques, as presented in the Experimental Results Section. © 2022 by the authors.

ABSTRACT: Genetic polymorphisms affect lipid profiles and are associated with disease complications. Genetic variants in the vitamin D receptor (VDR) gene are associated with type 2 diabetes mellitus (T2DM). In this study, we investigated the effects of VDR genotypes on the lipid profile and disease complications of T2DM patients in a Jordanian population. Ninety T2DM patients were genotyped for four major functional VDR genetic variants, rs2228570 C > T (FokI), rs7975232 A > C (ApaI), rs731236 T > C (TaqI), and rs1544410 C > T (BsmI), using the polymerase chain reaction-restriction fragment length polymorphism method. Lipid profiles and diabetes complications were analyzed and correlated with VDR genotypes. We found that the VDR rs7975232 and rs1544410 alleles were significantly ($p = 0.008-0.04$) associated with high-density lipoprotein (HDL) levels and retinopathy among patients. Carriers of the rs7975232 A/A genotype exhibited higher levels (49.68 ± 15.86 mg/dL) of HDL than patients with the A/C (44.73 ± 13.38 mg/dL) and C/C (37.93 ± 9.22 mg/dL) genotypes. Moreover, carriers of the rs1544410 T/T genotype had higher levels of HDL (54.31 ± 16.45 mg/dL) than patients with the C/T (43.57 ± 13.24 mg/dL) and C/C (43.98 ± 13.17 mg/dL) genotypes. T2DM patients who carry the rs7975232 C/C genotype were at higher risk (odds ratio [OR] = 7.88) of developing retinopathy compared with carriers of the rs7975232 C/A and A/A genotypes. In addition, T2DM patients with the rs1544410 C/C genotype had a higher risk (OR = 4.21) of developing retinopathy than patients with the rs1544410 C/T and T/T genotypes. Therefore, we concluded that the VDR rs7975232 and rs1544410 alleles were associated with HDL levels and retinopathy and can be considered as potential genetic biomarkers for the lipid profile and retinopathy complication among T2DM patients in a Jordanian population of Arabic origin. Further studies with larger sample sizes are needed to confirm our findings. © 2022 by the authors.

ABSTRACT: *Lavandula angustifolia* is the most widely cultivated *Lavandula* species for medicinal use.

In this study, chemical and biological evaluation of *L. angustifolia* aqueous, methanol (MeOH), ethanol (EtOH), ethyl acetate (EtOAc), and chloroform (CHCl₃) extracts were conducted.

Phytochemically, the extracts' total phenol and flavonoid contents and their antioxidant potential were evaluated. Ethanol extract was analyzed by LC-MS. All extracts were screened in vitro for their antitumor potential using human breast cancer cell lines MCF-7 and MDA-MB-23. For the first time, the

antiproliferative potential of the EtOH extract was tested in vivo using mice with induced breast cancer. Ethanol extract exhibited the best cytotoxicity and safety profile of the tested extracts, with IC50 values of 104.1 µg/mL on MCF-7 and 214.5 µg/mL on MDA-MB-231 cell lines, respectively. In vivo, this extract revealed a reduction in tumor size by 43.29% in the treated group, compared to an increase in the tumor growth by 58.9% in the control group. Moreover, undetected tumor was found in 12.5% of the sample size. In conclusion, this study provides novel insight and evidence on the antiproliferative efficacy of *L. angustifolia* ethanol extract against breast cancer with potent antioxidant potential. © 2022 by the authors.

ABSTRACT: This paper presents a simple mathematical and Simulink model of a two-phase hybrid stepper motor, where ignoring the permeance space harmonics of the hybrid stepper motor is regarded as the main physical assumption in this article. Moreover, the dq transformation method is adopted as the main mathematical approach for the derivation of the proposed model, where simple voltages, currents, and torque equations are obtained and used to build the proposed Simulink and circuit model of the stepper motor. The validity and the effectiveness of the proposed model are examined by comparing its results with the results collected from the Simulink model in the library of Matlab. The obtained simulation results showed that the proposed model achieved a high simplicity and high accuracy when compared with conventional models. © 2022 by the authors.

ABSTRACT: The current paper aims to analyze the keywords related to mobile banking (otherwise known as m-banking) issues by focusing on its development from 2000 to 2020, of which the first publication about this issue appeared in the Scopus database. This paper explored and analyzed 1206 research papers using the Scopus database. Bibliometric analysis and content analysis had been conducted through Excel and VOS viewer software to obtain the results. In addition, the findings of this paper reveal that the universal trends and increased production at a global level led to many changes, and the most rampant topic associated with m-banking in most periods is mobile telecommunication systems. By showcasing the creation of the key terms in m-banking, it was possible to identify significant changes in the development of the field's key terminologies. Therefore, it is important to follow up on the development in future decades, particularly how the recent universal occurrences have influenced the changes in m-banking use at a global level. Moreover, the present study makes a significant contribution to the literature by providing a framework for future research. The framework provides opportunities for researchers to explore the research streams in future research. Finally, the current paper is the first of its kind in its method of contribution, and according to the research databases (Scopus, Google Scholar, etc.), no work was witnessed in the published literature covering m-banking in a detailed and comprehensive multi-period manner and in such an applied method. In addition, the current paper fills this gap by conducting a bibliometric analysis and content analysis. © 2022 by the authors.

ABSTRACT: (1) Background: Chronic myeloid leukemia is defined as the neoplastic development of mostly myeloid cells in the bone marrow, including chemotherapy, radiation, hormone treatment, and immunological therapy, can be used to control this condition. The therapeutic impact on leukemic individuals varies, and the response to therapy varies between patients due to disease heterogeneity. The primary goal of this study is to compare the effects of single and Imatinib (IM) and Hydroxyurea (HU) combined treatment on hematological parameters and gene expression in CML patients. (2) Methods: This study was conducted on 51 patients, with chronic myeloid leukemia, who were admitted to Al-Basher hospital in Amman, Jordan, for follow-up. Their hematological parameters were checked and gene expression was measured for (BCL2, PP2A, CIP2A, and WT1). (3) Results: The BCL2 gene was found to be less expressed in both IM and (HU + IM) treatments as compared to the HU group alone, while PP2A gene expression was raised. Such a thing indicates that the outcome of the combined therapy method is not ideal, since PP2A activation causes CML cells to move toward the blast crisis stage. Furthermore, CIP2A gene expression revealed that IM and (HU + IM) had the same therapeutic effect and were more successful in CML patients than HU alone. With regards to the treatment effect on hematological parameters, notably in CML patients in later stages, the combination therapy (HU + IM) raised lymphocyte count, indicating a greater response to the treatment. When compared to single medicines, the combination treatment reduced the proportion of neutrophils to normal reference ranges. Platelet counts, on the other hand, dramatically decreased in both IM and (HU + IM). (4) Conclusion: Because the studied genes (BCL2, PP2A, CIP2A, and WT1) are participating in cell proliferation and death, the findings show that the examined genes are significant to understand the efficacy of various therapies. Furthermore, it was found that there was a clear effect of the clinic-based strategic treatment on hematological indicators such as WBCs, lymphocytes, neutrophils, and platelet counts. © 2022 by the authors.

ABSTRACT: Phenol is a major worry pollutant resulting from industrialized manufacturing and chemical reactions. The growth kinetics and biodegradation of phenol were initially investigated using *C. flaccumfaciens*, a recently identified plant growth stimulating bacterium. Based on the Haldane inhibition model, Haldane's growth kinetics inhibition coefficient (K_i), half-saturation coefficient (K_s), and the maximum specific growth rate (μ_{max}) for phenol-dependent growth kinetics were estimated to be 329 (mg/L), 9.14 (mg/L), and 1.05 (h^{-1}), respectively. With a sum of squared error (SSR) of 1.36×10^{-3} , the Haldane equation is well adapted to empirical data. The improved Gombertz model also accurately predicts phenol biodegradation trends. The rate of phenol biodegradation and the lag time both increased as the initial phenol concentrations were increased. *C. flaccumfaciens* growth and phenol biodegradation were best achieved at a pH of 7.0 at a temperature of 28 °C incubation. A phenol biodegradation mechanism by *C. flaccumfaciens* has been proposed. In conclusion, this study

revealed the ability of *C. flaccumfaciens* to promote plant growth and biodegrade phenol simultaneously. This could aid in rhizoremediation and crop yield preservation in phenol-stressed conditions. © 2022 The Author(s)

ABSTRACT: The consequences of reverse factoring in a supply chain are examined in this article.

Reverse factoring occurs when a buying firm offers a reduced short-term borrowing rate to a supplier company in exchange for longer payment terms. From the standpoint of a supplier, this paper investigates the impact of rating changes, interest rate fluctuations, and business cycle position on the cost-benefit trade-off in the SMEs and manufacturing companies. However, the data was collected using a questionnaire. The main result is that changes in critical financial variables like ratings, news alerts and interest rates will shift former win-win circumstances for the supplier dependent on the business cycle into win-lose situations for the supplier. Overall, the reverse factoring results reveal sophisticated trade-offs, necessitating careful consideration in managerial decisions. © 2022 Growing Science Ltd. All rights reserved.

ABSTRACT: This research aims to find principles that achieve an integrated architectural environment in the desert environment that meets human needs and preserves the rights of future generations. Studying and analyzing the successful solutions and treatments provided by the traditional architectural environment in a desert environment and in a hot, dry climate help achieve this aim. Nowadays, we find a growing research interest in sustainability. This research paper concentrated on the relationship of the desert environment with the built environment to achieve an integrated environment to meet human needs, ration energy consumption and preserve the identity of the architecture. This research studies traditional architecture in a desert environment to identify appropriate solutions to the climatic environment and its ability to harmonize and respond to its climatic environment, with its high capacity to respond to human needs in these communities. The research adopted the analytical descriptive approach in its study of the relationship of the desert climatic environment with the built architectural environment. The Climate Consultant software is used for this research to recommend various design strategies suitable for each climate. The three central climates analyzed in this study are coastal desert areas, moderate desert areas, and hot, dry desert environments. In conclusion, this research found that in the past, the traditional environment has provided and continues to provide effective climatic solutions. © 2022 by Authors.

ABSTRACT: This study aims at investigating the factors that determine the continuous intention to use smart-watches, one of the most prevalent types of wearable devices. The study extends the expectation confirmation model (ECM) by incorporating other variables (i.e., construct) which capture the unique

context of smartwatches continuous usage, namely healthology, perceived aesthetics, habit, and social influence. Hypotheses were assessed using partial least square structural equation modeling (PLS-SEM) approach on data collected from 287 actual smartwatch users. The results reveal that performance expectancy, satisfaction, healthology, perceived aesthetics and habit significantly influence the continuous usage of smartwatches, while social influence is non-significant. The research model of this study explains 65.7% of the variance in the continuous usage intention of smart-watches. The insights provided by this study suggest fruitful opportunities for future research. They can also help smartwatches companies, developers and marketers with strategies and directions for further development and growth by ensuring users' continuous usage of smartwatches. © 2022 by the authors; licensee Growing Science, Canada.

ABSTRACT: In the current era of information technology Big Data has gained significant importance in almost all the industries throughout the world. Big Data is now renowned for having the capability of effective decision making. Now companies around the globe are using Big Data for market analysis, customer analysis, however, the utilization of Big Data is much higher in the financial sector, yet publications on Big Data and finance are limited because of having significant challenges. Even though utilization of Big Data is highest in the financial sector and its importance cannot be ignored, the studies and analysis are inadequate. Considering the importance of Big Data in the financial sector this paper is an attempt to conduct a comprehensive literature review in the field of Big Data and finance. Thus, the study will contribute to the body of knowledge by providing horizons for empirical research in the field of Big Data and finance. © 2022 by the authors; licensee Growing Science, Canada.

ABSTRACT: The current research main purpose is to examine the effect of digital marketing on both value creation and customer satisfaction. The literature was reviewed for the relevant existing studies to address the knowledge gap that has not been fulfilled before by a proposed integrative model. A quantitative research approach was used in this study to investigate the hypothesized proposed model with a survey questionnaire to collect data from the sample of customers of telecommunication firms operating in Jordan. The instrument was developed and customized to achieve the research objectives. With a total of 315 valid and complete returned questionnaires, the research has analyzed the data collected by using the PLS-SEM approach to run the essential analysis procedures and test the hypothesized statements. The results showed a significant and positive effect of digital marketing on both value creation and customer satisfaction. The research would contribute to providing more understanding of the issues related to this topic and filling research gaps and provide some new knowl-edgeable and theoretical research implications. © 2022 by the authors; licensee Growing Science, Canada.

ABSTRACT: This paper aims to explore the intentions to use FinTech and its important role in the banking industry in Jordan. Accordingly, this study analyzes the nature of the relationship between intention to use financial technology and each of: Processing Unit (PU) perceived usefulness, social impact (SI), customer's trust (TRU) and perceived ease of use (PEU). Previous research related to financial technology is still under development and which is still being researched by providing an alternative approach to understanding how different business levels have stimulated the emergence of innovation-focused fintech companies, and what are the motives of success. Therefore, the main contribution of this research is to fill the gap in previous research related to financial technology that is still under development and which is still being researched by providing an alternative approach to understanding how different business levels have stimulated the emergence of innovation-focused fintech companies, and what are the motives of success. Results show a positive relation between intention to use financial technology and Processing Unit (PU), social impact (SI), customer's trust (TRU) and perceived ease of use (PEU). The main contribution of this research is to fill the gap in previous research related to financial technology that is still under development and which is still being researched by providing an alternative approach to understanding how different business levels have stimulated the emergence of innovation-focused fintech companies, and what are the motives of success. © 2022 by the authors; licensee Growing Science, Canada.

ABSTRACT: Greenly synthesized iron oxide nanoparticles (IONPs) were prepared from *Spinacia oleracea* leaf extract. They were coated with 10% polyethylene glycol (PEG) and conjugated with doxorubicin (DOX). They were characterized by UV-Vis spectrophotometer, X-ray diffraction, and Fourier transforms infrared spectroscopy (FTIR). They exhibited a particle size of 29.0 ± 1.2 nm, a polydispersity index of 0.52 ± 0.05 , and zeta potential of -12.3 ± 0.1 mV. The absorption spectrum of the greenly synthesized IONPs was endorsed by a characteristic peak at 450 nm. FTIR revealed that DOX conjugated to PEGylated IONPs occurred via the interaction of the $-NH_2$ group of DOX with $-OH$ groups of PEG through hydrogen bonding. PEGylation, as well as DOX conjugation, improved the cytotoxic activity of IONPs on triple-negative breast cancer. Cytotoxic activity of DOX conjugated to PEGylated IONPs was significantly higher than free DOX. Furthermore, the IC_{50} of DOX conjugated PEGylated IONPs (0.1804 $\mu\text{g/mL}$) was lower than unloaded PEGylated IONPs (0.2119 $\mu\text{g/mL}$) and uncoated IONPs (0.3817 $\mu\text{g/mL}$), which was further verified by a lower percentage of closure area in the scratch test. Moreover, the zones of microbial inhibition of PEGylated and non-PEGylated IONPs were higher than the commonly used antimicrobial agents including ampicillin and gentamycin. In conclusion, the prepared nanoparticles offer potential passive target chemotherapy with lower dose than free DOX. © 2022 Elsevier B.V.

ABSTRACT: This paper aims at investigating mathematics teachers' satisfaction with new math textbook for grades seven and ten in Jordan. A sample of (127) Jordanian mathematics teachers who teach the new textbooks replied to a questionnaire. The questionnaire consisted of (5) domains and (37) items. The results show teachers are moderately satisfied with the new textbooks, and there is a statistically significant difference ($\alpha=0.05$) in teachers' satisfaction according to gender (Male, Female) in favor of males. Also, the results show there is a statistically significant difference ($\alpha=0.05$) in teachers' satisfaction regarding teachers' experience in favor of more and moderately experienced teachers. © 2022 NSP.

ABSTRACT: Background: During hematopoietic stem cell transplant (HSCT), patients underwent various serious prolonged treatments, including conditioning and immunosuppressive drugs, resulting in several symptoms and alterations in the patient's functioning. One of the most commonly reported symptoms is fatigue. Aim: To assess fatigue levels and associated factors during the first 100 days post-HSCT among Jordanian patients. Methods: A descriptive cross-sectional design assessed fatigue and associated factors during the first 100 days post-HSCT among Jordanian patients. A convenient sample was used to recruit post-HSCT patients. Data were collected using the demographic survey and the Brief Fatigue Inventory (BFI) scale. Results: The findings of this study demonstrated that 40.5% of the participants had severe total fatigue scores, while the mean BFI intensity average score was 5.01 and the mean interference of fatigue with patients' daily life was 5.06. In terms of fatigue interference with daily activities, the highest interference was with the patient's mood and normal work, while the lowest interference was with the walking ability. The analysis revealed a strong positive correlation between the fatigue intensity and its interference with the daily activities ($r = .98$, $p < .001$). Besides, a significantly strong negative correlation was found between the number of days post-HSCT and fatigue scores ($r = -.92$, $p < .001$). Conclusion: Post-transplant, patients experienced increased fatigue intensity, reduced physical activity, interference with the patient's mood, and diminished functional capacity. Patients who have HSCT require a significant nursing care immediately post-transplant. © 2022, The Author(s), under exclusive licence to Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: The current study aims to design a nanoparticulate system that could encapsulate insulin and improve its stability. Nanoparticles were formulated by ionic cross-linking of chitosan (CS) with carbonate divalent anions. The interaction between the two moieties was evidenced by AFM, FTIR and surface tension measurements. CS carbonate nanoparticles were prepared with different mole fractions. The mole fraction of carbonate that produced the smallest size nanoparticles and highest zeta potential (40 nm and +39 mV, respectively) was determined. Circular dichroism (CD) studies revealed that insulin conformation was not affected by CS at 20 °C. However, the studies at elevated temperatures demonstrated that CS had a role in insulin stabilization. Fluorescence spectroscopy indicated the interaction between insulin and CS carbonate. The findings from this investigation showed the potential use of CS carbonate as an insulin stabilizer and at the same time as an insulin nanocarrier system. © 2022 Elsevier Ltd

ABSTRACT: New self-compacting concrete (SCC) mixtures were designed to improve the interfacial bond strength in concrete-filled steel tubes (CFST) at 30 days and one year. The proposed SCC mixtures involved the strengthening of bond strength by using waste steel slag aggregates (SSA). A total of thirty-six circular and squared tube specimens with different ratios (0%, 25% and 50%) of SSA as a replacement by weight of coarse and fine aggregates in SCC were initially prepared. The results

revealed that the using of SSA in SCC enhanced the specimens' bond strength for both shapes of steel tubes and the bond strength was reduced with an increase of concrete's age. Additionally, the incorporating of SSA did not decrease the loss in bond strength at one year. A three-dimensional non-linear finite element (FE) analysis was further conducted to simulate the interfacial bond-slip mechanism between two surfaces of the infill concrete and inner steel tubes. © 2022 The Authors

ABSTRACT: Aim: This study aimed to examine the association between work-related psychological empowerment and quality of nursing care in Jordanian critical care nurses. Background: Nurses' work-related empowerment is the essential element to enhance nurses' quality of care. There are few studies about this area among critical care nurses. Methods: A cross-sectional design was used, and data were collected from critical care registered nurses (N = 480) from different health sectors. Results: The mean scores of work-related psychological empowerment and quality of nursing care were 5.22 (SD = 0.92) and 3.75 (SD = 0.62), respectively. The nurses had agreement level of psychological empowerment and very good level of quality of nursing care. There was a positive relationship between quality of nursing care and psychological empowerment. Conclusion: The need to enhance work psychological empowerment is necessary to improve quality of nursing care. Implication for Nursing Management: The results reflect the need for policy-makers and nursing managers to develop and implement strategies to promote psychological empowerment to provide high quality of nursing care among critical care nurses. © 2022 John Wiley & Sons Ltd.

ABSTRACT: Natural deep eutectic solvents (NADES) are a new class of green solvents, which can solubilize natural and synthetic chemicals of low water solubility. NADES are mixtures of two or three compounds of hydrogen bond acceptors and hydrogen bond donors. Many NADES' components are of natural origin and therefore, NADES are presumed to be nontoxic and often exhibit antimicrobial activity. This work aimed to investigate the potential antimicrobial effect of menthol, capric acid and Solutol™, and their associated eutectic system on two Gram-positive bacteria (*Staphylococcus aureus* ATCC 6538 and *Bacillus subtilis* ATCC 6633), two Gram-negative bacteria (*Escherichia coli* ATCC 8739 and *Pseudomonas aeruginosa* ATCC 9027) and one fungus (the yeast *Candida albicans* ATCC 10231). The results obtained showed a stronger antimicrobial effect for the NADES when compared to their individual components and that they exhibit a promising antimicrobial activity against *S. aureus* and *C. albicans* and good activity against *P. aeruginosa*. NADES exhibited no observable antimicrobial activity against spore-forming *B. subtilis*. © 2022 The Society for Applied Microbiology.

ABSTRACT: Background: Nanoemulsions (NEs) have been explored as nanocarriers for the delivery of many drugs and cosmeceuticals. The extraordinary expansion of using NEs is due to their capability to conquer the main challenges of conventional delivery systems such as short residence time with low patient acceptance, poor stability, low aqueous solubility, permeability, and hence bioavailability. Methods: This review recapitulated the most recent pharmaceutical and cosmeceutical applications of NEs as effective delivery nanocarriers. The outputs of our research studies and the literature review

on the latest NEs applications were assessed to highlight the NEs components, preparations, applications, and the improved quality and elegance of the used product. Results: NEs are stable submicronic translucent dispersions with narrow droplet size distribution. They exhibited excellent ability to efficiently encapsulate therapeutics of diverse nature of drugs and cosmeceuticals. NE formulations showed superiority over conventional delivery approaches with overabundances of advantages through different routes of administration. This novel technology exhibited better aesthetic appeal, higher bioavailability, and a longer duration compared to the conventional delivery systems. Conclusion: This novel technology holds promise for different therapeutics fields. However, the success of NEs use advocated the development of robust formulations, proper choice of equipment, ample process characterization, and assurance of their efficacy, stability, safety and cosmetic appeal. © 2021 Wiley Periodicals LLC.

ABSTRACT: This study aimed to assess the prevalence, correlates, and significant associated factors of anxiety among patients with stroke. A cross-sectional, correlation design was utilized. The Hospital Anxiety and Depression scale was used to detect and assess the severity of anxiety and depression among mentally well patients at general hospital settings. Among the 226 patients with stroke, 45.6% had clinically significant levels of anxiety to be considered as a definite case. Having a short duration since the stroke onset, being a definite case of depression, being unable to perform self-care activities, having an insufficient monthly income, and having visual problems due to stroke were the significantly associated factors. The high prevalence of anxiety among patients with stroke highlights the need for interventions of early detection and management to enhance recovery. Patients who have any of the significant traits predicted post-stroke anxiety required special attention. © The Author(s) 2021.

ABSTRACT: Microemulsions are thermodynamically stable, transparent, isotropic mixtures of oil, water and surfactant (and sometimes a co-surfactant), which have shown potential for widespread application in disinfection and self-preservation. This is thought to be due to an innate antimicrobial effect. It is suggested that the antimicrobial nature of microemulsions is the result of a combination of their inherent kinetic energy and their containing surfactants, which are known to aid the disruption of bacterial membranes. This review examines the contemporary evidence in support of this theory. © 2021 The Society for Applied Microbiology.

ABSTRACT: Background: nanotechnology is one of the fastest-growing areas, and it is expected to have a substantial economic and social impact in the upcoming years. Gold particles (AuNPs) offer an opportunity for wide-ranging applications in diverse fields such as biomedicine, catalysis, and electronics, making them the focus of great attention and in parallel necessitating a thorough

evaluation of their risk for humans and ecosystems. Accordingly, this study aims to evaluate the acute and developmental toxicity of surface-modified gold nanorods (AuNRs), on zebrafish (*Danio rerio*) early life stages. Methods: in this study, zebrafish embryos were exposed to surface-modified AuNRs at concentrations ranging from 1 to 20 $\mu\text{g}/\text{mL}$. Lethality and developmental endpoints such as hatching, tail flicking, and developmental delays were assessed until 96 h post-fertilization (hpf). Results: we found that AuNR treatment decreases the survival rate in embryos in a dose-dependent manner. Our data showed that AuNRs caused mortality with a calculated LC50 of EC50,24hpf of AuNRs being 9.1 $\mu\text{g}/\text{mL}$, while a higher concentration of AuNRs was revealed to elicit developmental abnormalities. Moreover, exposure to high concentrations of the nanorods significantly decreased locomotion compared to untreated embryos and caused a decrease in all tested parameters for cardiac output and blood flow analyses, leading to significantly elevated expression levels of cardiac failure markers ANP/NPPA and BNP/NPPB. Conclusions: our results revealed that AuNR treatment at the EC50 induces apoptosis significantly through the P53, BAX/BCL-2, and CASPASE pathways as a suggested mechanism of action and toxicity modality. © 2022 American Chemical Society.

ABSTRACT: The phosphatidylinositol 3-kinase/protein kinase B (PI3K/AKT) pathway is a crucial pathway in cancer pathogenesis. Novel derivatives of 4,6-dihydroxy-2-quinolone-3-carboxamides were synthesized as potential PI3K α inhibitors. Derivatives' chemical identity was approved using ¹H-NMR, ¹³C-NMR, FTIR, and MS. Cytotoxicity was evaluated on the breast (MCF-7) and colon cancer (HCT-116) cell lines using the CCK8 assay. Apoptosis was assessed by Annexin-PI staining. Western blotting was employed to assess the expression of Bcl2, Bax, and the phosphorylation status of AKT. Data revealed that compounds exhibited a dose-response cytotoxic effect. Compounds 8 b and 8 f showed the lowest IC50 on all cell lines and highest apoptosis levels that were associated with lower Bcl2/Bax ratios. Western blot results showed a significant inhibition of pAKT in the treated cells, which could be attributed to PI3K α inhibitory effects of 8 b and 8 f. In conclusion, our findings indicate that 8 b and 8 f are drug-like chemical compounds that possess promising anticancer effects. © 2022 Wiley-VCH GmbH.

ABSTRACT: Adsorption and controlled release of agrochemicals has been studied widely using different nanomaterials and a variety of formulations. However, the potential for application of high surface-area metal-organic frameworks (MOFs) for the controlled release of agrochemicals has not been thoroughly explored. Herein, we report controlled and sustainable release of a widely used herbicide (2-methyl-4-chlorophenoxyacetic acid, MCPA) via incorporation in a range of zirconium-based MOFs and their biodegradable polymer composites. Three Zr-based MOFs, viz., UiO-66, UiO-66-NH₂, and UiO-67 were loaded with MCPA either postsynthetically or in situ during synthesis of the MOFs. The MCPA-loaded MOFs were then incorporated into a biodegradable polycaprolactone (PCL) composite membrane. All three MOFs and their PCL composites were thoroughly characterized using FT-IR, TGA, SEM, PXRD,

BET, and mass spectrometry. Release of MCPA from each of these MOFs and their PCL composites was then studied in both distilled water and in ethanol for up to 72 h using HPLC. The best performance for MCPA release was observed for the postsynthetically loaded MOFs, with PS-MCPA@UiO-66-NH₂ showing the highest MCPA concentrations in ethanol and water of 0.056 and 0.037 mg/mL, respectively. Enhanced release of MCPA was observed in distilled water when the MOFs were incorporated in PCL. The concentrations of herbicides in the release studies provide us with a range of inhibitory concentrations that can be utilized depending on the crop, making this class of composite materials a promising new route for future agricultural applications. © 2022 The Authors. ABSTRACT: This study aimed to examine the relationship between nursing informatics competencies and clinical decision-making by taking into account nurses' individual characteristics and job-related characteristics. A cross-sectional design was used. The cluster random sampling method was adopted to select 14 governmental hospitals in West Bank, Palestine, in which all nurses in these hospitals were invited to participate in this study. Results found that the total mean (SD) score for the nursing informatics competency scale was 2.6 (0.88), which indicates that the nurses had lower nursing informatics competency, and the informatics skills subscale had the lowest mean score (mean [SD], 2.4 [1.00]). Concerning clinical decision-making, the total mean (SD) score was 2.59 (0.38), which indicates that the nurses had lower clinical decision-making. Regarding clinical decision-making subscales, searching for information and unbiased assimilation of new information had the highest mean score (mean [SD], 2.64 [0.39]); on the contrary, the canvassing of objectives and values subscale had the lowest mean score (mean [SD], 2.53 [0.38]). Nursing informatics competency had a positive relationship with clinical decision-making. Thus, it is necessary to enhance nurses' informatics competency, especially informatics skills and clinical decision-making, by developing training programs about this technology directed to nurses. © 2021 Lippincott Williams & Wilkins.

ABSTRACT: Fractional-order systems have proved to be accurate in describing the spread of the COVID-19 pandemic by virtue of their capability to include the memory effects into the system dynamics. This manuscript presents a novel fractional discrete-time COVID-19 model that includes the number of vaccinated individuals as an additional state variable in the system equations. The paper shows that the proposed compartment model, described by difference equations, has two fixed points, i.e., a disease-free fixed point and an epidemic fixed point. A new theorem is proven which highlights that the pandemic disappears when an inequality involving the percentage of the population in quarantine is satisfied. Finally, numerical simulations are carried out to show that the proposed incommensurate fractional-order model is effective in describing the spread of the COVID-19 pandemic. © 2022 by the authors.

ABSTRACT: This paper addresses a puzzle involving two modes of superlative modification in definite relatives in Jordanian Arabic: the so-called (A)tributive and (G)enitive superlatives. We show that under the low interpretation of the definite relative clause, both modes of superlative modification exhibit an asymmetrical behavior: while the A-superlative is ambiguous between the absolute and relative readings, the relative reading is blocked in G-superlatives. To resolve the puzzle, we propose a compositional analysis based on the late merger of the definite relative which generates the absolute/relative ambiguity in A-superlatives and at the same time it blocks the relative reading in G-superlatives. © 2022 The Author(s)

ABSTRACT: Disasters, extreme weather conditions and rural recreation makes the availability of a portable heating and cooling device as a must. There are many devices that work on the heating and power generation in the market. The air-conditioner which works on the heat pump principle is well known. Harsh weather conditions, natural disasters and recreation in rural areas (deserts and mountains) requires the availability of a heating and cooling device that works on well available fuel and has a low fuel consumption rate. Such a device will help in saving lives and encourage rural tourism. In this paper, a heating and cooling device is proposed for rural places, harsh weather conditions and natural disasters where no electricity is available. The device is working on the principle of heat pump (HP) to optimize its performance. The source of energy selected for this device is fossil fuels; fossil fuel is used for its convenience where no electricity is available. Low vibration low noise Stirling Engine (SE) is used to drive the heat pump that produces heating/cooling effects. Analysis of the proposed device is performed for each of its components. The results attained from analysis coincide with the results in literature. An electricity free, low vibration, silent and improved performance CHC device was attained. With suitable selected sub-devices an OHR of 2.429 was achieved by the proposed device compared to currently available devices. © 2022

ABSTRACT: The aim of this study is to declare the most published articles on PPP by authors, countries, institutions and Journals in Scopus database using RStudio, VOSviewer, and advanced Excel software packages to formulate the analysis. The results show that, 1003 authors have published articles on PPP with 775 papers up to 2021. Where, Rogoff (1996) and Pedroni (2001) received the highest cited papers with 1378 and 918, respectively. While, the most countries tested the validity of PPP is the United State with 248 documents and Applied Economics Letters Journal was the most sources for PPP with 86 papers. © 2022, SRAC - Romanian Society for Quality. ABSTRACT: Background: Cancer incidence in the world is predicted to increase in the next decade.

While progress has been in diagnosis and treatment, much still remains to be done to improve cancer pain therapy, mainly in underserved communities in low-income countries. Objective: To determine knowledge, beliefs, and barriers regarding pain management in both high- and low-income countries (according to the WHO classification); and to learn about ways to improve the current state of affairs. Design: Descriptive survey. Setting/Subjects: Fifty-six countries worldwide; convenience sample of 1639 consisted of 36.8% physicians; 45.1% nurses, and 4.5% pharmacists employed in varied settings. Results: Improved pain management services are key elements. Top barriers include religion factors, lack of appropriate education and training at all levels, nonadherence to guidelines, patients' reluctance to report on pains, over regulation associated with prescribing and access to opioid analgesics, fear of addiction to opioids, and lack of discussions around prognosis and treatment planning. Conclusion: The majority of patients with cancer in low-income countries are undertreated for their pain. Promoting cancer pain accredited program of training and education on pain management for physicians and nurses is crucial, as well as advocating policymakers and the public at large. © Copyright 2022, Mary Ann Liebert, Inc.

ABSTRACT: KP167 is a novel hypoxia-activated prodrug (HAP), targeting cancer cells via DNA intercalating and alkylating properties. The single agent and radiosensitizing efficacy of KP167 and its parental comparator, AQ4N, were evaluated in 2D and 3D cultures of luminal and triple negative breast cancer (TNBC) cell lines and compared against DNA damage repair inhibitors. 2D normoxic treatment with the DNA repair inhibitors, Olaparib or KU-55933 caused, as expected, substantial radiosensitization (sensitizer enhancement ratio, SER_{0.01} of 1.60–3.42). KP167 induced greater radiosensitization in TNBC (SER_{0.01} 2.53 in MDAMB-231, 2.28 in MDAMB-468, 4.55 in MDAMB-436) and luminal spheroids (SER_{0.01} 1.46 in MCF-7 and 1.76 in T47D cells) compared with AQ4N. Significant radiosensitization was also obtained using KP167 and AQ4N in 2D normoxia. Although hypoxia induced radioresistance, radiosensitization by KP167 was still greater under 2D hypoxia, yielding SER_{0.01} of 1.56–2.37 compared with AQ4N SER_{0.01} of 1.13–1.94. Such data show KP167 as a promising single agent and potent radiosensitizer of both normoxic and hypoxic breast cancer cells, with greater efficacy in TNBCs. © 2022 The Authors. ABSTRACT: Introduction: The genus *Daphne* is an important source of anticancer constituents. In the present study, the Middle-Eastern medicinal plant, *Daphne mucronata* subsp. *Linearifolia*, was selected to evaluate its anti-angiogenic and antioxidant activities. Methods: Root extracts (n-hexane, chloroform "CHCl₃", chloroform/methanol "CHCl₃/MeOH", and methanol "MeOH") and isolated pure compounds were used to assess the effects on angiogenesis by using an in vivo chorioallantoic membrane (CAM) model. Reversed Phase High Performance Liquid Chromatography "RP-HPLC" analyses were performed on the most active extract to isolate potential anti-angiogenic compounds. The antioxidant

activity was evaluated by 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical assay and by measuring the reducing power with a Folin-Ciocalteu reagent. Results: In the CAM model, the CHCl₃/MeOH extract (100 µg/egg) exhibited a good anti-angiogenic response (37.4% of inhibition) compared with the control group ($p < 0.01$). Chromatographic separation of the bioactive extract provided four lignans, the phenylpropanoid glycoside syringin, and two biflavonoids. Syringin and daphnodorin B showed the best anti-angiogenic response on the CAM, inducing a marked reduction of the microvasculature (55.75% and 46.77% of inhibition at 20 µM) and a decrease of haemoglobin content. Additionally, syringin, pinoresinol 4-O-β-D-glucopyranoside, daphnodorin B, lariciresinol 4,4'-bis-O-β-D-glucopyranoside, and genkwanol A revealed a strong antioxidant activity against DPPH radical (IC₅₀ 0.11-0.55 mM) and a good reducing power (2.08-5.32 GAEs). Conclusion: The bio-guided isolation of *D. mucronata* root CHCl₃/MeOH extract afforded anti-angiogenic and antioxidant compounds with a potential beneficial role against dangerous and reactive species that were involved in many oxidative stress-related diseases. © 2022

ABSTRACT: Latent heat thermal energy storage systems exhibit a significant performance over other thermal energy storage systems. The performance of these particular systems during melting/solidification is influenced by their orientation. Therefore, a numerical investigation and experimental validation were conducted. ANSYS Fluent 18.1 is used to develop a numerical model to investigate the effects of the pipe's orientation angle. Parametric analysis of various pipe orientation angles (0°, 30°, 60°, 90°) and various oil inlet temperatures were conducted during the investigation. It was determined that the melting time and absorbed heat flux when the inlet temperature increased from 493 K to 523 K is reduced by 42% and increases by 59%, respectively. Furthermore, the solidification time decreases by 63% when the inlet temperature is reduced from 444 K to 413 K. Increasing the orientation angle of the pipe results in a reduction in the melt fraction by 16.5% as the orientation angle is increased from 0° to 90°. In addition, the orientation angle has a significant effect during the melting, which is influenced by increasing the orientation angle from 0° to 90° by 18.2%. Conversely, the orientation angle has no impact on solid fraction during solidification. © 2022 The Author(s).

ABSTRACT: In this paper, an enhanced binary version of the Rat Swarm Optimizer (RSO) is proposed to deal with Feature Selection (FS) problems. FS is an important data reduction step in data mining which finds the most representative features from the entire data. Many FS-based swarm intelligence algorithms have been used to tackle FS. However, the door is still open for further investigations since no FS method gives cutting-edge results for all cases. In this paper, a recent swarm intelligence metaheuristic method called RSO which is inspired by the social and hunting behavior of

a group of rats is enhanced and explored for FS problems. The binary enhanced RSO is built based on three successive modifications: i) an S-shape transfer function is used to develop binary RSO algorithms; ii) the local search paradigm of particle swarm optimization is used with the iterative loop of RSO to boost its local exploitation; iii) three crossover mechanisms are used and controlled by a switch probability to improve the diversity. Based on these enhancements, three versions of RSO are produced, referred to as Binary RSO (BRSO), Binary Enhanced RSO (BERSO), and Binary Enhanced RSO with Crossover operators (BERSOC). To assess the performance of these versions, a benchmark of 24 datasets from various domains is used. The proposed methods are assessed concerning the fitness value, number of selected features, classification accuracy, specificity, sensitivity, and computational time. The best performance is achieved by BERSOC followed by BERSO and then BRSO. These proposed versions are comparatively assessed against 25 well-regarded metaheuristic methods and five filter-based approaches. The obtained results underline their superiority by producing new best results for some datasets. © 2022 Elsevier Ltd

ABSTRACT: Concrete pavements comprise a considerable portion of pavements that are currently in use. This paper presents the results from a laboratory investigation on the effect of temperature and surface texture on the skid resistance of concrete pavements. Briquettes representative of concrete pavements were created and textured in the laboratory. Readings of skid resistance on laboratory specimens were obtained using a portable British pendulum tester. Water and liquid hand soaps were used as lubricants in an attempt to separate the adhesion and hysteresis components of friction. In order to simulate the wear and ageing of concrete pavements, several cycles of polishing were applied to the briquettes. Tests were conducted at five different temperatures. The results showed that there is a correlation between the magnitude of friction components and temperature. A normalisation procedure for friction measurements based on temperature was developed, which can be used to normalise measurements to a standard temperature of 293.15 K. © 2019 ICE Publishing: All rights reserved.

ABSTRACT: Background: Burns are a global public health phenomenon accounting for 180,000 deaths yearly. Burn wounds were considered among the most devastating injuries worldwide and is the fourth most common type of injury globally. It is also negatively associated with the quality of life of those patients. Improving the quality of life and mindfulness could be helpful in those survivors after burn injury to deal with others. Based on the findings of the study, there remains limited knowledge about the unique role of mindfulness in improving the quality of life of burn survivors. Therefore, this study aims to identify the role of mindfulness in improving the QOL of Jordanian burn survivors. Methods: A descriptive correlational design was used to answer the research questions. A convenience sample of 212 participants took part in the study. Participants completed measures regarding the quality of life and mindfulness. Results: Some demographic and clinical variables were associated with quality of life. The burn-related QOL was significantly and positively correlated with mindfulness ($r = .294$, $p < 0.01$). Mindfulness explained a distinctive variance in burn-related quality of life among the study participants. Conclusion: This study identified the role of various factors in the burn-related quality of life among burn survivors. Mindfulness could have an important role in improving the burn-related quality of life among burn survivors. © 2021 Elsevier Ltd and ISBI

ABSTRACT: Objectives: Coronavirus disease 2019 (COVID-19) is a communicable disease transmitted via respiratory droplet from 1 person to another caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). This study aims to investigate the knowledge, attitudes, and practice of Jordanian people toward COVID-19 during the COVID-19 pandemic. In addition, the paper explores the lack of perception and adherence to preventive measures toward COVID-19. Methods: A quantitative, cross-sectional, descriptive online survey was used to explore study variables. A convenience sample of individual who are of Jordanian nationality, were aged 18 years or older, understood the content of the questionnaire, and agreed to participate voluntarily was surveyed. Results: The average correct score of COVID-19 knowledge was 84.44% (12.66/15). In addition, knowledge scores significantly differed across demographic characteristics of participants. Moreover, 93.8% (1009) of the study sample had confidence that Jordan can win the battle against the COVID-19 virus. However, study participants acknowledged that they did not visit crowded places in recent days (91.6%), while 71.3% (767) wore masks when leaving home. Conclusions: The current study added a new knowledge that generally the Jordanian people during the quarantine period have a high knowledge and optimistic attitudes and practices toward COVID-19. © Society for Disaster Medicine and Public Health, Inc. 2021.

ABSTRACT: Objective: The aim was to evaluate nurses' self-efficacy, confidence, and nurse-patient interaction during caring of patients with coronavirus disease 2019 (COVID-19). Methods: A cross-sectional design with online survey was used with a Self-efficacy scale, Self-confidence scale, and Caring nurse-patient interaction scale: 23-item Version-Nurse (CNPI-23 N). Results: A sample of 120 nurses participated in the current study. The results showed that the participants had a moderate level of self-efficacy, self-confidence and interaction ($M = 28.84$ ($SD = 7.7$), $M = 47.41$ ($SD = 9.0$), and $M = 93.59$ ($SD = 16.3$), respectively). Positive relationships were found between nurse' self-efficacy, self-confidence, and nurse-patient interaction ($r = 0.81$; $P < 0.0001$ and 0.79 ; $P < 0.0001$, respectively). Significant differences were found in self-efficacy according to years of experience, academic qualifications and position ($F = 2.10$; $P = 0.003$; $F = 3.60$; $P = 0.002$, and $F = 2.60$; $P = 0.007$, respectively). Furthermore, the results indicated that there was a significant difference in self-confidence and nurse-patient interaction also. Conclusion: Nurse educators and administrators should develop and implement further strategies, such as continuing education and training, compensatory payment, organizational support, and availability of protective measures to increase their self-efficacy, self-confidence, and interaction with COVID-19 patients. © Society for Disaster Medicine and Public Health, Inc. 2021. ABSTRACT: Rhoifolin (ROF) is a bioactive plant flavonoid with potent antioxidant and anti-inflammatory activity. However, no delivery system has yet been developed for ROF to overcome its biopharmaceutical limitations. The purpose of this study was to design a ROF-loaded polymeric nanocarrier as a potential anti-inflammatory nanomedicine. ROF was isolated from Jordanian Teucrium polium L. and entrapped into poly(lactide-co-glycolide) nanoparticles (PLGA NPs), followed by tannic acid-mediated surface modification with poly(ethylene glycol) (PEG). The optimal ROF NPs were highly

monodisperse with an average diameter of 204 nm, a zeta potential of -28 mV, an entrapment efficiency of 45%, and drug loading of 9% w/w. The NPs exhibited excellent colloidal stability during storage and in the presence of serum and achieved sustained drug release for up to 96 h at physiologic (7.4) and acidic pH (5.0). In vitro cell-free antioxidant assays confirmed the potent radical scavenging activity of free ROF and ROF NPs. Moreover, ROF NPs were superior to free ROF in relieving oxidative stress in stimulated RAW 264.7 murine macrophages, which was attributed to enhanced cellular uptake of the NPs as confirmed by confocal microscopy and fluorimetry. In vivo anti-inflammatory activity was evaluated in a formalin-induced rat paw edema model. The results showed that ROF NPs were superior to free ROF in mitigating the histopathological changes in the inflamed paw tissues. Moreover, the NPs were equally potent to free ROF and the nonsteroidal anti-inflammatory drug diclofenac in terms of inhibiting the increase in paw thickness, normalizing nitric oxide levels, and modulating the gene expression of pro-inflammatory cytokines in the inflamed paw tissues. Our findings present a promising nanocarrier platform that can enhance the solubility and control the release of ROF, which will facilitate its administration in the treatment of inflammatory diseases. © 2022 The Royal Society of Chemistry.

ABSTRACT: Introduction: COVID-19 has impacted all dimensions of life and imposed serious threat on humankind. Background: In Jordan, understanding how nurses experienced providing care for patients with COVID-19 offers a framework of knowledge about similar situations within the context of Arabic culture. Aim: To explore nurses' experience with providing hands-on care to patients with active COVID-19 infection in an Arabic society. Methods: A descriptive phenomenological study interviewed 10 nurses through a purposive sampling approach until data saturation was reached. The research site was hospital designated to receive patients with active COVID-19 infection. Semi-structured interviews were used to collect the data. Findings: Three themes were generated from the data: the impact of the COVID-19 outbreak on nurses' health; unfamiliar work and social environments; and conforming to professional standards. Discussion: There are specific risks to the physical and mental wellbeing of nurses who provide hands-on care to patients with COVID-19 in an Arabic society. Implication for nursing and health policy: Health care institutions should consider establishing programs that promote nurses' wellbeing and support their productivity in a crisis. A danger pay allowance should be considered for nurses during extraordinary circumstances, such as pandemics. ABSTRACT: Two methods of high-impact polystyrene (HIPS) polymer addition to asphalt concrete (AC) mixtures were used to evaluate the effect of freeze-thaw (FT) cycles on the performance of unmodified AC and AC modified by using supplementary and additional HIPS polymer as asphalt aggregates. Various polymer contents were used to modify AC in both methods-namely, 0 (control), 5, 10, 15 and 20%. Marshall stability, flow, bulk density and indirect tensile strength (ITS) tests were performed on control and modified samples. A non-destructive test was performed by using the ultrasonic pulse

velocity method. In the first method, replacing the mineral filler in AC with 10% HIPS polymer increased the density by 1%, the stability by 113%, the retained stability by 52% and the ITS by 56% compared with those of the control specimen. The results also show a 14% reduction in the damage caused by 8 weeks of FT cycles for modified AC compared with that of unmodified AC. However, modifying AC by using the second method did not provide promising results. The velocity within the specimen dropped by 20.9% at 10% HIPS addition before the FT effect compared with that of the control. The results of the first method revealed the feasibility of improving AC by using HIPS polymer to resist effective FT cycles. © 2022 ICE Publishing: All rights reserved.

ABSTRACT: Food security is an essential issue for human survival and civilization. Whenever food-water security is in doubt, the community is negatively affected. Globally, Jordan is the second most water-stressed country, located in an arid, politically divided and migratory active Middle East region that lacks the access to valuable natural resources such as fertile soils. Jordan receives about 78 m³/person/year from renewable resources, which represents 1% of the world water share. Jordan's Water Minister declared that a 50 million m³ lack of drinking water is to be faced next year; this shortage is added to the lack of irrigation water, which yields food insecurity and food price fluctuations that wear out the consumer. The aim of this study is to provide a comprehensive overview of the impact of agricultural cropping patterns and water security by analyzing the most relevant national databases. The study results will contribute to the development of national policy in order to strategize the aid programs and adaptation measures for more sustainable planning in the Jordanian agri-food sector. © 2022 by the authors.

ABSTRACT: The human microbiome encodes more than three million genes, outnumbering human genes by more than 100 times, while microbial cells in the human microbiota outnumber human cells by 10 times. Thus, the human microbiota and related microbiome constitute a vast source for identifying disease biomarkers and therapeutic drug targets. Herein, we review the evidence backing the exploitation of the human microbiome for identifying diagnostic biomarkers for human disease. We describe the importance of the human microbiome in health and disease and detail the use of the human microbiome and microbiota metabolites as potential diagnostic biomarkers for multiple diseases, including cancer, as well as inflammatory, neurological, and metabolic diseases. Thus, the human microbiota has enormous potential to pave the road for a new era in biomarker research for diagnostic and therapeutic purposes. The scientific community needs to collaborate to overcome current challenges in microbiome research concerning the lack of standardization of research methods and the lack of understanding of causal relationships between microbiota and human disease. © 2022 by the authors.

ABSTRACT: In the presented work, with the help of using Adomian decomposition method (ADM), two particular situations connected to the equilibria's stability of the nonlinear fractional-order Lorenz system (FoLS) are examined and confirmed numerically. Such situations can be extremely valuable for discerning between several other situations that might be employed to explore the stability of Lorenz system. In this study, all numerical simulations are carried out by using MATLAB software package. © 2022 NSP

ABSTRACT: The synthesis of activated carbon (AC) from pine fruit shells (PFS) biomass (BM) is described in this paper. AC was made from BM by gradual pyrolysis at 600°C. AC was also chemically activated with H3 P04 (BC-H3 P04) and pyrolyzed at 600°C. BM, BC, and BC-H3 P04 adsorbents were characterized by Fourier-transform infrared spectroscopy, X-ray diffraction, scanning electron microscopy, thermal gravimetric analysis, and elemental analysis. The batch system was used to apply the BM, BC, and BC-H3 P04 to the adsorption of paracetamol (PCM) from aqueous solution. Adsorption was evaluated in relation to adsorbent dosage, ionic strength, initial pH solution, con-tact time, and temperature. Based on their coefficient of determination (R2), chi-square (χ^2) and error function (Ferror%) values, equilibrium and kinetic PCM adsorption data revealed that the process obeys the Langmuir, Dubinin-Radushkevich, and pseudo-second-order kinetic equations, respectively. According to the Langmuir model, the highest adsorption capacity for PCM by BM, BC, and BC-H3 P04 was 99.010, 166.667, and 256.10 mg/g, respectively. Thermodynamic analysis revealed that PCM adsorption by the adsorbents is spontaneous and exothermic. © 2022 Desalination Publications. All rights reserved.

ABSTRACT: Purpose: To examine the quality of pharmaceutical experiential training by developing an experiential training survey. Methods: An online survey was placed on E-learning platforms in Jordan and UK to develop a validated instrument that can assess pharmacy students' perceptions of the experiential program implemented in their curricula. Results: A total of 377 students from Jordan (250 students) and the UK (127 students) completed the survey. Principal component analysis was used to conduct exploratory factor analysis and to assess the factor structure for the data. A two-factor model was applied to the data obtained from the students. These factors included students' feelings toward experiential training (Perceiver Feelings; PF) and their ability to conduct a full Pharmaceutical Care Plan (PCP). Students from both Jordan and the UK showed a higher satisfaction PF score toward the experiential training program compared to PCP. Being female and not having prior practice experience led to significantly lower PCP scores compared to males and having a prior practice experience, respectively. Conclusion: The availability of a validated questionnaire will help in investigating the effectiveness of experiential training courses. © 2022 The authors.

ABSTRACT: Health workers play an important part as role models, advocates for vaccination, vaccinators and educators in a community. Furthermore, they are at high risk of being infected with COVID-19 as they are on the frontlines. Thus, this study purposed to determine the willingness of the healthcare professionals working in healthcare institutions to accept the first dose of COVID-19 vaccine in Jordan. A cross-sectional design and a convenience-sampling method were used to recruit the study population from different healthcare sectors. A web-based survey was used to collect data. Findings showed that 1594 healthcare professionals responded and 74% of them were aged less than 45 years. Almost 65% of the respondents were registered nurses and 68.4% of them were married. A total of 94.9% of the participants heard about the COVID-19 vaccine, but only 56.5% of them had had the opportunity to attend lectures/discussions about COVID-19 vaccine. Official government websites were the primary source of obtaining information about COVID-19 (36.3%). The willingness of acceptance rate of COVID-19 vaccine was 63%. There were positive correlations between vaccine acceptance and compliance toward COVID-19 infection control precautions ($r = 0.119$, $p < 0.01$), knowledge about COVID-19 ($r = 0.256$, $p < 0.01$), age ($r = 0.170$, $p < 0.01$), and years of experience ($r = 0.105$, $p < 0.01$). Furthermore, age, knowledge, and compliance were significant predictors of the acceptance of the COVID-19 vaccine. Thus, it is necessary to develop specific interventions for healthcare professionals with low acceptance rates and take into consideration the predictors of COVID-19 vaccine acceptance. Further research is needed to explore the factors influencing the refusal of the COVID-19 vaccine by healthcare professionals. © 2022 by the authors.

ABSTRACT: COVID-19 vaccines have been instrumental tools in reducing the impact of SARS-CoV-2 infections around the world by preventing 80% to 90% of hospitalizations and deaths from reinfection, in addition to preventing 40% to 65% of symptomatic illnesses. However, the simultaneous large-scale vaccination of the global population will indubitably unveil heterogeneity in immune responses as well as in the propensity to developing post-vaccine adverse events, especially in vulnerable individuals. Herein, we applied a systems biology workflow, integrating vaccine transcriptional signatures with chemogenomics, to study the pharmacological effects of mRNA vaccines. First, we derived transcriptional signatures and predicted their biological effects using pathway enrichment and network approaches. Second, we queried the Connectivity Map (CMap) to prioritize adverse events hypotheses. Finally, we accepted higher-confidence hypotheses that have been predicted by independent approaches. Our results reveal that the mRNA-based BNT162b2 vaccine affects immune response pathways related to interferon and cytokine signaling, which should lead to vaccine success, but may also result in some adverse events. Our results emphasize the effects of BNT162b2 on calcium homeostasis, which could be contributing to some frequently encountered adverse events related to mRNA vaccines. Notably, cardiac side effects were signaled in the CMap query results. In summary, our approach has identified mechanisms underlying both the expected protective effects of vaccination as well as possible post-vaccine adverse effects. Our study illustrates the power of systems biology approaches in improving our understanding of the comprehensive biological response to vaccination against COVID-19. © 2022 by the authors. ABSTRACT: Maintaining remission and improving quality of life for individuals with schizophrenia can encourage them to return to work, participate in volunteer opportunities, and establish healthy intimate relationships. The purpose of the current review was to explore the impacts of using relapse prevention interventions on maintaining remission and minimizing relapse rate for individuals with schizophrenia. A scoping review was performed using the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews guidelines to screen 134 studies published between 2010 and 2020. A total of 14 articles met eligibility criteria. Included studies showed that intervention strategies tailored to meet the needs of individuals with schizophrenia must be developed and applied in different psychiatric settings to maintain remission and minimize relapse rate. © 2022 Abu Sabra, Hamdan-Mansour.

ABSTRACT: This is a cross-sectional Web-based study that aims to assess the knowledge, attitudes, and practices (KAP) of the Jordanian women toward iron-deficiency anemia. Participants were invited to complete a questionnaire via multipurpose Facebook groups. In total, 4110 women completed the questionnaire. Of these, 15.9% had never heard of iron-deficiency anemia. The KAP scores were calculated for the remaining 3457 participants and variables that influenced these scores were determined. The factors that influenced KAP scores were monthly income and education/working field ($P < .01$). There was a positive association between age and attitude score. The results indicate that there is a need to improve Jordanian women's KAP toward iron-deficiency anemia. © 2022 Lippincott Williams and Wilkins. All rights reserved.

ABSTRACT: In this paper, we define surfaces of revolution without parabolic points in three-dimensional Lorentz-Minkowski space. Then, we classify this class of surfaces under the condition $\Delta I I x = Ax$, where $\Delta I I I$ is the Laplace operator regarding the third fundamental form, and A is a real square matrix of order 3. We prove that such surfaces are either catenoids or surfaces of Enneper, or pseudo spheres or hyperbolic spaces centered at the origin. © 2022 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: In the proposed work, the MATLAB program was used to model and simulate the performance of the investigated two-stage adsorption chiller with and without heat recovery using an activated carbon/methanol pair. The simulated model results were then validated by the experimental results conducted by Millennium Industries. The model was based on 10th order differential equations; six of

them were used to predict bed, evaporator and condenser temperatures while the other four equations were used to calculate the adsorption isotherm and adsorption kinetics. The detailed validation is stated in the next paragraphs; for example, it clearly notes that the simulation model results for the two-stage air cooled chiller are well compared with the experimental data in terms of cooling capacity (6.7 kW for the model compared with 6.14 kW from the experimental results at the same conditions). The Coefficient of Performance (COP) predicted by this simulation was 0.4, which is very close to that given by the Carnot cycle working at the same operating conditions. The model optimized the switching time, adsorption/desorption time and heat recovery time to maximize both cooling capacity and COP. The model optimized the adsorption/desorption cycle time (300 to 400 s), switching cycle time (50 s) and heat recovery cycle time (30 s). The temporal history of bed, evaporator and condenser temperatures is provided by this model for both heat recovery and without heat recovery chiller operation modes. The importance of this study is that it will be used as a basis for future series production. © 2022 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Alcohol dependence results in long-lasting neuroadaptive changes in meso-corticolimbic system, especially in the nucleus accumbens (NAc), which drives relapse-like ethanol drinking upon abstinence or withdrawal. Within NAc, altered glutamate homeostasis is one of the neuroadaptive changes caused by alcohol dependence. Accumbal glutamate homeostasis is tightly maintained through glutamate transporter 1 (GLT-1) and cystine-glutamate antiporter (xCT). But the role of GLT-1 and xCT in relapse-like ethanol drinking is poorly understood. Here, we used alcohol-preferring (P) rats in relapse-like ethanol drinking paradigm to (a) determine the effect of relapse-like ethanol drinking on gene and protein expression of GLT-1 and xCT in NAc, measured by quantitative polymerase chain reaction (qPCR) and Western blot, respectively; (b) examine if glutamate uptake is affected by relapse-like ethanol drinking in NAc, measured by radioactive glutamate uptake assay; (c) elucidate if upregulation of either/both GLT-1 or/and xCT through ceftriaxone is/are required to attenuate relapse-like ethanol drinking. The GLT-1 or xCT protein expression was suppressed during ceftriaxone treatments through microinjection of GLT-1/xCT anti-sense vivo-morpholinos. We found that relapse-like ethanol drinking did not affect the gene and protein expression of GLT-1 and xCT in NAc. The glutamate uptake was also unaltered. Ceftriaxone (200 mg/kg body weight, i.p.) treatments during the last 5 days of abstinence attenuated relapse-like ethanol drinking. The suppression of GLT-1 or xCT expression prevented the ceftriaxone-induced attenuation of relapse-like ethanol drinking. These findings confirm that upregulation of both GLT-1 and xCT within NAc is crucial for ceftriaxone-mediated attenuation of relapse-like ethanol drinking. © 2022 Society for the Study of Addiction.

ABSTRACT: Measuring software quality is one of the success keys in healthcare organizations, so this research work is conducted to study the quality functional and technical factors in cloud healthcare systems. For a successful implementation of cloud healthcare systems, the providers should offer superior services that meet customers' expectations. The quality models can be employed to present and evaluate the quality of the services or products provided by such providers, in which the cloud healthcare systems' stakeholders can establish concreted understanding. In this research work, a novel quality model is proposed to help the providers of cloud healthcare services and healthcare organizations provide and implement systems that meet stakeholders' expectations. The proposed quality model includes seven quality characteristics, namely, functionality, reliability, efficiency, usability, maintainability, portability, and marketability. After conducting a survey on 50 cloud healthcare system stakeholders, the Analytic Hierarchy Process has been applied to evaluating the

validity of the proposed model. The results of this research work arrange the quality characteristics of the proposed model according to its importance (weights) as follows: functionality, reliability, efficiency, usability, maintainability, marketability, and portability. © 2022 ISSN 2185-2766.

ABSTRACT: Chronic tobacco exposure can alter the endocannabinoid (eCB) system, consequently leading to an anxiety state. In this study, we investigated the effects of waterpipe tobacco smoke (WTS) on cannabinoid receptor 1 and 2 (CBR1 and CBR2) gene and protein expression in mesocorticolimbic brain regions. Using elevated plus maze (EPM) and open field (OF) tests, the effects of WTS exposure on withdrawal-induced anxiety-like behavior were examined. The effect of ceftriaxone (CEF), a β -lactam known to upregulate glutamate transporter 1 (GLT-1), on anxiety and the expression of cannabinoid receptors was also determined. Male Sprague-Dawley rats were randomly assigned to four groups: 1) the Control group was exposed only to standard room air; 2) the WTS group was exposed to tobacco smoke and treated with saline vehicle; 3) the WTS-CEF group was exposed to WTS and treated with ceftriaxone; and 4) the CEF group was exposed only to standard room air and treated with ceftriaxone. Rats were exposed to WTS (or room air) for two hours per day, five days per week for a period of four weeks. Behavioral tests (EPM and OF) were conducted weekly during acute withdrawal, 24 h following WTS exposure. Rats were given either saline or ceftriaxone (200 mg/kg i.p.) for five days during Week 4, 30 min prior to WTS exposure. Withdrawal-induced anxiety was induced by WTS exposure but was reduced by ceftriaxone treatment. WTS exposure decreased CBR1 mRNA and protein expression in the NAC and VTA, but not PFC, and ceftriaxone treatment attenuated these effects. WTS exposure did not change CBR2 mRNA expression in the NAC, VTA, or PFC. These findings demonstrate that WTS exposure dysregulated the endocannabinoid system and increased anxiety-like behavior, and these effects were reversed by ceftriaxone treatment, which suggest the involvement of glutamate transporter 1 in these effects. © 2022 Elsevier Inc.

ABSTRACT: Gold nanorods (AuNRs) were synthesized by the seed-mediated wet chemical method using a binary surfactant system. AuNRs were stabilized with polyethylene glycol, then functionalized with 4-mercaptophenol (4-MPH) ligand by surface ligand exchange. The surface-functionalized AuNRs (4-MPH-AuNRs) exhibited a typical UV-vis spectrum of AuNRs with a slightly shifted longitudinal peak. Furthermore, 4-MPH-AuNRs demonstrated a similar Fourier-Transformed Infrared spectrum to 4-MPH and a fading of the thiol band, which suggests a successful functionalization through thiol-gold binding. The antibacterial and antibiofilm activities of 4-MPH-AuNRs were evaluated against a clinical isolate of Methicillin-Resistant Staphylococcus aureus (MRSA). The results indicate that 4-MPH-AuNRs exhibit a bactericidal activity with a minimum inhibitory concentration (MIC) of $\sim 6.25 \mu\text{g/mL}$ against a planktonic suspension of MRSA. Furthermore, 4-MPH-AuNRs resulted in a 1.8–2.9 log-cycle reduction of MRSA biofilm viable count over a concentration range of $100\text{--}6.0 \mu\text{g/mL}$. The bacterial uptake of the surface-modified nanorods was investigated by inductively coupled plasma-optical emission spectroscopy (ICP-OES) and scanning electron microscopy (SEM) imaging; the results reveal that the nanorods were internalized into the bacterial cells after 6 h (h) of exposure. SEM imaging revealed a significant accumulation of the nanorods at the bacterial cell wall and a possible cellular internalization. Thus, 4-MPH-AuNRs can be considered a potential antibacterial agent, particularly

against MRSA strain biofilms. © 2022, The Author(s).

ABSTRACT: This study seeks to determine the impact of corporate governance dimensions (compliance with the corporate governance code, top management, control environment, transparency and disclosure, rights of shareholders and stakeholders) on the three main types of organizational commitment, (affective, continuance and normative). It also aims at examining the impact of organizational culture, as an intermediate variable, on the relationship between the two above mentioned variables. The sample of this study comprised 152 respondents working at five types of Jordanian companies. The results of the study have confirmed the positive effect of the three corporate governance dimensions (compliance with the corporate governance code, top management, and control environment) on three types of organizational commitment (affective, continuance, and normative). The results also confirmed that there is no significant effect of transparency and disclosure and the rights of shareholders and stakeholders on affective and normative commitment. Key terms: Corporate governance, top management, Board of directors, management committee, control environment, transparency, disclosure, shareholders, and stakeholders. © 2022.

ABSTRACT: Albumin-based hydrogels offer unique benefits such as biodegradability and high binding affinity to various biomolecules, which make them suitable candidates for biomedical applications. Here, we report a non-immunogenic photocurable human serum-based (HSA) hydrogel synthesized by methacryloylation of human serum albumin by methacrylic anhydride (MAA). We used matrix-assisted laser desorption ionization-time-of-flight mass spectrometry, liquid chromatography-tandem mass spectrometry, as well as size exclusion chromatography to evaluate the extent of modification, hydrolytic and enzymatic degradation of methacrylated albumin macromer and its cross-linked hydrogels. The impacts of methacryloylation and cross-linking on alteration of inflammatory response and toxicity were evaluated in vitro using brain-derived HMC3 macrophages and Ex-Ovo chick chorioallantoic membrane assay. Results revealed that the lysines in HSA were the primary targets reacting with MAA, though modification of cysteine, threonine, serine, and tyrosine, with MAA was also confirmed. Both methacrylated HSA and its derived hydrogels were nontoxic and did not induce inflammatory pathways, while significantly reducing macrophage adhesion to the hydrogels; one of the key steps in the process of foreign body reaction to biomaterials. Cytokine and growth factor analysis showed that albumin-based hydrogels demonstrated anti-inflammatory response modulating cellular events in HMC3 macrophages. Ex-Ovo results also confirmed the biocompatibility of HSA macromer and hydrogels along with slight angiogenesis-modulating effects. Photocurable albumin hydrogels may be used as a non-immunogenic platform for various biomedical applications including passivation coatings. © 2022 American Chemical Society. All rights reserved.

ABSTRACT: In this article, using the simplicial Bernstein form of polynomials on a simplex, we provide positivity certificates for the approximate solution of a linear elliptic PDE obtained by simplicial Bernstein Bubnov-Galerkin method. Particularly, we show how to obtain a simplicial Bernstein certificate of positivity for the approximate solution, although the discretized system does not satisfy a discrete weak maximum principle. © 2022 ACM.

ABSTRACT: Nonsteroidal anti-inflammatory drugs are the most commonly prescribed anti-inflammatory drugs worldwide. The most common side effects are gastrointestinal. Pantoprazole, a proton pump inhibitor (PPI), can be used to prevent these events from occurring. In this study, we attempt to develop and validate a novel method for determining and validating the fixed-dose combination of meloxicam and pantoprazole. A new method has been developed and validated to estimate pantoprazole and meloxicam in a fixed-dose combination using RP-HPLC. In order to separate the drugs, a mobile phase phosphate buffer/acetate was used (30:70, v/v), with a pH of 3.4 and a flow rate of 1.0 mL/min at 25 °C. The detection wavelength for the drugs was at a wavelength of 310 nm. The retention times for meloxicam and pantoprazole were 6 and 9 min, respectively. In concentrations ranging from 0.1 to 200 mg/L, the linearity of the detector was established. The r was 0.9998 for both drugs. Recovery rates ranged from 98 to 102% on average. According to the guidelines of the International Council on Harmonization, the results were satisfactory. Using the method presented herein, the pharmaceutical formulation of the combined meloxicam and pantoprazole can be routinely tested. © 2022 by the authors.

ABSTRACT: Psychological realism emphasizes characters' inner thoughts and motivation. This paper discusses the inner self in the Silent Patient, by Michaelides. The Woman in the Window, by AJ Finns, and the Girl on the Train by Paula Hawkins. This research will also examine the characters' inner selves and moral and ethical dilemmas. Identifying the features of psychological realism, such as characters' thoughts and motivations, minds and personalities, psyche and its relationship to a novel, and flashbacks of various types. These are psychological thrillers. These works compare the depression and abandonment. Inner conflicts, family issues, heartbreak, and tragedy as a common cause. Characters become murderers, cheaters, and depressed. These three works have many similarities. This paper concludes that the three books have different psychological elements. The conclusion of this paper shows psychological realism is seen in The Silent Patient, The Woman in the Window, and The Girl on the Train. Psychological realism is a writing style was shown in late 19th-and early 20th-century. Henry James' fiction expressed romantic desires and family relationships. It focuses on the character, say Manikandan et al (2021). A novelist focuses on characters' inner thoughts, motivations, and actions. © 2022, Association Res Militaris. All rights reserved.

ABSTRACT: In this paper, an extension for the tanh-function method is proposed by using an $(\alpha_1, \alpha_2, \dots, \alpha_n, \beta)$ - rational transformation method, n is an arbitrary integer. As applications and to illustrate the validity of this method, the (1+3)-dimensional conformable time and space fractional Burgers equation, and two other (1+3)-dimensional conformable fractional evolution examples, that are useful for academic purposes, are solved. More kink and generalized traveling wave solutions are obtained and some three-dimensional solution graphs are presented at the end of this paper. ABSTRACT: The Restoration and the eighteenth century brought great changes to the islands of Great Britain. It was a time that witnessed the Act of Union which joined Scotland and Wales to Britain in 1707. Britain achieved political stability and commercial prosperity. New standards of politeness and social behavior prevailed to distinguish between civilized and vulgar citizens. The standards of hierarchy and order helped people participate in and contribute to the emergence of the British Empire and culture. For the sake of expansion, Britain started to drive many of its population and soldiers to settle in its newly occupied territories to encourage the British hegemony in those colonies. For that reason, several English writers, critics, and poets approached the theme of political and social transformation in their literary works. Although Thomas Gray's poem "Elegy Written in a Country Churchyard" has been predominantly analyzed as a poem that mourns the death of marginalized poor people, this paper aims to put the poem in its socio-political context. Within a historical framework, this study argues that the poem does not only lament the death of England's underprivileged individuals but that it also contains a prophecy that started to be fulfilled decades later. © 2022 Librairie du Liban Publishers. ABSTRACT: Purpose: This study aims to examine the key intellectual and influential aspects of financial technology literature? and to evaluate the future research direction of financial technology literature? Design/methodology/approach: This paper adopts multiple software packages were employed, including Excel, VOSviewer and RStudio. VOSviewer is used to build networks of scientific articles, journals, researchers, organizations, countries, and terms. Findings: the analysis of the Bibliographical focusing on sources, depends on five clusters, the Sustainability (Switzerland), Financial Innovations, Investment Management, Europe journal of finance and Electronic Commerce Research and Applications the lead journals in the clusters. Originality: This paper contributes to the literature based on 4 classes of research streams in Fintech namely Fintech, blockchain, Artificial intelligence and Innovation which are represent the most future upcoming trends. © 2022, SRAC - Romanian Society for Quality. Attitudes to Organ Donation and Transplantation: An Insight From Jordan

(2022) Experimental and Clinical Transplantation, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133543706&doi=10.6002%2flect.2021.0419&partnerID=40&md5=32ddfde78ada1a9a279743c51435e06e>

ABSTRACT: Objectives: Organ donation rates in the Arabic-speaking world remain low; however, little is known about why. This study adapted an existing questionnaire into Arabic to improve understanding of perceived barriers to donation as a step toward increasing donation rates. **Materials and Methods:** We developed and validated an Arabic version of a published questionnaire, and we used this to collect data on knowledge and attitudes toward organ and tissue donation and trans-plantation, as well as reasons for the beliefs among adults in Jordan. The questionnaire was circulated through various Facebook groups. **Results:** The questionnaire was completed by 404 Jordanian adults. Factor analysis indicated that a 3-factor model was suitable for the present study. These factors were Organ Donation Attitude, Organ Transplantation Attitude, and Fear of Health Outcomes. Generally, knowledge of organ donation was good, although only some respondents were aware of the opt-out system. Attitudes toward donation were favorable, with very few respondents reporting that religious or cultural beliefs would prevent them from donating organs. One surprising finding was that one-third of respondents expressed some degree of distrust of health services. **Conclusions:** Efforts to improve organ donation in the Arab world remain in development. We found a substantial awareness of organ donation and largely favorable views of it among selected adults in Jordan. This indicates a need to shift focus away from education and perceived religious and cultural barriers and refocus instead on the concerns regarding distrust of health services by the general population. © Başkent University 2022 Printed in Turkey. ABSTRACT: Although vaccination has been adopted by the WHO to limit worldwide transmission of COVID-19, people's worries about COVID-19 vaccines may suppress their desire for vaccination despite vaccine availability. This study aimed to investigate anxiety and stress symptoms among 250

Jordanians (mean age = 43.18 ± 6.34 years, 72% females) who received their first vaccine dose. The respondents completed the anxiety and stress subscales of the Depression Anxiety and Stress scale 21 (DASS-21) before and after vaccination. The respondents expressed more moderate-severe levels of stress before than after vaccination (20.8% and 13.2%, respectively). Meanwhile, 37.2% and 45.2% of the respondents expressed moderate-severe anxiety before and after vaccination, respectively.

Wilcoxon signed-rank test revealed that the drop in the level of stress from before-(median (IQR) = 5 (1-8)) to after vaccination (median (IQR) = 3 (1-7)) was statistically significant ($z = -3.81$, $p = 0.001$, $r = 0.17$) while the increase in anxiety was not. Anxiety significantly dropped postvaccination among individuals experiencing mild to severe anxiety before vaccination. Similarly, stress and anxiety significantly increased among individuals expressing normal anxiety before vaccination ($z = -3.57$ and -8.24 , p values = 0.001 , $r = 0.16$ and 0.37 , respectively). Age positively correlated with postvaccination anxiety among respondents with mild prevaccination anxiety, and it negatively correlated with the prevaccination level of stress in the normal-anxiety group. Gender, marital status, respondents' level of education, and history of COVID-19 infection had no significant correlation with anxiety or stress at either point of measurement. Overcoming their hesitancy to receive COVID-19 vaccines, individuals with normal levels of anxiety experienced a rise in their distress symptoms following immunization. On the contrary, vaccination seemed to desensitize anxious individuals. Policymakers need to formulate a population-specific plan to increase vaccine preparedness and promote psychological well-being over all during the pandemic. © 2022 by the authors. ABSTRACT: Paracetamol and nonsteroidal anti-inflammatory drugs are widely used in the management of respiratory viral infections. This study aimed to determine the effects of the most commonly used analgesics (paracetamol, ibuprofen, and diclofenac) on the mRNA expression of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) entry and arachidonic-acid-metabolizing genes in mouse lungs. A total of twenty eight Balb/c mice were divided into four groups and treated separately with vehicle, paracetamol, ibuprofen, and diclofenac in clinically equivalent doses for 14 days. Then, the expressions of SARS-CoV-2 entry, ACE2, TMPRSS2, and Cts1 genes, in addition to the arachidonic-acid-metabolizing cyp450, cox, and alox genes, were analyzed using real-time PCR. Paracetamol increased the expressions of TMPRSS2 and Cts1 genes by 8.5 and 5.6 folds, respectively, while ibuprofen and diclofenac significantly decreased the expression of the ACE2 gene by more than 2.5 folds. In addition, all tested drugs downregulated ($p < 0.05$) cox2 gene expression, and paracetamol reduced the mRNA levels of cyp4a12 and 2j5. These molecular alterations in diclofenac and ibuprofen were associated with pathohistological alterations, where both analgesics induced the infiltration of inflammatory cells and airway wall thickening. It is concluded that analgesics such as paracetamol, ibuprofen, and diclofenac alter the expression of SARS-CoV-2 entry and arachidonicacid-metabolizing genes in mouse lungs. © 2022 by the authors. ABSTRACT: Background: Due to a lack of proper pharmaceutical care, Syrian refugees in the Zaatari refugee camp are more likely to have drug-related issues, such as prescription errors and adverse drug occurrences. Aim: The current study aims to identify drug-therapy problems among Syrian refugees in the Zaatari refugee camp. Method: This is a retrospective cross-sectional study. Patients' files were collected from the Zaatari camp database. Patients who were 18 years or older and were previously diagnosed with a chronic disease were included. A classification of drug therapy problems (DTPs) was adapted. Results: The data of 1530 adult patients (896 females) were collected. The mean age of the sample was 53.7 years and the mean Body mass Index (BMI) was 27.20. The mean of all taken medications was 4.01 (± 2.33) medications, with a maximum number of 13. A total of 3572 DTPs was identified, with a mean of 2.33 (± 1.26) DTPs per patient. Based on the above-mentioned classification, 70.32% of the DTPs were related to indication, 26.65% were related to effectiveness, and 3.03% were related to safety. Conclusion: This study found that refugees in the Zaatari refugee camp have numerous DTPs among their medications. Greater focus should be placed on their medical care, in order to prevent any future complications due to DTPs. © 2022 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: The ideal drug delivery system has a bioavailability comparable to parenteral dosage forms but is as convenient and easy to use for the patient as oral solid dosage forms. In recent years, there has been increased interest in transdermal drug delivery (TDD) as a non-invasive delivery approach that is generally regarded as being easy to administer to more vulnerable age groups, such as paediatric and geriatric patients, while avoiding certain bioavailability concerns that arise from oral drug delivery due to poor absorbability and metabolism concerns. However, despite its many merits, TDD remains restricted to a select few drugs. The physiology of the skin poses a barrier against the feasible delivery of many drugs, limiting its applicability to only those drugs that possess physicochemical properties allowing them to be successfully delivered transdermally. Several techniques have been developed to enhance the transdermal permeability of drugs. Both chemical (e.g., thermal and mechanical) and passive (vesicle, nanoparticle, nanoemulsion, solid dispersion, and nanocrystal) techniques have been investigated to enhance the permeability of drug substances across the skin. Furthermore, hybrid approaches combining chemical penetration enhancement technologies with physical technologies are being intensively researched to improve the skin permeation of drug substances. This review aims to summarize recent trends in TDD approaches and discuss the merits and drawbacks of the various chemical, physical, and hybrid approaches currently being investigated for improving drug permeability across the skin. © 2022 by the author Licensee MDPI, Basel, Switzerland.

ABSTRACT: The objective of this study is to determine the antimutagenic effect of honey and its correlation with the concentration of the total polyphenolic content. Seven honey samples were collected from different regions of Algeria. The total polyphenolic content was determined by Folin-Ciocalteu colorimetric assay. The antimutagenic effect was carried out by the AMES Salmonella/microsome mutagenicity assay against three known mutagenic substances (4-nitro-o-phenylenediamine, sodium azide, and mitomycin C), using *Salmonella typhimurium* TA98, TA100, and TA102 strains. The results obtained revealed that Algerian honey contains high polyphenol content, which varied significantly between 38.04 and 286.28 µg of GAE/100 mg of honey. This variation is due to their different botanical and regional origins. In addition, all tested honey exhibited an antimutagenic effect against mutagenic substances; honey is effective to inhibit between 29.18±11.11 % and 73.14±11.14 % of mutagenic activity of chemical substances. There is a strong positive correlation between the total polyphenolic content and the antimutagenic proprieties of honey against the mutagenic substances. The results obtained suggest that honey is effective as an antimutagenic agent; it can play an important role in the protection of the mutagenic effect of DNA caused by chemical substances. © 2022. *Journal of Microbiology, Biotechnology and Food Sciences*. ABSTRACT: Background: The latest revolution in pharmaceutical industries has led to an enormous production of medications, and therefore massive prescriptions. Sadly, the innocence of the correct disposal methods correlates with the hazardous accumulation of unused and even expired medicines. This is a worldwide issue and needs to be monitored. The current study aims to assess patients and customers' knowledge, attitude, and awareness of the correct storage conditions of the prescribed medications, in addition to their disposal methods. Methods: Online Google forms were randomly distributed among 450 participants. The achieved response rate was 97%. The questionnaire was titled "Regarding the Factors Influencing Consumers' Knowledge about Unused and Expired Medications". Results and conclusion: The output of this study highlights the risk of mishandling expired and unused medications due to people's knowledge backwardness. The obtained data confirmed the effect of reference groups on patient behavior regarding storage conditions, the disposal of medicines, and the environmental and health hazards related to medications abuse. In essence, establishing a disposal program for unused and expired medicines under the supervision of trained pharmacists is necessary to increase social awareness, therefore alleviating misuse hazards. © 2022. ABSTRACT: Traffic congestion and road intersection management have become a significant issue, mainly with the highly increasing number of vehicles in cities. There is a common belief from vehicle drivers that installing traffic lights with some consideration of traffic flows will be dominant in traffic movements. This article proposes a novel system for Urban Traffic Control (UTC) with a continuous dynamic environment adaptation to improve traffic flow on large cities' network roads. The proposed system introduces vehicle counting method, lane evaluation of the current status and controlling method considering the effect on the whole traffic network—not just the intersection itself—to provide an efficient traffic scheduling. The main objective of the authors' system is to reduce traffic jam, by reducing waiting time and trip time for vehicles at intersections. Some indicators and models are introduced in this work to assign traffic flow schedules with minimum traffic congestion and vehicle waiting time. These indicators and models include a traffic jam indicator, vehicle priority and lane weight. A multi-agent urban traffic control system is proposed as the simulation environment using NetLogo simulator. (A total of 150) Vehicles are generated with random behaviour distributed over 25 intersections for 9 h duration to compare the normal fixed cycle traffic light and the authors' smart traffic control. Results show a reduction in the total average waiting time of all vehicles for the simulation period by more than (29.98%). Hence, it is more suitable for the complexity of the current traffic condition with minimum changing infrastructure. © 2022 The Authors. Assessment of high-temperature damaged concrete using non-destructive tests and artificial neural network modelling

(2022) Case Studies in Construction Materials, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85129461810&doi=10.1016%2fj.cscm.2022.e01080&partnerID=40&md5=1cfbf2fbbf207930805d335f49536921

AFFILIATIONS: Civil Engineering Department, Faculty of Engineering, Al Albayt University, Mafraq, Jordan;

Department of Civil and Infrastructure Engineering, Faculty of Engineering and Technology, Al Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: Evaluation of high-temperature damaged concrete is crucial to ensure the safety of any structure after a fire event. However, using destructive tests, such as taking cores from the concrete, can be costly and dangerous; specifically for damaged structures. Therefore, it is preferred to use in-situ non-destructive testing (NDT) in the assessment of damaged concrete. The objective of this study is to develop an artificial neural network model, based on destructive and non-destructive testing results, to assess the concrete strength after being subjected to high-temperature levels; without the need for further in-situ destructive testing. The effect of high-temperature levels (200–800 °C) on concrete compressive strength was investigated in this study using

destructive compression and non-destructive tests on concrete cubes; including ultrasonic pulse velocity and Schmidt rebound hammer testing methods. The results of destructive and non-destructive tests of damaged and undamaged concrete were found to be highly correlated. Therefore, the data of this study and data obtained from the cited literature were augmented together and used to optimise and train the artificial neural network model. The artificial neural network analysis indicated that concrete compressive strength (CS), the magnitude of high-temperature damage, and the level of exposure temperature can be predicted with reasonable accuracy using only a combination of non-destructive tests results. The model had a coefficient of determination equals to 0.944. © 2022 The Authors

ABSTRACT: People worldwide suffer from fake news in many life aspects, healthcare, transportation, education, economics, and many others. Therefore, many researchers have considered seeking techniques for automatically detecting fake news in the last decade. The most popular news agencies use e-publishing on their websites; even websites can publish any news they want. However, thus before quotation any news from a website, there should be a close look at news resource ranking by using a trusted websites classifier, such as the website world rank, which reflects the reputé of these websites. This paper uses the world rank of news websites as the main factor of news accuracy by using two widespread and trusted websites ranking. Moreover, a secondary factor is proposed to compute the news accuracy similarity by comparing the current news with fakes news and getting the possible news accuracy. Experiments results are conducted on several benchmark datasets. The results showed that the proposed method got promising results compared to other comparative methods in defining the news accuracy. © 2022, The Author(s), under exclusive licence to Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: This study aims to investigate the effect of digital marketing, social media marketing and electronic word-of-mouth EWOM, on the purchase intention with moderating effect of brand equity. A quantitative research approach was used to achieve the research objectives. The data was collected from a sample consisting of 254 online shoppers of IKEA Jordan. By using a random sampling technique, the data was collected through an electronic questionnaire. Statistical analyses were conducted such as data normality and scale reliability by using IBM SPSS 21 software, followed by measurement model and hypothesis testing by using Smart PLS3 software. The results assessed the validity of the measurement model, structural model as well moderation analysis that was conducted based on the study objectives. The findings confirmed the assumptions which stated the digital marketing had a positive significant effect on purchase intention, and the moderating effect of brand equity revealed a significant effect. The study has contributed to the existing literature by providing future research suggestions and directions linked to this topic in the context of Jordan social media marketing and shopping. © 2022, Growing Science. ABSTRACT: The purpose of the current paper is to identify influential aspects of published literature and future research questions to set forth future research agenda based on comprehensive literature review using bibliometric and content analysis. The study analyzed 1225 documents from the international Scopus database using bibliometric analysis and content analysis. VOSviewer software is used for bibliometric analysis. The analysis revealed that most of the information was derived from the Finance Research Letters. Moreover, the United Kingdom is the most cited country, while Tianjin University in China has the highest publications affiliations. Furthermore, the analysis shows that the keyword analysis of cryptocurrency literature had four classes of research streams in cryptocurrency, namely, cryptocurrency, Blockchain, Fintech, and currency, representing the most upcoming trends. The present study makes a significant contribution to the literature by providing a framework for future research. The framework provides opportunities to future researchers to explore the web of relations among some identified research streams as future research agenda. © 2022, Growing Science. ABSTRACT: Background: The literature demonstrated a positive impact of medication therapy management (MTM) services provided by the pharmacists to improve the overall health outcomes. Nevertheless, limited data is available with regard to MTM service implementation by community pharmacists and its associated factors in Jordan. Objective: To evaluate community pharmacists' knowledge, attitude and practice of MTM service and to explore the challenges and barriers for its implementation. Methods: The present cross-sectional study utilized a validated online survey which was filled by community pharmacists in different areas across Jordan. In addition to the socio-demographic variables, the study questionnaire evaluated pharmacists' knowledge and attitudes towards MTM service, extent of MTM implementation and its associated challenges and barriers. Results: A total of 250 pharmacists completed the survey. The study pharmacists showed moderate knowledge level (median of the total knowledge score = 6 (4-7) out of 10) and positive attitude (median of the attitude score was 23 (19-26) out of 30) towards MTM services. The participating pharmacists recognized performing or obtaining necessary assessments of patient's health status as the most frequently provided MTM service (84.8%), while the least one was documenting the care delivered and communicating essential information to other healthcare providers (62%). Furthermore, collecting patient-related information was the most commonly recognized challenge to MTM service provision (36.8%), followed by referring the patient to a physician or consultant (36%) and collaboration with them (35.6%). The most reported barrier was negative physician attitudes (40.4%), followed by the lack of training on MTM provision (38.4%), and lack of adequate support staff (37.2%). Conclusion: Efforts are needed to enhance collaboration between pharmacists and other health care professional, to develop documentation systems that would preserve and facilitate access to patient information, and to implement appropriate training programs which aim to overcome the challenges and barriers for MTM implementation. © 2022 The Author(s)

ABSTRACT: Punching shear behavior is experimentally investigated through testing a total of thirteen reinforced concrete flat slabs. Four different types of punching shear reinforcement configurations are examined, namely, ordinary closed rectangular stirrups (ST group), rectangular spiral stirrups (RSP group), advanced rectangular spiral stirrups (ARSP group), and circular spiral stirrups (SP group). Each configuration included three different spacings of 100, 150 and 200 mm. In addition, a reference slab specimen is cast without any punching shear reinforcement. The test results indicated that the circular spiral reinforcement scheme has the highest enhancement with regard to the punching shear capacity compared to the other reinforcement schemes. The percentage of enhancement of the SP group compared to the reference specimen ranges between 23% and 30%. For the other three different

rectangular schemes, the enhancement of the punching shear strength for the RSP group and the ARSP group is in the range of 15–23% and 16–25%, respectively. Finally, the punching shear capacity of the ST group increased by 9–13% compared to the reference specimen. The shear carrying capacity of the specimens is also calculated using the ACI 318-19 code and Eurocode 2 equations. The results showed that both codes are capable of predicting the shear carrying capacity for all the schemes. Also, although both codes are conservative, the Eurocode 2 gives a better estimate of the shear carrying capacity than the ACI 318-19 code. © 2022 The Authors

ABSTRACT: Objectives: Increased cholesterol levels were found to be associated with diabetes mellitus type II (DM2). The cholesterol is metabolized by cytochrome 7A1 (CYP7A1) and transported in the intestine by ATP-binding cassette G8 (ABCG8). Genetic variants in CYP7A1 and ABCG8 genes can affect the cholesterol levels. The aim of this study is to compare the frequency of CYP7A1 rs3808607 and ABCG8 rs11887534 and rs4148217 genotypes between healthy and DM2 subjects from Jordanian population. Methods: A total of 117 DM2 patients and 100 healthy controls, of Jordanian Arabic origin, were genotyped for CYP7A1 rs3808607 and ABCG8 rs11887534 and rs4148217 genetic variants using polymerase chain reaction (PCR) followed by restriction fragment length polymorphism technique. Results: The study showed that homozygosity of rs3808607 (A-204C) genotype in CYP7A1 was significantly higher in DM2 patients (ANOVA, $p < 0.05$) with an odd ratio of 2.66, but rs11887534 (G55C) and rs4148217 (C1199A) genetic polymorphisms in ABCG8 were found in comparable frequencies in both healthy and DM2 subjects. Conclusions: The results of this study indicate that CYP7A1 rs3808607 genetic polymorphism is associated with DM2. Further clinical studies are required to confirm this finding among DM2 patients of Jordanian origin. © 2021 Walter de Gruyter GmbH, Berlin/Boston.

ABSTRACT: Nowadays, the economy of countries highly depends on the agriculture productivity which has a great effect on the development of human civilization. Sometimes, plant diseases cause a major reduction in agricultural products. This paper proposes a new approach for the automatic detection and classification of plant leaf diseases based on using the ELM deep learning algorithm on a real dataset of plant leaf images. The proposed approach uses the k-means clustering algorithm for image

segmentation and applies the GLCM for feature extraction. The BDA optimization algorithm is employed for feature selection, and lastly the ELM algorithm is used for plant leaf diseases classification. The presented approach optimizes the input weights and hidden biases for ELM. The dataset used in this study includes 73 plant leaf images, such that we tested our approach on four diseases that usually affect plants, including: *Alternaria alternata*, Anthracnose, Bacterial blight, and *Cercospora* leaf spot. The experimental results show that the proposed approach has achieved encouraging results in terms of these classification measures: accuracy, error rate, recall, F score, and AUC which are 94%, 6%, 92%, 95%, and 96% respectively. ABSTRACT: The integration of certain cultural elements into the design of user interface (UI) can help promote specific user behaviors. Tailoring the design of UI to meet users' design needs can help increase the usability of a system. This study explored the potential of integrating Hofstede's dimensions of Arabic culture into the design of mobile UI. We used a think-aloud method and Hofstede's cultural dimensions to propose the relevant design guidelines for designing mobile health interfaces. We invited 78 participants to participate in this study. The usability of the design was tested among male and female users. The results showed significant differences in male and female users' satisfaction with the design of UI. The findings from this study can guide the development of mobile health applications that can cater to the needs/preferences of a group-specific culture. © 2021, The Author(s), under exclusive licence to Springer Nature Switzerland AG.

ABSTRACT: The coronavirus disease-2019 (COVID-19) pandemic is a public health emergency of international concern. This pandemic poses a challenge to research and scientific community. In this study, we developed and tested content reliability and content validity of a questionnaire designed for evaluating the readiness and willingness of researchers to participate in virology research in Jordan. The survey was hosted on an online platform, and the link was emailed. A total of 332 participants from universities across Jordan completed the survey. For factor analysis, Kaiser-Meyer-Olkin value (KMO) and Bartlett's Test of Sphericity were conducted. Furthermore, exploratory factor analysis (EFA) with parallel analysis and scree plots were conducted to evaluate the most suitable model for the data. The result of the EFA suggested a 5-factor model would fit the survey. Data showed that the lowest means were for researchers' readiness to conduct virology research and readiness for virology research with means of 2.07 and 2.95, respectively. Moreover, years of experience and speciality had a significant effect on the readiness and willingness of virology research in Jordan. In conclusion, readiness for research and researchers should be addressed and authorities should pay attention to these shortcomings in virology research. © 2022 The Author(s). ABSTRACT: Cancer is one of the leading causes of death worldwide, and it has a major impact on public health. Phosphatidylinositol 3-kinase (PI3K α) has been recognized as a promising drug target for developing anticancer agents. Herein, a series of N-phenyl-6-fluoro-4-hydroxy-2-quinolone-3-carboxamides was developed to target PI3K α . All synthesized compounds were characterized using FT-IR, NMR (1H and 13C) and elemental analysis. All synthesized chemical analogues exerted distinctive anticancer activity. They inhibited the growth of human epithelial colorectal adenocarcinoma (Caco-2) with IC₅₀ values between 48.63–378 μ M, and human colon cancer (HCT-116) cell lines with IC₅₀ values between 44–664 μ M. Computational modelling studies provided important biological insight. Induced-fit docking (IFD) studies showed that the synthesized chemical analogues fit the kinase catalytic domains and form a significant H-bond interaction network with key amino acids at the binding site. Furthermore, cheminformatics analyses indicated that all synthesized compounds were drug-like permitting further animal testing or clinical development. © 2022 Wiley-VCH GmbH.

ABSTRACT: The construction industry in the Middle East and North Africa (MENA) faces many challenges throughout the project's lifecycle; on top of these challenges is poor communication which occasionally results in project failure or at least time and cost overruns. A range of steps and methods must be taken to minimize the causes and effects of poor communication to enhance communication. The main aim of the study is to exploring poor communication in MENA construction industry and defining the causes and effects of poor communication from the perspective of consultants, clients, and contractors in small and medium enterprises in a developed region like MENA. Construction professionals from different project parties were asked to complete a questionnaire listing 32 causes and 21 effects of poor communication identified from the literature. The model was validated by Structural Equation Modelling SEM in terms of convergent and discriminant validities. The results revealed, that out of 54 cause and effect factors of poor communication, only 18 factors were retained. These causes and effects were ranked using the relative importance index RII. Results showed that all causes and effects are highly important, with RII above 0.6. The most important causes of poor communication are lack of communication procedure and training, followed by lack of adequate representation for project stakeholders. However, the least important cause of poor communication is a lack of understanding among the construction parties. Conversely, the most acute effects of poor communication are misinterpretation, followed by conflict among construction parties. However, the least important effect of poor communication is a late response to the disaster. Results and recommendations derived from this study represent the vital need of the MENA construction industry to focus on enhancing the current status of communication. The commitment of all project stakeholders to the drawn recommendations regarding the causes of poor communication will undoubtedly limit or reduce the effects of poor communication. Construction firms looking to improve their performance may benefit from the developed model. © 2022 The Author(s). Published by Vilnius Gediminas Technical University.

ABSTRACT: Objectives: In this work, 9 lipophilic-acid chelating FQs (fluoroquinolones) comprising chelating groups have been prepared, characterized and screened for in vitro cytotoxicity, radical

scavenging and antiinflammation propensities. Methods: Using sulforhodamine B colorimetric bioassay vs. cisplatin; FQs-inflicted reductions' of viability against breast T47D and MCF7, Pancreatic PANC-1, colorectal HT29, HCT116, SW620, CACO2, SW480 and Leukaemia K562 cancer cell lines were examined in quadruplicates/dose/cell line. Parameters including potency, toxicity, and selectivity (potency/toxicity) have been reported along with DPPH and NO-radicals' scavenging capacities -as their molecular action mechanism-in comparison to ascorbic acid and indomethacin respectively. Using Griess assay in Lipopolysaccharide (LPS) prompted RAW264.7 macrophages; mitigation of inflammation was investigated. Results: nitroFQ 3b, unlike the rest of FQs in PANC1 and MCF7 cells, exhibited remarkably superior NO-radical scavenging/ antiinflammation capacity to indomethacin with respective antiproliferative IC50 values ($50\mu\text{M}$) 49 vs. cisplatin's 122 and 6 vs. cisplatin's 28 ($p<0.01-0.001$; $n=4$). Reduced FQ 4b of significantly dual DPPH-NO scavenging propensities exerted exceptionally substantial micromolar antiproliferation in colorectal cancer cells with respective antiproliferative IC50 values ($50\mu\text{M}$) of HCT116 0.84\pm HT29 1.6\pmPANC1 5.7\pmSW620 9.2 vs. cisplatin's, ($p<0.01-0.001$; $n=4$). FQ 5a of superb NO radical reduction effect had antiproliferative IC50 value ($50\mu\text{M}$) of 37.6 in PANC1 cells. In breast cancer T47D the ascending order of pronounced nano-micromolar antiproliferative IC50 values ($50\mu\text{M}$) was 4d\pm3d\pm4a\pm4b\pm3b (0.009\pm0.59\pm10\pm15\pm41 vs. cisplatin's, $p<0.01-0.001$; $n=4$). Both 4d and 4b displayed both DPPHNO radicals reduction -related cytotoxicities. NO radical scavengers 3d and 3b as well as DPPH radical scavenger 4a exerted highly appreciably relevant antineoplastic affinities. Conclusion: Acidic groups and C8-C7 ethylene diamine Chelation Bridge along with bulky dual halogenations can be substantially associated with molecular action mechanisms of FQs cytotoxicities, antioxidative and antiinflammation effects, collectively. © This work is licensed under a Creative Commons Attribution-Non Commercial 4.0 International License.

ABSTRACT: The focus of coronavirus disease 2019 (COVID-19) vaccination campaigns has been the adult population, particularly the elderly and those with chronic diseases. However, COVID-19 can also affect children and adolescents. Furthermore, targeting this population can accelerate the attainment of herd immunity. The aim of the current study was to evaluate parental intentions to vaccinate their children and the variables associated with them. An online questionnaire was circulated via generic Iraqi Facebook groups to explore parental intentions regarding the vaccination of their children. Multinomial regression analysis was conducted to evaluate variables associated with parental vaccination acceptance. A total of 491 participants completed the study questionnaire. Only 38.3% of the participants were willing to vaccinate their children against COVID-19, while the rest either refused to vaccinate their children (35.6%) or were unsure whether they would (26.1%). Participants' perceptions about the effectiveness (OR = 0.726, 95% CI = 0.541-0.975, $p = 0.033$) and safety (OR = 0.435, 95% CI = 0.330-0.574, $p < 0.0001$) of COVID-19 vaccines were significantly associated with parental acceptance of having children vaccinated. Participants who had received or who were planning to receive the COVID-19 vaccine were significantly less likely to reject vaccinating their children (OR = 0.156, 95% CI = 0.063-0.387, $p < 0.0001$). There is high refusal/hesitancy among Iraqi parents to vaccinate their children, which is associated with concerns related to the safety and efficacy of COVID-19 vaccines. More efforts, including educational and awareness campaigns to promote the safety and efficacy of COVID-19 vaccines, should be made to increase parental acceptance of childhood COVID-19 vaccinations in Iraq. © 2022 by the authors. ABSTRACT: This study is the second part of the theoretical study of "Modeling and Simulation of a Two-Stage Air-Cooled Adsorption Chiller with Heat Recovery", which is based on developing a theoretical model for a two-stage adsorption chiller with an activated carbon/methanol pair. The following models were conducted numerically using MATLAB. The model was based on 10th order differential equations; six of them were used to predict bed, evaporator and condenser temperatures, while the other four equations were used to calculate adsorption isotherm and adsorption kinetics. In this second part, bed heat exchangers and evaporator and condenser heat exchangers are studied by varying the parametric design of a chiller. This includes but is not limited to activated carbon mass inside a single bed, overall heat transfer coefficient for the bed and evaporator and the mass flow rates of all components comprising the chiller. The optimum values increased the COP from 0.35 to 0.4, while the cooling capacity was slightly changed. The COP is 95% of a Carnot cycle working at hot water temperatures as low as 60°C, and 90% at hot water temperatures as high as 90°C. It was found that the simulation model results for the two-stage air-cooled chiller agreed well with the experimental data in terms of cooling capacity (6.7 kW for the model against 6.14 kW for the experimental result at 30°C cooling water temperature). The model optimized the adsorption/desorption time, switching time and heat recovery time to maximize both cooling capacity and COP. Moreover, the model is used to study the effect of activated carbon mass, size of beds and mass flow rates of cooling, heating, chiller and condenser on both cooling capacity and COP. © 2022 by the authors. ABSTRACT: Background: The use of health-related applications (apps) on smartphones has become widespread. This is especially of value during the ongoing SAR-COV-2 pandemic, where accessibility to health care services has been greatly limited. Patients with free access to apps can obtain information to improve their understanding and management of health issues. Currently, there are cancer-related apps available on iPhones and androids. However, there are no guidelines to control these apps and ensure their quality. Furthermore, these apps may significantly modify the patients' perception and knowledge about drug-related health services. Objectives: The aim of this study was to assess the convenience, quality, safety and efficacy of apps for cancer patient care. Methods: The study was conducted by searching all apps related to cancer care on both Google Play Store and Apple iTunes Store. A detailed assessment was then performed using the mobile application rating scale (MARS) and risk assessment tools. Results: The results indicated that on a scale from 1-5, 47% of the apps were rated ≥ 4 . The MARS assessment of the apps yielded an overall quality rating of 3.38 ± 0.9 (mean \pm SD). The visual appeal of the app was found to have a significant effect on app functionality and user engagement. The potential benefits of these apps come with challenges and limitations. Patents related to smartphone applications targeting patients were also discussed. Conclusion: We recommend a greater emphasis toward producing evidence-based apps. These apps should be rigorously tested, evaluated and updated by experts, particularly clinical pharmacists. Also, these apps may alter patient attitudes toward services provided by physicians and pharmacists. Finally, these apps should not replace in-person interactive health services. © 2022 Bentham Science Publishers.

ABSTRACT: Quality is a critical aspect of any software system. Indeed, it is a key factor for the competitiveness, longevity, and effectiveness of software products. Code review facilitates the discovery of programming errors and defects, and using programming language standards is such a technique. In this study, we developed a code review technique for achieving maximum software quality by using programming language standards. A Java Code Quality Reviewer tool (JCQR) was proposed as a practical technique. It is an automated Java code reviewer that uses SUN and other customized Java standards. The JCQR tool produces new quality-measurement information that indicates applied, satisfied, and violated rules in a piece of code. It also suggests whether code quality should be improved. Accordingly, it can aid junior developers and students in establishing a successful programming attitude. JCQR uses customized SUN-based Java programming language standards. Therefore, it fails to cover certain features of Java. © 2022, Zarka Private University. All rights reserved.

ABSTRACT: Lung cancer is one of the most common causes of cancer-related deaths worldwide. Monoamine Oxidase-A (MAO-A) enzyme mediates the production of reactive oxygen species (ROS) that trigger DNA damage and oxidative injury of cells resulting in tumor initiation and progression. Available MAO-A inhibitors are used as antidepressants, however, their role as anticancer agents is still under investigation. Ligand- and structure-based drug design approaches guided the discovery and development of novel MAO-A inhibitors. A series of 1H indole-2-carboxamide derivatives was prepared and characterized using 1H-NMR, 13C-NMR, and IR. The antiproliferative effects of MAO-A inhibitors were evaluated using the cell viability assay (MTT), and MAO-A activity was evaluated using MAO-A activity assay. The presumed inhibitors significantly inhibited the growth of lung cell lines in a dose- and time dependent manner. The half maximal inhibitory concentration (IC50) values of MAO-A inhibitors (S1, S2, S4, S7, and S10) were 33.37, 146.1, 208.99, 307.7, and 147.2 µM, respectively, in A549. Glide docking against MAO-A showed that the derivatives accommodate MAO-A binding cleft and engage with key binding residues. MAO-A inhibitors provide significant and consistent evidence on MAO-A activity in lung cancer and present a potential target for the development of new chemotherapeutic agents. © 2022 by the author. ABSTRACT: Benzofuran is a heterocyclic compound found naturally in plants and it can also be obtained through synthetic reactions. Multiple physicochemical characteristics and versatile features distinguish benzofuran, and its chemical structure is composed of fused benzene and furan rings.

Benzofuran derivatives are essential compounds that hold vital biological activities to design novel therapies with enhanced efficacy compared to conventional treatments. Therefore, medicinal chemists used its core to synthesize new derivatives that can be applied to a variety of disorders. Benzofuran exhibited potential effectiveness in chronic diseases such as hypertension, neurodegenerative and oxidative conditions, and dyslipidemia. In acute infections, benzofuran revealed anti-infective properties against microorganisms like viruses, bacteria, and parasites. In recent years, the complex nature and the number of acquired or resistant cancer cases have been largely increasing. Benzofuran derivatives revealed potential anticancer activity with lower incidence or severity of adverse events normally encountered during chemotherapeutic treatments. This review discusses the structure-activity relationship (SAR) of several benzofuran derivatives in order to elucidate the possible substitution alternatives and structural requirements for a highly potent and selective anticancer activity. © 2022 by the authors. ABSTRACT: This study aimed to develop thermosensitive in-situ microgels loaded with the antimicrobial agent metronidazole (MTN) and the nonsteroidal anti-inflammatory drug ibuprofen (IBU) as adjunctive therapy for periodontitis. The MTN-IBU microgels were prepared by combining IBU-Microemulsions with MTN solution prepared with Pluronic® F127 (F127) hydrogel. The effect of various cosolvents and Pluronic F68 (F68) on the thermo-rheological properties (sol-gel transition temperature ($T_{sol \rightarrow gel}$), viscosity, and viscoelastic properties) of MTN-IBU microgels was studied. The physicochemical properties of microgels were characterized by Fourier transform infrared (FTIR) and differential scanning calorimetry (DSC). The in vitro release and stability studies of microgels were investigated. An HPLC method was developed for the simultaneous quantification of MTN and IBU. Results showed that microgels were thermosensitive exhibiting $T_{sol \rightarrow gel}$ of 25-37 °C, pseudoplastic flow, and viscoelastic properties. The thermo-rheological properties of microgels were dependent on the concentration of F127, IBU-Microemulsion, cosolvents, and F68. Stability studies demonstrated that the thermo-rheological properties of microgels decreased after six months, except microgels containing F68 that were able to maintain their strength and undergo the phase transition. Microgels provided a complete MTN release after 8 h and a sustained IBU release for 24-48 h. This study highlighted the significance of in-situ microgels for delivering a combined therapy of MTN and IBU using two drug delivery systems (IBU-microemulsion and F127 sol) and the ability to modulate the thermo-rheological properties of microgels via the addition of various cosolvents and F68 to F127-based microgels as potential platforms for periodontitis. © 2022

ABSTRACT: Context: *Ajuga orientalis* L. (Lamiaceae) is an aromatic herb used in traditional medicine in Jordan and neighboring countries. Aims: To evaluate the cytotoxic potential of ethanolic and aqueous extracts from the aerial parts of *A. orientalis* against three cell lines MCF-7, Caco-2, and HDFa. In addition to assessing the total phenolic and flavonoid contents, antioxidant activity. Further to analyze the phytochemical constituents. Methods: The phytochemical analysis was performed using gas chromatography/mass spectrometry. The total phenolic (TPC) and flavonoid (TFC) contents were assessed using colorimetric methods. The antioxidant properties of both extracts were assessed using 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity and reducing power ability. Cytotoxicity was investigated using methyl thiazol tetrazolium (MTT) assay. Results: The most abundant compounds in the extract were 9-octadecenoic acid, methyl ester, (E)- (27.2%), hexadecanoic acid, methyl ester (12.8%), and methyl stearate (9.6%). The ethanolic extract demonstrated higher TPC

and TFC than the aqueous extract. Also, the ethanolic extract showed higher antioxidant activity than aqueous extract using DPPH and the reducing power ability. Furthermore, the aqueous extract of *A. orientalis* has a potent cytotoxic effect against the Caco-2 cell line ($IC_{50} = 2.059 \pm 0.10 \mu\text{g/mL}$). In contrast, the ethanolic extract demonstrated a cytotoxic effect against the MCF-7 cell line ($IC_{50} = 59.32 \pm 0.04 \mu\text{g/mL}$). Both extracts did not exhibit a toxic effect against normal dermal fibroblast cell line (HDFa). Compared to non-cancerous cells, the ethanolic extract of *A. orientalis* demonstrated high selectivity against MCF-7 cells and limited selectivity against Caco-2 cells. In comparison, the aqueous extract was highly selective against both cancerous cells. Conclusions: *A. orientalis* demonstrated antioxidant properties and significant antiproliferative potential against breast and colon cancer. Therefore, additional investigations are needed to study the mechanism of the cytotoxicity for this plant. © 2022 Journal of Pharmacy & Pharmacognosy Research,

ABSTRACT: We report on the photocatalytic degradation activity of methylene blue (MB) using Cellulose acetate (CA) membranes embedded by metal oxide nanoparticles (NPs). Titanium dioxide and Cerium dioxide (TiO_2 and CeO_2) and their nanocomposites are used as nanofillers in CA membranes to enhance photocatalytic activity. The casted nanocomposite membranes are synthesized using the phase inversion method and characterized using X-ray diffraction, X-ray fluorescence, scanning electron microscopy, Fourier-transform infrared spectroscopy, and UV-Vis to investigate structural, surface morphological, elemental content, and the optical properties. In particular, surface morphological and optical results are analyzed to elucidate a deeper understanding of porosity and photocatalytic activity via the degradation of the MB dye. The as-prepared CA-NP membranes are tested for photocatalytic degradation of MB by exposing the membrane/MB dye combination to UV illumination for different exposure times. Results reveal that CA- TiO_2 membrane exhibits the smallest nanopore size, the most efficient exciton separation, and the largest surface area as compared with CA- CeO_2 and CA- TiO_2 - CeO_2 -casted membranes. Consequently, CA- TiO_2 membrane shows a good cyclic photocatalytic degradation activity (about 64%). Furthermore, the obtained MB degradation activity follows the increasing trend: CA- TiO_2 membrane (Energy gap $E_g=3.26\text{eV}$, Absorption activity $A\%= 64\%$) > CA- TiO_2 - CeO_2 membrane ($E_g=3.33\text{eV}$, $A\%=15\%$) > CA- CeO_2 ($E_g=3.4\text{eV}$, $A\%=7\%$) that is directly correlated with the values of the E_g of the NP component of the membranes, the high porosity, and large surface area of the membrane. This suggests the synergetic use of the two metal oxides in potential applications of the photocatalytic degradation of MB and other organic pollutants for water treatment. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.

ABSTRACT: Background: There is an alarming spread of cases of lipid disorders in the world that occur due to harmful lifestyle habits, hereditary risk influences, or as a result of other illnesses or medicines. Cholesteryl Ester Transfer Protein (CETP) is a 476-residue lipophilic glycoprotein that helps in the transport of cholesteryl ester and phospholipids from the atheroprotective HDL to the proatherogenic LDL and VLDL. Inhibition of CETP leads to elevation of HDL cholesterol and reduction of LDL cholesterol and triglycerides; therefore, it is considered a good target for the treatment of hyperlipidemia and its comorbidities. Objective: In this research, synthesis, characterization, molecular modeling, and biological evaluation of eight 3,5-bis(trifluoromethyl)benzylamino benzamides 9a-d and 10a-d were carried out. Methods: The synthesized molecules were characterized using 1H -NMR, ^{13}C -NMR, IR, and HR-MS. They were biologically tested in vitro to estimate their CETP inhibitory

activity. Results: These compounds offered inhibitory effectiveness ranging from 42.2% to 100% at a concentration of 10 μ M. Compounds bearing unsubstituted three aromatic rings (9a) or ortho-CF₃ substituted (9b) were the most effective compounds among their analogs and showed IC₅₀ values of 1.36 and 0.69 μ M, respectively. The high docking scores of 9a-d and 10a-d against 4EWS imply that they might be possible CETP inhibitors. Pharmacophore mapping results demonstrate that the series approves the fingerprint of CETP active inhibitors and therefore explains their high binding affinity against CETP binding site. Conclusion: This work concludes that 3,5-bis(trifluoromethyl)benzylamino benzamides can serve as a promising CETP inhibitor lead compound. © 2022 Bentham Science Publishers.

ABSTRACT: This study explores the relationships between intellectual capital, supply chain agility, collaborative knowledge creation, and corporate sustainability during unprecedented crises such as the COVID-19 epidemic. Data were collected from food and beverages firms and analyzed using Smart-Partial Least Squares (Smart-PLS) structural equation modeling software. The sample consisted of 289 managers, directors, and heads of department. The results reveal that intellectual capital significantly impacts supply chain agility, collaborative knowledge creation, and corporate sustainability. Furthermore, the findings confirm that collaborative knowledge creation and supply chain agility significantly impact corporate sustainability during the COVID-19 crises. This study contributes to the literature on intellectual capital, dynamic capabilities, supply chain management, and knowledge management, and the role of these capabilities in preserving corporate sustainability during unprecedented crises. © 2022 Elsevier Inc.

ABSTRACT: Objective: Vaccination is one of the most important measures that the world is relying on to end the COVID-19 pandemic. A number of vaccines have been authorized; however, there are several differences in the available vaccines which may lead to differences in public hesitancy levels toward each vaccine. Therefore, the aim of this study was to assess the young Jordanian population's acceptance of the COVID-19 vaccine, their knowledge, and attitudes toward different vaccine types, and to explore the variables that could influence their preferences. Material and methods: An online questionnaire was distributed via Jordanian multipurpose Facebook groups. COVID-19 knowledge, and practice scores were calculated, in addition to general and specific COVID-19 vaccine knowledge scores. Repeated measures analysis was conducted to investigate the association between the participants' knowledge about each vaccine and their willingness to take it. Quantile regressions were conducted to determine the predictors of the participants' willingness to take each vaccine. Results: A total of 1897 participants completed the survey. One fifth of the participants (19.9%) were willing to take the COVID-19 vaccine. The acceptance of Pfizer/BioNTech vaccine and the knowledge about it were significantly different from all the other vaccines. Predictors of acceptance of the different vaccines were sex, estimation of the severity of the disease, COVID-19 knowledge score, practice score, and specific vaccine knowledge score. Conclusion: The young Jordanian adults had limited acceptance of the COVID-19 vaccine. Differences in the participants' acceptance of different vaccines were observed and specific vaccine knowledge was a significant predictor of acceptance of the vaccine. © 2021 Elsevier España, S.L.U.

ABSTRACT: Facebook, as a social networking site, is one of the most important means of communication technologies that have been widely adopted by college students and their professors worldwide. The purpose of this study is to shed light on the impact of Facebook on higher education generally and specifically on the academic performance of the students of the University of Jordan. For the completion of this study, the researchers selected a random sample of students from the University of Jordan and gave them a questionnaire on how Facebook affected their academic performance. The collected data was analyzed and tested by using correlation tests through SPSS, a data analysis program. The independent variable measured: 1-communication among students and communication between them and the faculty members; 2-sharing of resources and materials; 3-and collaboration among students. The academic achievement of students was measured by examinations and/or by continuous assessment such as (their GPAs, overuse or multitasking, and the time they spend on studying). Three pre-determined hypotheses tested are: (H1) Communication through Facebook has no significant impact on students' academic performance. (H2) The sharing of educational resources and materials through Facebook does not significantly influence students' academic performance. (H3) Collaboration among students through Facebook has no significant influence on their academic performance. © Italian e-Learning Association.

ABSTRACT: The study is to examine the effect of progressive muscle relaxation exercise on anxiety of nursing students during their initial clinical experience. A quasi-experimental, pre-post study was carried out in the Arab American University. A convenience sample consists of 90 first-year nursing students were chosen. A progressive muscle relaxation exercise for five days per week was conducted on one group of nursing students. Students' anxiety was measured by S-anxiety scale (STAI Form Y-1) at pre and post the intervention. The severity of anxiety reduction was greater post the exercise ($t(89) = 30.783, P = .001$). © The Author(s) 2022.

ABSTRACT: Purpose: The purpose of this paper is to identify the effect of radical innovation and incremental innovation on the competitive advantage of Jordanian industrial companies and identify the moderating role of technological intensity. Design/methodology/approach: For this study's purposes, 303 questionnaires from employees of 30 manufacturing firms were analysed. Convergent validity and discriminant validity tests were performed through structural equation modelling in the Smart-PLS programme. Data reliability was confirmed. A bootstrapping technique was used to analyse the data. Multi-group analysis was performed to investigate the moderating role of technological intensity. Findings: Empirical results showed that both radical innovation and incremental innovation explain 60.2% of the variance in competitive advantage and that both constructs have a statistically significant effect on competitive advantage. The results also revealed that the relationship between radical innovation and competitive advantage is modified through the high-tech industries. Meanwhile, the relationship between incremental innovation and competitive advantage is modified through the

low-tech industries. Research limitations/implications: This cross-sectional study provides a snapshot at a given moment in time, a methodological limitation that affects the generalization of its results and the results are limited to one country, Jordan. Practical implications: This study promotes the idea of focusing on radical and incremental innovation to enhance competitive advantage in the Jordanian manufacturing sector and knowing the effect of technological intensity in this relationship. Originality/value: This study has important implications for leaders in the Jordanian manufacturing sector in general, as the study highlights the importance of radical innovation and incremental innovation to enhance the competitive advantage, especially in light of the technological intensity in this sector, and thus, increase the innovative capabilities of this firms, which leads to an increase in the level of competitive advantage. © 2021, Emerald Publishing Limited.

ABSTRACT: Numerous existing formulas predicted the ultimate interfacial bond strength in concrete-filled steel tubes (CFST) between steel tubes and concrete core without investigating the whole response under push-out load. In this research, four models are proposed to predict the interfacial behavior in CFST including the post-peak branch under the push-out loading test based on 157 circular specimens and 105 squared specimens from the literature. Two models (one for circular and one for squared CFST) are developed and calibrated using artificial neural network (ANN) and two models (one for circular and one for squared CFST) are developed based on multivariable regression analysis, analysis of variance (ANOVA). The shape of the specimen (circular or squared), diameter of the tube, thickness of the tube, concrete compressive strength, age at the time of testing, and length of the specimen are the main factors considered. These models are then compared to other existing formulas to verify their capability to better predict the ultimate interfacial bond strength. It is found that the ANN model gives better results for most of the considered data. It is also found that ANN models can predict the overall bond-slip response for the considered dataset. In order to simulate the response of any CFST column using finite element (FE) method, it is vital to have sufficient input data on the overall bond-slip behavior between the interior face of the steel tube and the exterior surface of the concrete core including the post-peak branch. Accordingly, the suggested ANN model is used to generate the required input data related to the cohesive behavior and damage along the interface in ABAQUS model to simulate the response of two circular and two squared CFST columns under concentric compressive load. The results are in good agreement with experimental outcomes. The cohesive criterion and damage interface that are used based on ANN models in FE are found to be sufficient and can be adopted to model CFST columns. © 2022 by the authors. ABSTRACT: In this work, the so-called conformable fractional derivative definition is employed to obtain the fractional Frobenius series solutions around the regular α -singular point $x = 0$ for the confluent α -hypergeometric differential equation. Of course, such solutions for this equation in its classical case are just confluent hypergeometric functions. The proposed method is straightforward to be applied as an algorithm. © 2022. ABSTRACT: This study examines critical care nurses' attitudes, roles, experience, education, and barriers regarding breaking the bad news. A descriptive, cross-sectional design was used in this study. A convenience sample of 210 critical care nurses completed the study. Most of the critical care nurses contributed to breaking bad news and they were involved in different roles in this process and they had a positive attitude regarding breaking bad news. In this study, (75.2%) of the participants reported that they did not receive any specific training regarding breaking bad news. In addition, nurses face various barriers when breaking bad news. Critical care nurses' involvement in breaking bad news should be encouraged. Most barriers to BBN were negatively associated with nurses' roles, attitudes, and experiences during BBN. Administrators should promote the involvement of critical care nurses in breaking bad news and strengthen them through addressing the challenges they face in the process of BBN. © The Author(s) 2022.

ABSTRACT: Schiff bases have played significant roles in the development of inorganic or coordination chemistry. Three Schiff base (NB, CB and HB) ligands, prepared for the reaction of 2-amino-6-methoxybenzothiazole with 2-Nitrobenzaldehyde, 2-chlorobenzaldehyde and 2,4-Dihydroxybenzaldehyde, respectively, were investigated for their transition metal complexes, which were prepared by reacting the ligand (2:1 molar ratio) with Co(II), Ni(II), Cu(II), Cd(II), Cr(III) and Fe(III) chlorides. The nature of the interaction between the metal ions and ligands (L) was studied with the aid of magnetic susceptibility, elemental analysis, FTIR and ¹H-NMR spectroscopy. Based on the magnetic superstability and elemental analysis results, octahedral structures of the complexes, such as [ML₂Cl₂] or [ML₂Cl(OH)], were proposed for Cu(II), Cd(II), Co(II) and Ni(II) in which the ligand (L:NB, CB or HB) is bidentate through the azomethine and benzothiazole nitrogen. For Cr(III) and Fe(III) complexes, octahedral ML₂Cl(OH)₂ or ML₂(OH)₃ structures were proposed, where one ligand is monodentate and the other is bidentate. The azomethine ν(-HC=N-) and ¹H-NMR peaks of NB and CB were shifted to a higher frequency and downfield, respectively, upon complexation with metal ions. The bonding of OH groups of HB to Co(II), Cu(II) and Ni(II) enables π-backdonation from these metals to the azomethine of Schiff bases and the consequent shift of ν(-HC=N-) to a lower frequency and changes in the intensity of the ¹H-NMR peak of OH. On the other hand, this backdonation was not evidenced in the FTIR of HB complexes with high-charge Cr(III) and Fe(III) ions. © 2022 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Medication Adherence Report Scale questionnaire (MARS-5) and the Beliefs about Medication Questionnaire-specific (BMQ-specific) are well known tools to assess adherence to medication and beliefs of chronic patients. However, validated Arabic versions of such questionnaires are lacking. We aim to validate the Arabic versions of BMQ-specific and MARS-5. In this study, a cross-sectional study was performed between November 2019 and March 2020. Participants were reached from secondary and tertiary care clinics in Jordan. Exploratory factor analysis (EFA) and Confirmatory Factor analysis (CFA) were conducted to validate the employed questionnaires on the tested sample. The

internal consistency of the questionnaires was assessed by calculating Cronbach's alpha, and Cronbach's alpha if item is deleted. A total of 485 patients who met the inclusion criteria were recruited. The mean age of the participants was 57.14 years (22-82 years); and 39% of the participants were older than 65 years. The most common chronic diseases reported by participants were hypertension and diabetes mellitus, 35.7 and 32.2% respectively. EFA suggested twofactor model for BMQ-specific and one-factor model for MARS-5 which was confirmed by CFA analyses. The resulted Cronbach's alphas of the questionnaires ranged from 0.89- 0.93. Both analyses showed that the Arabic versions of both MARS-5 and BMQ-specific are valid and can be used for the suggested study population. Further validation-based research may enhance the transcultural adaptation of such questionnaires. © 2022 Al-Qerem et al. ABSTRACT: To control the spread of COVID-19 disease and reduce its mortality, an early and precise diagnose of this disease is of significant importance. Emerging research data show that the current COVID-19 pandemic may be affected by environmental conditions. Therefore, the impact of weather parameters on COVID-19 distribution should be explored to predict its development in the next few months. This research aims to study the association between the daily confirmed COVID-19 cases in the three major cities of Jordan; Amman, Zarqa, and Irbid and climate indicators to include the average daily temperature (°C), wind speed (m/s), relative humidity (%), pressure (kPa), and the concentration of four pollutants (CO, NO₂, PM₁₀, and SO₂). The data were obtained from the World Air Quality Project website and the Jordanian Ministry of Environment. A total of 305 samples for each city was used to conduct the data analysis using multiple linear regression and a feedforward artificial neural network. It was concluded that the multiple linear regression and feedforward artificial neural network could forecast the COVID-19 confirmed cases in the case studies; Amman, Irbid, and Zarqa. Finally, global sensitivity analysis using Sobol analysis indicated that pressure in Amman and Zarqa and the concentration of NO₂ in Irbid has a high rate of positive cases that supports the virus's spread. © 2022, The Author(s), under exclusive licence to Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: This study empirically explores the role of social capital in creating collaborative innovation and collective intelligence and maintaining organizational sustainability in the unprecedented COVID-19 crisis. Data were collected from a sample of 289 managers, directors and heads of departments of top 50 manufacturing firms in Jordan and analyzed using Smart-PLS-SEM. The results indicate that social capital significantly impacts collaborative innovation, collective intelligence and organization sustainability during the COVID-19 crisis. They also reveal that collective intelligence significantly impacts collaborative innovation and organization sustainability. This study enriches the literature on social capital, collaborative innovation and collective intelligence. It elucidates the role of such dynamic capabilities in maintaining both organizational sustainability and the chance of recovery from unprecedented crises. © 2022 The Author(s)

ABSTRACT: Objectives: To perform a cost of control analysis of glucagon like peptide-1 receptor agonists (GLP1RA) in Saudi Arabia (SA) and determine the economic impact of adopting GLP1RAs.

Methods: A budget impact model that captures the cost of control model was constructed to simulate hypothetical patient on six treatment options: a current mix of 60% liraglutide and 40% dulaglutide, semaglutide, liraglutide, dulaglutide, exenatide, and lixisenatide. We estimated the relative amounts of SAR spend to achieve HbA1c targets ($\leq 6.5\%$ or $< 7.0\%$). For each treatment option, annual treatment cost, proportion of patients achieving HbA1c targets, and cost to treat major adverse cardiovascular events (MACE) were aggregated to estimate the cost of control per patient per year (CCPPPY) over 5-year horizon (2021-2025). Probabilistic sensitivity analysis (PSA) was performed as a confirmatory analysis. Results: The CCPPPY to achieve HbA1c $\leq 6.5\%/<7.0\%$ using current mix, semaglutide, liraglutide, dulaglutide, exenatide, and lixisenatide were SAR 17,097/SAR 14,113, SAR 12,889/SAR 11,123, SAR 15,594/SAR 12,892, SAR 19,184/SAR 15,940, SAR 580,211/SAR 380,936, and SAR 246,570/SAR 143,759, respectively. The relative amounts of SAR spend to achieve HbA1c $\leq 6.5\%/<7.0\%$ relative to 1 SAR on semaglutide in case of adopting current mix, liraglutide, dulaglutide, exenatide, and lixisenatide were SAR 1.42/SAR 1.18, SAR 1.30/SAR 1.07, SAR 1.60/SAR 1.33, SAR 48.33/SAR 31.73, and SAR 20.54/SAR 11.97, respectively. These results were confirmed in the PSA. Conclusions: Semaglutide 1 mg once weekly was the most economically favorable GLP1RA; associated with the least CCPPPY, and amount of SAR spent to achieve HbA1c of $\leq 6.50\%/<7.00\%$ versus all other GLP1RAs. © 2022 The Author(s)

ABSTRACT: A hybrid solar lighting/ thermal system utilized a parabolic solar dish as a solar collector illustrated in this paper. A two-axis tracking system was developed and employed to improve the energy output of a concentrating solar system (CSP) that produces hot water and light. During the daytime, sunlight is transmitted by fiber optics to an indoor photovoltaic PV device to generate electricity, or it can be used directly as daylighting. The heat generated is used to heat water. The findings show that the proposed system is a low-cost, high-performance approach for solar energy use in building energy efficiency, and readily available tracking components and tools. The experimental work shows that the maximum efficiency of the hybrid solar lighting/ thermal system controlled with a dual-axis solar tracking system was 32.2%. © 2021 The Author(s)

ABSTRACT: The goal of this research is to investigate the effect of utilizing selective liquids as absorption filters to prevent PV module overheating by blocking the undesirable part of the spectrum (long wavelength) while allowing the beneficial part of the spectrum (visible light and near infrared) to pass through. The fluids were evaluated on two different panels, and their results were compared to those of a control panel. In this work, two liquids were used and tested: copper sulfate solution (CuSO₄·5H₂O) and distilled water as absorption filter; each was arranged in such a way that it flows evenly over the surface of a PV module through a cavity mounted on the top side of the PV module. In addition, a standard PV panel was employed as a comparison. The average power produced by the PV when pure was used as an optical filter is 31.3%, while it was 11.3% when copper sulfate solution was used compared with base unit. Furthermore, the cooling effect of pure water on the PV was more efficient than that of copper sulfate solution, with an average PV temperature drop of 15% compared with 7.5% when copper sulfate is used compared with the base unit panel's performance improved by an average of 31.3% when distilled water was used as the absorption filter, compared to the reference panel's performance, while the copper sulfate solution improved the panel's performance by an average of 11.3% compared to the reference panel's performance. © 2021, The Author(s), under exclusive licence to Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: Abstract: Diabetes mellitus is a main global health apprehension. Macrovascular illnesses, neuropathy, retinopathy, and nephropathy are considered some of its severe hitches. Gliptins are a group of hypoglycemic agents that inhibit dipeptidyl peptidase-IV (DPP-IV) enzyme and support blood glucose-lowering effect of incretins. In the current research, synthesis, characterization, docking, and biological evaluation of fourteen Schiff's bases 5a-f and 9a-h were carried out. Compound 9f revealed the best in vitro anti-DPP-IV activity of 35.7% inhibition at a concentration of 100 µM. Compounds 9c and 9f with the highest in vitro DPP-IV inhibition were subjected to the in vivo glucose-lowering test using vildagliptin as a positive inhibitor. Vildagliptin, 9c, and 9f showed significant reduction in the blood glucose levels of the treated mice after 30 min of glucose administration. Moreover, induced fit docking showed that these derivatives accommodated the enzyme binding site with comparable docking scores. Schiff's bases can serve as promising lead for the development of new DPP-IV inhibitors. Understanding the Impact of Intellectual Capital on E-Business Entrepreneurial Orientation and Competitive Agility: An Empirical Study

(2022) Information Systems Frontiers, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099088035&doi=10.1007%2fs10796-020-10092-7&partnerID=40&md5=d5cb909b92e276679440e04609da8309>

AFFILIATIONS: Al-Zaytoonah University of Jordan, Amman, Jordan

ABSTRACT: This study empirically examines the impact of intellectual capital on the frontiers of e-business entrepreneurial orientation and how intellectual capital and e-business entrepreneurial orientation contribute to competitive agility. A questionnaire was used for data collection from telecommunication companies and obtained from a sample of 212 participants. Data analysis was conducted using a structural equation modeling approach using smart PLS. The results show the positive impact of human capital, structural capital, and relational capital on e-business entrepreneurial orientation. The findings also indicate a direct positive impact of intellectual capital and e-business entrepreneurial orientation on competitive agility. An understanding of the impact of intellectual capital, e-business entrepreneurial orientation dimensions, and their relationship with competitive agility will provide organizations with a better background and knowledge on how to foster and manage these capabilities. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature.

ABSTRACT: With the increased efforts and focus on sustainable development and changes in the climate, literature has given more attention to the green economy. However, researchers have not yet been totally able to consensus on the definition of this phenomenon. The study presented in the paper provides an overview of the advancements present in research on the green economy for the period from 1990 to 2020. Using a bibliometric analysis approach, the paper summarizes the trends of development and the status quo of the green economy. The aim is to provide the reader with guidance and a solid conceptual framework for future research. © 2022, Econjournals. All rights reserved.

ABSTRACT: We present new precision measurements of the elastic electron-proton scattering cross section for momentum transfer (Q^2) up to 15.75 (GeV/c)². Combined with existing data, these provide an improved extraction of the proton magnetic form factor at high Q^2 and double the range over which a longitudinal or transverse separation of the cross section can be performed. The difference between our results and polarization data agrees with that observed at lower Q^2 and attributed to hard two-photon exchange (TPE) effects, extending to 8 (GeV/c)² the range of Q^2 for which a discrepancy is established at >95% confidence. We use the discrepancy to quantify the size of TPE contributions needed to explain the cross section at high Q^2 . © 2022 American Physical Society.

ABSTRACT: Aldehyde dehydrogenases (ALDHs) are overexpressed in various tumor types including prostate cancer and considered a potential target for therapeutic intervention. 4-(Diethylamino)benzaldehyde (DEAB) has been extensively reported as a pan-inhibitor of ALDH isoforms, and here, we report on the synthesis, ALDH isoform selectivity, and cellular potencies in prostate cancer cells of 40 DEAB analogues; three analogues (14, 15, and 16) showed potent inhibitory activity against ALDH1A3, and two analogues (18 and 19) showed potent inhibitory activity against ALDH3A1. Significantly, 16 analogues displayed increased cytotoxicity (IC₅₀ = 10–200 μM) compared with DEAB (>200 μM) against three different prostate cancer cell lines. Analogues 14 and 18 were more potent than DEAB against patient-derived primary prostate tumor epithelial cells, as single agents or in combination treatment with docetaxel. In conclusion, our study supports the use of DEAB as an ALDH inhibitor but also reveals closely related analogues with increased selectivity and potency. © 2022 American Chemical Society

ABSTRACT: Cosmetics are composed of a mixture of chemicals and natural compounds, and most adverse effects occur due to sharing the same products and using the makeup after the expiry date. This behavior tends to increase the side effects of cosmetics due to pathogenic infections. Lack of awareness and knowledge were found to be the main factors that could affect women's perception which plays a critical role in using expired cosmetic preparations and had negative impact on health behavior. It has been shown that awareness, reference groups, experience, and information produced a statistically significant effect on the perception. In addition, knowledge didn't have a statistically significant effect. Regarding utilizing the second-hand used cosmetics products, 84 % of women agreed that they have used those that belonged to another person. There is a need to educate women about the possible risks of expired or previously used cosmetics by formal channels, internet websites, and social media. © 2022 Indian Drug Manufacturers' Association. ABSTRACT: Contemplation of Estrangement Features is the title of one of the story series by the Jordanian story writer, Teriz Haddad.1 This study aims to critically and analytically survey this series according to the semiotic principles, in an attempt to uncover the main narrative elements, aesthetic features, and the ideological, social, artistic and aesthetic contents of the series. This story series is important because it is one of the relatively early models of feminist literature in general and of short stories in Jordan in particular. In addition, this series is written by a Jordanian story writer whose works have not been criticized and studied sufficiently. This is probably because I made an attempt to search for a critical report or study of this story series, but I found nothing. The study consists of an introduction and three parts. The first part deals with the series' title as a "paratext" helping to convey the meaning of the series and sketch it out. The second part, however, gives a general look at the series' stories, where their summaries and paramount occurrences and ideas as well as their paramount techniques are presented. Finally, the last part came to deal, in some detail, with the story Leave Me Alone. This story has been analyzed and its most important artistic elements have been studied. Such elements include: The narrator, language, place, time and impression integrity. In the conclusion of the study, the most important results of the research have been incorporated. © 2022 Alameri et al.

ABSTRACT: Introduction: Stemming is an important preprocessing step in text classification, and could contribute to increasing text classification accuracy. Although many works have proposed stemmers for the English language, few stemmers have been proposed for Arabic text. Arabic language has gained increasing attention in the previous decades and the need to further improve Arabic text classification. Methods: This work combined the use of the recently proposed P-stemmer with various classifiers to find the optimal classifier for the P-stemmer in terms of Arabic text classification.

As part of this work, a synthesized dataset was collected. Results: The previous experiments show that the use of P-stemmer has a positive effect on classification. The degree of improvement is classifier-dependent, which is reasonable as classifiers vary in their methodologies. Moreover, the experiments show that the best classifier with the P-Stemmer is NB. This is an interesting result as this classifier is well-known for its fast learning and classification time. Discussion: First, the continuous improvement of the P-stemmer by more optimization steps is necessary to further improve the Arabic text categorization. This can be made by combining more classifiers with the stemmer, by optimizing the other natural language processing steps, and by improving the set of stemming rules. Second, the lack of sufficient Arabic datasets, especially large ones, is still an issue. Conclusion: In this work, an improved P-stemmer was proposed by combining its use with various classifiers. In order to evaluate its performance, and due to the lack of Arabic datasets, a novel Arabic dataset was synthesized from various online news pages. Next, the P-stemmer was combined with Naïve Bayes, Random Forest, Support Vector Machines, K-Nearest Neighbor, and K-Star. © 2022 Bentham Science Publishers.

ABSTRACT: The current study's goal is to investigate the financial determinants of the market stock price in Jordan, which is an emerging market. It gives empirical evidence from the industrial companies listed on the Amman Stock Exchange. This research was carried out over nine years (2010-2018), with a panel data analysis of 57 industrial companies used during the period. The study sample consists of all of the companies in the population, for a total of 513 observations. In conclusion, the findings of the study reveal that the ratio of assets turnover, long-term debt-to-total assets ratio, earnings per share, return on assets, inventory-to-total current assets ratio, total current assets-to-total assets ratio, and total assets significantly affect the market stock price of Jordanian industrial companies; while the equity-to-total assets ratio and working capital ratio have no significant effect. These results are compatible with the pecking order theory and signalling theory. Besides, the shift in the market stock prices of Jordanian industrial companies is governed by financial indicators at a relatively high level. As a final point, these results can be used by financial analysts, investors, and other strategic decision-makers to boost the effectiveness and efficiency of the Jordanian financial market. © 2022 NSP Natural Sciences Publishing Cor.

ABSTRACT: SARS-CoV-2 (COVID-19) vaccines are critical for containing serious infections. However, as COVID-19 evolves toward more transmissible varieties and serum antibody levels in vaccinated persons steadily decline over time, the likelihood of breakthrough infections increases. This is a cross-sectional study based on an online questionnaire for Jordanian adults (n = 915) to determine how individuals who have finished the current vaccination regimen feel about a prospective COVID-19 booster shot and what factors might influence their decision. Almost half of the participants (44.6%) intended to get the booster dose of the COVID-19 vaccine. The most frequently mentioned reasons for participants' reluctance to get the COVID-19 vaccine booster dose were "The benefits of booster dose have not been scientifically proven" (39.8%), followed by "I took the last dose a short time ago, and there will be no need to take the booster dose for at least a year" (24.6%). In turn, "I was infected with COVID-19; thus, I do not require the booster dose" was the least reported reason (13.1%). These findings highlight the considerable hesitancy toward COVID-19 booster immunization among Jordanians, as well as the variables associated with vaccine hesitancy and the most frequently mentioned reasons for hesitancy, which will aid in creating excellent campaigns regarding booster doses. © 2022 by the authors. ABSTRACT: Thymomas and thymic carcinomas (TC) are malignant thymic epithelial tumors (TETs) with poor outcome, if non-resectable. Metabolic signatures of TETs have not yet been studied and may offer new therapeutic options. Metabolic profiles of snap-frozen thymomas (WHO types A, AB, B1, B2, B3, n = 12) and TCs (n = 3) were determined by high resolution magic angle spinning 1H nuclear magnetic resonance (HRMAS 1H-NMR) spectroscopy. Metabolite-based prediction of active KEGG metabolic pathways was achieved with MetPA. In relation to metabolite-based metabolic pathways, gene expression signatures of TETs (n = 115) were investigated in the public “The Cancer Genome Atlas” (TCGA) dataset using gene set enrichment analysis. Overall, thirty-seven metabolites were quantified in TETs, including acetylcholine that was not previously detected in other nonendocrine cancers. Metabolite-based cluster analysis distinguished clinically indolent (A, AB, B1) and aggressive TETs (B2, B3, TCs). Using MetPA, six KEGG metabolic pathways were predicted to be activated, including proline/arginine, glycolysis and glutathione pathways. The activated pathways as predicted by metabolite-profiling were generally enriched transcriptionally in the independent TCGA dataset. Shared high lactic acid and glutamine levels, together with associated gene expression signatures suggested a strong “Warburg effect”, glutaminolysis and redox homeostasis as potential vulnerabilities that need validation in a large, independent cohort of aggressive TETs. If confirmed, targeting metabolic pathways may eventually prove as adjunct therapeutic options in TETs, since the metabolic features identified here are known to confer resistance to cisplatin-based chemotherapy, kinase inhibitors and immune checkpoint blockers, i.e., currently used therapies for non-resectable TETs. © 2022 by the authors. ABSTRACT: The cooling of PV models is an important process that enhances the generated electricity from these models, especially in hot areas. In this work, a new, active cooling algorithm is proposed based on active fan cooling and an artificial neural network, which is named the artificial dynamic neural network Fan cooling algorithm (DNNFC). The proposed system attaches five fans to the back of a PV model. Subsequently, only two fans work at any given time to circulate the air under the PV model in order to cool it down. Five different patterns of working fans have been experimented with in this work. To select the optimal pattern for any given time, a back propagation neural network model was trained. The algorithm is a dynamic algorithm since it re-trains the model with new recorded surface temperatures over time. In this way, the model automatically adapts to any weather and environmental conditions. The model was trained with an indoor dataset and tested with an outdoor dataset. An accuracy of more than 97% has been recorded, with a mean square error of approximately 0.02. © 2022 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: *Pseudomonas aeruginosa* is an opportunistic pathogen that is commonly found in nosocomial infections. *P. aeruginosa* is one of the most frequent model bacterial species, with the genomes of hundreds of strains of this species have been sequenced to date. This study aimed to analyze the whole genome sequence of *P. aeruginosa* ATCC® 10145™. The whole genome of the *P. aeruginosa* ATCC® 10145™ was sequenced by shotgun sequencing using Genomic DNA Mini Kit, genome AnalyzerIIX with 100-bp paired-end reads and genomic DNA extracted using the MasterPure complete DNA and RNA purification kit and complete genome sequence analysis was done. The genome of the *P. aeruginosa* ATCC® 10145™ was sequenced on the IlluminaMiseq platform. The raw sequenced reads were assessed for quality using FastQC v.0.11.5 and filtered for low quality reads and adapter regions using Trimmomatic v.0.36. The de novo genome assembly was made with CLC Genomics Workbench 5.1 and annotated using Prokaryotic Genome Annotation Pipeline (PGAP) v4.10. Here, we report the whole genome sequence of *P. aeruginosa* ATCC® 10145™ strain. All filtered and assembled genomic data sequences have been submitted to National Centre for Biotechnology Information (NCBI) and can be located at DDBJ/ENA/GenBank under the accession of VAOQ000000000 (UniSZA) and BioProject number PRJNA533327 and ID: 533327). The high-quality *P. aeruginosa* ATCC® 10145™ genome sequence provides a reference for further research including investigation of horizontal gene transfer or comparative genomics. © 2022 Al-kafaween et al.

ABSTRACT: In this work, we investigate a new sequential coupled differential system of Duffing type. The considered system involves Caputo Hadamard derivatives. Based on both Banach contraction principle and Schaefer fixed point theorems, we establish two results on the existence and uniqueness of solutions for the introduced problem. Some examples are presented to show the validity of our results. To give more interpretation to the examples, we establish a new approximation of Caputo-Hadamard derivative for the case $1 < b < 2$. Then, we plot the dynamics of one of the examples in terms of time and space coordinates. © 2022. NSP Natural Sciences Publishing Cor.

ABSTRACT: Background: Cancer is one of the most overwhelming diseases nowadays. It is considered the second cause of death after cardiovascular diseases. Due to the diversity of its types, stages and genetic origin, there is no available drug to treat all cancers. Serious side effects and resistance of existing drugs are other problems in the struggle against cancer. In such quest, fluoroquinolones (FQs) promising as antiproliferative compounds due to safety, low cost and lack of resistance. Objectives: Therefore, this work aims at developing lipophilic FQs and screening their antiproliferative activity against colorectal cancer. Methods: Nine prepared FQs were investigated for antiproliferative activity utilizing in vitro SRB method. In comparison to the antiproliferative agent cisplatin; the assessment of antiproliferative activities of these novel FQs in a panel of Colorectal Cancer Cell (CRC) lines (HT29, HCT116, SW620, CACO2, SW480) and normal periodontal ligament fibroblasts for safety examination was performed. Antibacterial activity (MIC) was conducted against *Staphylococcus aureus* and *Escherichia coli* standard strains using the broth double dilution method. Antioxidant properties were suspected as the mechanism of antiproliferative activity; thus, a DPPH test was performed to analyze radical scavenging potency of FQs compared to ascorbic acid as reference agent. FQs compounds 3-5(a-c) were prepared, characterized and their structure was confirmed using spectroscopy techniques. Results: All compounds manifested good to excellent antiproliferative activity on HT29, HCT116, and SW620 with high safety index. The reduced series 4a, 4b and 4c exerted excellent micro to nano-molar antiproliferative activities on HT29, HCT116, and SW620 which were stronger than the reference cisplatin against all cells. The reduced group of compounds 4(a-c) revealed higher potency vs. both nitro and triazolo groups. On cell lines HT29, HCT116, and SW620, reduced 4a with 7,8-ethylene diamine, the substitution revealed the highest antiproliferative efficacy (IC50 value) approaching nano molar affinity with higher safety vs. cisplatin. The most active compound, 4a, exhibited significant potency against HCT116, and SW620 with IC50 0.6 and 0.16 μM respectively. Novel FQs (4a, 4b and 4c) also showed strong radical scavenging activity with IC50 values (μM) 0.06, 23, and 7.99, respectively. Exquisitely 4a revealed a similar pattern of activity to doxorubicin, indicating a similar mechanism of action. Strong antiproliferative and weak antibacterial activities of series 4 endorse that their mechanism involves eukaryotic topoisomerase II inhibition. This work has revealed novel FQs with excellent anticancer activity against 5 colorectal cancer (HT29, HCT116, SW620, CACO2, SW480) cell lines with a potential chelation mechanism due to 7,8-ethylene diamine chelator bridge. Conclusion: The new FQs have confirmed that more lipophilic compounds could be more active as hypothesized. The p-halogenated aniline, N1-Butyl group in addition to 3-COOH, 8-NH2 are all essential requirements for strong antiproliferative FQ of our FQ scaffold. This work emphasizes the role of C-8 amino as part of ethylene diamine group as an essential requirement for antiproliferative FQs for the first time in the literature, entailing its role toward potential antineoplastic FQs. © 2022 Bentham Science Publishers.

Loading of Coal Tar in Polymeric Nanoparticles as a Potential Therapeutic Modality for Psoriasis (2022) ACS Omega, .

<https://www.scopus.com/inward/record.uri?eid=2-s2.0->

85125350741&doi=10.1021%2facomega.1c07267&partnerID=40&md5=2d2470fab2f5333cb0de224e4c0f905

ABSTRACT: Coal tar (CT) is a commonly used therapeutic agent in psoriasis treatment. CT formulations currently in clinical use have limitations such as toxicity and skin staining properties, leading to patient nonadherence. The purpose of this study was to develop a nanoparticle (NP) formulation for CT based on biocompatible poly(lactide-co-glycolide) (PLGA). CT was entrapped in PLGA NPs by nanoprecipitation, and the resulting NPs were characterized using dynamic light scattering and high-performance liquid chromatography (HPLC) to determine the particle size and CT loading efficiency, respectively. In vitro biocompatibility of the NPs was examined in human dermal fibroblasts. Permeation, washability, and staining experiments were carried out using skin-mimetic Strat-M membranes in Franz diffusion cells. The optimal CT-loaded PLGA NPs achieved 92% loading efficiency and were 133 nm in size with a polydispersity index (PDI) of 0.10 and a zeta potential of -40 mV, promoting colloidal stability during storage. CT NPs significantly reduced the cytotoxicity of crude CT in human dermal fibroblasts, maintaining more than 75% cell viability at the highest concentration tested, whereas an equivalent concentration of CT was associated with 28% viability. Permeation studies showed that only a negligible amount of CT NPs could cross the Strat-M membrane after 24 h, with 97% of the applied dose found accumulated within the membrane. The superiority of CT NPs was further demonstrated by the notably diminished staining ability and enhanced washability compared to those of crude CT. Our findings present a promising CT nanoformulation that can overcome its

limitations in the treatment of psoriasis and other skin disorders. © 2022 The Authors. Published by American Chemical Society

ABSTRACT: This study aims to examine the impact of Arab cultural values on consumer adoption of social commerce (s-commerce). Data were obtained from 528 participants through an online questionnaire. Structural equation modeling (PLS-SEM) was utilized to test the research hypotheses. The findings indicate a significant positive impact of collectivism and masculinity cultural values on s-commerce adoption. At the same time, the findings reveal a significant impact of uncertainty avoidance. Furthermore, the findings reveal a mediating impact by perceived value on the relationship between word of mouth (WOM) and s-commerce adoption. The findings contribute to a better understanding of the impact of cultural values on the adoption of s-commerce in the Arab world. It also shows how WOM and the perceived value of s-commerce both contribute to social commerce adoption, taking into consideration both the direct and mediated impacts of WOM. © 2021 Elsevier Inc.

ABSTRACT: We explored the effect of globalization and international geopolitical risks on Saudi Arabia's economic development via the channel of Saudi's oil rent during the period 1970–2018. In addition, we tested if globalization and international geopolitical risk can strengthen or weaken the impact of oil rent on Saudi Arabia's economic development. A time series autoregressive distributed lag model with moderation effects was used to achieve the paper's objective. Our results revealed that the direct short and long run effects of oil rent and globalization are statistically significant and positive, while the influence of international geopolitical risk is statistically insignificant in the short and long run. However, adding the moderation effects to the analysis reversed the results. The interaction terms of our paper are significant and negative. It implies that the interaction terms deflate the direct positive effects. Therefore, the final effect of oil rent and globalization could be either positive or negative, while the final effect of the international geopolitical risk is negative. The findings from the current paper confirms that globalization effect is dominant on economic development, compared to geopolitical risk. The policy implication of our paper focuses on diversifying Saudi's economy and strengthen Saudi Arabia's institutional framework. © 2021 Elsevier Ltd

ABSTRACT: Objective: The effectiveness of using food-grade coolant thickener solutions on the amount of aerosols generated and splatter contamination spread distance during simulated ultrasonic scaling was examined. Materials and methods: The study was performed using a phantom lower jaw placed on a black box. Simulated ultrasonic scaling was performed for 2 min using four coolant solutions: distilled water (control), 2% wt. polyacrylic acid (PAA), 0.4% wt. xanthan gum (XA), and 0.4% wt. carboxymethyl cellulose (CMC). The simulation was repeated 10 times for each coolant group. The generated aerosols and droplets were quantified using a handheld particle counter, and the splatter

contamination spread distance was evaluated by adding tracing fluorescent dye to the coolant reservoir supplying the scaler unit. One-way multivariate analysis of variance was performed to determine the difference among coolant groups ($\alpha = .05$). Results: The amount of aerosols and droplets and splatter contamination distance ($p < .001$) pertaining to the three food-grade coolant thickener solutions were considerably lower than those for the distilled water (control). The PAA group exhibited a significantly lower splatter contamination distance ($p < .001$) and a number of generated droplets ($p = .031$) than those of the XA group. The CMC group exhibited a significantly lower splatter contamination distance ($p < .001$) than that of the XA group. No statistically significant difference was observed between the PAA and CMC in terms of the three dependent variables ($p > .05$). Conclusion: The food-grade coolant thickeners could reduce the amount of generated aerosols and splatter contamination distance but not completely eliminate them. PAA and CMC solutions were more effective in reducing the aerosol/splatter during scaling compared to XA. Clinical relevance: Many dental procedures generate aerosols and splatter, which pose a potential risk to the patients and dental personnel, especially during the current COVID-19 pandemic. © 2021, The Author(s), under exclusive licence to Springer-Verlag GmbH Germany, part of Springer Nature.

ABSTRACT: Location-based services (LBSs) have drastically changed the way smart cities and smart buildings operate, giving a new dimension to the life of citizens. LBS have various applications ranging from power management, marketing, vehicle to everything communication to social networking, and many other applications. The concept of LBS relies on the estimation of a mobile device location either inside a city or a building. In this work, we present our three-layer collaborative LBS platform for various types of users and buildings. The first of these layers is the hardware layer consisting of the hardware used for location estimation inside smart buildings. On top of the hardware layers exists the indoor localization layer, at which we implement our indoor localization algorithms using long short-term neural networks for location estimation. Finally, the collaborative LBS system lies on top of other layers. The novelty of our approach stems from providing a complete layered architecture for LBS usage for power management. The proposed system offers collaborative features and services, that is, input to power management system that optimizes power usage in smart buildings based on user locations. © 2020 John Wiley & Sons, Ltd.

ABSTRACT: Most of the key agreement protocols (e.g., Menezes-Qu-Vanstone [MQV] family) generate one common key per session. This leaves the session key vulnerable against various attacks. This article proposed an enhanced multiple session key (EMSK) protocol which is based on the elliptic curve Diffie-Hellman (ECDH), HMQV, and the YAK protocols. The EMSK generates multiple session keys per session. Unlike the MQV protocol, the EMSK needs only two messages to be exchanged in order to create nine session keys. However, the MQV requires 18 messages to be exchanged in order to produce these nine session keys. In EMSK, one of the session keys is used to encrypt the plaintext using the one-time pad cipher. The encrypted message is then embedded in an RGB-image in order to provide confidentiality service of communication. The EMSK is evaluated theoretically against various types of attacks and practically using the Scyther simulator. The results from the simulator showed that the EMSK protocol withstand various types of attacks on the MQV, HMQV, and the YAK protocols, and provided perfect forward secrecy. In addition, the EMSK provides a digital signature feature which validates the authenticity and integrity of a digital message using the zero knowledge prove. © 2021 John Wiley & Sons Ltd.

ABSTRACT: Introduction: The preparedness of nurses in relation to providing palliative care is not always adequate, indeed, it is sometimes unsatisfactory; this may be caused by lack of knowledge and limited experience in end-of-life care (EOLC). Thus, this study purposed to assess the levels of registered nurses' knowledge about EOLC, examine the relationships between EOLC knowledge and some demographic variables, and explore predictors of EOLC knowledge. Methods: A cross-sectional design survey was conducted with Jordanian registered nurses in critical care units (N = 175) in different health sectors in Jordan. The End-of Life Professional Caregiver Survey (EPCS) was used. Results: Findings showed that nurses had moderate/quite a lot of knowledge (M (SD) = 2.58 (.48)) about EOLC. The cultural and ethical values was the highest subscale of knowledge about EOLC (M (SD) = 2.74 (.52)), while effective care delivery subscale was the lowest one ((M (SD) = 2.33 (.66). Knowledge about EOLC was correlated with age (r =.145, P <.05), work experience (r =.173, P <.05), and training course in palliative or EOLC (r =.217, P <.01). The main predictor of EPCS was training courses in palliative or EOLC (B =.190, P <.05). Conclusion: The nurses need to enhance their knowledge about EOLC and correlating factors should be taken into consideration when developing any intervention program. Nurses need palliative care training courses; also more attention is required in palliative care education particularly in clinical skills in effective care delivery. © The Author(s) 2022.

ABSTRACT: Although online teaching has been implemented worldwide, specifically in higher education, resistance to technology use exists, as faculty members may lack technology familiarity and may require both guidance and training. The present study evaluated faculty members' satisfaction towards distance teaching as imposed during the COVID-19 pandemic. An online survey which evaluated socio-demographics and faculties 'satisfaction toward distance education was validated and completed by 286 faculties from different faculty-fields of education across all Universities in Jordan. Factor analysis was conducted to validate the questionnaire and univariable analysis was conducted to evaluate demographic variables association with satisfaction degree. The confirmatory factor analysis indicated that the most suitable structure for the study data was a 3-factor model constructed from 21 items. The three factors were students-related factor, institution-related factor and technology-related factor. The scores for the three factors were 2.66, 2.00 and 3.33 out of 5 respectively. Faculties who received training for online teaching and those who have attended courses as a trainee were more satisfied with distance education. In conclusion, the faculties' low satisfaction level reported in the present study shows margin for distance education improvement by conducting intensive training courses for online teaching with the aim of improving faculties' satisfaction levels towards a web-based teaching environment and hence improving education outcomes. ABSTRACT: Background and Purpose: Accreditation is viewed to enhance the total quality of healthcare.

The present study aims at assessing patients' perspectives toward the quality of emergency healthcare services at different hospitals with different characteristics in Jordan. The elements of patients' perception were aligned with the conceptual framework of Patient Centeredness Model. Methods: This descriptive cross-sectional study was carried out in four emergency departments from different healthcare sectors and accreditation statuses in Jordan. Less urgent/nonurgent, alert, and cooperative patients were identified directly after the completion of emergency treatment. The perspectives of patients about the quality of emergency services were evaluated by 10 domains articulated in a validated accident and emergency questionnaire. Results: A total of 276 patients were enrolled in the study. Private sector scored higher in all assessment domains in both accredited and nonaccredited hospitals in comparison with the government sector. Accredited government hospitals scored higher in patients' evaluation for "doctor and nurse," "investigations," "pain," and "overall respect of medical staff" domains than nonaccredited government hospitals. The overall experience was significantly different between accredited and nonaccredited government hospitals. Implications for Practice: Quality of emergency care services should be assessed through various dimensions related to patients' perspectives. Patients' perception toward the quality of emergency health services is evidently enhanced by accreditation especially in the government sector. © Copyright 2022 Springer Publishing Company, LLC.

ABSTRACT: Several techniques for cooling mass concrete structures were developed in order to increase structural integrity and reduce the influence of cement hydration, which sometimes causes cracking in concrete structures, negatively affecting their durability. This research focuses on cooling system design, initial investment, and the influence of different refrigerants on cooling system performance aims in producing higher quality massive concrete. Cooling aggregates in massive concrete structures such as desert dams can be performed by employing cooled air from an air conditioning duct system or chilled water. The experimental study illustrates the relationship between the coefficient of performance COP, the evaporator temperature, cooling capacity, and refrigerant mass flow rate as a function of the evaporator temperature, cooling capacity, and refrigerant mass flow rate. The findings of the experiments were utilized to verify a numerical model developed utilizing engineering equation solver (EES) software. The performance of the vapor compression of the cooling systems was compared using alternative refrigerants, including R22, R32, and R410a at different operating conditions. This study revealed that R22 refrigerant has a higher coefficient of performance than R32 and R410A, while R32 has the highest cooling capacity among other refrigerants. © 2022 by the authors. ABSTRACT: Community pharmacists play a crucial role in providing comprehensive patient education regarding contraception methods. This study aims to investigate Jordanian pharmacists' knowledge and perceptions toward male oral contraceptive pills (OCPs). A mixed-explanatory sequential method was divided into two phases. The first was a self-administered electronic survey that was distributed to community pharmacists/trainees in Jordan. The second phase was carried out through online semi-structured in-depth interviews targeting the maximum variation purposive sample of community

pharmacists. A total of 158 (response rate 98%) questionnaires were included in the analysis. The majority of the participants were female (n = 118, 74.2%). In terms of knowledge, only 25% of participants acknowledged the presence of male OCPs and almost half were uncertain about the mechanism of action and the possible uses. The findings of the interviews confirmed a relatively negative perception toward male OCPs and the identified barriers to male OCPs were cultural norms, side effects, and poor compliance. It is argued that there is a negative perception toward male OCPs due to the majority of pharmacists not believing such products will be successful in Jordan. Once these pills are approved for their effectiveness and safety, men may need further education and encouragement to take an active role in family planning along with their partners. © The Author(s) 2022.

ABSTRACT: The current study is a randomized, open-label, two-period, two-sequence, two-way crossover pharmacokinetic study in healthy Jordanian subjects to evaluate the pharmacokinetics and bioequivalence profile of two cases of empagliflozin 10 mg under fasting and fed conditions. The plasma concentrations of empagliflozin were determined using an HPLC-MS/MS method. Tolerability and safety were assessed throughout the study. This study included 26 subjects, 26 in both fasting and fed groups. The pharmacokinetic parameters, which included the area under the concentration-time curve from time zero to infinity (AUC_{0-inf}) and the final quantifiable concentration (AUC_{0-last}), maximum serum concentration (C_{max}), and time to reach the maximum drug concentration (T_{max}) were found to be within an equivalence margin of 80.00-125.00%. The pharmacokinetic profiles show that the empagliflozin test and parent reference cases were bioequivalent in healthy subjects. The two treatments' safety evaluations were also comparable. © 2022 by the authors. Licensee MDPI, Basel, Switzerland.

ABSTRACT: Background: Diabetes mellitus is a chronic metabolic disorder, characterized by hyperglycemia over a prolonged period, disturbance of fat, protein, and carbohydrate metabolism, resulting from defective insulin secretion, insulin action or both. Dipeptidyl peptidase-IV (DPP-IV) inhibitors are relatively a new class of oral hypoglycemic agents that reduce the deterioration of gut-derived endogenous incretin hormones secreted in response to food ingestion to stimulate the secretion of insulin from beta cells of the pancreas. Objective: In this study, synthesis, characterization, and biological assessment of twelve novel phe-nanthridine sulfonamide derivatives 3a-3l as potential DPP-IV inhibitors were carried out. The target compounds were docked to study the molecular interactions and binding affinities against the DPP-IV enzyme. Methods: The synthesized molecules were characterized using ¹H-NMR, ¹³C-NMR, IR, and MS. Quantum-polarized ligand docking (QPLD) was also performed. Results: In vitro biological evaluation of compounds 3a-3l reveals comparable DPP-IV inhibitory activities ranging from 10%-46% at 100 μM concentration, where compound 3d harboring or-tho-fluoro moiety exhibited the highest inhibitory activity. QPLD study shows that compounds 3a-3l accommodate DPP-IV binding site and form H-bonding with the R125, E205, E206, S209, F357, R358, K554, W629, S630, Y631, Y662, R669, and Y752 backbones. Conclusion: In conclusion, phenanthridine sulfonamides could serve as potential DPP-IV inhibitors that require further structural optimization in order to enhance their inhibitory activity. © 2022 Bentham Science Publishers.

ABSTRACT: Background: Oxandrolone is a synthetic testosterone analog that is widely used among bodybuilders and athletes. However, oxandrolone causes male infertility. Recently, it was found that metformin reduces the risk of infertility associated with diabetes mellitus. Aim: This study aimed to investigate the protective effects of metformin against oxandrolone-induced infertility in male rats. Methods: Rats continuously received one of four treatments (n=7) over 14 days: control DMSO administration, oxandrolone administration, metformin administration, or co-administration of oxandrolone and metformin. Doses were equivalent to those used for human treatment. Subsequently, testicular and blood samples were collected for morphological, biochemical, and histological examination. In addition, gene expression of the testosterone synthesizing enzyme CYP11A1 was analyzed in the testes using RT-PCR. Results: Oxandrolone administration induced male infertility by significantly reducing relative weights of testes by 48%, sperm count by 82%, and serum testosterone levels by 96% (ANOVA, P value < 0.05). In addition, histological examination determined that oxandrolone caused spermatogenic arrest, which was associated with 2-fold downregulation of testicular CYP11A1 gene expression. However, co-administration of metformin with oxandrolone significantly ameliorated toxicological alterations induced by oxandrolone exposure (ANOVA, P-value < 0.05). Conclusion: Metformin administration provided protection against oxandrolone-induced infertility in male rats. Further clinical studies are needed to confirm the protective effect of metformin against oxandrolone-induced infertility among athletes. © 2022 Bentham Science Publishers.

ABSTRACT: Breast cancer is the second leading cause of cancer death in women after lung cancer. The first-line treatment of metastatic breast cancer in premenopausal women relies on tamoxifen. The development of tamoxifen resistance is not fully understood. In this study, capillary electrophoresis with capacitively coupled contactless conductivity detector was developed to monitor the changes in lactate and pyruvate levels in supernatant media of three models of developed MCF-7 tamoxifen-resistant cells and correlate these metabolites changes with lactate dehydrogenase genes expression and glucose consumption. The electrophoretic separation was achieved under reversed electroosmotic flow conditions. The linear ranges were 0.15–5 and 0.01–1 mM with a correlation coefficient of 0.9966 and 0.9971 and the limits of detection were 0.01 and 0.02 µM for lactate and pyruvate, respectively. Inter- and intrarun accuracy were in the range of 96.88–105.94% with precision (CV, %) of ≤7.35%. The method was completely validated and the results were in agreement with those obtained using the lactate and glucose assay kits. The results revealed a significant increase in both lactate and pyruvate production in the three tamoxifen-resistant MCF-7 cells models compared to control cells. This increase was correlated with the increase of lactate dehydrogenase genes expression and the increase of glucose consumption. © 2021 Wiley-VCH GmbH

ABSTRACT: Background: Burn injury survivors usually experience multiple psychosocial problems, which occur commonly in low and middle-income countries. However, the previous literature provides limited

information about the unique roles of coping strategies, social support, and mindfulness in improving the psychological well-being of burn survivors. Therefore, this study identified the role of coping strategies, social support, and mindfulness in improving the psychological well-being of burn survivors. Methods: A descriptive correlational study on 224 burn survivors at a large government hospital in Amman, Jordan, was conducted. Participants completed questionnaires about socio-demographic and clinical data, anxiety and depression, social support, mindfulness, and coping. Standard multiple regression was performed to identify the unique role of the main study variables in improving the psychological well-being of burn survivors. Results: Participants were found to have a severe level of psychological distress. Escape avoidance coping had the highest mean score among all other coping strategies, while acceptance of responsibility had the lowest mean score. Regression analysis showed that confrontive coping ($\beta = -0.224$, $p = p < 0.01$), social support ($\beta = -.212$, $p = p < 0.01$), and mindfulness ($\beta = -.403$, $p = p < 0.01$) were significantly associated with less psychological distress. Conclusions: Therefore, confrontive coping, social support, and mindfulness-based supportive interventions could be helpful in providing enhanced support to burn survivors. © 2021 Elsevier Ltd and ISBI

ABSTRACT: Thiazolidinediones are well-known anti-diabetic drugs. However, they are not widely used due to their cardiotoxic effects. Therefore, in this study, we aimed to determine the molecular toxicological alterations induced in the mouse hearts after thiazolidinedione administration. Balb/c mice received doses clinically equivalent to those given to humans of the most commonly used thiazolidinediones, pioglitazone, and rosiglitazone for 30 days. After that, RNA samples were isolated from the hearts. The mRNA expression of cytochrome (cyp) p450 genes that synthesize the cardiotoxic 20-hydroxyeicosatetraenoic acid (20-HETE) in addition to 92 cardiotoxicity biomarker genes were analyzed using quantitative polymerase chain reaction array technique. The analysis demonstrated that thiazolidinediones caused a significant upregulation ($p < 0.5$) of the mRNA expression of *cyp1a1*, *cyp4a12*, *itpr1*, *ccl7*, *ccl1*, and *b2 m* genes. In addition, thiazolidinediones caused a significant ($p < 0.05$) downregulation of the mRNA expression of *adra2a*, *bsn*, *col15a1*, *fosl1*, *Il6*, *bpifal*, *plau*, and *reg3b* genes. The most affected gene was *itpr1* gene, which was upregulated by pioglitazone and rosiglitazone by sevenfold and 3.5-fold, respectively. In addition, pioglitazone caused significant upregulation of ($p < 0.05$) *hamp*, *ppbp*, *psma2*, *sik1*, *timp1*, and *ucp1* genes, which were not affected significantly ($p > 0.05$) by rosiglitazone administration. In conclusion, this study showed that thiazolidinediones induce toxicological molecular alterations in the mouse hearts, such as the induction of *cyp450s* that synthesize 20-HETE, chemokine activation, inflammatory responses, blood clotting, and oxidative stress. These findings may help us understand the mechanism of cardiotoxicity involved in thiazolidinedione administration. © 2021 Société Française de Pharmacologie et de Thérapeutique

ABSTRACT: Purpose: This study aims to investigate the relationship between management accounting systems effectiveness (MASE) and company performance and then it examines the role of perceived environmental uncertainty as a moderator on this relationship. It provides empirical evidence from a developing market, especially from the Jordanian market. Design/methodology/approach: This study is based on collecting its data using a quantitative method to assist in explaining and interpreting the results, whereby the study data were collected through a survey design approach using a questionnaire method to achieve the objectives of the study. The population of this study included all Jordanian companies listed on the Amman Stock Exchange (ASE) at the end of 2019, a total of 187 companies. Therefore, the study sample consists of all these companies (a completely sensuous population) which

are listed on ASE at the end of 2019. Findings: The findings of this study offered that two informational characteristics of MASE, namely, timeliness and integration, have a significant impact on the financial performance and other characteristics have no impact on the financial (FP) and nonfinancial (NFP) performance. The informational characteristics of management accounting systems complement each other to ensure the MASE in the company, where the relationship between MASE proxied by four informational characteristics together and FP as well as NFP, were highly significant. Additionally, the findings documented that perceived environmental uncertainty, namely, customer uncertainty, competitor uncertainty and technology uncertainty separately do not moderate the relationship between MASE and company performance (both FP and NFP). Research limitations/implications: The findings of this study shape the way for more thorough studies into monitoring MASE. Nevertheless, to start efficient decisions, managers need to comprehend the interaction of the MASE with other factors. All these considerations need to be comprehended both for and against the performance. Finally, this study addressed important issues that have practical management value. However, it is limited to a sample from one country. Future research would be interesting to study different businesses and cultural settings to enhance the theoretical and practical contributions of the study's findings and conclusions. To be more specific, further study should have a wider view of the determinants of performance by containing economic factors in different areas such as the MENA region. Originality/value: To the best of the knowledge, this is the first study of Jordan to examine the relationship between MASE and company performance from two sides (namely, financial and non-financial performance), moderated by perceived environmental uncertainty. As such, the study raises significant findings drawing attention to management accounting systems and the role of management accounting systems in Jordan. © 2021, Emerald Publishing Limited.

ABSTRACT: Rural Research Stations (RRS), Refugee Camps Motorhomes and Caravans are in need of a portable Compact Heating, Cooling and Power (CHCP) generating device. Heating and power generation devices with diesel as driving source of energy are available commercially. In this paper, an innovative compact heating, cooling and power generating device which uses renewable hydrogen and suits rural areas, extreme weather conditions and disastrous situations is proposed. The device is driven by renewable hydrogen fuel generated by PV electrolysis as the source of energy. Low vibration low noise Stirling Engine (SE) is used as mechanical energy converter. Generator is used as electrical energy converter and heat pump is used for supplying heating and cooling effects. The proposed device has many advantages such as encouraging the rural tourism, supply rural research stations the heating and/or cooling loads and contribute in saving lives in the extreme weather conditions and disastrous situations. Analysis of the proposed device in terms of workability and performance was performed. Results showed that renewable energy base, electricity independent, silent, low vibration and better performance were achieved (OHR = 2.662) with the current device compared to available devices. © 2021 Hydrogen Energy Publications LLC

ABSTRACT: Many cities worldwide take pride in their traditional markets. This research aims to verify the importance of lessons learned from old traditional markets, characterized by the effective response to their physical environment. This main aim leads to many secondary aims. First is the aim to explain the role of the phenomena of diversity in the establishment of various markets. Second, the research aims to explain the relationship between the specialization of goods, the architectural form and general planning of the market. Third, the research aims to investigate the relationship between markets and the diversity of the goods, width of the corridors, roofing style, and how this diversity affects shoppers, as well as interacting among the shoppers themselves. The research adopts

a descriptive analytical methodology for a number of market types in order to study the morphology of traditional markets, their form, their urban context, and their relationship with the diversity of the goods and the impact it has on shoppers. The most important conclusion reached by the research is that the diversity in the morphology of traditional markets corresponds to the diversity and change of goods, the width of the corridors and the style of the roof ... etc. This diversity affects shoppers and generates a state of pleasure and social interaction. © (2022). ABSTRACT: The main aim of this study is to achieve an in-depth understanding of the mechanism by which internal marketing affects job satisfaction. A theoretical framework was developed basing on related marketing literature. The study model was intended to determine the influence of internal marketing dimensions (IMD) in tourism and hospitality industry, particularly in the Dead Sea Region in Jordan. 378 valid questionnaires were retrieved from respondents representing different departments in targeted hotels and resorts. SPSS statistical package and its related module Amos were used to test the relationship between the independent variables of (IMD) and dependent variables related to employees' satisfaction (ES). The findings of the study have indicated the existence of significant positive correlations between three main dimensions of internal marketing (service culture, human resources management, and marketing information) on employees' job satisfaction. However, results have shown a less motivation effect on employee's satisfaction (ES). Copyright © 2022 Inderscience Enterprises Ltd.

ABSTRACT: This study explored the data mining tools role in cyber-risk management among Jordanian commercial banks listed on the Amman Stock Exchange. A standardized questionnaire was distributed to the information technology and bank risk management staff (n=139) in 13 commercial banks. There were significant effects of data mining tools in cyber-risk management on the discovery, dissemination, and participation of knowledge systems, and on opportunities to improve knowledge systems through the development of the environment for study and data retrieval systems. This study emphasizes the need to look for areas of improvement that would affect the efficiency of using data mining tools in the discovery, dissemination, and sharing of knowledge systems to manage cyber risks, as well as the need to combine data mining technology with to use their cognitive abilities and technical concepts with the necessary methods and tools to improve the bank's knowledge culture and to provide all necessary data stores and warehouses for the formation of new knowledge, which would help in the development of cyber risk management in Jordanian banks, which are listed on the Amman Stock Exchange. © 2022 IEEE.

ABSTRACT: Addiction is a chronic relapsing disorder, which creates challenges for its treatment. Chronic use of drugs of abuse can change the neurobiology and neurochemistry of brain circuits and underlies drug relapse during voluntary abstinence. The role of dopamine (DA) and glutamate in drug addiction has been extensively investigated, and interactions between these neurotransmitters are important for the development of drug use disorders and drug relapse. For the past two decades, the role of glial glutamate transporters has emerged as a key mechanism in drug dependence and relapse. This chapter focuses on the role of these mechanisms in two commonly abused drugs, ethanol and cocaine, that are often abused at the same time. Here, the effect of acute and chronic exposure to cocaine and ethanol on glutamatergic systems in different brain regions within the mesocorticolimbic pathway is considered. The ultimate goal of research into mechanisms of co-use of cocaine and ethanol is to consider how co-use amplifies the changes in this circuitry and complicates attempts to abstain from drug use. This research has the ultimate goal of identifying therapeutic targets that will be effective in preventing relapse in individuals suffering from concurrent alcohol and cocaine use disorders. © Springer Nature Switzerland AG 2022.

ABSTRACT: Skin disease diagnosis using modern artificial intelligence (AI) approaches proved impressive results in classifying diseases compared to dermatologists. Employing AI techniques in computer-aided diagnosis systems will help in self-identification using intelligent nodes in healthcare facilities. Convolutional Neural Networks (CNN) have been employed by many previous researchers for skin lesion classification. In this work, the use of several Transfer Learning will be introduced for classifying monkey pox from other skin diseases. Even though deep learning (DL) and Transfer Learning (TL) have advantages over a dermatologist, they also have significant weaknesses, such as the potential to incorrectly identify photos in some cases. The achieved results conclude the best environment and techniques for diagnosing monkey pox from other skin diseases. Accuracy, loss, precision, recall, and F1 score will be used to assess the suggested system's performance. Using TL in Keras and computer vision models, the system successfully diagnoses 3 distinct types of skin illnesses with an accuracy rate of 99.3 %. The best model was InceptionResNetV2 with exponents with epoch 50 and Adam optimizer. © 2022 IEEE.

ABSTRACT: Optical fiber has become the medium of choice for reliable high speed and high capacity data transfer. Signal to Noise Ratio (SNR) and Bit Error Rate (BER) are two important parameters used for evaluating the quality of Fiber Optic transmission. SNR is a logarithmic ratio of the received signal and noise power, while BER is the measure of the probability of incorrect bit identification. This paper aims to improve the transmission security for images over Fiber Optic communication. Several modulation methods have been implemented to find the best modulation method for transmission over a Fiber Optic channel in the single-mode to minimize SNR and BER. To maximize the correlation value between transferred and received images, the Malta Simulink environment has been used. The simulation results showed that the best accuracy can be obtained using Binary Phase-Shift Keying (BPSK). © 2022 IEEE.

ABSTRACT: This study analyzes numerous models of complete sentence forms combined in one word that contain a verb, a subject and an object, or only a verb and a subject, such as Tarrazani's "embroider me" and Zambagat "lily", where these formulas are abundantly found in Rashid Issa's poetry, and this phenomenon has become an aesthetic advantage shining in his poetic language, in addition, one of the reasons we sought to identify other structural aspects of the single word that the poet brought to serve the image and the psychological state that brought him to this, such as generating from the rigid, its conjugation and the necessary transgression of verbs, and also his use of formulas that contradict linguistic analogy. To reveal the importance of these technical advantages, the researchers memorized the potential spaces of the poetic image in those universal formulas, and deduced the semantic fields expected in them as well, by relying on the analytical, descriptive, and psychological methods. The researchers concluded that the poet's use of such words (sentences) was based on what was measured against the words of the Arabs, especially in the field of derivation according to Ibn Jana and others, however, he presented to the Arabic poem a new set of innovative linguistic enriching, such as "sawsantne" from Alsawsanah (lily), and "Lailakaha" from the lilac star or the lilac flower, and "Tamarimat" from Mary, mother of Jesus, peace be upon him. © 2022 DSR Publishers/ The University of Jordan.

ABSTRACT: This research analyses the causes of traffic congestion in urban corridors. It specifically studies the intersected relationship between land-use and transportation planning by examining Al-Madina Al Monawara street in Amman, the capital of Jordan, as a case study. Techniques implemented in data collection are personal observations, traffic counts, land use maps and questionnaires. The methods applied in analysing the collected traffic counts are: Level of Service (LOS), Automatic Traffic Counters (ATC) and Trip Attraction Analysis (TAA). The outcome of the research verified the relationship between the high level of traffic, where the traffic exceeds the actual capacity of the street by 43%, and the unregulated land use planning where 85% of the existing buildings along the street are commercial. The findings of this research will help to establish an assessment tool for testing the impacts of transportation and land use in congested developing cities. This study is important since transportation solutions receive little attention by planner's development agendas in Jordan and the neighbouring countries. © 2022, Russian Geographical Society. ABSTRACT: This article, in the introduction, gives a brief historic description on surfaces of finite Chen-type and of coordinate finite Chen-type according to the first, second and third fundamental form of a surface in the Euclidean space E^3 . Then, an important class of surfaces was introduced, namely, the ruled surfaces were classified according to its coordinate finite Chen type with respect to the second fundamental form. © 2022 World Scientific and Engineering Academy and Society.
